  1. Separate conduit shall be run from each refrigeration/HVAC controller, IRLDS-II panels, Input/output boards, and control boards to each respective enclosure or panel housing their source of power. Conduit will not be necessary if equipment is mounted directly to enclosure housing source of power providing electrical couplings are fitted to link enclosures permitting enough room to supply power wires to equipment.

- C. Low Voltage Connections:
1. Controllers: Separate conduit will be run to connect any Alerton VLC, or equal controllers where by the units are separated from each other in different rooms. Conduit will be labeled at each end as "echelon net and/or 485 com" and to what controller opposite end of conduit leads to.
  2. Input / output boards: Separate conduit will be run to connect any enclosures housing I/O and/or controller boards where communication wires are needed to link each other through an area outside of the building structure ensuring no communication wires are left exposed to outside air. Conduit will be labeled at each end as to what I/O board and/or controller the opposite end of conduit leads to.
  3. Sensors: Separate conduit per island or dual-temp case shall be run in slabs from equipment enclosure housing respective I/O boards of each case to enclosed area of case. Conduit shall be labeled with case or I/O board number on each end of conduit.

## 2.12 LABELS

- A. All components, devices and cables shall be identified with printed labels. Labels shall include name of equipment, unit numbers, identify associated equipment and devices.
- B. Cables shall have labels at each end.
- C. Input and Output relays, digitals controls shall be labeled with control description.
- D. Alarms shall be labeled as "out alarms" or "in alarms".

## 2.13 ALARM LIGHT AND STROBE

- A. Furnish one (1) alarm strobe light with time delay button.

## 2.14 INFRARED SENSORS

- A. Approved manufacturers: Raytek M13 sensors and boxes or approved equal.
- B. Furnish and install one complete infrared temperature sensor system with (2) sensors and shall include all equipment, wiring, configuration, programming, setup, hangers, supports and all related work.
- C. Terminate wiring in ice system control panel. Program and configure controller to control start/stop function on packaged refrigeration systems based on user adjustable set-point and IR sensor input as an option to controlling packaged refrigeration systems on return glycol.
- D. Provide visibility of IR Sensors Ice Temperature on control system.
- E. Install above the ice rink floor in owner directed location. Field verify and coordinate conduit and wire routing.

## PART 3 - EXECUTION PERFORMANCE

### 3.1 GENERAL INSTALLATION

- A. Installation shall be in accordance with manufacturers' recommendations.

### 3.2 SENSOR AND TRANSDUCER INSTALLATION

- A. All sensors and transducers are to be mounted in an appropriate location. All pressure transducers must be mounted in an upward vertical position and accessible for adjustment. All sensors and transducers are to be properly set up through software and hardware.

**3.3 WIRE INSTALLATION**

- A. No cable will be run in the same conduit as line voltage wiring.
- B. All cables can be run exposed whenever permitted by code and shall be secured in such a manner so that they are not visible from the floor.
- C. Communications cables connecting boards shall be run from board to board in a logical daisy chained fashion with no breaks, or star configurations.

**3.4 GAS MONITORING SYSTEM CONNECTIONS**

- A. Connect gas monitoring system unit outputs to IRCS for alarming and monitoring functions.
- B. An alarm strobe light and bell with time delay button shall be mounted by the controller.
- C. Furnish and install one dry contact pushbutton. Mount switches to the outside of alarm panel. Label one switch as "Sign Override".
- D. Settings shall enable alarms to stay "on" if system fails.
- E. Program all necessary set points, parameters, and alarm settings for proper operation.

**3.5 ALARMS**

- A. All alarm parameters must be programmed and fine-tuned at time of product delivery.
- B. Owner must be notified of all alarms through email and text messages.
- C. Connect ice system controls to automatic dialer system, specified in Section 131812 – Ice Rink Refrigeration System, for alarm notifications.
- D. Outside alarms must be tested in the present of Owner's representative.
- E. All alarms and settings identified herein are recommended guidelines for initial system setup. These settings shall be fully adjustable.
- F. The following alarms and Set Points shall be established.
  - 1. Compressor high discharge pressure - 200 psi
  - 2. Compressor high discharge temperature - 300°F
  - 3. Compressor low suction pressure - 10 psi
  - 4. Compressor high oil temperature - 150°F
  - 5. Compressor low oil temperature - 90°F
  - 6. Compressor low oil net pressure - 15 psi (net oil pressure – suction pressure)
  - 7. Brine/glycol return high temperature - 24°F.
  - 8. Heat recovery water heater high water temperature - 150°F
  - 9. Emergency bypass/crossover solenoid valve activation - 235psi
  - 10. Refrigeration system power failure.
- G. The following equipment shall be monitored for status/current after a start command has been given. Alarms shall be recorded and require manual user reset when the current monitoring has identified that the equipment is not operating.
  - 1. Compressors
  - 2. Brine/glycol pumps
  - 3. Condenser Fan and Water Pump
  - 4. Snowmelt pump
  - 5. Subfloor pump
- H. The following alarms shall be recorded and automatically de-energize the associated compressor. When the alarms are cleared, the user must manually reset alarms through on-site access or remote access to bring associated compressors back into operation.
  - 1. Compressor high discharge pressure.

- 2. Compressor low suction pressure.
  - 3. Compressor high discharge temperature.
  - 4. Compressor high oil temperature.
  - 5. Compressor low oil pressure (net).
  - 6. Start failure (MCC failure for motor overload, phase loss, etc.)
- I. The following alarms shall be recorded and automatically de-energize all compressors. When the alarm condition is cleared, the compressor shall automatically reset. The alarm shall remain in a latched state for operator to identify that alarm occurred.
- 1. Chiller flow switch
  - 2. Emergency stop activated.
  - 3. Refrigerant leak detection activation

**3.6 CABLE FOR SENSOR TRANSDUCERS AND CONTROL RELAY INSTALLATION**

- A. No cable will be run in the same conduit as line voltage wiring.
- B. All cables can be run exposed whenever permitted by code and shall be secured in such a manner so that they are not visible from the floor.
- C. Cables with multiple conductors to accommodate more than one sensor can be utilized for island and dual-temp cases only, providing all limitations are met through specifications for each sensor connected.
- D. Cables for input sensors shall be run with no breaks or splices from the I/O board to sensors wires. Use wire butt connector. Do not use wire nuts.
- E. Cables for control relays shall be run with no breaks or splices from the I/O board to termination on points of relay.

**3.7 PENETRATIONS**

- A. Provide fire stopping for all penetrations used by dedicated BMS/EMS conduits and raceways.
- B. All openings in fire proofed or fire stopped components shall be closed by using approved fire resistive sealant.
- C. All wiring passing through penetrations, including walls shall be in conduit or enclosed raceway.
- D. Penetrations of floor slabs shall be by core drilling. All penetrations shall be plumb, true, and square.

**3.8 GENERAL POINTS LIST**

- A. The IRCS shall, at minimum, monitor the following system points and points necessary for a complete control system as described in this section.
- B. Points Type Legend:
  - 1. AI – Analog Input
  - 2. AO – Analog Output
  - 3. BI – Binary Input
  - 4. BO – Binary Output

**3.9 SEQUENCE OF OPERATION**

- A. The following is a general sequence of operation to familiarize the control system developer/supplier with the functions and controls of the ice system. It may not be comprehensive sequence or list and may be modified throughout the project.
- B. All temperatures and pressure settings identified herein are recommended guidelines for initial system setup. These settings should be adjusted during system operation to achieve optimum system performance.
- C. Compressors
  - 1. Compressor Lead/Lag.
    - a. The three (3) compressors shall rotate lead / lag positions based on operator sequence selection to rotate order of operation. The following compressor sequences shall be used.

<i>Lead Position</i>	<i>Lag Position</i>	<i>Standby Position</i>
1	2	3
2	3	1
3	1	2

- 2. Compressor Operation
  - a. Compressor operation is controlled by secondary refrigerant temperature returning from rink floor based on operator adjustable Set Point (SP).

- b. Lead / Lag compressors shall be energized in accordance with the SP offsets in the table below. SP offsets shall be operator adjustable.

<b>Compressor</b>	<b>ON (°F)</b>	<b>OFF (°F)</b>
Lead	SP 1□	SP - 1□
Lag	SP 2□	SP - 1□

- c. Lag compressors shall not be energized until the SP offset has been reached and the lead compressor has been operating fully loaded for 10-minutes.
- d. If the lead compressor fails to start, the lag compressor shall be energized within 2-minutes of the failure.
- e. The standby compressor shall be automatically enabled if the lead or lag compressor are locked out on start fail or can be enabled manually in an emergency once the lead and lag compressors are enabled.
3. Compressor loading shall be fully adjustable with initial settings as follows:
- Stage 1 loading will occur 1-minute after compressor start.
  - Stage 2 loading will occur 2-minutes after compressor start.
- D. Heat Reclaim System
- Snow Melting
    - Pump on and solenoid valve open when compressors are running.
  - Subfloor Heating
    - With subsoil temperature sensors: Pump on when compressors are running and subsoil temperature is less than 40□(F). If glycol temperature is less than 55□(F), the three-way valve shall modulate warmer glycol from the snow melt piping loop into the subfloor heat loop. Pump shall turn off when subsoil temperature reaches 45□(F).
  - Preheat Domestic and Resurfacers Water
    - Solenoid valve opens when compressors are running and water temperature inside heat recovery water heater is less than 140°F.

E. Condenser

- Controlled by compressor discharge head pressure downstream of the pressure regulating valve. Condensing pressure shall be controlled by a combination of the fan and water pump to maintain the specified condensing temperature. Add ambient air sensor to assure water pump does not operate at very low air temperatures (0F, etc.) to avoid freeze up of unit. Typical set points are as follows. The fan speed is regulated by VFD. Initial fan and water pump set points are as follows:

<b>Operation</b>	<b>Discharge Pressure (psi)</b>
Fan ON @ min. speed	145
Fan ON @ max. speed	165
Water Pump ON	175
Water Pump OFF	150
Fan OFF	135

- Provide two modes of operation.
  - Winter mode: Condenser fan leads and water pump follows.
  - Summer mode: Water pumps leads and condenser fan follows. Fans to shut off first as pressure decreases.
  - Provide an automatic switchover mode between winter and summer modes. When this mode is enabled, if the temperature falls below the User setpoint, the control switches to winter mode.

F. Chiller

- The level of refrigerant in the chiller vessel is controlled by:
  - A solenoid valve (king valve) as described below.

- b. An automatic expansion valve regulated by the specified adjustable level controller that is mounted on the liquid refrigerant column.
  - c. A high-level float switch shall be wired in series with the solenoid valve (king valve) to close the solenoid valve if the maximum set level in the chiller is reached.
- G. Rink Pumps
  - 1. Continuously running. Pump speed regulated by VFD based on operator adjustable Set Point (SP) for the ice rink floor temperature as measured by the rink floor sensors. One pump should always operate at 100%.
- H. Solenoid Valves:
  - 1. Chiller Vessel:
    - a. This valve allows refrigerant to pass from the high-pressure receiver to the chiller vessel.
    - b. This valve shall be enabled with any one or more compressors are running.
    - c. This valve shall be wired in series with the chiller high level float switch to close the solenoid valve if the maximum set level in the chiller is reached.
  - 2. Emergency Bypass/Crossover Solenoid Valve: This valve allows high and low-pressure refrigerant to equalize if high discharge pressures are reached. Valve opens if compressor discharge pressure reaches 235 psi (adj.) Compressors shall be locked out when valve is open. Valve shall be controlled by a dedicated mechanical pressure safety switch.
  - 3. Compressor Only Enabled Solenoid Valve: These valves control refrigerant hot gas flow to heat exchangers. Valves are open when compressors are running.
  - 4. Water Preheat System Solenoid Valve: This valve controls refrigerant hot gas flow to the heat recovery water heaters. Valve is open when compressors are running and the water temperature inside the heat recovery water heaters is less than 140°F.
- I. King Valve
  - 1. This valve allow refrigerant to pass from the high-pressure receiver to the chiller vessel and is a manually operated isolation valve.
- J. The following programming shall be included in the control system.
  - 1. Modes of Operation. The following modes of operation shall be programmed into the control system. The modes of operation shall be fully programmable and adjustable per the Owner's requirements and direction.
    - a. IRC Mode: The rink is controlled based on the temperature from the Infrared sensor.
    - b. Slab Mode: The rink is controlled based on the average temperature of the slab sensors.
    - c. Return Mode: The rink is controlled based on the return glycol temperature.
    - d. Day Mode: This indicates the rink is in day mode and control will be based on the day mode targets.
    - e. Night Mode: This indicates the rink is in night mode and control will be based on the night mode targets.
    - f. Game Mode: This indicates the rink is in Game mode and control will be based on the Game mode targets. Under "Game Mode", the system shall always operate with a minimum of (1) compressor and (1) rink pump. System shall operate based on the in-floor slab sensors.
    - g. Cover Mode: Under "Cover Mode", the system shall operate based secondary refrigerant temperature returning from rink floor based on operator adjustable Set Point (SP).
    - h. Ice Refresh Mode: Under "Refresh Mode", the system shall automatically bring down the rink slab temperature based on in-floor slab sensors to a user defined set-point at a user defined rate per hour. The system shall automatically bring up the rink slab temperature based on in-floor slab sensors to a user defined set-point at a user defined rate per hour.

2. Calendar. Provide a programmable daily calendar that allows different modes of operation to be incorporated in the calendar. The calendar shall be fully adjustable and programmable by the Owner.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 13 18 19 - ICE RINK WATER TREATMENT SYSTEM****PART 1 - GENERAL****1.01 SECTION INCLUDES**

- A. General system description and design criteria.
- B. Reverse Osmosis Equipment and Materials.
- C. Valves Piping and Accessories.
- D. Waterline connections.

**1.02 GENERAL SYSTEM DESCRIPTION AND DESIGN CRITERIA**

- A. Furnish and install all materials, equipment and controls necessary for a fully functional demineralization system. In general, the treatment system shall include:
  - 1. Water Softener System.
  - 2. Carbon Filter System.
  - 3. Demineralizer System.
  - 4. Storage Tank.
  - 5. Circulation Pump and Distribution System.
  - 6. Water Heating System.
  - 7. Ice Quality System.
- B. The system shall be capable of providing a continuous supply of treated and heated water for the purpose of ice making, at a rate of seven (7) gallons per minute to the storage reservoir.
- C. Work shall include all design, engineering, supply, installation and startup of equipment and training for a complete operating demineralization water treatment system.
- D. Work shall include furnishing and installing 4" high concrete equipment pads for entire system.

**1.03 RELATED SECTIONS**

- A. Section 007200 - General Conditions.
- B. Section 007300 – Supplementary Conditions.
- C. Section 131811 - Ice Rink General.
- D. Section 131814 - Ice Rink Piping, Valves and Accessories.

**1.04 REFERENCES**

- A. AWWA, ANSI, ASME, FDA, NSF, TSS, UL related sections.

**1.05 SUBMITTALS**

- A. Shop Drawings. All submittals shall conform to the requirements of General Conditions and Division 0 and 1 Specifications and shall also include schematic drawings of the systems, detail description of the treatment and control systems
- B. Operational and Maintenance manuals – Provide three (3) copies of the manuals prior to start-up and as required by the General Conditions and Division 0 and 1 specifications.

**1.06 WARRANTY GUARANTY**

- A. The water treatment system and all its components shall be warranted against defects in equipment, materials and workmanship for a period of one (1) year from substantial completion of system and as required by the general conditions.

#### **1.07 PRODUCT DELIVERY STORAGE AND HANDLING REQUIREMENTS**

- A. As required in the General Conditions and Division 0 and 1 specifications.

### **PART 2 - PRODUCTS**

#### **2.01 APPROVED MANUFACTURERS OF WATER TREATMENT SYSTEM**

- A. Approved Manufacturers: Jet Ice Limited, Newmarket, Ontario, Canada (905-853-4204) or equal.
- B. Model: PS-Mach 6.
- C. All components of the demineralization treatment system shall be manufactured from new, unused materials, free from defects and of the highest quality possible.
- D. The material shall be of the configuration, quantity, quality and design elements as described herein.
- E. Furnish and install all piping, valves, controls and electrical for each system component(s) whether or not stated in this section.

#### **2.02 PRE-TREATMENT EQUIPMENT AND SYSTEMS**

- A. Water Softener System: System shall include a duplex (two vessels), 16" diameter water softener unit with a capacity of 180,000 grains of hardness, alternating tank design, and meter-initiated regeneration. Tanks shall be glass fiber reinforced polyester with a working pressure of 120 psi and a hydrostatic test pressure of 300 psi.
- B. Carbon Filter System: System shall include a duplex (two vessels), 16" diameter carbon filter system with premium coconut carbon media. System shall provide an uninterrupted supply of water flowrate of 20 gpm. Tanks shall be glass fiber reinforced polyester with a working pressure of 120 psi and a hydrostatic test pressure of 300 psi.
- C. Prefilter System: System shall include a replacement type element filter for the demineralization system. Filter elements shall be rated at five (5) micron nominal size removal.

#### **2.03 PURIFICATION (DEMINERALIZATION) EQUIPMENT AND SYSTEMS**

- A. Pro Ice Unit: System shall include a Pro Ice Demineralizer unit designed to provide a continuous supply of treated water to meet the resurfacing and ice making rates of the facility.
- B. Circulating Pump: Shall be a stainless steel, multi-stage, pump with a direct coupled, premium efficiency motor. Pump shall boost operating pressure to 200 psig. A thermal overload relay shall be provided to protect the pump motor from overheating.
- C. Pro Ice Module: Module assembly shall consist of six (6) – 4" diameter by 40" long high flow elements. Elements shall be polyamide thin film composite membrane type elements in a spiral-wound modular configuration. Elements material and configuration shall be capable of producing water at least 95% free of dissolved solids based on standard conditions of feed water at 77°F containing 1500 ppm NaCl and an operating pressure of 200 psi. The element housings shall be constructed of stainless steel. Modules shall be connected in a series, multi-stage arrangement to deliver the design capacity by using a waste recycle system to minimize waste flow requirements.
- D. Electrical and Control System Enclosure and Framework: Shall be open type mounted on a freestanding welded steel frame with a durable powder coating finish. Pressure gauges, flow

indicators and waste flow control valve shall be mounted on a protective metal frame below the control panel.

- E. Protection Features: A pressure switch shall be installed after the inlet water solenoid to protect the pump from cavitating by shutting down the inlet solenoid valve and pump should the inlet pressure fall below 20 psi for more than five (5) seconds. A 'low pressure event' readout shall be displayed on the LED panel to warn the operator of the condition. For membrane protection, the unit shall be equipped with time delay startup.
- F. Auto Flush: Unit shall automatically flush debris from membrane.
- G. Controls:
  - 1. All controls required for the system; including mechanical, hydraulic and electrical controls shall be provided for a complete, self-contained unit. Operation of the unit shall be controlled by an 'on / off' button located on the front of the cabinet. The panel LED shall include the following readouts:
    - a. System running
    - b. Low pressure event
    - c. Storage full
  - 2. Connections shall be for liquid level control, which will shut down the unit and prevent overflow of the product water storage tank.
  - 3. Two (2) liquid filled pressure gauges shall be installed to indicate the feed and module pressure of the unit and to notify the operator when a replacement cartridge is required. A third pressure gauge to monitor system pressure shall be included.
  - 4. Two (2) clear rotameter flow indicators shall be mounted on the front of the cabinet to show the rate of production flow and the rate of waste flow.
  - 5. The unit shall be equipped with LCD Total Dissolved Solids meter for monitoring quality of product water at all times.
- H. Waste Water Line: Shall include piping and stainless-steel throttling valve to permit adjustment of the waste flow. An adjusting handle shall be located on the front of the cabinet for operator convenience.
- I. Recycle Line: Shall include a stainless-steel throttling valve to permit the recycle of wastewater through the membranes to minimize the discharge of wastewater.

#### **2.04 STORAGE TANK AND DELIVERY PUMP**

- A. Storage Tank: The demineralized water shall be fed to a polyethylene closed top storage tank with capacity of 850 gallons tank measuring 48" diameter by 120" tall. Level controls in the tank will control feed to the tank. Owner may require tank dimensions to change to fit allocated space within existing resurfacer room. Tank shall be a rotationally molded polyethylene storage tank. The tank shall have an integral factory manufactured vent in the manway cover. Bulkhead fittings shall be provided to allow for 2"-3" drain/outlet, 1"-1.5" inlet, level control.
- B. Distribution Pump: The water distribution pump shall be of stainless steel construction capable of producing up to 15 gallons per minute of flow at 50 psi pressure with a premium efficiency, inverter duty motor. A variable frequency drive shall be provided with pump to maintain 50 psi system pressure. Accessories shall include a liquid filled pressure gauge, and a pressured well tank.

#### **2.05 HEATING PACKAGE**

- A. Heating Package: Shall consist of two (2) natural gas fired, glass lined, water heaters with a holding capacity of 85 gallons each and a recovery rate of 442 gallons per hour each at 80 degrees F temperature rise. Input rating shall be 365,000 BTU's. Minimum efficiency rating shall be 80%.
- B. Approved water heater manufacturer: A.O. Smith BTR365(A) or equal.

**2.06 ELECTRICAL SYSTEMS**

- A. The water treatment system shall be prewired, and CSA approved. A disconnect panel will be included. The electrical subcontractor on the project will provide the following electrical systems for the system (see electrical drawings):
  - 1. One (1) 30-amp 208/230/240-volt electrical service for the main panel.
  - 2. Two (2) 120-volt connections for the two water heaters.
  - 3. One (1) 110-volt quad receptacle to power the controllers for the pretreatment package.

**2.07 PLUMBING SYSTEMS**

- A. Thermostatic mixing valve: Furnish and install a Symmons 6-500 thermomixing valve on the 1" domestic hot and cold-water supply lines. The 1" supply line supplied by the mechanical subcontractor (see mechanical drawings). RO feed water is to be maintained at 77°F to ensure the system achieves maximum performance. The valve shall have union connectors on each side for service accessibility.
- B. Drain line: Drains lines for the carbon tanks, softener and RO waste shall be schedule 40 PVC, 3"-4" in diameter. Pipe to floor drain provided by mechanical subcontractor (see mechanical drawings) or existing floor drain.

**2.08 LABELING**

- A. All system components shall be clearly labeled.

**2.09 PIPE**

- A. Low pressure piping: upstream of the RO high pressure pump or downstream of the concentrate and recycle valves, shall be schedule 80 CPVC, to insure freedom from corrosion and chemical degradation. Connections shall be flanged, glued, threaded or grooved mechanical couplings.
- B. High pressure piping shall be schedule 40, 304 stainless steel. Connections shall be flanged, butt welded, threaded or grooved mechanical couplings. Mechanical couplings shall be galvanized. High-pressure thermoplastic tubing shall be utilized for gauges and pneumatic lines.
- C. Piping to domestic water supply: See Plumbing Drawings.
- D. Pipe Markers: All exposed piping shall be marked with name of fluid be conveyed and direction of flow. Markers shall be clearly visible and shall conform to ANSI and OSHA requirements for marker size, marker color, legend size, and legend color. Install at least three (3) markers for each pipe in each room.

**PART 3 - EXECUTION****3.01 GENERAL**

- A. Installation contractor shall follow manufactures instructions for installing equipment.
- B. Furnish and install all supports, anchors and all other materials required to install system equipment and materials.
- C. Installation contractor shall meet with the manufacturer before commencing installation to discuss any questions that may have arisen. Contractor shall contact manufacturer regarding any questions that develop during installation.

**3.02 PIPE INSTALLATION**

- A. Support all piping in such a manner as to prevent all vibration and vertical or horizontal movement.

### **3.03 PUMP INSTALLATION**

- A. The pumps shall be mounted and balanced to prevent vibration.

### **3.04 VALVES AND ACCESSORIES**

- A. Install valves at the locations shown on the drawings, described in the specifications, as required for system operation and maintenance, and as required by the manufacturer.
- B. Install all valves so that they can be easily replaced in the future including installing unions and allowing adequate clearance.
- C. Install all valves with adequate clearance around the valve for maintenance.
- D. Install valves for system drainage at all exposed low points in the system whether or not shown on the drawings.
- E. Provide all power and electrical systems as necessary for operation.

### **3.05 GAUGES AND INSTRUMENTATION**

- A. All gauges and instrumentation shall be installed at eye level wherever possible unless specified otherwise and shall be positioned for ease of reading by operation and maintenance staff.

### **3.06 START UP**

- A. Provide written verification to the Engineer/Architect, Owner and Equipment Manufacturer that the equipment is ready for start-up. Coordinate training and scheduling with all parties.
- B. Provide one (1) day (8 hours) of combined on-site start-up and operator training. Equipment manufacturer representative and professional ice maker shall review installation, place the equipment in service, optimize operating parameters, and confirm that the equipment is operating properly. Training shall be completed with operation and maintenance manuals in hand.

**END OF SECTION**

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 13 28 16 – HOCKEY SAFETY NETTING SYSTEM****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section includes design, fabrication, and installation of hockey safety netting system, including netting and rigging accessories, for the protection of spectators.
- B. Related Requirements:
  - 1. Division 05 Section "Metal Fabrications" for steel framing and supports for netting systems.
  - 2. Division 13 Section "Ice Rink Dasher System" for dasher boards and glass shields.
  - 3. Division 26 Sections for electrical wiring and connections and for installation of remote-control switches for lift motors.

**1.2 SCOPE OF WORK**

- A. The work of this Section consists of furnishing equipment and appliances, materials, and labor required to perform all operations in connection with the installation of two complete winch rigging and netting systems as hereinafter specified.
  - 1. Netting Equipment:
    - a. Net.
    - b. Two (2) 1000 pound capacity winch systems with (7) beam mounted loft blocks for the protective netting.
  - 2. Control Equipment and Cabinet.
    - a. Remotely located control cabinet to contain control switches for all motorized winch systems.
  - 3. All electrical connections for winch motors and controls.
  - 4. All conduit and wiring.
  - 5. Auxiliary steel to support netting system.

**1.3 PERFORMANCE REQUIREMENTS**

- A. Delegated Design: Design rigging, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated. Engineer must be licensed in the State where the project is located.
- B. Structural Performance: System shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:
  - 1. Design Loads: Weight of netting and the design loads indicated in the General Notes of the Structural Drawings.
- C. National Hockey League (NHL) Approval: Design netting system of height, type, and hung in a manner approved by the NHL. Provide documentation to the NHL for approval.

**1.4 SUBMITTALS**

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for exposed rigging accessories. For lift motors, include rated capacities, operating characteristics, and electrical characteristics.

- B. Shop Drawings: Show fabrication and installation details for netting system. Include plans, elevations, sections, details, attachments to other work, and the following:
  - 1. Operating clearances.
  - 2. Requirements for supporting netting, rigging accessories, and equipment. Verify capacity of each rigging component to support loads.
  - 3. Locations of equipment components, switches, and controls. Differentiate between manufacturer-installed and field-installed wiring.
  - 4. Wiring Diagrams: For power, signal, and control wiring.
- C. Final Shop Drawings: Following approval of preliminary drawings and prior to the beginning of fabrication, submit four sets of complete shop drawings of the rigging components including, but not limited to, the following:
  - 1. Mechanical assembly drawings.
  - 2. Mechanical detail drawings.
  - 3. Mechanical general layout.
  - 4. Component equipment drawings.
  - 5. Erection plans and diagrams.
  - 6. Miscellaneous details and assembly drawings.
- D. Delegated-Design Submittal: For rigging indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- E. Qualification Data: For qualified Installer and professional engineer.
- F. Product Certificates: For the following, from manufacturer:
  - 1. Netting: Provide name of flame-retardant chemical used, identification of applicator, treatment method, application date, allowable life span for treatment, and details of any restrictions and limitations.
- G. Field Quality Control reports as specified in Part 3 of this Section.
- H. Operation and Maintenance Data: For netting system to include in operation and maintenance manuals.
- I. Warranty: Sample of special warranty.
- J. Material Safety Data Sheets (MSDSs): Submit information directly to Owner; do not submit to Architect.

## 1.5 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who has completed netting systems similar in material, design, and extent to that indicated for this Project and whose work has resulted in netting installations with a record of successful in-service performance.
- B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of rigging systems that are similar to those indicated for this Project in material, design, and extent.
- C. Fire-Test-Response Characteristics: Provide netting with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or a testing and inspecting agency acceptable to authorities having jurisdiction.
  - 1. Flame-Resistance Ratings: Passes NFPA 701.
    - a. Permanently attach label to each panel of the netting system indicating whether netting is inherently and permanently flame resistant or treated with flame-retardant chemicals, and whether it requires retreatment after designated time period or cleaning.

- D. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel," and AWS D1.3, "Structural Welding Code--Sheet Steel."
- E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- F. Preinstallation Conference: Conduct conference at Project site.

## 1.6 PROJECT CONDITIONS

- A. Field Measurements: Verify actual dimensions of construction contiguous with netting system by field measurements before fabrication.

## 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Packing and Shipping: Deliver products in original unopened packaging with legible manufacturer's identification.
- B. Storage and Protection: Comply with manufacturer's recommendations.
  - 1. Store in a cool, dry place out of direct sunlight.
  - 2. Protect from damage by the elements and construction procedures.
  - 3. Store at temperature above 40 degrees F.

## 1.8 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of rigging equipment that fail in materials or workmanship within specified warranty period.
  - 1. Failures include, but are not limited to, faulty operation of rigging equipment.
  - 2. Warranty Period: Two years from date of Substantial Completion.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, manufacturers offering safety netting systems that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Athletic and Performance Rigging.
  - 2. Chicago Spotlight.
  - 3. Atlanta Rigging Systems.
  - 4. Sport Systems Unlimited Corp. (d/b/a Athletica).

### 2.2 MATERIALS

- A. Protective Netting. Provide safety netting approved by the NHL for spectator protection.
  - 1. Mesh, maximum opening size of 1-1/2 inch (37 mm) square.
  - 2. Dyneema or "Kevlar" Twine Diameter: 1.2 mm; knotted netting.
  - 3. Rope binding.
  - 4. Color: Black.
- B. Cable: Steel cable for winch systems shall be 3/32 inch (2.4 mm) diameter 7 x 19 galvanized aircraft quality.
- C. Trusses: Aluminum trusses shall be manufactured by Applied Electronics or approved equal. All connections to such units to be by manufacturers recommendations.

- D. Electrical Hoisting Machines:
1. Machines shall incorporate helical worm gear reduction units rated by AGMA (American Gear Manufacturers Association) for Class I service. Attach metal name tag to unit indicating name of manufacturer.
  2. Power Requirements: Provide 208 V three (3) phase power. No 110 V motors power will be acceptable.
  3. Include the following in each machine assembly:
    - a. A control switch plus three-pole fused disconnect switch to protect the motor against short circuit or prolonged locked rotor conditions.
    - b. A reversing motor starter with three (3) overload heater coils. Starter shall be sized to motor requirements.
    - c. A safety load control device to stop motor if over load is detected in netting travel.
  4. Machine shall be internally wired to a labeled terminal strip to require a minimum of field connections.
  5. Electrical diagrams for field connecting shall be included for all electrical equipment furnished under this contract.
- E. Control Cabinet and Equipment:
1. The control cabinet shall be a NEMA-1 enclosure for wall mounting with hinged locking door and removable panel.
    - a. Provide labeled terminal strips equal to Allen-Bradley Bulletin 1492 Type F8 for all conductors entering or leaving the cabinet. Mark each conductor to correspond to the wiring diagram.
    - b. Cabinet Depth: Approximately 6 inches (150 mm) deep and of necessary height and width to accommodate the required control equipment.
  2. Thirty (30) ampere 3-phase source shall be used for 208 volt power. Control power at 120 volts shall be connected to the fused circuit terminals at the control cabinet.
  3. Provide two (2) control devices for each machine to permit exclusive operation of each machine at the following positions:
    - a. At the machine.
    - b. At the control cabinet.
  4. Control at the machines shall consist of a three (3) push button switch. This control shall be operable only when the main control switch at the control cabinet is turned to the "SERVICE" position. A name plate on the switch shall indicate direction of travel.
- F. Equipment common to system by system provider.
1. Miscellaneous auxiliary steel to connect to building steel.
  2. All miscellaneous hardware and equipment either inferred or implied to allow full design-build project.

## 2.3 FINISHES

- A. Exposed Finishes: Apply manufacturer's standard black finish to all exposed rigging components.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine areas and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2 INSTALLATION**

- A. Install netting system in accordance with approved Shop Drawings.

**3.3 FIELD QUALITY CONTROL**

- A. Manufacturer's Field Services: Technical representative from manufacturer shall provide the following field services during installation:
  - 1. Perform pre-installation examination and acceptance of site preparation for each stage. Issue report.
  - 2. Be present at initial start-up for each process. Confirm application rates and techniques. Issue report.
  - 3. Issue a summary report at completion of installation indicating manufacturer's acceptance of installed system and warranty conditions.

**3.4 DEMONSTRATION**

- A. Startup Services: Engage a factory-authorized service representative to train Owner's maintenance personnel as specified below:
  - 1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
  - 2. Review data in maintenance manuals. Refer to Division 01 Section "Operation and Maintenance Data."
  - 3. Provide at least 8 hours of on-site training for Owner's maintenance personnel.

**3.5 ADJUSTING**

- A. Adjust moving parts to function smoothly.

**3.6 CLEANING AND PROTECTION**

- A. Touchup Painting: Clean and touchup field welds, bolted connections, and abraded areas of shop paint as specified in Division 09 Section "Painting."

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 14 21 00 - GEARLESS MACHINE ROOM LESS TRACTION ELEVATORS****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes: Gearless Machine Room Less (MRL) Traction elevators as follows:
  - 1. Passenger Elevators, Cars PE 1 & 2, PE 3 and PE 4
  - 2. One Service Elevator, Car SE 5
  
- B. Related Requirements: Including but not limited to the following:
  - 1. Division 05 Section "Structural Steel Framing" for the following:
    - a. Attachment plates, angle brackets, and other preparation of structural steel for fastening guide-rail brackets.
    - b. Divider beams.
    - c. Hoist beams.
    - d. Structural-steel shapes for subsills.
  - 2. Division 05 Section "Metal Fabrications" for the following:
    - a. Pit ladders

**1.2 PRODUCT VARIATIONS AND ADJUSTMENTS**

- A. Product Variations: In the event of differences between products and systems of acceptable or available manufacturer/fabricators, Contractor shall notify Architect of such differences and resolve conflicts prior to awarding Contract. Failure of Contractor to provide notification shall be construed as acceptance of conditions indicated, and changes caused by differences between products and Contract Documents shall be included in the Work at no additional cost to Owner.
  
- B. Adjustments: Proposed deviations shall include a detailed analysis of impact to adjacent substrates, structural, mechanical, electrical or other building systems, including related design or construction cost impacts. Deviations causing changes in materials, constructability, substrates, systems or conditions shall be included in the Work at no additional cost to Owner.

**1.3 ACTION SUBMITTALS**

- A. Product Data:
  - 1. Include capacities, sizes, performance data, operation, control, signal systems operation, safety features, finishes, and similar information.
  - 2. Include product data for car enclosures and hoistway entrances.
  - 3. Include product data for signal fixtures, lights, graphics, Tactile marking plates, and details of mounting.
  
- B. Shop Drawings:
  - 1. Provide scaled shop drawings of the following:
    - a. Plan and section layouts of hoistways, pits, overheads, machinery spaces and openings at each landing, to include the following:
      - 1) Location of all equipment.
      - 2) Static and dynamic loads imposed on building structure.
      - 3) Details of equipment isolation.
      - 4) Required clearances around equipment.
      - 5) Control room and machine heat release.
        - a) Provide heat loads based on a regenerative emergency power operation.
      - 6) Power requirements:

- a) motor horsepower, code letter, starting current, full load running current, and demand factor.
  - b) Provide engineered power consumptions based on 80 starts per hour.
  - c) Provide maximum and average power consumption.
- 7) Service connections.
- 8) Running Clearances.
- 9) Location of fixtures.
- b. Elevation section of hoistways:
  - 1) Overhead, pits: clearances, and runby.
  - 2) Entrance details.
  - 3) Sill support detail.
- c. Pit Equipment:
  - 1) Buffers.
  - 2) Counterweight guards.
  - 3) Pit reactions.
  - 4) Service ladder, platform.
  - 5) Stop switches.
  - 6) Compensation equipment.
- d. Elevator cabs:
  - 1) Car shell fabrication.
  - 2) Ventilation.
  - 3) Ceiling construction details.
  - 4) Wall construction details.
  - 5) Lighting details.
  - 6) Handrail mounting details.
  - 7) Transom, entrance returns.
- e. Fixtures:
  - 1) Car operating panel.
  - 2) Hall stations.
  - 3) Destination / landing input stations.
  - 4) Hall Lanterns.
  - 5) Position indicators.
  - 6) Access key switches.
  - 7) Remote fixtures.
    - a) Group Status Panel.
    - b) Emergency Power selector switches.
  - 8) Two-way communication device at all master stations.

C. Submittals:

1. All submittals are delivered via Portable Document Format (.pdf)
2. All submittals are clearly marked and identified with project name and appropriate device identification.
3. All submittals are subject to approval.
4. Corrections requested are incorporated onto the submittals.

D. Samples for Verification:

1. For exposed car, hoistway door and frame, and signal equipment finishes.
2. Samples of sheet materials: 3" (75 mm) square.
3. Running trim members: 4" (100 mm) lengths.
4. Include full component samples, if requested:
  - a. Signal fixtures
  - b. Lighting
  - c. Graphics
  - d. Tactile markings

**1.4 CLOSEOUT SUBMITTALS**

- A. Continuing Maintenance Proposal:
1. Submit executed Installer's standard five-year maintenance agreement, starting at the end of the warranty maintenance period.
  2. State services, obligations, conditions, and terms for agreement period and for future renewal options.
- B. Record Documents:
1. The following record documents are furnished upon completion and before final payment and delivered via Portable Document Format (.pdf):
    - a. Shop Drawings:
      - 1) Complete sets of as installed plan and section layouts of hoistways, pits, overheads, and equipment spaces, to include the following:
        - a) Static and dynamic loads imposed on building structure.
        - b) Details of equipment isolation.
        - c) Required clearances around equipment.
        - d) Control room heat release.
        - e) Power requirements.
      - 2) Elevation section of hoistways:
        - a) Overhead, pits and entrance details.
      - 3) Elevator cabs.
      - 4) Fixtures:
        - a) Car fixtures.
        - b) Hall fixtures.
        - c) Remote fixtures.
      - 5) Control room heat release and power requirements.
    - b. Wiring Diagrams:
      - 1) Complete sets of as installed straight-line wiring diagrams, showing the electrical connections of all altered vertical transportation equipment, are furnished upon completion.
      - 2) A legend sheet is furnished with each set of drawings containing the following information:
        - a) Name and symbol of each relay, switch and other electrical or solid-state apparatus.
        - b) Location on drawings, drawing sheets, number and area of switches and relays, and location of all contacts.
        - c) Location of apparatus whether on controller, in hoistway or on elevator cab.
    - c. Maintenance and Operating Manuals:
      - 1) Description and sequence of operation of all equipment installed, including operating use for Building Personnel and tenants, as well as system troubleshooting manuals for technicians.
      - 2) Maintenance instructions and procedures of all vertical transportation equipment installed, including parts lists, for each elevator system.
      - 3) Lubrication charts indicating all lubricating points and type of lubricant recommended for all equipment.
      - 4) Complete parts catalogs for all replaceable parts.
- C. Tools:
1. The following equipment is furnished upon completion and before final payment:
    - a. The Elevator Contractor provides all the necessary tools, including laptop, hand-held devices, required software and manuals, required to troubleshoot, adjust, synchronize, calibrate, repair, and maintain the vertical transportation systems, as well as perform all necessary procedures to perform all safety tests as required by code and local governing authority.

- b. Owner's equipment and software is updated regularly to properly troubleshoot, adjust, synchronize, calibrate, repair, maintain and test the vertical transportation systems. All equipment and/or software is of the same version as issued to technicians maintaining the vertical transportation systems.
  - c. The Elevator Contractor provides a backup copy of any software that resides on the troubleshooting tool.
  - d. Upon cancellation of service agreement, the Elevator Contractor provides all updates indicated above.
- D. Keys:
- 1. Four sets of keys to operate all keyed switches and locks are furnished upon completion.
  - 2. Keys properly tagged.
  - 3. All keying arranged with the Contractor.

### 1.5 PERMITS TESTS & CERTIFICATES

- A. Permits:
- 1. The Elevator Contractor secures the permits required for work to be performed, including work of sub-contractors.
  - 2. The Elevator Contractor obtains and pays for all municipal and state permits necessary for execution of the elevator work, including fees for renewing permits.
  - 3. The Elevator Contractor is responsible for posting all permits as required by the AHJ.
  - 4. The Elevator Contractor is responsible for obtaining final sign-off and approval for each permit.
- B. Tests and Inspections:
- 1. The Elevator Contractor performs all necessary tests as required by ASME A17.1 and recommended by A17.2.
  - 2. The Elevator Contractor is responsible for scheduling the necessary tests as required by the local authorities.
    - a. Any fees associated with a missed appointment, or for expediting of test or overtime tests due to delays caused by the Elevator Contractor are the responsibility of the Elevator Contractor.
- C. Certificates:
- 1. Elevator Contractor is responsible for obtaining and providing Contractor with all temporary and final inspection certificates of the proper governing authorities and provides the Contractor with such certificates.
  - 2. The Elevator Contractor pays for all fees necessary for obtaining temporary and final inspection certificates.

### 1.6 QUALITY ASSURANCE

- A. Compliance with Regulatory Agencies:
- 1. Comply with most stringent provisions of codes, laws, and/or authorities, including revisions and changes in effect.
- B. Progress Reviews:
- 1. The Elevator Contractor is subject to reviews by the Consultant and/or Contractor at any time throughout the project.
  - 2. Contractor to assist without additional cost.

### 1.7 DELIVERY STORAGE AND HOISTING

- A. General:

1. The protection of all equipment and exposed finishes is the responsibility of the Elevator Contractor during delivery, handling, and installation until final acceptance of elevator equipment.
  2. The Elevator Contractor replaces damaged materials with new, at no additional cost for material and labor.
- B. Delivery and Storage:
1. It is the responsibility of the Elevator Contractor to properly store and protect all materials in space provided or designated by the Contractor against damage, stains, scratches, corrosion, weather, construction debris and environmental conditions.
  2. Deliver materials to the site in the manufacturer's original and unopened containers and packaging, bearing labels as to type of material, brand name and manufacturer's name.
  3. Store materials under cover in a dry and clean location, off the ground. Remove delivered materials that are damaged or not suitable for installation from the job site and replace with acceptable materials.
- C. Hoisting:
1. All required hoisting and movement of equipment is the responsibility of the Elevator Contractor.

## 1.8 COORDINATION

- A. General:
1. Coordinate the following requirements with the other trades.
- B. Cast-in-Place Concrete:
1. Elevator Contractor to provide guide rail bracket inserts and the locations for the General Contractor to install.
  2. Provide other hoistway and pit requirements, including location of sump pits.
- C. Masonry Penetrations:
1. Provide locations in elevator control room/hoistway walls where conduit, ropes, and wiring penetrate walls and slabs.
  2. Coordinate installation of sleeves, block outs, inserts, and items that are embedded in concrete or masonry for elevator equipment.
  3. Furnish inserts, templates and installation instructions and deliver to Project site in time for installation.
- D. Structural Steel:
1. Including, but not limited to, elevator control rooms, hoistways and pits, sill supports, rail supports.
- E. Miscellaneous Steel:
1. Pit ladders, working platforms, inspection platforms, guard rails, divider beams.
- F. Electric:
1. Electrical service, mainline disconnects, 110 VAC disconnects, outlets, lights, switches in elevator control rooms and pits.
- G. Sprinklers:
1. Including installation of sprinkler systems in the elevator pits or shaft as per NFPA 13.
- H. HVAC:
1. Provide necessary information to General Contractor and coordinate installation of equipment for elevator control rooms.

- I. Finishes:
  - 1. Cab interiors, hoistway entrances, fixtures.
  
- J. Elevator Cab Flooring:
  - 1. Material and finish as specified.
  - 2. Flooring installation must be coordinated to ensure car sill is installed level with finished floor.
  
- K. Security Equipment:
  - 1. Coordinate locations in elevator control rooms and cabs where cables, conduit, and other components for CCTV and/or security equipment must be installed.

## 1.9 WARRANTY

- A. Manufacturer's Warranty:
  - 1. Manufacturer agrees to repair, restore, or replace elevator equipment that fails due to defective materials or poor workmanship within specified warranty period.
  
- B. Warranty Period: 12 months from date of Substantial Completion:
  - 1. The Elevator Contractor guarantees that the materials and workmanship of the apparatus installed by them and any subcontractor, under this contract, is first class in every respect and that they will make good on any defects not due to ordinary wear and tear or improper use, which may develop within one year from the date of final acceptance of all equipment.
  - 2. Manufacturer's warranty to repair or replace defective products or their components in the event of defects within a specified period.
  - 3. Neither the final payment nor any provisions of the contract documents relieve the Elevator Contractor of any obligation provided by law. They shall remedy any defects and pay all expenses for any damage to other work.
  - 4. The warranty as outlined above, for all devices, starts from the date of final acceptance of each device, by the Consultant and the Owner, of all work specified and intended under these contract documents.

## 1.10 MAINTENANCE

- A. General:
  - 1. All maintenance is performed according to the guidelines stated in manufacturer's Maintenance and Operations manuals.
  - 2. Maintenance records for each device, including lubrication logs, check charts, are provided in each control room.
  
- B. Construction Maintenance:
  - 1. Upon substantial completion of a device, after receiving sign-off from the governing authorities and acceptance from Consultant and/or Contractor, the device may be accepted for service before completion of the entire project.
  - 2. During the Construction Maintenance period, the necessary preventive maintenance is performed on a scheduled basis.
  - 3. Provide the necessary protection of the hoistway entrances and sills, hoistway fixtures, cab interiors and fixtures and car door sills.
  - 4. Replacement or repair of components, due to misuse by others, is the responsibility of the Contractor/Owner.
  - 5. Perform emergency callback service during normal working hours
  - 6. Include 24-hour-per-day, 7-day-per-week emergency callback service with response time of sixty minutes or less.

- C. Warranty Maintenance:
1. Upon final acceptance of each device, subsequent to receiving acceptance and sign-off from the governing authorities and final acceptance, each device is accepted for full operation.
  2. The warranty maintenance period begins for each device when all conditions in the above paragraph are met and will continue for a specified period.
    - a. Warranty Maintenance Period may begin at different times for each elevator.
  3. The warranty maintenance program includes the following:
    - a. Monthly examinations, including adjustments, cleaning, and lubrication of equipment.
    - b. 24-hour Emergency Call back service is provided at no additional cost to Owner.
    - c. Replacement of components as required, using only components produced by the original manufacturer.
      - 1) Each control room is equipped with a lockable storage cabinet to contain the necessary spare parts.
- D. Maintenance Specification:
1. Upon completion of the Warranty Maintenance period, the Elevator Contractor will provide the personnel to service the vertical transportation equipment.
    - a. Full-Service Maintenance commences upon the completion of the warranty maintenance period for a term of five (5) years:
      - 1) Contractor provides a proposal for a full-service agreement which covers the following:
        - a) All required inspections and tests.
        - b) 24-hour emergency call service at no additional cost to Owner.

## PART 2 - PRODUCTS

### 2.1 REFERENCES

- A. Definitions:
1. Terms used are defined in the latest edition of the Safety Code for Elevators and Escalators, ASME A17.1.
- B. American Society of Mechanical Engineers:

## 2.2 MANUFACTURERS

- A. Subject to compliance with project requirements, provide products by one of the following:
  - 1. MRL Systems:
    - a. KONE Elevator.
    - b. Schindler Elevator
    - c. TK Elevator
    - d. Otis Elevator
  - 2. Fixtures vandal resistant

## 2.3 PERFORMANCE REQUIREMENTS

- A. Car Speed:
  - 1.  3% of contract speed under any loading condition.
- B. Car Capacity:
  - 1. Safely lower, stop and hold 125% of rated load.
- C. Car Stopping Zone:
  - 1.  1/4" under any loading condition.
- D. Door Times:
  - 1. Seconds from start to fully open or fully closed:
    - a. Car PE 1-4: Door open 2.0 seconds, door close 2.6 seconds.
    - b. Car SE 5: Door open 2.5 seconds, door close 4.0 seconds.
- E. Car Floor-to-Floor Performance Time:
  - 1. Seconds from start of doors closing until doors are 1/2 open for side opening doors, and car level and stopped at next successive floor under any loading condition or travel direction:
    - a. Car PE 1-4: 15.0 seconds.
    - b. Car SE 5: 16.5 seconds
- F. Car Ride Quality:
  - 1. Acceleration and Deceleration:
    - a. Smooth, constant, and not less than 2.5 feet/second  with an initial ramp between 0.5 and 0.75 second.
  - 2. Sustained Jerk:
    - a. Not more than 6 feet/second  or twice the rate of acceleration.
  - 3. Horizontal and vertical acceleration within car during all riding and door operating conditions.
    - a. Not more than 15 mg peak to peak (adjacent peaks).
  - 4. Measurement Standards:
    - a. Measure and evaluate ride quality consistent with ISO 18738, using low pass cutoff frequency of 10 Hz and A95 peak-to-peak average calculations.
- G. Noise and Vibration Control:
  - 1. Airborne Noise:
    - a. Measured noise level of elevator equipment and its operation does not exceed 55 dBA inside car under any condition including door operation and car ventilation exhaust blower on its highest speed.
    - b. Limit noise level in the control room and control space relating to elevator equipment and its operation to no more than 80 dBA.
    - c. All dBA readings to be taken 3'-0" off the floor and 3'-0" from the equipment using the "A" weighted scale.

2. Vibration Control:
  - a. All elevator equipment is mechanically isolated from the building structure and other components to minimize noise and vibrations being transmitted to occupied areas of the building.

## 2.4 ELEVATORS

### A. Passenger Elevator Description:

1. Elevator Identification: Cars PE 1-2.
2. Capacity: 3,500 pounds
3. Class of Loading: Class A.
4. Contract Speed: 200 fpm.
5. Roping: 2:1
6. Machine: Gearless.
7. Machine Location: Overhead in Hoistway
8. Control System: Collective microprocessor-based: Duplex selective collective
9. Floors Served, Front: 01, 02, 03.
10. Openings: Front 3.
11. Minimum Clear Height to underside of canopy: 8'-0" High.
12. Entrance Size: 3'-6" Wide X 7'-0" High.
13. Entrance Type: Single-speed, center-opening.

### B. Passenger Elevator Description:

1. Elevator Identification: Cars PE 3
2. Capacity: 3,500 pounds
3. Class of Loading: Class A.
4. Contract Speed: 200 fpm.
5. Roping: 2:1
6. Machine: Gearless.
7. Machine Location: Overhead in Hoistway
8. Control System: Collective microprocessor-based: Simplex selective collective
9. Floors Served, Front: 01, 02, 03.
10. Openings: Front 3.
11. Minimum Clear Height to underside of canopy: 8'-0" High.
12. Entrance Size: 3'-6" Wide X 7'-0" High.
13. Entrance Type: Single-speed, center-opening.

### C. Passenger Elevator Description:

1. Elevator Identification: Cars PE 4.
2. Capacity: 3,500 pounds
3. Class of Loading: Class A.
4. Contract Speed: 200 fpm.
5. Roping: 2:1
6. Machine: Gearless.
7. Machine Location: Overhead in Hoistway
8. Control System: Collective microprocessor-based: Simplex selective collective
9. Floors Served, Front: 01, 02, 03.
10. Openings: Front 3.
11. Minimum Clear Height to underside of canopy: 8'-0" High.
12. Entrance Size: 3'-6" Wide X 7'-0" High.
13. Entrance Type: Single-speed, center-opening.

### D. Service Elevator Description:

1. Elevator Identification: Car SE 5.
2. Capacity: 5000 pounds. Service Shaped

3. Class of Loading: Class C3.
4. Contract Speed: 200 fpm.
5. Roping: 2:1 Overslung
6. Machine: Gearless.
7. Machine Location: Overhead in Hoistway
8. Control System: Collective microprocessor-based: Simplex selective collective
9. Floors Served, Front: 01, 02, 03.
10. Openings: Front 3.
11. Minimum Clear Height to underside of canopy: 8'-0" High.
12. Entrance Size: 4'-6" Wide X 7'-0" High.
13. Entrance Type: Two-speed, side-opening

## 2.5 MATERIALS

### A. Steel:

1. Sheet Steel (Furniture Steel for Exposed Work): Stretcher-leveled, cold-rolled, commercial quality carbon steel, complying with ASTM A366, matte finish.
2. Sheet Steel (for Unexposed Work): Hot-rolled, commercial quality carbon steel, pickled and oiled, complying with ASTM A568/A568M-03.
3. Structural Steel Shapes and Plates: ASTM A36.

### B. Stainless-steel:

1. Type 302 or 304 series complying with ASTM A240, with standard tempers and hardness required for fabrication, strength, and durability.
2. Apply mechanical finish on fabricated work in the locations shown or specified, Federal Standard and NAAMM nomenclature, with texture and reflectivity required to match Architect's sample. Protect with adhesive paper covering.
  - a. No. 4 Satin:
    - 1) Directional polish finish.
    - 2) Graining directions as shown or, if not shown, in longest dimension.
  - b. Textured:
    - 1) .050 inches mean pattern depth with bright directional polish (No. 4 satin finish).
    - 2) 5WL as manufactured by Rigidized Metals.
    - 3) Windsor pattern as manufactured by Rimex Metals.
    - 4) Scottish Quad finish.
3. Extruded stainless-steel:
  - a. 304 stainless-steel per ASTM A276.
  - b. Hot finished and stretched straightened.
  - c. Polished finish.

### C. Aluminum:

1. Extrusions per ASTM B221; sheet and plate per ASTM B209.
2. Die Cast Aluminum – ASTM B108, Alloy 356.0, T6.
3. Extruded Aluminum – FS QQ-A 200/8, Alloy 6061, T6.

### D. Nickel-Silver:

1. Extruded nickel-silver:
  - a. C77600 nickel-silver
  - b. Hot extruded, temper code M30

### E. Plastic Laminate:

1. ASTM E84 Class A and NEMA LD3.1, Fire-Rated Grade (GP-50), Type 7, 0.050" ±0.005" thick.
2. Exposed Surfaces: Color and texture selected by Architect.

3. Concealed Surfaces: Manufacturer's standard color and finish.
- F. Fire-Retardant Treated Particle Board Panels:
1. Minimum 3/4" thick backup for natural finished wood and plastic laminate veneered panels, edged and faced as shown, provided with suitable anti-warp backing.
  2. Meet ASTM E84 with a flame-spread rating of 75 or less, and smoke development rating of 450 or less.
- G. Paint Finishes:
1. General:
    - a. Clean exposed metal parts and assemblies of oil, grease, scale, and other foreign matter and factory paint one shop coat of standard rust-resistant primer.
    - b. Galvanized metal need not be painted.
  2. Prime Finish:
    - a. Apply one coat of rust-resistant primer followed by a filler coat over uneven surfaces.
    - b. Sand smooth and apply final coat of primer.
  3. All equipment and metal work installed under this contract, which does not have a baked enamel or special architectural finish, and which is exposed in the hoistway, is cleaned, and painted one field coat of enamel.
  4. All control room equipment is painted upon completion of the installation with the manufacturer's standard machinery enamel.
  5. Elevator designation (number and/or letter) is prominently indicated on all control room and machinery space equipment, top of car crosshead and pit equipment.
- H. Baked Enamel Finish:
1. Prime finish per above.
  2. Unless specified "prime finish" only, apply and bake three additional coats of enamel in the selected solid color.

## 2.6 OPERATION

- A. General:
1. Cars automatically slow down and stop level at floors in response to car and landing calls with stops made in sequence in the established direction of travel, regardless of order in which buttons are pressed.
  2. Landing calls are canceled when the assigned car arrives at the landing.
  3. Automatic Dispatch Failure: Provide auxiliary dispatch system to automatically dispatch elevators in the event of failure of the primary control system.
  4. Hall Call Button Failure: Should failure of hall call button system occur, initiate operation providing predetermined service to all landings; elevators respond normally to car calls.
  5. Automatic Leveling:
    - a. When arriving at a floor cars level to within 1/8" above or below the landing sill prior to opening doors, without travelling past the landing during leveling
    - b. Maintain leveling accuracy regardless of carload, direction of travel, rope slippage or stretch.
  6. Power Conservation: P1, S1
    - a. Shut off car interior illumination after adjustable period (60-180 seconds) of no elevator demand.
    - b. Turn on prior to opening car doors when elevator demand returns.
- B. Door Operation:
1. Automatically open doors when car arrives at a floor.
  2. Stop and reopen doors or hold doors in open position upon activation of "door open" button.

3. At expiration of normal dwell time, or upon activation of "door close" button, close doors:
    - a. Prevent doors from closing and reverse doors at normal opening speed if door reopening device beams are obstructed while doors are closing, except during nudging operation.
    - b. In event of door reopening device failure, provide for automatic shutdown of car at floor level with doors open.
    - c. Close cycle does not begin upon activation of "door close" button until normal door dwell time for a car or hall call has expired, except firefighters' operation.
  4. Nudging Operation:
    - a. After beams of door reopening device are obstructed for a predetermined time interval (minimum 20.0-25.0 seconds), sound warning signal, and attempt to close doors with maximum of 2.5 foot-pounds kinetic energy.
    - b. Activation of the door open button overrides nudging operation and reopens doors.
  5. Interrupted Beam Time:
    - a. When beams are interrupted during initial door opening, hold door open a minimum of 3.0 seconds.
    - b. When beams are interrupted after the initial 3.0 second hold open time, reduce time doors remain open to an adjustable time of approximately 1.0-1.5 seconds after beams are reestablished.
  6. Differential Door Time:
    - a. Field adjustable time that doors remain open after stopping in response to calls.
    - b. Car Call: Hold open time adjustable between 3.0 and 5.0 seconds.
    - c. Hall Call:
      - 1) Hold open time adjustable between 5.0 and 8.0 seconds.
      - 2) Use hall call time when car responds to coincidental calls.
- C. Independent Service:
1. When feature is activated from within the car, allow control of car from buttons and controls inside the car.
  2. Close doors by constant pressure on desired destination floor button or door close button.
  3. Open doors automatically upon arrival at selected floor.
- D. Load Weighing:
1. Provide cars with adjustable load weighing device which monitors cable tension.
  2. Control system to provide dispatching at main floor in advance of normal intervals when car fills to a field adjustable, 10%-100%, percentage of rated capacity.
  3. Provide hall call by-pass when car is filled to a field adjustable, 10%-100%, percentage of rated capacity.
  4. Audible overload signaling device inside elevator cab shall be activated upon load weighing device sensing carload has reached or exceeded a pre-determined percentage of capacity.
  5. Doors will not close when overload signaling device is active.
- E. Duplex Selective Collective Operation, Cars PE 1 & PE 2:
1. Elevators operate via momentary pressure buttons to:
    - a. place hall call by selecting direction of travel at each hall landing (up and down buttons at each intermediate landing, single buttons at each terminal landing).
    - b. place car call by selecting destination floor from inside the car (individual buttons for each floor served).
  2. Hall calls, other than calls placed at the landing at which car is standing, start car and cause the car to stop at first landing for which a call is registered in the direction of travel.
  3. Car calls cause the car to stop at the floors registered in the order the car arrives at each selected floor in its current direction of travel.
  4. Free Car:

- a. When there are no calls in the system, one car is automatically dispatched to the elevator discharge level (home car), park other car (free car) at its last stop above elevator discharge level.
  - b. An idle free car answers call above or below it, except calls at main or Basement landings (where applicable).
  - c. When free car travels to main landing in response to a car call, it becomes home car and former home car travels to a middle floor above main landing and becomes the free car.
  - d. When free car is responding to calls, home car shall respond to the following:
    - 1) Up calls below UP traveling free car.
    - 2) All Up and Down calls behind DOWN traveling free car.
    - 3) Any hall calls registered when free car is delayed in its normal operation for a predetermined period.
  - e. When both cars are responding to registered car and hall calls, the first car to complete its calls becomes the assigned home car and is dispatched automatically to the Main Landing.
  - f. Only one car responds to each hall call.
5. If either car is removed from service, the other car responds to all registered hall calls and its own car calls.
6. Car and Hall Lanterns:
- a. Lanterns provide audio and visual signal upon each stop, regardless of responding to car or hall call.
  - b. Visual signal remains active from commencement of door opening until doors are completely closed.
- F. Simplex Selective Collective Operation, Car PE 3, PE 4 and SE 5:
- 1. Elevators operate via momentary pressure buttons to:
    - a. Place hall call by selecting direction of travel at each hall landing (up and down buttons at each intermediate landing, single buttons at each terminal landing).
    - b. Place car call by selecting destination floor from inside the car (individual buttons for each floor served).
  - 2. Hall calls, other than calls placed at the landing at which car is standing, start car, and cause the car to stop at first landing for which a call is registered in the direction of travel.
  - 3. Stops are made in order in which landings are reached, irrespective of sequence in which calls are registered.
  - 4. Parked Car (No Demand):
    - a. When feature is enabled, elevator remains at landing of last assignment (if no further demand) with doors closed, for a predetermined amount of time (programmable for any amount of time). Upon expiration of time, the elevator returns to the main egress landing with the doors closed.
    - b. If feature is disabled, if no further demand, the elevator remains at landing of last assignment with the doors closed until a hall call is registered.
  - 5. Car and Hall Lanterns:
    - a. Lanterns provide audio and visual signal upon each stop, regardless of responding to car or hall call.
- G. Standby or Emergency Power Operation:
- 1. The terms Standby Power and Emergency Power are both referred to as Emergency Power in this Section. Elevator operation is the same when either is provided.
  - 2. Where emergency power is provided to the elevator main disconnects and required by the Building Code the elevator installation shall comply with the Emergency Power Operation requirements of ASME A17.1 as modified by any superseding Building Code requirements.
  - 3. Operation is activated by a signal from an Automatic Transfer Switch (ATS) to elevator controls indicating the Emergency power source is operational.

- a. Start and run one elevator per group or single elevator at contract car speed and capacity.
  - b. Illuminate "ELEVATOR EMERGENCY POWER" signals.
- 4. Restoration of Normal Power:
  - a. At least 20 seconds prior to transfer from emergency power to normal power at the ATS, a pre-transfer signal is supplied to the elevator control system from the ATS.
  - b. Elevators operating on emergency power stop at the next available landing and remain there until normal power is restored.
- H. Firefighters' Emergency Operation:
  - 1. Provide equipment and operation in accordance with code requirements.
- I. Car-to-Lobby Operation, All Cars:
  - 1. Activated and deactivated for each elevator or group of elevators:
    - a. Remotely via Elevator Management System.
    - b. Remotely via keyswitch activation.
  - 2. Return car nonstop after answering pre-registered car calls, and park with doors open for an adjustable time of 60-90 seconds.
- J. Interface to Building Management Systems:
  - 1. The elevator monitoring system shall be capable of interfacing and exchanging data with third-party building management systems including Siemens, Landis AND Staefa, Johnson Controls, SCADA.
  - 2. Information shall be exchanged by Modbus protocol, open protocol or other suitable methods as required.
- K. Motion Control:
  - 1. Microprocessor-based AC variable-voltage, variable frequency with digitally encoded closed-loop velocity feedback suitable for operation specified and capable of providing smooth, comfortable car acceleration, retardation, and dynamic braking.
  - 2. Limit the difference in car speed between full load and no load to not more than  $\pm 3\%$  of the contract speed.
- L. Emergency Lighting, Communication, and Alarm:
  - 1. Car mounted battery unit with solid-state charger to operate alarm bell, car emergency lighting, and communication system.
  - 2. Car lighting and communication shall be provided with a minimum of 4 hours of operation on back-up power during a loss of normal power, and a minimum of 1 hour of operation for car-mounted alarm.
  - 3. Battery to be rechargeable with minimum five-year life expectancy.
  - 4. Provide constant pressure light test button in service compartment of car operating panel.
  - 5. Provide lighting integral with normal car lighting system.

## 2.7 EQUIPMENT SPACE EQUIPMENT

- A. Arrange equipment in spaces shown on drawings.
- B. Solid State Power Conversion and Regulation Unit:
  - 1. Provide solid-state, alternating current, variable voltage, variable frequency (ACV $\square$ F), IGBT converter/inverter regenerative drive.
  - 2. Design unit to limit current, suppress noise, and prevent transient voltage spikes into building power supply.
    - a. Provide internal heat sink cooling fans for the power drive portion of the converter panels.
    - b. Mechanically isolate unit to minimize noise and vibration transmission.

3. Conform to IEEE standard 519-2014 for line harmonics and switching noise.
  4. Provide isolation transformers, filter networks, and choke inductors.
  5. Suppress solid-state converter noises, radio frequency interference, and eliminate regenerative transients induced into the mainline feeders or the building standby power generator.
  6. Supplemental direct-current power for the operation of hoist machine brake, door operator, dispatch processor, signal fixtures, from separate static power supply.
  7. ACVF Drives are regenerative and utilize IGBT converter/inverter and dynamic braking during overhauling condition.
- C. Resistor Load Bank:
1. Provide means of diverting regenerated power during emergency power operation and restoring regenerated power delivery back to the electrical distribution system following emergency power operation termination.
  2. Provide resistor load bank to discharge regenerative power during emergency power operation.
  3. Load bank is installed on the load side of the mainline disconnect.
- D. Encoder:
1. Direct drive, solid-state, digital type. Update car position at each floor and automatically restore after power loss.
- E. Controller:
1. UL/CSA labeled.
  2. Compartment:
    - a. Securely mount all assemblies, power supplies, chassis switches, relays, on a substantial, self-supporting steel frame.
    - b. Completely enclose equipment with covers.
    - c. Provide means to prevent overheating.
  3. Relay Design:
    - a. Magnet operated with contacts of design and material to insure maximum conductivity, long life, and reliable operation without overheating or excessive wear.
    - b. Provide wiping action and means to prevent sticking due to fusion.
    - c. Contacts carrying high inductive currents are provided with arc deflectors or suppressors.
  4. Microprocessor Hardware:
    - a. Provide built-in noise suppression devices that provide a high level of noise immunity on all solid-state hardware and devices.
    - b. Provide power supplies with noise suppression devices.
    - c. Isolate inputs from external devices (such as pushbuttons) with opto-isolation modules.
    - d. Design control circuits with one leg of power supply grounded.
    - e. Safety circuits are not affected by accidental grounding of any part of the system.
    - f. System automatically restarts when power is restored.
    - g. System memory is retained in the event of power failure or disturbance.
    - h. Equipment is provided with Electro Magnetic Interference (EMI) shielding within FCC guidelines.
  5. Wiring:
    - a. CSA labeled copper for factory wiring.
    - b. Neatly route all wiring interconnections and securely attach wiring connections to studs or terminals.
    - c. Provide labels for all extra or spare wires, neatly organized at base of controller cabinet.
  6. Data Monitoring:

- a. Provide an onboard monitor or screen, either inside the controller or in a stand-alone PC station, to display an easily understood format.
  - b. Upon command, the current operating parameters, individual car status, floor positions or other selected operational features will be displayed.
  - c. Display a minimum of 20 previous errors, which will be logged for statistical evaluation.
  - d. Provide means for hard copy printouts.
  - e. Diagnostic display will support monitoring of elevator motion, velocity, door operation parameters and timing functions.
  - f. Non-volatile memory is required to store group operation data with provisions for data logging and hard copy reporting.
  - g. Network connectivity provision is incorporated in the basic dispatching control system.
    - 1) This provision may be employed for traffic analysis, hard copy computation and/or remote monitoring of status conditions utilizing an isolated PC and compatible printer for reports or graphs.
    - 2) All reports are time and date stamped to confirm reporting period.
  - h. Monitor employs color video displays for the following information:
    - 1) Display screen (group operations statistics).
    - 2) Monitoring screen (diagnostics, system status).
    - 3) Performance screen (traffic analysis).
  - i. Features required regarding remote and additional location monitoring, as indicated in other applicable sections, apply.
7. Permanently mark components with symbols shown on wiring diagrams.
8. Provide control panel compliant with UL 508A SB.SCCR of 5000A required.

F. Electrical Wiring and Wiring Connections:

- 1. Conductors and Connections:
  - a. Copper throughout with individual wires coded and connections on identified studs or terminal blocks.
- 2. The use of splices or similar connections in wiring except at terminal blocks, control compartments, or junction boxes is prohibited. Conduit:
  - a. Galvanized steel conduit, EMT, or duct.
  - b. Flexible conduit length not to exceed 3'-0".
- 3. Traveling Cables:
  - a. Tag spares in equipment space.
  - b. Provide cables from controller to car top.
- 4. Auxiliary Disconnect:
  - a. Provide controller or machine mounted auxiliary, lockable "open" disconnect.
- 5. Auxiliary Wiring:
  - a. Provide dedicated equipment space junction boxes for the following:
    - 1) Fire alarm initiating devices.
    - 2) Emergency two-way communication system.
    - 3) Network connectivity.
    - 4) Paging speaker.
    - 5) CCTV.
    - 6) Digital video display.
    - 7) Intercom, announcement speaker and/or background music.
  - b. Provide conduit, wiring and connections from controller space junction box to each controller in the equipment space for the following:
    - 1) Fire alarm initiating devices.
    - 2) Emergency two-way communication system.
    - 3) Network connectivity.
    - 4) CCTV.
    - 5) Digital video display.
    - 6) Intercom, announcement speaker and/or background music.

## 2.8 HOISTWAY EQUIPMENT

- A. Gearless Traction Hoist Machine:
1. AC induction or P.M.S.M. ACVIF gearless traction motor with brakes, drive sheave, and deflector sheave mounted in proper alignment.
  2. Provide hoist machine mounted direct drive, digital, closed-loop velocity encoder.
  3. Provide machine with an electromechanical brake.
    - a. The brake is spring applied and electrically released.
    - b. Brake shoes are applied to the braking surface simultaneously and with equal pressure.
  4. Provide means to prevent ascending car over-speed and unintended car movement via dual modular redundant braking system.
  5. Provide ladders and platforms with handrails and toe boards for overhead sheave and governor access within the bounds of the equipment space.
- B. Machine and Equipment Support Beams:
1. Provide structural steel beams required for direct support of and attachment to building structure of hoist machine, deflector sheaves, overhead sheaves, governor, and hoist rope dead-end hitch assemblies.
  2. Provide bearing plates, anchors, shelf angles, blocking, embedment, for support and fastening of machine beams or equipment to the building structure.
  3. Isolate machine and overhead sheave beams to prevent noise and vibration transmission to building structure.
- C. Governor:
1. Centrifugal-type, car driven mounted with pull-through jaws and bi-directional shutdown switches.
  2. Provide required bracketing and supports for attachment to building structure.
  3. Provide ladders and platforms with handrails and toe boards for governor access.
  4. Provide manual remote reset capability at controller.
- D. Guide Rails:
1. Planed steel T-sections for car and counterweight of suitable size and weight for the application, including brackets for attachment to building structure.
  2. No additional structural points of attachment other than those shown on the Contract Documents will be provided.
  3. Provide rail backing and intermediate counterweight tie brackets.
  4. Provide bracketing, at top and bottom of floor beams.
- E. Sheaves:
1. Machined grooves and sealed bearings.
  2. Provide mounting to machine beams, car, and counterweight structural members, or building structure.
- F. Counterweight:
1. Steel frame with metal filler weights.
- G. Counterweight Guides:
1. Spring dampened roller guides.
- H. Governor Rope and Encoder Tape Tensioning Sheaves:
1. Mount sheaves and support frame on pit floor or guide rail.
  2. Provide frame with guides or pivot point to enable free vertical movement and proper tension of rope and tape.

- I. Suspension Means:
  - 1. 8 x 19 or 8 x 25 Seale construction, traction steel.
    - a. Fasten with staggered length, adjustable, spring isolated wedge shackles.
  - 2. Noncircular elastomeric-coated steel belt comprising of several steel cords arranged in parallel and molded within a coating.
  - 3. Approved governor rope.
  
- J. Terminal Stopping:
  - 1. Provide normal and final devices.
  
- K. Electrical Wiring and Wiring Connections:
  - 1. Conductors and Connections:
    - a. Copper throughout with individual wires coded and connections on identified studs or terminal blocks.
    - b. The use of splices or similar connections in wiring except at terminal blocks, control compartments, or junction boxes is prohibited.
    - c. Provide 20% spare conductors for each wire type.
    - d. Run spare wires from car connection points to individual elevator controllers in the equipment space.
  - 2. Conduit:
    - a. Galvanized steel conduit, EMT, or duct.
    - b. Flexible conduit between isolated equipment, length not to exceed 3'-0".
    - c. Flexible heavy-duty service cord may be used between fixed car wiring and car door switches for door protective devices.
    - d. Provide conduit from the closest hoistway of each elevator group or single elevator to the group control console. Provide wiring
  - 3. Traveling Cables:
    - a. Flame and moisture-resistant outer cover.
    - b. Prevent traveling cable from rubbing or chafing against hoistway or equipment within hoistway.
    - c. Provide the following minimum composition, which are not considered spares:
      - 1) Two pair of shielded 18-gauge wire for CCTV, from car controller to car top junction box, plus 3'-0" excess loop at both ends.
      - 2) Two pair of 18-gauge wire for CCTV power.
      - 3) Two pair of 18-gauge wire for emergency communication system power.
      - 4) Two pair of 18-gauge wire for network connectivity power.
    - d. Provide eight pair of spare shielded communication wires in addition to those required to connect specified items.
    - e. Tag spares in control room or equipment space. Provide cables from controller to car top.
    - f. Support traveling cable by suspending from supports by means that automatically tighten around the cable when tension is increased
  - 4. Auxiliary Wiring:
    - a. Provide conduit, wiring and connections for systems specified.
  
- L. Entrance Equipment:
  - 1. Two-point hanger roller with non-metallic roller surface and suspension with eccentric upthrust roller adjustment.
  - 2. Bar or formed, cold-drawn removable steel door tracks with smooth roller contact surface.
  - 3. Door Interlocks:
    - a. Operable door locks without retiring cam.
  - 4. Door Closers:
    - a. Spring, spirator, weighted, or jamb/strut mounted.
    - b. Design and adjust to ensure a smooth and quiet mechanical close of doors.
  
- M. Floor Numbers:

1. Stencil paint 4" high floor designations in contrasting color on inside face of hoistway doors and hoistway fascia. Must be visible from within car.

## 2.9 HOISTWAY ENTRANCES

### A. Entrance Assemblies:

1. Complete entrances bearing fire labels from a certified testing laboratory approved by authority having jurisdiction.
2. Provide entrance assemblies bearing 1-1/2hr label.

### B. Frames:

1. Provide Arabic floor designation/Tactile marking plates:
  - a. Centered at 60" above finished floor.
  - b. Located on both side jambs of all entrances.
  - c. Minimum 4" in height.
  - d. Tactile indications below Arabic floor designation.
  - e. Permanently fastened.
2. Provide car identification label:
  - a. Mounted directly below floor designation/Tactile marking plates.
  - b. Located on both side jambs at the following levels:
    - 1) Designated Level.
    - 2) Alternate Level.
  - c. Finish and design to match floor designation/Tactile marking plates.
  - d. Permanently fastened.
3. Provide plates at main egress landing with "Star" designation.
4. For designated emergency car, provide "Star of Life" cast designation plates at height of 78"-84" above finished floor on both side jambs at all floors.

### C. Door Panels:

1. Sandwich construction without binder angles.
2. Provide one leading edge of doors with rubber astragals.
3. Provide a minimum of two gibs per panel, one at leading and one at trailing edge with gibs in the sill groove entire length of door travel.
4. Provide one separate 4" steel reinforcement safety gib mounted between door gibs, where not integrated with door gibs.
5. Architectural metal cladding wraps around leading and trailing edge of panel and return a minimum of 1/2" on rear side of leading edge of panel at all floors.

### D. Sight Guards:

1. Same material, finish, and height as hoistway entrance door panels.
2. Construct without sharp edges.

### E. Sills:

1. Extruded aluminum.

### F. Sill Supports:

1. Structural or formed steel designed to support sill load.
2. Design to eliminate need for grout under the sill.

### G. Fascia, Platform Guards and Hanger Covers:

1. 16-gauge furniture steel with Contractor's standard finish.

### H. Struts and Headers:

1. Provide support of all entrances to building structure including connections to building structure.

2. Provide door open bumpers on entrances equipped with vertical struts.
- I. Finish of Frames and Doors:
    1. Satin finish stainless-steel.
  - J. Hoistway Access:
    1. Hoistway Door Unlocking Device:
      - a. Provide unlocking device escutcheon in door panel at all floors, with finish to match adjacent surface.
    2. Hoistway Access Switches:
      - a. Mount in entrance frame side jamb at top floor.
      - b. Provide switch with faceplate.

## 2.10 PIT EQUIPMENT

- A. Buffers:
  1. Provide Spring type with blocking and support channels.
  2. Stencil car number on buffer.
- B. Pit Access:
  1. Hoistway Access Key Switch:
    - a. Provide key switch at lowest terminal landing.
    - b. Mount in entrance frame side jamb.
    - c. Provide switch with faceplate.
  2. Provide pit stop switches.
- C. Counterweight Guard:
  1. Metal guard in pit in front of counterweight where no compensation is provided or where there is no space greater than 20 inches between the compensation means, suspension means, counterweight rails, or guards.
- D. Compensation: (If required by design)
  1. Encapsulated chain with pit guide assembly.
    - a. Pit mounted guide assembly:
      - 1) Provide quiet, effective restraint without excessive wear of components.
      - 2) Inhibit rubbing or chafing against hoistway or equipment within hoistway or pit.
    - b. Application must meet performance/noise level requirement of specification.

## 2.11 CAR EQUIPMENT

- A. Frame:
  1. Welded or bolted formed steel channel construction to meet load classification specified.
- B. Safety Device:
  1. Type "B," flexible guide clamp.
- C. Platform:
  1. Design and construct to accommodate load classification requirements.
    - a. Provide Class "A" construction for passenger elevators, Class "C3" for service elevators.
    - b. Provide 1" recess to accommodate floor and subfloor thickness.
    - c. Allow 500 lbs. for floor weight.
  2. The car platform consists of a steel frame with necessary steel stringers, all securely welded together.

3. Provide platform with two layers of 3/4" marine grade plywood.
  4. Cover the underside of the car platform with sheet steel.
  5. Isolate the passenger elevator platform.
    - a. The support frame includes rubber pads on which the platform rests.
    - b. No mechanical connections between platform and frame.
  6. Work Light Fixtures & AC Receptacles:
    - a. Provide permanent mounted work light fixtures below platform, complete with proper lamp guards.
- D. Platform Guard:
1. Minimum 48" high, reinforced and braced to car platform front with Manufacturer's standard finish
- E. Cartop Guard Rail:
1. Provide a railing system provided on the outside perimeter of the car top on all sides where the horizontal distance between the edges of the car top and the adjacent hoistway enclosure exceeds 12 inches.
- F. Car Guides:
1. Roller type with three or more spring dampened, sound-deadening rollers per shoe. Minimum 6" outside diameter.
- G. Cab Steadying Plates:
1. Provide and install top of car steadying plates.
  2. Emphasis is placed on proper tension to car styles allowing minimal lateral movement of the cab.
  3. Steadying plates are isolated using non-metallic guides or rollers.
- H. Sills:
1. One-piece extrusion with extension between car entrance columns to face of car front return.
  2. Extruded extension to match finish of sill.
  3. Aluminum.
- I. Door Panels:
1. Sandwich construction without binder angles.
  2. Provide one leading edges of doors with rubber astragals.
  3. Provide a minimum of two gibs per panel, one at leading and one at trailing edge with gibs in the sill groove entire length of door travel.
  4. Construct door panels with interlocking, stiffening ribs.
  5. Architectural metal cladding wraps around leading and trailing edge of panel and return a minimum of 1/2" on rear side of leading edge of panel.
- J. Door Hangers:
1. Two-point suspension.
  2. Hanger roller with non-metallic surface and eccentric roller adjustment.
- K. Door Track:
1. Bar or formed, cold-drawn removable steel track with smooth roller contact surface.
- L. Door Header:
1. Construct of minimum 12-gauge steel, shape to provide stiffening flanges.
- M. Door Electrical Contact:
1. Prohibit car operation unless car door is closed.

- N. Door Clutch:
1. Heavy-duty clutch, linkage arms, vane assembly and pickup rollers or cams to provide positive, smooth, quiet door operation.
  2. Design clutch so car doors can be closed while hoistway doors remain open.
- O. Restricted Opening Device:
1. Provide mechanical car-door restrictor to prevent opening of doors when outside unlocking zone.
  2. Plunger type restrictors are not applicable.
  3. Utilize mechanical angle to prevent door opening
- P. Door Operator:
1. High speed, heavy-duty door operator capable of opening doors at no less than 2.5 fps.
  2. Accomplish reversal within 2" of door movement.
  3. Provide solid-state door control with closed loop circuitry to constantly monitor and automatically adjust door operation based upon velocity, position, and motor current.
  4. Provide a minimum of four controller-based motion profiles, per floor, per door, to maintain consistent, smooth, and quiet door operation at all floors, regardless of door weight or varying air pressure.
- Q. Door Reversing Device:
1. Infrared Reopening Device:
    - a. Black fully enclosed device with full screen infrared matrix or multiple beams extending vertically along leading edge of each door panel to minimum height of 74" above finished floor.
    - b. 3D beam device to detect approach from elevator lobby.
    - c. Reverse doors at normal opening speed if beams are obstructed while doors are closing, except during nudging operation.
    - d. In event of device failure, provide for automatic shutdown of car at floor level with doors open.
  2. Nudging Operation:
    - a. After door close is obstructed for a predetermined time interval (minimum 20.0-25.0 seconds), warning signal sounds, and doors close with a maximum of 2.5 foot-pounds kinetic energy.
    - b. Door open button overrides nudging operation and reopen doors.
  3. Interrupted Beam Time:
    - a. When beams are interrupted during initial door opening, hold door open a minimum of 3.0 seconds.
    - b. When beams are interrupted after the initial 3.0 second hold open time, reduce remaining adjustable open time to 1.0-1.5 seconds after beams are reestablished.
  4. Differential Door Time:
    - a. Provide separate adjustable timers to vary door dwell time after stopping in response to calls.
    - b. Car Call:
      - 1) Hold open time adjustable between 3.0 and 5.0 seconds.
    - c. Hall Call:
      - 1) Hold open time adjustable between 5.0 and 8.0 seconds.
      - 2) Use hall call time when car responds to coincidental calls.
- R. Car Operating Panel:
1. Elevator:
    - a. One car operating panel without faceplates:
      - 1) Consisting of a metal box containing the vandal resistant operating fixtures, mounted behind the car swing front return panels.
      - 2) Faceplates are hinged and constructed of satin finish stainless-steel.

- b. Suitably identify floor buttons, alarm button, door open button, door close button and emergency push-to-call button with cast stainless tactile symbols rear mounted.
  - c. Pushbuttons:
    - 1) Provide minimum 3/4" diameter raised floor pushbuttons which illuminate to indicate call registration.
  - d. Locate operating controls no higher than 48" above the car floor; no lower than 35" for emergency push-to-call button and alarm button.
  - e. Locked Firefighters Operation Panel:
    - 1) For fire officer use and independent service only.
    - 2) Openable by the same key which operates the Fire Operation switch.
    - 3) Including the following features:
      - a) Phase II fire access switch.
      - b) Firefighters' visual indication.
      - c) Call cancel button.
      - d) Stop switch, manually operated.
      - e) Door open button.
      - f) Door close button.
      - g) Floors served.
  - f. Provide "door open" button to stop and reopen doors or hold doors in open position.
  - g. Provide "door close" button to activate door close cycle.
    - 1) Cycle does not begin until normal door dwell time for a car or hall call has expired, except firefighters' operation.
2. Service Compartment:
- a. Provide lockable service compartment with recessed flush door.
  - b. Door material and finish matches car return panel or car operating panel faceplate.
  - c. Include the following controls in lockable service cabinet with function and operating positions identified by permanent signage or engraved legend:
    - 1) Access switch.
    - 2) Light switch.
    - 3) 4-position Exhaust blower switch.
    - 4) Independent service switch.
    - 5) Constant pressure test button for battery pack emergency lighting.
    - 6) 120-volt, AC, GFCI protected electrical convenience duplex outlet.
    - 7) Card reader override switch.
    - 8) Keyed stop switch.
3. Provide black filled, engraved, or approved etched signage as follows with approved size and font:
- a. Phase II firefighters' operating instructions on inside face of firefighters' compartment door.
  - b. Red filled engraved firefighters' operation on outside face of compartment door.
  - c. Building identification car number over main car operating panel.
  - d. Car capacity in pounds on service compartment door.
  - e. "No Smoking" over main car operating panel.
- S. Car Top Control Station:
- 1. Mount to provide safe access and utilization while standing on car top.
  - 2. Operating device contains Up and Down direction buttons, a Run button, an Inspection/Automatic switch and Emergency Stop switch.
  - 3. Operating device contains an audible and visible indicator that fire recall has been initiated.
  - 4. This station is fixed to the car crosshead or may be portable provided the extension cord and housing are permanently attached to the car crosshead.
  - 5. The car will be operated by constant pressure on the appropriate direction button and the Run button simultaneously.

6. Normal operating devices will be inoperative while this device is in use.
- T. Emergency Audible Signaling:
1. Provide on top of each elevator.
  2. Activation of the Alarm Button or Emergency Stop switch will cause Emergency Audible Signal.
  3. Provide auxiliary power supply to provide 1hr power in the event of normal power loss.
- U. Work Light and Duplex Plug Receptacles:
1. GFCI protected outlet at top and bottom of car.
  2. Include on/off switch and lamp guard.
  3. Provide additional GFCI protected circuit and dedicated junction box on car top for installation of car CCTV
  4. Provide additional GFCI protected circuit and dedicated junction box on car top for installation of car digital video display.

## 2.12 CAR ENCLOSURE

- A. Elevator: Provide complete as specified herein and detailed on architectural drawings.
1. Shell:
    - a. Reinforced formed furniture steel panels with baked enamel interior finish.
    - b. Apply sound-deadening mastic to exterior.
    - c. Provide concealed ventilation cutouts.
  2. Canopy:
    - a. Reinforced formed furniture steel panels with lockable, contacted, hinged emergency exit.
    - b. Interior finish white reflective baked enamel.
  3. Front Swing Return Panels and Integral Entrance Columns:
    - a. Reinforced furniture steel clad with satin finish stainless-steel No. 4 finish.
    - b. Swing entire unit on substantial pivot points for service access to car operating panels.
    - c. Locate pivot points to provide full swing of return panel without interference with side wall finish or handrail.
    - d. Secure in closed position with concealed three-point latch.
    - e. Provide firefighters' and service compartments with recessed flush cover and cutouts for operating switches.
  4. Transom:
    - a. Reinforced furniture steel clad with satin finish stainless-steel full width of enclosure.
  5. Base:
    - a. Stainless-steel with concealed ventilation cutouts.
  6. Finish Floor Covering:
    - a. Furnished under other sections.
    - b. Accommodate floor and subfloor thickness.
  7. Interior Wall Finish:
    - a. SE 5: Removable panels faced and edged, with textured finish stainless-steel
    - b. PE 1-4: provide 25,000 allowance per elevator for wall finish
  8. Ventilation:
    - a. Forced Ventilation
      - 1) 3-speed blower mounted to car canopy.
      - 2) Exhaust blower meets noise and vibration criteria.
  9. Lighting:
    - a. Provide LED fixtures with wiring and hookup.
  10. Suspended Ceiling:
    - a. Six-section for PE 1-4; Nine-section for SE 5 Satin finish stainless-steel panels with lighting cutouts in each panel.

11. Handrails:
  - a. Minimum 1-1/2" stainless-steel flat grab bar with backing plates and captive nuts across rear wall walls.
  - b. Bolt rails through car walls from back and mount on 1-1/2" deep solid round stainless-steel standoff spacers no more than 18" O.C.
  - c. Provide at 32 in. above finished floor, as indicated on Architectural drawings.
  - d. Additionally for the Service Elevator: Lower guardrail line 4" x 3/8" solid stainless-steel flat stock bars mounted on both sides and rear of the car.
  - e. Locate bottom guardrail line at 8" above car floor and handrail line at 32" above the car floor.

## 2.13 HALL CONTROL STATIONS

- A. Pushbuttons:
  1. Provide one riser for each elevator or group.
  2. Provide flush mounted faceplates
  3. Include pushbuttons for each direction of travel that illuminate to indicate call registration.
  4. Include engraved message and pictorial representation prohibiting use of elevator during fire or other emergency as part of faceplate.
  5. Pushbutton design matches car operating panel pushbuttons.
  6. Provide vandal resistant pushbutton and light assemblies.
  7. Provide LED illumination.
  8. Provide Phase I Fire Service key switch, engraved operating instructions and illuminating jewel.
  9. Provide communication check failure indication and silence key switch.
  10. Provide illuminating jewels indicating standby power status.

## 2.14 SIGNALS

- A. Hall Direction Lantern:
  1. Provide at each entrance to indicate travel direction of arriving car.
  2. Illuminate up or down LED lights and sound tone once for up and twice for down direction prior to car arrival at floor.
  3. Illuminate light until the car doors start to close.
  4. Sound level adjustable from 20-80 dBA measured at 5'-0" in front of hall control station and 3'-0" off floor.
  5. Provide advanced hall lantern notification to comply with ADA hall call notification time.
  6. Provide adjustable car door dwell time to comply with ADA requirements relative to hall call notification time.
  7. Hall direction lenses are arrow shaped with faceplates.
  8. Lenses are minimum 2" in their smallest dimension.
  9. Provide vandal resistant lantern and light assemblies consisting of series of dots or lines for maximum visibility.
- B. Hall Position Indicator, All Cars:
  1. Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 2" high to indicate floor served and direction of car travel.
  2. Mount integral with hall station at the Primary landing.
  3. Provide vandal resistant indicator and light assemblies.
- C. Car Position Indicator:
  1. Alpha-numeric digital indicator screens containing floor designations and direction arrows a minimum of 2" high to indicate floor served and direction of car travel.
  2. Locate fixture in each car operating panel.

3. When a car leaves or passes a floor, illuminate indication representing position of car in hoistway.
  4. Illuminate proper direction arrow to indicate direction of travel.
- D. Fixture Faceplate Material and Finish:
1. Satin finish stainless-steel for all fixtures.
  2. Tamper resistant fasteners for all public facing fastenings.
- E. Voice Synthesizer:
1. Provide electronic device with easily reprogrammable message and female voice to announce car direction, floor, emergency exiting instructions.

## 2.15 COMMUNICATION

- A. Car Communication System:
1. Hands-Free Phone System:
    - a. Two-way communication instrument in car with automatic dialing, tracking, and recall features, with shielded wiring to car controller in control room or equipment space.
    - b. Provide dialer with automatic rollover capability with minimum two numbers:
      - 1) Actuate two-way communication via "Help" button.
      - 2) Adjacent light jewel illuminates and flash when call is acknowledged.
      - 3) Button matches car operating panel pushbutton design.
      - 4) Provide "Help" button tactile symbol, engraved signage, and Tactile marking adjacent to button mounted integral with car front return panel.
  2. Emergency Personnel Communication:
    - a. Communication system is provided allowing emergency personnel to establish communications with each elevator individually.
    - b. Emergency Personnel Communication overrides any existing connection outside of building.
    - c. Adjacent light jewel illuminates and flashes when call is acknowledged.
    - d. Provide operating instructions.
    - e. On the same car operating panel as the phone push button, provide capability to communicate with and obtain responses from passengers.
    - f. Provide display video capability for entrapment assessment.
  3. Communication for deaf, hearing and speech impaired:
    - a. On the same car operating panel as the phone push button, provide capability to communicate visually with and obtain responses from passengers, including those passengers who cannot communicate verbally or hear.
    - b. Provide shielded twisted pair wiring to communicate to control room or equipment space network box.
    - c. Device shall be capable of being monitored by any entity as selected by the owner. All software, hardware, and training cost associated with the device shall be included within this project. Associated monthly monitoring costs will not be accepted.
- B. Remote Monitoring:
1. Provide system to capture faults or system shutdowns in real-time occurrence.
  2. Communicate faults or shutdowns to reception system, enabling automatic dispatch of technicians.
  3. System monitors faults 24-hours per day, 7-days per week.
- C. Firefighters' Key Box:
1. Flush-mounted box with lockable hinged cover.
  2. Engrave instructions for use on cover per Local Fire Authority requirements.

**PART 3 - EXECUTION****3.1 EXAMINATION**

- A. Prior to beginning installation of equipment examine hoistway and control room and equipment space areas.
- B. Verify no irregularities exist that affect execution of work specified.
- C. Verify electrical power location and characteristics in coordination with equipment requirements.
- D. Do not proceed with installation until work in place conforms to project requirements.

**3.2 INSTALLATION**

- A. Install all equipment in accordance with Contractor's instructions, referenced codes, specification, and approved submittals.
- B. Install control room and equipment space equipment with clearances in accordance with referenced codes and specification.
- C. Install all equipment so it may be easily removed for maintenance and repair.
- D. Provide any required hoisting/safety beams.
- E. Install all equipment to afford maximum accessibility, safety, and continuity of operation.
- F. Remove oil, grease, scale, and other foreign matter from the following equipment and apply one coat of field-applied machinery enamel.
  - 1. All exposed equipment and metal work installed as part of this work which does not have architectural finish.
  - 2. Control room equipment, hoistway equipment including guide rails, guide rail brackets, and pit equipment.
  - 3. Neatly touch up damaged factory-painted surfaces with original paint color. Protect machine-finish surfaces against corrosion.
- G. Fill hoistway door frames, back boxes for hallway stations and signal devices, and sills.
- H. Clean all architectural finishes and replace or restore any surfaces damaged during construction to like new condition.

**3.3 FIELD QUALITY CONTROL**

- A. Acceptance Testing:
  - 1. On completion of elevator installation and before permitting elevator use (either temporary or permanent), perform acceptance tests as required and recommended by ASME A17.1/CSA B44 and by governing regulations and agencies.
- B. Advise Contractor, Architect, and authorities having jurisdiction in advance of dates and times that tests are to be performed on elevators.
- C. Independent Testing by Owner's Consultant.

**3.4 CONSTRUCTION TOLERANCES**

- A. Install rails plumb and align vertically with tolerance of 1/16" in 100'-0".
  - 1. Secure joints without gaps and file any irregularities to a smooth surface.

**3.5 ADJUSTING**

- A. Static balance car to equalize pressure of guide shoes on guide rails.
  - 1. Dynamically balance car and counterweight.
- B. Lubricate all equipment in accordance with Contractor's instructions.
- C. Adjust motors, power conversion units, brakes, controllers, leveling switches, limit switches, stopping switches, door operators, interlocks, and safety devices to achieve specified performance levels.

**3.6 CLEANING**

- A. Keep work areas orderly and free from debris during progress of project.
- B. Remove packaging materials on a daily basis.
- C. Remove all loose materials and filings resulting from work.
- D. Clean Control room and equipment space equipment and floor.
- E. Clean hoistways, car, car enclosure, entrances, operating and signal fixtures.
- F. Clean pit equipment and floor.

**3.7 DEMONSTRATION**

- A. Check operation of each elevator with Owner's personnel present before date of Substantial Completion and again not more than one month before end of warranty period.
  - 1. Determine that operation systems and devices are functioning properly.

**3.8 PROTECTION**

- A. Temporary Use: Comply with the following requirements for each elevator used for construction purposes:
  - 1. Provide car with temporary enclosure, either within finished car or in place of finished car, to protect finishes from damage.
  - 2. Provide strippable protective film on entrance and car doors and frames.
  - 3. Provide padded wood bumpers on entrance door frames covering jambs and frame faces.
  - 4. Provide other protective coverings, barriers, devices, signs, and procedures as needed to protect elevator and elevator equipment.
  - 5. Do not load elevators beyond their rated weight capacity.
  - 6. Engage elevator Installer to provide full maintenance service.
    - a. Include preventive maintenance, repair, or replacement of worn or defective components, lubrication, cleanup, and adjustment as necessary for proper elevator operation at rated speed and capacity.
    - b. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
  - 7. Engage Elevator Installer to restore damaged work, if any, so no evidence remains of correction.

- a. Return items which cannot be refinished in the field to the shop, make required repairs, and refinish entire unit, or provide new units as required.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 14 22 00 - ELECTRIC TRACTION FREIGHT ELEVATORS****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes: Traction elevators as follows:
  - 1. One (1) Geared Freight Elevator, Car FR 6.
  
- B. Related Requirements: Including but not limited to the following:
  - 1. Division 05 Section "Structural Steel Framing" for the following:
    - a. Attachment plates, angle brackets, and other preparation of structural steel for fastening guide-rail brackets.
    - b. Divider beams.
    - c. Hoist beams.
    - d. Structural-steel shapes for subsills.
  - 2. Division 05 Section "Metal Fabrications" for the following:
    - a. Pit ladders
  
- C. Products Installed but Not Furnished Under This Section:
  - 1. Building announcement speakers.
  - 2. CCTV camera provisions.
  - 3. Elevator security devices, control unit, mounting brackets, wiring materials, logic circuits, security system interface terminals, boxes and relays.
  - 4. Monitoring system interface.

**1.2 PRODUCT VARIATIONS AND ADJUSTMENTS**

- A. Product Variations: In the event of differences between products and systems of acceptable or available manufacturer/fabricators, Contractor shall notify Architect of such differences and resolve conflicts prior to awarding Contract. Failure of Contractor to provide notification shall be construed as acceptance of conditions indicated, and changes caused by differences between products and Contract Documents shall be included in the Work at no additional cost to Owner.
  
- B. Adjustments: Proposed deviations shall include a detailed analysis of impact to adjacent substrates, structural, mechanical, electrical or other building systems, including related design or construction cost impacts. Deviations causing changes in materials, constructability, substrates, systems or conditions shall be included in the Work at no additional cost to Owner.

**1.3 ACTION SUBMITTALS**

- A. Product Data:
  - 1. Include capacities, sizes, performances, operation, control, signal systems operations, safety features, finishes, and similar information.
  - 2. Include product data for car enclosures and hoistway entrances.
  - 3. Include product data for signal fixtures, lights, graphics, Tactile marking plates, and details of mounting.
  
- B. Shop Drawings:
  - 1. Provide scaled shop drawings and construction drawings of the following:
    - a. Plan and section layouts of hoistways, pits, overheads, machinery spaces and openings at each landing, to include the following:
      - 1) Location of all equipment.

- 2) Static and dynamic loads imposed on building structure.
- 3) Details of equipment isolation.
- 4) Required clearances around equipment.
- 5) Machine room heat release.
  - a) Provide heat loads based on a non-regenerative emergency power operation.
- 6) Power requirements:
  - a) motor horsepower, code letter, starting current, full load running current, and demand factor.
  - b) Provide engineered power consumptions based on 120 starts per hour.
  - c) Provide maximum and average power consumption.
- 7) Service connections.
- 8) Running Clearances.
- 9) Location of fixtures.
- b. Elevation section of hoistways:
  - 1) Overhead, pits (clearance, runby, etc.
  - 2) Entrance details.
  - 3) Sill support detail.
- c. Pit Equipment:
  - 1) Buffers.
  - 2) Compensation equipment and tie-downs.
  - 3) Counterweight guards.
  - 4) Pit reactions.
  - 5) Service ladder, platform.
  - 6) Stop switches.
- d. Elevator cabs:
  - 1) Car shell fabrication.
  - 2) Ventilation.
  - 3) Ceiling construction detail.
  - 4) Wall construction detail.
  - 5) Lighting detail.
  - 6) Handrail mounting detail.
  - 7) Transom, front returns.
- e. Fixtures:
  - 1) Car operating panel.
  - 2) Hall stations.
  - 3) Hall Lanterns.
  - 4) Position indicators.
  - 5) Access key switch.
  - 6) Remote panel:
    - a) Group Status Panel.
    - b) Emergency Power selector switches.
  - 7) Two-way conversation device (all master stations).
2. All submittals shall be clearly marked and identified with project title and appropriate device identification.
3. All submittals are subject to approval.
4. Corrections requested shall be incorporated onto the submittals.
5. All submittals shall also be submitted to Elevator Consultant via Portable Document Format (.pdf).

C. Samples for Verification:

1. For exposed car, hoistway door and frame, and signal equipment finishes.
2. Samples of sheet materials: 3" (75 mm) square.

3. Running trim members: 4" (100 mm) lengths.

#### 1.4 CLOSEOUT SUBMITTALS

- A. Continuing Maintenance Proposal:
  1. Submit a continuing maintenance proposal from Installer to Owner, in the form of a standard five-year maintenance agreement, starting on date initial maintenance service is concluded.
  2. State services, obligations, conditions, and terms for agreement period and future renewal options.
- B. Record Documents
  1. The following record documents shall be furnished upon completion and before final payment:
    - a. Shop Drawings:
      - 1) Complete sets of as installed plan and section layouts of hoistways, pits, overheads and machinery spaces, to include the following:
        - a) Static and dynamic loads imposed on building structure.
        - b) Details of equipment isolation.
        - c) Required clearances around equipment.
        - d) Machine room heat release/diversity factor.
        - e) Power requirements.
      - 2) Elevation section of hoistways:
        - a) Overhead, pits and entrance details.
      - 3) Elevator cabs.
      - 4) Fixtures:
        - a) Car fixtures.
        - b) Hall fixtures.
        - c) Remote fixtures.
      - 5) Machine room heat release/diversity factor and power requirements.
    - b. Wiring Diagrams:
      - 1) Complete sets of as installed straight-line wiring diagrams, showing the electrical connections of all altered vertical transportation equipment, shall be furnished upon completion.
      - 2) A legend sheet shall be furnished with each set of drawings containing the following information:
        - a) Name and symbol of each relay, switch and other electrical or solid-state apparatus.
        - b) Location on drawings, drawing sheets, number and area of switches and relays, etc., and location of all contacts.
        - c) Location of apparatus whether on controller, hoistway or elevator cab.
    - c. Maintenance and Operating Manuals:
      - 1) Description and sequence of operation of all equipment installed, including operating use for Building Personnel and tenants, as well as system troubleshooting manuals for technicians.
      - 2) Maintenance instructions and procedures of all vertical transportation equipment installed, including parts lists, for each elevator system.
      - 3) Lubrication charts indicating all lubricating points and type of lubricant recommended for all equipment.
      - 4) Complete parts catalogs for all replaceable parts.
- C. Tools:
  1. The following equipment shall be furnished upon completion and before final payment:

- a. The Elevator Contractor shall provide all the necessary tools, including laptop, hand-held devices, required software and manuals, required to troubleshoot, adjust, synchronize, calibrate, repair and maintain the vertical transportation systems, as well as perform all necessary procedures to perform all safety tests as required by code and local governing authority.
- b. Owner's equipment and software shall be updated regularly as necessary to properly troubleshoot, adjust, synchronize, calibrate, repair, maintain and test the vertical transportation systems. All equipment and/or software shall be of the same version as issued to technicians maintaining the vertical transportation systems.
- c. The Elevator Contractor shall provide a backup copy of any software that resides on the troubleshooting tool.
- d. Upon cancellation of service agreement, the Elevator Contractor shall provide all upgrades indicated above.

D. Keys:

1. Four sets of keys to operate all keyed switches and locks shall be furnished upon completion.
2. Keys shall be properly tagged.
3. All keying shall be arranged with the Contractor.

## 1.5 PERMITS TESTS AND CERTIFICATES

A. Permits:

1. The Elevator Contractor shall secure the necessary permits required for work to be performed, including work performed by sub-contractors.
2. The Elevator Contractor shall also secure the necessary permits required for the work to be performed to remove any existing devices on the premises.
3. The Elevator Contractor shall obtain and pay for all municipal and state permits necessary for execution of the elevator work, including fees for renewing permits.
4. The Elevator Contractor shall be responsible for posting all permits as required by the AHJ.
5. The Elevator Contractor shall be responsible for obtaining final sign-off for each permit filed by them.

B. Tests and Inspections:

1. The Elevator Contractor shall perform all necessary tests as required by ASME A17.1 and recommended by A17.2.
2. The Elevator Contractor shall be responsible for scheduling the necessary tests as required by the local authorities.
  - a. Any fees associated with a missed appointment, expediting of test or overtime test due to delays caused by the Elevator Contractor shall be the responsibility of the Elevator Contractor.

C. Certificates:

1. Elevator Contractor is responsible for obtaining and providing Contractor with all temporary and final inspection certificates of the proper governing authorities and shall provide the Contractor with such certificates.
2. The Elevator Contractor shall pay for all fees necessary for obtaining temporary and final inspection certificates.

D. Violations:

1. Any violations that exist on devices being removed shall be cleared by the Elevator Contractor prior to final acceptance by the Contractor.

**1.6 QUALITY ASSURANCE**

- A. Compliance with Regulatory Agencies:
  - 1. Comply with most stringent applicable provisions of codes, laws, and/or authorities, including revisions and changes in effect.
- B. Inspections:
  - 1. The Contractor is subject to reviews by the Consultant and/or Contractor at any time throughout the project.

**1.7 DELIVERY STORAGE AND HOISTING**

- A. General:
  - 1. The protection of all equipment and exposed finishes shall be the responsibility of the Elevator Contractor during delivery, handling and installation until completion of project.
  - 2. The Elevator Contractor shall replace damaged materials with new, at no additional cost for material and labor to Contractor.
- B. Delivery and Storage:
  - 1. It is expected that manufacturers' original packing shall adequately protect materials during delivery.
  - 2. Deliver materials to the site ready for use in the accepted manufacturer's original and unopened containers and packaging, bearing labels as to type of material, brand name and manufacturer's name. Delivered materials shall be identical to accepted samples.
  - 3. Store materials under cover in a dry and clean location, off the ground. Remove delivered materials that are damaged or otherwise not suitable for installation from the job site and replace with acceptable materials.
  - 4. It is the responsibility of the Elevator Contractor to properly store and protect all materials in space provided or designated by the Contractor against damage, stains, scratches, corrosion, weather, construction debris and environmental conditions.
- C. Hoisting:
  - 1. All required hoisting and movement of equipment shall be the responsibility of the Elevator Contractor.

**1.8 COORDINATION**

- A. General:
  - 1. Coordinate the following requirements with the other trades.
- B. Cast-in-Place Concrete:
  - 1. Elevator Contractor to provide guide rail bracket inserts and the locations for the General Contractor to install.
  - 2. Elevator Contractor to provide templates for machine room slab penetrations.
  - 3. Provide other hoistway and pit requirements, including location of sump pits.
- C. Masonry Penetrations:
  - 1. Provide locations in elevator machine room/hoistway walls where conduit, ropes, etc. shall penetrate walls and slabs.
  - 2. Coordinate installation of sleeves, block outs, inserts, and items that are embedded in concrete or masonry for elevator equipment.
  - 3. Furnish inserts, templates and installation instructions and deliver to Project site in time for installation.

- D. Structural Steel:
  - 1. Including, but not limited to, elevator machine rooms, hoistways and pits, sill supports, rail supports.
- E. Miscellaneous Steel:
  - 1. Pit ladders, working platforms, inspection platforms, guard rails, divider beams.
- F. Electric:
  - 1. Electrical service, outlets, lights, switches in elevator machine rooms and pits.
- G. Sprinklers:
  - 1. Including installation of sprinkler systems in the elevator pits or shaft per NFPA 13.
- H. HVAC:
  - 1. Provide necessary information to General Contractor and coordinate installation of equipment for elevator machine rooms.
- I. Finishes:
  - 1. Cab interiors, hoistway entrances, fixtures.
- J. Elevator Cab Flooring:
  - 1. Material and finish to be specified in other applicable section.
  - 2. Flooring installation must be coordinated to ensure car saddle is installed at proper height (even with finished floor).
- K. Security Equipment:
  - 1. Coordinate location(s) in elevator machine rooms and cabs where cables, conduit, components, etc. for CCTV and/or secure access interface equipment must be installed.

## **1.9 WARRANTY**

- A. Manufacturer's Warranty:
  - 1. Manufacturer agrees to repair, restore, or replace elevator work that fails in materials or workmanship within specified warranty period.
- B. Warranty Period: 12 months from date of Substantial Completion:
  - 1. The Elevator Contractor shall guarantee that the materials and workmanship of the apparatus installed by them and any subcontractor under this contract, shall be first class in every respect and that he will make good on any defects not due to ordinary wear and tear or improper use, which may develop within one year from the date of final acceptance of all equipment.
  - 2. Manufacturer's warranty to repair or replace defective products or their components in the event of defects within a specified period.
  - 3. Neither the final payment nor any provisions of the contract documents shall relieve the Elevator Contractor of the extent and period provided by law and upon written notice he shall remedy any defects due thereto and pay all expenses for any damage to other work resulting there from.
  - 4. The warranty as outlined above, for all devices, shall start from the date of final acceptance of each device, by the Consultant and the Owner, of all work specified and intended under these contract documents.

## **1.10 MAINTENANCE**

- A. General:

1. All maintenance shall be performed according to the guidelines stated in manufacturer's Maintenance and Operations manuals.
  2. Maintenance records for each device, including lubrication logs, check charts, shall be provided in each machine room.
- B. Construction Maintenance:
1. Upon substantial completion of a device, subsequent to receiving sign-off from the governing authorities and acceptance from Consultant and/or Contractor, the device may be accepted for service before completion of the entire project.
  2. During the Construction Maintenance period, the necessary preventive maintenance shall be performed on an as required basis.
  3. Provide the necessary protection of the hoistway entrances and sills, hoistway fixtures, cab interiors and fixtures and car door sills.
  4. Replacement or repair of the aforementioned components, due to abnormal use by others, shall be the responsibility of the Contractor/Owner.
  5. Perform emergency callback service during normal working hours.
  6. Include 24-hour-per-day, 7-day-per-week emergency callback service with response time of sixty minutes or less.
- C. Warranty Maintenance:
1. Upon final acceptance of each device, after Construction Maintenance period (if applicable), subsequent to receiving acceptance (sign-off) from the governing authorities and final acceptance, each device shall be accepted for full operation.
  2. The warranty maintenance period shall begin for each device when all conditions in the above paragraph are met and will continue for the specified period.
    - a. Warranty Maintenance Period may begin at different times for each elevator.
  3. The warranty maintenance program shall include the following:
    - a. Monthly examinations, including adjustments, cleaning and lubrication of equipment.
    - b. 24-hour Emergency Call back service shall be provided at no additional cost to Owner.
    - c. Replacement of components as required, using only components produced by the original manufacturer.
      - 1) Each machine room shall be equipped with a lockable storage cabinet to contain the necessary spare parts.
- D. Maintenance Specification:
1. Upon completion of the Warranty Maintenance period, the Elevator Contractor will provide the personnel to service the vertical transportation equipment.
    - a. Full-Service Maintenance Agreement shall commence upon the completion of the warranty maintenance period for a term of five (5) years:
      - 1) Contractor shall provide a proposal for a full-service agreement which covers the following:
        - a) All required inspections and tests.
        - b) 24-hour emergency call service at no additional cost to Owner.

## PART 2 - PRODUCTS

### 2.1 REFERENCES

- A. Definitions:
1. Terms used are defined in the latest edition of the Safety Code for Elevators and Escalators, ASME A17.1.

- B. American National Standard Institute (ANSI):
  1. A117.1 - Accessible and Usable Buildings and Facilities.
- C. American Society of Mechanical Engineers:
  1. ASME A17.1 - Safety Code for Elevators and Escalators.
  2. ASME A17.2 – Guide for Inspection of Elevators, Escalators, and Moving Walks.
  3. ASME A17.5 – Elevator and Escalator Electrical Equipment.
  4. ASME A17.6 – Standard for Elevator Suspension, Compensation, and Governor Systems.
- D. National Fire Protection Association (NFPA):
  1. NFPA 13 – Installation of Sprinkler Systems.
  2. NFPA 70 – National Electric Code.
  3. NFPA 80 – Fire Doors and Windows.
  4. NFPA 101 – Life Safety Code.
- E. Accessibility:

  2. American National Standard Institute (ANSI):
    - a. A117.1 - Accessible and Usable Buildings and Facilities.
  3. ADAAG – Americans with Disabilities Act Accessibility Guidelines.

## 2.2 MANUFACTURERS

- A. Subject to compliance with requirements, provide products by one of the following:
  1. Controllers:
    - a. KONE Incorporated.
    - b. Schindler Elevator Corporation.
    - c. TK Elevator.
    - d. Otis Elevator
  2. Freight Vertical Bi-Parting Door:
    - a. Courion.
    - b. EMS.
    - c. Peelle.
  3. Fixtures vandal resistant:
  4. Hoist Machines:
    - a. Hollister Whitney.
    - b. Torin.
    - c. Imperial.
  5. Rope Brakes:
    - a. Hollister Whitney.

## 2.3 PERFORMANCE REQUIREMENTS

- A. Car Speed:
  1.  3% of contract speed under any loading condition.
- B. Car Capacity:
  1. Safely lower, stop and hold 125% of rated load.
- C. Car Stopping Zone:
  1.  1/4" under any loading condition.
- D. Car Ride Quality:

1. Acceleration and Deceleration:
    - a. Smooth, constant, and not less than 3.0 feet/second with an initial ramp between 0.5 and 0.75 second.
  2. Sustained Jerk:
    - a. Not more than 6 feet/second or twice the rate of acceleration.
  3. Horizontal and vertical acceleration within car during all riding and door operating conditions.
    - a. Not more than 20mg peak to peak (adjacent peaks).
  4. Measurement Standards:
    - a. Measure and evaluate ride quality consistent with ISO 18738, using low pass cutoff frequency of 10 Hz and A95 peak-to-peak average calculations.
- E. Noise and Vibration Control:
1. Airborne Noise:
    - a. Measured noise level of elevator equipment and its operation shall not exceed 60 dBA inside car under any condition including door operation and car ventilation exhaust blower on its highest speed.
    - b. Limit noise level in the machine room and control space relating to elevator equipment and its operation to no more than 80 dBA.
    - c. All dBA readings to be taken 3'-0" off the floor and 3'-0" from the equipment using the "A" weighted scale.
  2. Vibration Control:
    - a. All elevator equipment shall be mechanically isolated from the building structure and other components to minimize the possibility of objectionable noise and vibrations being transmitted to occupied areas of the building.

## 2.4 ELEVATORS

- A. Geared Freight Elevators Description:
1. Elevator Identification: Car FR 6.
  2. Capacity: 10,000 lbs.
  3. Class of Loading: Class C 3.
  4. Contract Speed: 200 fpm.
  5. Roping: 2:1 Underslung.
  6. Machine: Geared
  7. Machine Location: Offset.
  8. Control System: Operational Control, Collective microprocessor-based: Selective collective
  9. Floors Served, Front: 01, 02, 03, 04.
  10. Openings: Front 4.
  11. Minimum Clear to underside of canopy: 8'-0" High.
  12. Entrance Size: 10'-0" Wide X 8'-0" High.
  13. Entrance Type: Vertical Bi Parting

## 2.5 MATERIALS

- A. Steel:
1. Sheet Steel (Furniture Steel for Exposed Work): Stretcher-leveled, cold-rolled, commercial quality carbon steel, complying with ASTM A366, matte finish.
  2. Sheet Steel (for Unexposed Work): Hot-rolled, commercial quality carbon steel, pickled and oiled, complying with ASTM A568/A568M-03.
  3. Structural Steel Shapes and Plates: ASTM A36.
- B. Stainless-steel:

1. Type 302 or 304 series complying with ASTM A240, with standard tempers and hardness required for fabrication, strength, and durability.
  2. Apply mechanical finish on fabricated work in the locations shown or specified, Federal Standard and NAAMM nomenclature, with texture and reflectivity required to match Architect's sample. Protect with adhesive paper covering.
    - a. No. 4 Satin:
      - 1) Directional polish finish.
      - 2) Graining directions as shown or, if not shown, in longest dimension.
    - b. Textured:
      - 1) .050 inches mean pattern depth with bright directional polish (No. 4 satin finish).
      - 2) 5WL as manufactured by Rigidized Metals.
      - 3) Windsor pattern as manufactured by Rimex Metals.
- C. Aluminum:
1. Extrusions per ASTM B221; sheet and plate per ASTM B209.
  2. Die Cast Aluminum – ASTM B108, Alloy 356.0, T6.
  3. Extruded Aluminum – FS QQ-A 200/8, Alloy 6061, T6.
- D. Paint Finishes:
1. General:
    - a. Clean exposed metal parts and assemblies of oil, grease, scale, and other foreign matter and factory paint one shop coat of standard rust-resistant primer.
    - b. Galvanized metal need not be painted.
  2. Prime Finish:
    - a. Apply one coat of rust-resistant primer followed by a filler coat over uneven surfaces.
    - b. Sand smooth and apply final coat of primer.
  3. All equipment and metal work installed under this contract, which does not have a baked enamel or special architectural finish, and which is exposed in the hoistway, shall be cleaned and painted one field coat of enamel.
  4. All machine room equipment shall be painted upon completion of the installation with the manufacturer's standard machinery enamel.
  5. Elevator designation (number and/or letter) shall be prominently indicated on all machine room and machinery space equipment, top of car crosshead and pit equipment.
- E. Baked Enamel Finish:
1. Prime finish per above.
  2. Unless specified "prime finish" only, apply and bake three additional coats of enamel in the selected solid color.

## 2.6 OPERATION

- A. General:
1. Cars automatically slow down and stop level at floors in response to car and landing calls with stops made in sequence in the established direction of travel, regardless of order in which buttons are pressed.
  2. Landing calls canceled when answered.
  3. Automatic Dispatch Failure:
    - a. Provide auxiliary dispatch system to automatically dispatch elevators in the event of failure of the primary control system.
  4. Hall Call Button Failure:

- a. Should failure of hall call button system occur, initiate operation providing predetermined service to all landings; elevators to respond normally from car call buttons.
  5. Automatic Leveling:
    - a. An automatic two-way leveling device shall be provided, designed to govern the leveling of the car to within 1/8" above or below the landing sill. The leveling operation shall be effective to avoid overtravel, as well as undertravel of the car and maintain the leveling accuracy regardless of the load in the car, direction of travel, rope slippage or stretch.
  6. Door Control:
    - a. A car without registered car calls arriving at a floor where both up and down hall calls are registered, responds to the call in the direction of car travel. If no car call is registered for further travel in that direction, lantern immediately indicates changed direction without closing and reopening doors.
    - b. Direction lantern to remain illuminated until doors are fully closed.
  7. Coincident Calls:
    - a. The dispatching system shall be designed with a 20 second parameter, whereby an elevator with a car call will receive priority to answer a corresponding corridor call if it can do so within 20 seconds. If that elevator cannot answer the call within the prescribed time, the first available car shall be assigned.
  8. Independent Service:
    - a. Provide controls for operation of each car from its pushbuttons only.
    - b. Close doors by constant pressure on desired destination floor button or door close button.
    - c. Open doors automatically upon arrival at selected floor.
  9. Load Weighing:
    - a. General:
      - 1) Provide cars with adjustable cable tension monitoring load weighing device.
      - 2) Devices must be self-calibrating for the time-dependent effects of compression in any resilient materials in the assemblies, transducers, etc.
      - 3) Control system to provide dispatching at main floor in advance of normal intervals when car fills to capacity.
      - 4) Provide hall call by-pass when the car is filled to preset percentage of rated capacity and traveling in down direction.
      - 5) System shall be provided with field adjustable range, 10 to 100%.
      - 6) Audible overload signaling device inside elevator cab shall be activated upon load weighing device sensing carload has reached or exceeded a predetermined percentage of capacity.
      - 7) Elevator shall not be capable of closing doors and running when Overload signaling device is active.
- B. Simplex Microprocessor, Selective Collective Operation:
1. General:
    - a. Arrange for Simplex Selective Collective automatic operation.
    - b. Elevators shall operate via car and landing buttons.
  2. Operation:
    - a. Momentary pressure of one or more car or landing buttons shall activate the elevator.
    - b. Momentary pressure of calls, other than calls for landing at which car is standing, will start car, and cause car to stop at first landing for which a call is registered corresponding to direction in which car is traveling.
    - c. Stops made in order in which landings are reached, irrespective of sequence in which calls are registered.
  3. Parked Car (No Demand):

- a. Elevator may remain at landing of last assignment (if no further demand) with doors closed, for a predetermined amount of time (programmable for any amount of time) if feature is enabled.
    - b. If this feature is enabled, upon expiration of time, the elevator shall return to the main egress landing with the doors closed.
  4. If this feature is disabled, if no further demand, the elevator shall remain at landing of last assignment with the doors closed until a hall call is registered.
- C. Firefighters' Service:
  1. Provide equipment and operation in accordance with code requirements.
- D. Interface to Building Management Systems:
  1. The elevator monitoring system shall be capable of interfacing and exchanging data with a variety of third party building management systems including Siemens, Landis AND Staefa, Johnson Controls, SCADA.
  2. Information shall be exchanged by Modbus protocol, open protocol or other suitable methods as required.
- E. Motion Control:
  1. Microprocessor-based AC variable-voltage, variable frequency with digitally encoded closed-loop velocity feedback suitable for operation specified and capable of providing smooth, comfortable car acceleration, retardation, and dynamic braking.
  2. Limit the difference in car speed between full load and no load to not more than  $\pm 3\%$  of the contract speed.
- F. Standby Lighting, Communication, and Alarm:
  1. Car mounted battery unit with solid-state charger to operate alarm bell, car emergency lighting, and voice communication system.
  2. Car lighting and communication shall be provided with a minimum of 4 hours of operation on back-up power during a loss of normal power, and a minimum of 1 hour of operation for car-mounted alarm and any remote alarm mounted at the designated level.
  3. Battery to be rechargeable with minimum five-year life expectancy.
  4. Provide constant pressure test button in service compartment of car operating panel.
  5. Provide lighting integral with portion of normal car lighting system.
- G. Power Door Operation:
  1. Open door and gate automatically when car arrives at a floor.
  2. Control door and gate closing by using constant-pressure buttons on car and at each floor.
  3. Provide passenger sequence operation:
    - a. After an adjustable time period between, 30 to 300 seconds, provide audible and visible warning signal and automatically close door and gate.
    - b. Provide dual reversing safety device for car gate.
- H. Attendant Operation:
  1. Include provision for attendant control of door closing, car direction, and calls answered.
  2. Provide two-position key switch in service cabinet to activate Attendant service operation.
  3. Electronic buzzer shall be installed to provide audible signal on registration of hall calls.
  4. Upon activation of Attendant service, DOOR CLOSE, UP, DOWN and NON-STOP buttons become operational for use by Attendant in car. Constant pressure of DOOR CLOSE, UP or DOWN button causes doors to close and car to proceed in direction corresponding to button pushed or assigned call; car to answer car and hall calls in order in which they are reached.

5. Where front and rear entrances are provided, provisions shall be made to allow the Operator to selectively close either the front or rear door.
  6. If direction button or DOOR CLOSE button is released prior to full closure of doors, doors reopen automatically.
  7. Change in direction of travel is accomplished by pushing opposite direction button.
  8. Constant pressure of NON-STOP button until the elevator is in motion shall cause car to bypass registered hall calls until released; hall calls remain registered until answered.
  9. Car calls canceled by pushing UP and DOWN buttons simultaneously or by pushing UP or DOWN button to change direction.
- I. Standby Power Operation:
1. Upon loss of normal power, adequate standby power will be supplied via building electrical feeders to start and run all cars simultaneously at contract car speed and capacity.
  2. Automatically return cars, nonstop to designated floor, open doors for approximately 3.0 seconds, close doors, and park car.
  3. During return operation, car and hall call pushbuttons shall be inoperative.
  4. As cars park, system shall immediately select the next car within the sequence until all cars have returned to the designated floor.
  5. If a car fails to start or return within 30 seconds, system shall automatically select the next car in the sequence to return.
  6. Provide separate group selection key switches in firefighters' control panel.
    - a. Switches shall be labeled "STANDBY POWER OVERRIDE" with positions marked "AUTO" and appropriate car numbers controlled by each respective switch.
    - b. Key shall be keyed differently from the key utilized for firefighters' Phase I and II key switch. Key shall be removable in "AUTO" position only.
    - c. Switch shall override automatic return and automatic selection functions and cause the manually selected car to operate.
    - d. Manual selection shall cause car to start and proceed to designated floor and open and close its doors before standby power is manually transferred to next selected car.
    - e. Provide "STANDBY POWER" indicator lights, one per car, in firefighters' control panel.
    - f. Indicator light illuminates when corresponding car is selected, automatically or manually, to operate on standby power.
  7. Successive Starting: When normal power is restored or there has been a power interruption, individual cars in each bank shall restart at five-second intervals.
- J. Card/Proximity Reader Security System:
1. Provide provisions inside car for reader unit.
  2. Mount reader unit as directed by Architect and make cross connects to card reader terminal interface and relays in machine room.
  3. Provide filler plate to match card slot size or proximity reader size and car return panel finish, including direction of graining, where card slot or proximity reader cutout is not initially utilized.
  4. Elevator control systems shall provide output signal of selected floor to facilitate system tracking of floor access.

## 2.7 MACHINE ROOM EQUIPMENT

- A. Arrange equipment in spaces shown on drawings.
- B. Geared Traction Hoist Machine and Motor:

1. Single worm geared or helical geared traction type with AC induction or P.M.S.M. ACV $\square$ F motor, brakes, gear, drive shaft, deflector sheave, and gear case mounted in proper alignment on an isolated bedplate.
  2. Provide bedplate blocking to elevate secondary or deflector sheave above machine room floor.
  3. Provide hoist machine mounted direct drive, digital, closed-loop velocity encoder.
  4. Provide hoist machine drip pans to collect lubricant seepage.
  5. Provide machine bedplate mounted deflector sheave A-frame or supporting steel beams and fastenings to mount deflector sheaves to building structure.
    - a. Provide 16-gauge removable sound insulated sheet metal closures in hoistway wall opening around machine.
  6. Provide machine with disc brake and secondary emergency brake:
    - a. Provide means to prevent ascending car over speed and unintended car movement.
    - b. Mount emergency brake on geared machine frame bed or suitable structural steel supports.
    - c. Provide drawing showing supports stamped by a Professional Engineer verifying the adequacy of the support provided.
    - d. Acceptable emergency brake devices:
      - 1) BODE Rope Brake.
      - 2) Hollister Whitney Rope Gripper.
      - 3) Draka.
- C. Solid State Power Conversion and Regulation Unit:
1. Provide solid-state, alternating current, variable voltage, variable frequency (ACV $\square$ F), IGBT converter/inverter regenerative drive.
  2. Design unit to limit current, suppress noise, and prevent transient voltage feedback into building power supply:
    - a. Provide internal heat sink cooling fans for the power drive portion of the converter panels.
    - b. Conform to IEEE standards 519-2014 for line harmonics and switching noise.
  3. Mechanically isolate unit to minimize noise and vibration transmission.
  4. Provide isolation transformers, filter networks, and choke inductors.
  5. Suppress solid-state converter noises, radio frequency interference, and eliminate regenerative transients induced into the mainline feeders or the building standby power generator.
  6. Supplemental direct-current power for the operation of hoist machine brake, door operator, dispatch processor, signal fixtures, etc., from separate static power supply.
  7. ACV $\square$ F Drives shall be regenerative and utilize IGBT converter/inverter and dynamic braking during overhauling condition.
- D. Encoder:
1. Direct drive, solid-state, digital type. Update car position at each floor and automatically restore after power loss.
- E. Controller:
1. UL/CSA labeled.
  2. Compartment:
    - a. Securely mount all assemblies, power supplies, chassis switches, relays, etc., on a substantial, self-supporting steel frame.
    - b. Completely enclose equipment with covers.
    - c. Provide means to prevent overheating.
  3. Relay Design:

- a. Magnet operated with contacts of design and material to insure maximum conductivity, long life, and reliable operation without overheating or excessive wear.
- b. Provide wiping action and means to prevent sticking due to fusion.
- c. Contacts carrying high inductive currents shall be provided with arc deflectors or suppressors.
4. Microprocessor Hardware:
  - a. Provide built-in noise suppression devices that provide a high level of noise immunity on all solid-state hardware and devices.
  - b. Provide power supplies with noise suppression devices.
  - c. Isolate inputs from external devices (such as pushbuttons) with opto-isolation modules.
  - d. Design control circuits with one leg of power supply grounded.
  - e. Safety circuits shall not be affected by accidental grounding of any part of the system.
  - f. System shall automatically restart when power is restored.
  - g. System memory shall be retained in the event of power failure or disturbance.
  - h. Equipment shall be provided with Electro Magnetic Interference (EMI) shielding within FCC guidelines.
5. Wiring:
  - a. CSA labeled copper for factory wiring.
  - b. Neatly route all wiring interconnections and securely attach wiring connections to studs or terminals.
  - c. Provide labels for all extra or spare wires, neatly organized at base of controller cabinet.
6. Diagnostics:
  - a. Provide an onboard monitor or screen, either inside the controller or in a stand-alone PC station, to display an easily understood format.
  - b. Upon command, the current operating parameters, individual car status, floor positions or other selected operational features will be displayed.
  - c. A display function shall be provided to reference a minimum of twenty (20) previous errors (malfunctions), which will be transmitted to the group dispatcher data log for statistical purposes or selected hard copy printouts.
    - 1) A color printer shall be provided on site.
  - d. Diagnostic display shall be programmed for monitoring of elevator motion, velocity, door operation parameters and timing functions.
    - 1) Provisions shall be made to allow printing of this information at Owner's request.
  - e. Non-volatile memory shall be used to store group operation data with provisions for data logging and hard copy reporting.
  - f. A telephone data link provision shall be incorporated in the basic dispatching control system.
    - 1) At the Owner's request, this provision may be employed for traffic analysis, hard copy computation and/or remote monitoring of status conditions utilizing an isolated PC and compatible printer for reports or graphs.
    - 2) All reports shall be time and date stamped to confirm reporting period.
  - g. Monitor shall employ color video displays for the following information:
    - 1) Display screen (group operations statistics).
    - 2) Monitoring screen (diagnostics, system status).
    - 3) Performance screen (traffic analysis).
  - h. Features required regarding remote and additional location monitoring, as indicated in other applicable sections, apply.
7. Permanently mark components (relays, fuses, PC boards, etc.) with symbols shown on wiring diagrams.

8. Provide control panel compliant with UL 508A SB.SCCR of 5000A required.
- F. Electrical Wiring and Wiring Connections:
1. Auxiliary Disconnect:
    - a. Provide controller or machine mounted auxiliary, lockable "open" disconnect.
  2. Conductors and Connections:
    - a. Copper throughout with individual wires coded and connections on identified studs or terminal blocks.
    - b. Use no splices or similar connections in wiring except at terminal blocks, control compartments, or junction boxes.
  3. Conduit:
    - a. Galvanized steel conduit, EMT, or duct.
    - b. Flexible conduit length not to exceed 3'-0".
  4. Traveling Cables:
    - a. Tag spares in machine room.
    - b. Provide cables from controller to car top.
  5. Auxiliary Wiring:
    - a. Provide machine room demarcation junction boxes for the fire alarm initiating devices, emergency two-way communication system, firefighters' phone jack, paging speaker, CCTV, security system and card reader interface terminals and relays, announcement speaker and/or background music.
- G. Sleeves and Guards:
1. Provide 4" steel angle guards around cable or duct slots through floor slabs or grating.
  2. Provide rope and smoke guards for sheaves, cables, and cable slots in machine room offset machinery levels.
  3. Configure guards to minimize free area around cables.
- H. Machine and Equipment Support Beams:
1. Provide structural steel beams required for direct support of and attachment to building structure of hoist machine, deflector sheaves, overhead sheaves, governor, and hoist rope dead-end hitch assemblies.
  2. Provide bearing plates, anchors, shelf angles, blocking, embedment, etc., for support and fastening of machine beams or equipment to the building structure.
  3. Isolate machine and overhead sheave beams to prevent noise and vibration transmission to building structure.
  4. Provide hold-down bolts for offset hoist machines located beside or under hoistway where concrete hold-down pad is provided.
- I. Structural Floor:
1. Provide template for equipment layout.
- J. Governor:
1. Centrifugal-type, car driven machine room mounted with pull-through jaws and bi-directional shutdown switches.
  2. Provide required bracketing and supports for attachment to building structure.

## 2.8 HOISTWAY EQUIPMENT

- A. Rails and Guides:
1. Rails:
    - a. Continuous steel angles.
    - b. Shall be securely fastened to the building structure and the entrance frame, at intervals, throughout their entire length.

2. Guides:
  - a. Provide four (4) guide shoes per panel.
- B. Sheaves:
  1. Machined grooves and sealed bearings.
  2. Provide mounting to machine beams, machine bedplate, car and counterweight structural members, or building structure.
- C. Counterweight:
  1. Steel frame with metal filler weights.
- D. Counterweight Guide Shoes:
  1. Solid guides with oilless inserts.
- E. Governor Rope and Encoder Tape Tensioning Sheaves:
  1. Mount sheaves and support frame on pit floor or guide rail.
  2. Provide frame with guides or pivot point to enable free vertical movement and proper tension of rope and tape.
- F. Suspension Means:
  1. 8 x 19 or 8 x 25 Seale construction, traction steel type:
    - a. Fasten with staggered length, adjustable, spring isolated wedge type shackles.
  2. Approved governor rope.
- G. Terminal Stopping:
  1. Provide normal and final devices.
- H. Electrical Wiring and Wiring Connections:
  1. Conductors and Connections:
    - a. Copper throughout with individual wires coded and connections on identified studs or terminal blocks.
    - b. Use no splices or similar connections in wiring except at terminal blocks, control compartments, or junction boxes.
    - c. Provide 20% spare conductors for each wire type.
    - d. Run spare wires from car connection points to individual elevator controllers in the machine room.
  2. Conduit:
    - a. Galvanized steel conduit, EMT, or duct.
    - b. Flexible conduit between isolated equipment, length not to exceed 3'-0".
    - c. Flexible heavy-duty service cord may be used between fixed car wiring and car door switches for door protective devices.
    - d. Coordinate conduit from the closest hoistway of each elevator or group or single elevator to the firefighters' control panel. Provide wiring.
  3. Traveling Cables:
    - a. Flame and moisture-resistant outer cover.
    - b. Prevent traveling cable from rubbing or chafing against hoistway or equipment within hoistway.
    - c. Provide the following composition at a minimum, which shall not be considered spares:
      - 1) Five pair of shielded 20-gauge wire for card reader.
      - 2) Two pair of shielded 18-gauge wire for CCTV, from car controller to car top junction box, plus 3'-0" excess loop at both ends.
      - 3) Two pair of 18-gauge wire for CCTV power.

- d. Provide eight pair of spare shielded communication wires in addition to those required to connect specified items.
- e. Tag spares in machine room. Provide cables from controller to car top.
- f. Support traveling cable by their steel supporting member by suspending from supports by means that automatically tighten around the cable when tension is increased.
- 4. Auxiliary Wiring:
  - a. Provide conduit, wiring and connections for systems defined within.
- I. Entrance Equipment:
  - 1. Continuous steel door guide tracks consisting of angles or formed steel tracks fastened to hoistway door jamb.
  - 2. Door Guide Shoes:
    - a. Machined iron door guide shoes.
    - b. Four shoes per door panel, with not less than 2" lateral contact per shoe.
  - 3. Door Interlocks:
    - a. Operable door locks without retiring cam.
  - 4. Provide hoistway door unlocking device with pull chain under hinged, lockable cover with stainless-steel No. 4 finish at all floors.
- J. Floor Numbers:
  - 1. Stencil paint 4" high floor designations in contrasting color on inside face of hoistway doors and hoistway fascia visible from within car.

## 2.9 HOISTWAY ENTRANCES

- A. Entrance Assemblies:
  - 1. Complete entrances bearing fire labels from a certified testing laboratory approved by authority having jurisdiction.
  - 2. Provide entrance assemblies bearing 1-1/2hr UL label.
  - 3. Paint all exposed metal ferrous metal black.
- B. Frames:
  - 1. 14-gauge hollow metal at all floors.
  - 2. Provide Arabic floor designation/Tactile marking plates:
    - a. Centered at 60" above finished floor.
    - b. Located on both side jambs of all entrances.
    - c. Minimum 4" in height.
    - d. Tactile marking indications shall be below Arabic floor designation.
    - e. Permanently fastened.
  - 3. Provide car identification label:
    - a. Mounted directly below floor designation/Tactile marking plates.
    - b. Located on both side jambs at the following levels:
      - 1) Designated Level.
      - 2) Alternate Level.
      - 3) Level where means necessary for tests is provided.
    - c. Finish and design to match floor designation/Tactile marking plates.
    - d. Permanently fastened.
  - 4. Provide plates at main egress landing with "Star" designation.
  - 5. For designated emergency car, provide "Star of Life" cast designation plates at height of 78"-84" above finished floor on both side jambs at all floors.
- C. Vertical Bi-Parting Freight Door Panels:
  - 1. 12-gauge formed steel plates welded into frame angles with enamel finish.

2. Provide with safety astragals, vision panels, unlocking device, and truckable sills, and load transfer angles.
3. Provide telescoping upper section or pass-type doors as required.
4. Provide stainless-steel finish.

D. Vertical Bi-Parting Door Cover Frames:

1. Hollow metal, bolted, fabricated from not less than 14-gauge material to form a one-piece unit covering steel channel subframes.

E. Hoistway Access:

1. Hoistway Door Unlocking Device:
  - a. Provide unlocking device with locking escutcheon in door panel at all floors, with finish to match adjacent surface.
2. Hoistway Access Switches:
  - a. Mount in wall at top floor.
  - b. Provide switch with faceplate.

## 2.10 PIT EQUIPMENT

A. Buffers:

1. Provide Spring type with blocking and support channels.

B. Pit Access:

1. Hoistway Access Key Switch:
  - a. Provide key switch at lowest terminal landing.
  - b. Mount in wall.
  - c. Provide switch with faceplate.
2. Provide pit stop switch(es).
3. Provide pit access door switch configured to effectively remove power to elevators in the event of pit access door operation.

C. Counterweight Guard:

1. Metal guard in pit in front of counterweight where no compensation is provided or where there is no space greater than 20 inches between the compensation means, suspension means, counterweight rails, or guard(s).

D. Compensation:

1. Encapsulated chain with pit guide assembly.
2. Pit mounted guide assembly shall:
  - a. Provide quiet, effective restraint without excessive wear of components.
  - b. Inhibit rubbing or chafing against hoistway or equipment within hoistway or pit.
3. Application must meet performance/noise level requirement of specification.

## 2.11 CAR EQUIPMENT

A. Frame:

1. Welded or bolted or formed steel channel construction to meet load classification specified.

B. Safety Device:

1. Type "B," flexible guide clamp.

C. Platform:

1. Design and construct to accommodate load classification requirements:

- a. Provide Class C3 construction for freight elevator.
2. The car platform shall consist of a steel frame with necessary steel stringers, all securely welded together.
3. Work Light Fixtures and AC Receptacles:
  - a. Provide permanent mounted work light fixtures below platform, complete with proper lamp guards.
- D. Platform Guard:
  1. Minimum 14-gauge steel, reinforced and braced to car platform Manufacturer's standard finish guard meeting 48" requirement when not at lowest terminal landing.
- E. Cartop Guard Rail:
  1. Provide a railing system provided on the outside perimeter of the car top on all sides where the horizontal distance between the edges of the car top and the adjacent hoistway enclosure exceeds 12 in.
- F. Freight Guide Shoes:
  1. Solid guides with oil less inserts.
- G. Cab Steadying Plates:
  1. Provide and install top of car steadying plates.
  2. Emphasis shall be placed on proper tension to car styles allowing minimal lateral movement of the cab.
  3. Steadying plates shall be isolated using non-metallic guides or rollers.
- H. Power-Operated Freight Door and Gate:
  1. Provide means to open doors and gate from inside of car in the event of power failure.
  2. Closing Speed:
    - a. Doors: Minimum of 0.8 f.p.s.; maximum of 1.0 f.p.s.
    - b. Gates: Minimum of 1.6 f.p.s.; maximum of 2.0 f.p.s.
  3. Provide emergency manual operation without necessity of disconnecting mechanical operator equipment.
  4. Provide an adjustable timer to hold doors open up to five minutes.
  5. Door closing initiated upon expiration of timer, activation of door close button or activation of a floor button within car.
  6. The door and gate operators shall be synchronized as follows:
    - a. Door and gate shall accelerate and decelerate smoothly
    - b. Provide means for door checking in both opening and closing motions electrically or by other suitable means.
    - c. Car gate shall close completely before the hoistway doors begin to close.
    - d. Car gate shall not open until the hoistway doors are completely open.
  7. Provide automatic closing of car doors after dwell time expires.
    - a. A loud audible signal and highly visible signal shall actuate not less than 5.0 seconds prior to initiation of door sequence.
    - b. Dwell time shall be easily adjustable between 20.0 and 300.0 second.
    - c. Pressing the Door Close button shall cancel dwell time.
    - d. Pressing the Door Open button shall restart the dwell time.
    - e. Dwell time shall initially be set at 60.0 seconds.
  8. Door operation at landing initiated by operation of elevator call button for that floor.
  9. Car gate includes protective edge to stop motion if gate is interrupted in closing.
  10. Provide an adjustable timer to hold doors open, up to five minutes.
  11. Door closing initiated upon expiration of timer, activation of door close button or activation of a floor button within car.

- I. Car Gate:
  - 1. Power-operated, vertical rise, single section minimum 6'-0" high, constructed of 12-gauge welded wire mesh welded into frame angles.
  - 2. Mount car gate lift chains on hoistway side of car gate.
  - 3. Include reversing safety edge device on gate.
  
- J. Infrared Reopening Device:
  - 1. Black, fully enclosed device with full screen infrared matrix or multiple beams extending vertically inside or along edge of each car gate guide track to the full height of opening.
  - 2. Obstruction of beams during gate closing shall cause immediate re-opening.
  
- K. Car Operating Panel:
  - 1. Freight:
    - a. One car operating panel with faceplates:
      - 1) Consisting of a metal box containing the vandal resistant operating fixtures, mounted behind the car stationary side return panel.
      - 2) Faceplates shall be hinged and constructed of No. 4 satin finish stainless-steel.
    - b. Suitably identify floor buttons, alarm button, door open button, door close button and emergency push-to-call button with flat stainless tactile symbols rear mounted.
    - c. Provide "door open" button to stop and reopen doors or hold doors in open position.
    - d. Provide "door close" button to activate door close cycle.
      - 1) Cycle shall not begin until normal door dwell time for a car or hall call has expired, except firefighters' operation.
    - e. Pushbuttons:
      - 1) Provide minimum 3/4" diameter raised floor pushbuttons which illuminate to indicate call registration.
    - f. Locate operating controls no higher than 48" above the car floor; no lower than 35" for emergency push-to-call button and alarm button.
    - g. Locked Firefighters Operation Panel:
      - 1) For fire officer use and use of car on independent service only.
      - 2) Openable by the same key which operates the Fire Operation switch.
      - 3) Including the following features:
        - a) Phase II fire access switch.
        - b) Firefighters' visual indication.
        - c) Call cancel button.
        - d) Stop switch, manually operated.
        - e) Door open button.
        - f) Door close button.
  - 2. Service Compartment (all cars):
    - a. Provide lockable service compartment with recessed flush door.
    - b. Door material and finish shall match car return panel or car operating panel faceplate.
    - c. Include the following controls in lockable service cabinet with function and operating positions identified by permanent signage or engraved legend:
      - 1) Access switch.
      - 2) Light switch.
      - 3) 4-position Exhaust blower switch.
      - 4) Independent service switch.
      - 5) Constant pressure test button for battery pack emergency lighting.
      - 6) 120-volt, AC, GFCI protected electrical convenience duplex outlet.
      - 7) Card reader override switch.
      - 8) Switch to select either floor voice annunciation, floor passing tone, or chime.

- 9) Attendant operation switch.
- 10) Keyed stop switch.
- 3. Provide black paint filled (except as noted), engraved, or approved etched signage as follows with approved size and font:
  - a. Phase II firefighters' operating instructions on inside face of firefighters' compartment door.
  - b. Engrave filled red firefighters' operation on outside face of compartment door.
  - c. Building identification car number on main car operating panel.
  - d. "No Smoking" on main car operating panel.
  - e. Car capacity in pounds on service compartment door.
  - f. Loading classification and description on service compartment door.
- L. Car Top Control Station:
  - 1. Mount to provide safe access and utilization while standing on car top.
  - 2. Operating device shall contain Up and Down direction buttons, a Run button, an Inspection/Automatic switch and Emergency Stop switch.
  - 3. Operating device shall contain an audible and visible indicator that fire recall has been initiated.
  - 4. This station shall be fixed to the car crosshead or may be portable provided the extension cord and housing is permanently attached to the car crosshead.
  - 5. The car will be operated by constant pressure on the appropriate directional button and the Run button simultaneously.
  - 6. Normal operating devices will be inoperative while this device is in use.
- M. Emergency Audible Signal:
  - 1. Provide on top of each elevator.
  - 2. Activation of Alarm Button or Emergency Stop switch will cause Emergency Audible Signal.
  - 3. Provide battery back-up system to provide 1hr power in the event of loss of normal power.
- N. Work Light and Duplex Plug Receptacle:
  - 1. GFCI protected outlet at top and bottom of car.
  - 2. Include on/off switch and lamp guard.
  - 3. Provide additional GFCI protected outlet on car top for installation of car CCTV.

## 2.12 CAR ENCLOSURE

- A. Freight Elevator: Provide complete as specified herein:
  - 1. Shell:
    - a. Reinforced 10-gauge furniture steel formed panels no more than 20" wide with light-proof joints.
    - b. Clad panels with stainless-steel textured finish as specified in Item 2.3.
    - c. Reinforce and brace panels to provide rigid structure and securely fasten to car sling and platform.
    - d. Provide recess in car side wall for recessed mounting of car operating panel.
  - 2. Finish Floor Covering:
    - a. Freight Cars 3/8" thick steel friction coated plate. Design for ease of replacement from within cab.
  - 3. Canopy:
    - a. Reinforced 12-gauge furniture steel formed panels no more than 20" wide with light-proof joints. Interior finish white reflective baked enamel.
    - b. Provide hinged emergency exit.
  - 4. Lighting:

- a. Minimum eight recessed fixtures flush mounted in canopy with expanded metal protective diffuser and steel guard over fixtures on car top.
- b. Provide protective fluorescent tube covers.
- 5. Bumper Rails:
  - a. Two rows of 2" x 12" oak or maple bumpers mounted on both sides and rear of the car.
  - b. Locate bottom rail at floor level and top rail at 36" above the car floor.
  - c. Bolt rails through car walls with countersunk bolt, backing plates and captive nuts on exterior of wall panel sections.
- 6. Ventilation:
  - a. Morrison Products, Inc. three-speed model AA No. 06-01048 exhaust blower mounted to car canopy on isolated rubber grommets.

### 2.13 HALL CONTROL STATIONS

- A. Pushbuttons:
  - 1. Provide one pushbutton riser.
  - 2. Provide flush mounted faceplates.
  - 3. Include pushbuttons for each direction of travel that illuminate to indicate call registration.
  - 4. Include approved engraved message and pictorial representation prohibiting use of elevator during fire or other emergency as part of faceplate.
  - 5. Pushbutton design shall match car operating panel pushbuttons.
  - 6. Provide vandal resistant pushbutton and light assemblies.
  - 7. Provide LED illumination.
  - 8. Provide Phase I Fire Service key switch, engraved operating instructions and illuminating jewel.
  - 9. Provide communication check failure indication and silence key switch.
  - 10. Provide illuminating jewels indicating standby power status.
  - 11. Incorporate all items required by Code at the primary egress level into a single hall fixture.
- B. Door Control Buttons:
  - 1. Include vandal resistant "door open," "door close," and "stop" buttons for control of power operated vertical bi-parting doors at each landing call button fixture.
  - 2. Provide buttons integral with hall control station.
  - 3. Pushbutton design shall match car operating panel pushbuttons.

### 2.14 SIGNALS

- A. Car Direction Lantern:
  - 1. Provide flush-mounted car lantern in all car entrance columns.
  - 2. Illuminate up or down LED lights and sound tone once for up and twice for down direction.
  - 3. Illuminate light until the car doors start to close.
  - 4. Sound level shall be adjustable from 20-80 dBA measured at 5'-0" in front of hall control station and 3'-0" off floor.
  - 5. Car direction lenses shall be arrow shaped with faceplates.
  - 6. Lenses shall be minimum 2" in their smallest dimension.
  - 7. Provide vandal resistant lantern and light assemblies consisting of series of dots or lines for maximum visibility.
- B. Hall Position Indicator:
  - 1. Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 2" high to indicate floor served and direction of car travel.

2. Mount integral with hall station at primary egress floor.
- C. Car Position Indicator:
1. Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 2" high to indicate floor served and direction of car travel.
  2. Locate fixture in car operating panel.
  3. When a car leaves or passes a floor, illuminate indication representing position of car in hoistway.
  4. Illuminate proper direction arrow to indicate direction of travel.
- D. Fixture Faceplate Material and Finish:
1. Satin finish stainless-steel, all fixtures.
  2. Tamper resistant fasteners for all fastenings exposed to the public.
- E. Floor Passing Tone:
1. Provide an audible tone of no less than 20 decibels and frequency of no higher than 1500 Hz, to sound as the car passes or stops at a floor served.

## 2.15 COMMUNICATION

- A. Car Communication System:
1. Hands-Free Phone System:
    - a. Two-way communication instrument in car with automatic dialing, tracking, and recall features, with shielded wiring to car controller in machine room.
    - b. Provide dialer with automatic rollover capability with minimum two numbers:
      - 1) Actuate two-way communication via "Help" button.
      - 2) Adjacent light jewel shall illuminate and flash when call is acknowledged.
      - 3) Button shall match car operating panel pushbutton design.
      - 4) Provide "Help" button tactile symbol, engraved signage, and Tactile marking adjacent to button mounted integral with car front return panel.
  2. Emergency Personnel Communication:
    - a. Communication system shall be provided allowing emergency personnel to establish communications with each elevator individually.
    - b. Emergency Personnel Communication shall override any existing connection outside of building.
    - c. Adjacent light jewel shall illuminate and flash when call is acknowledged.
    - d. Provide operating instructions.
    - e. On the same car operating panel as the phone push button, provide capability to communicate with and obtain responses from passengers.
    - f. Provide display video capability for entrapment assessment.
  3. Communication for deaf, hearing and speech impaired:
    - a. On the same car operating panel as the phone push button, provide capability to communicate with and obtain responses from passengers, including those passengers who cannot communicate verbally or hear.

## 2.16 FIREFIGHTERS' CONTROL PANEL

- A. Firefighters' Control Panel:
1. Locate in building fire control room or as directed by Contractor.
  2. Fixture faceplate, stainless-steel, satin finish, including the following features:
    - a. Car position and direction indicator, digital-readout or LCD flat screen color monitor.
      - 1) Identify each position indicator with car number and group identification.
    - b. Indicator showing operating status of car.

- c. Manual car standby power selection switches and power status indicators.
    - d. Two-position firefighters' emergency return switches and indicators with engraved instructions filled red.
  3. Where applicable, identify all indicators and manual switches with appropriate engraving.
  4. Provide wiring to control panel.
    - a. Coordinate size and location of conduit with Contractor.
- B. Firefighters' Key Box:
  1. Flush-mounted box with lockable hinged cover.
  2. Engrave instructions for use on cover per Local Fire Authority requirements.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Prior to beginning installation of equipment examine hoistway and machine room areas.
- B. Verify no irregularities exist that affect execution of work specified.
- C. Verify electrical power location and characteristics in coordination with equipment requirements.
- D. Do not proceed with installation until work in place conforms to project requirements.

#### **3.2 INSTALLATION**

- A. Install all equipment in accordance with Contractor's instructions, referenced codes, specification, and approved submittals.
- B. Install machine room equipment with clearances in accordance with referenced codes and specification.
- C. Install all equipment so it may be easily removed for maintenance and repair.
- D. Provide any required hoisting/safety beams.
- E. Install all equipment to afford maximum accessibility, safety, and continuity of operation.
- F. Remove oil, grease, scale, and other foreign matter from the following equipment and apply one coat of field-applied machinery enamel.
  1. All exposed equipment and metal work installed as part of this work which does not have architectural finish.
  2. Machine room equipment, hoistway equipment including guide rails, guide rail brackets, and pit equipment.
  3. Neatly touch up damaged factory-painted surfaces with original paint color. Protect machine-finish surfaces against corrosion.
- G. Fill hoistway door frames, back boxes for hallway stations and signal devices, and sills.
- H. Clean all architectural finishes and replace or restore any surfaces damaged during construction to like new condition.

#### **3.3 FIELD QUALITY CONTROL**

- A. Acceptance Testing:

1. On completion of elevator installation and before permitting elevator use (either temporary or permanent), perform acceptance tests as required and recommended by ASME A17.1/CSA B44 and by governing regulations and agencies.
- B. Advise Contractor, Architect, and authorities having jurisdiction in advance of dates and times that tests are to be performed on elevators.
- C. Independent Testing by Owner's Consultant.

### **3.4 CONSTRUCTION TOLERANCES**

- A. Install rails plumb and align vertically with tolerance of 1/16" in 100'-0".
  1. Secure joints without gaps and file any irregularities to a smooth surface.

### **3.5 ADJUSTING**

- A. Static balance car to equalize pressure of guide shoes on guide rails.
  1. Dynamically balance car and counterweight.
- B. Lubricate all equipment in accordance with Contractor's instructions.
- C. Adjust motors, power conversion units, brakes, controllers, leveling switches, limit switches, stopping switches, door operators, interlocks, and safety devices to achieve specified performance levels.

### **3.6 CLEANING**

- A. Keep work areas orderly and free from debris during progress of project.
- B. Remove packaging materials on a daily basis.
- C. Remove all loose materials and filings resulting from work.
- D. Clean machine room equipment and floor.
- E. Clean hoistways, car, car enclosure, entrances, operating and signal fixtures.
- F. Clean pit equipment and floor.

### **3.7 DEMONSTRATION**

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to operate all aspects of elevators while in normal operation.
- B. Check operation of each elevator with Owner's personnel present before date of Substantial Completion and again not more than one month before end of warranty period.
  1. Determine that operation systems and devices are functioning properly.

### **3.8 PROTECTION**

- A. Temporary Use: Comply with the following requirements for each elevator used for construction purposes:

1. Provide car with temporary enclosure, either within finished car or in place of finished car, to protect finishes from damage.
2. Provide strippable protective film on entrance and car doors and frames.
3. Provide padded wood bumpers on entrance door frames covering jambs and frame faces.
4. Provide other protective coverings, barriers, devices, signs, and procedures as needed to protect elevator and elevator equipment.
5. Do not load elevators beyond their rated weight capacity.
6. Engage elevator Installer to provide full maintenance service.
  - a. Include preventive maintenance, repair, or replacement of worn or defective components, lubrication, cleanup, and adjustment as necessary for proper elevator operation at rated speed and capacity.
  - b. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
7. Engage Elevator Installer to restore damaged work, if any, so no evidence remains of correction.
  - a. Return items which cannot be refinished in the field to the shop, make required repairs, and refinish entire unit, or provide new units as required.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 14 31 00 - ESCALATORS****PART 1 – GENERAL****1.1 SUMMARY**

- A. Scope Includes: Three (3) Escalators as follows:
1. Step Width:
    - a) Escalators: ESC 1-3: 40" Step
    - b) Balustrade: Escalators 1-3: Glass.

**1.2 ACTION SUBMITTALS**

- A. Product Data:
1. Provide complete product data including:
    - a) Duty type.
    - b) Step loading capacities.
    - c) Sizes and dimensions.
    - d) Performance data.
    - e) Control system details.
    - f) Signal system details.
    - g) Operational features.
    - h) Safety features.
    - i) Finish details.
- B. Shop Drawings:
1. Provide scaled shop drawings and construction drawings of the following:
    - a) Plan and section layouts of wellways, pits, intermediate support, truss structural support locations and rise, to include the following:
      - b) Location of all equipment.
      - c) Static loads imposed on building structure.
      - d) Details of equipment isolation.
      - e) Required clearances around equipment.
      - f) Equipment heat release.
      - g) Power requirements:
        - 1) Motor horsepower, code letter, starting current, full load running current.
        - 2) Provide maximum and average power consumption.
      - h) Service connections.
      - i) Signage.
      - j) Lighting.
    2. Wellway/Truss/Pit Equipment:
      - a) Escalator truss reactions/loads.
      - b) Stop switches.
    3. Fixtures:
      - a) Stop switch.

- b) Starting and Inspection switches
  - c) Fault indicator.
  - d) Diagnostic access port.
- C. Submittals:
- 1. All submittals shall be provided via Portable Document Format (.pdf).
  - 2. All submittals shall be marked and identified with project name and appropriate device identification.
  - 3. All submittals are subject to approval.
  - 4. Corrections shall be incorporated into the revised submittals.
- D. Samples for Initial Selection:
- 1. For visible finishes provide material and finish samples including paint, balustrades, skirts, step, decking, handrails, combplates, walk-on areas, fixture faceplates, signage, and lighting.
- E. Samples for Verification:
- 1. For exposed escalator and signal equipment finishes.
  - 2. Samples of sheet materials: 3" (75 mm) square.
  - 3. Running trim members: 4" (100 mm) lengths.

### 1.3 CLOSEOUT SUBMITTALS

- A. Continuing Maintenance Proposal:
- 1. Submit executed Installer's standard five-year maintenance agreement, commencing at the expiration of the warranty maintenance period.
  - 2. State services, obligations, conditions, and terms for agreement period and for future renewal options.
- B. Record Documents
- 1. The following record documents shall be furnished upon completion and before final payment delivered via Portable Document Format (.pdf):
    - a) Shop Drawings:
      - 1) Complete sets of as installed plan and section layouts of escalators, wellway/pits, machinery spaces, and requirements contained within submittal drawings.
    - b) Wiring Diagrams:
      - 1) Complete sets of as installed straight-line wiring diagrams, showing the electrical connections of all equipment, furnished upon completion.
      - 2) A legend sheet shall be furnished with each set of drawings containing the following information:
        - (a) Name and symbol of each relay, switch and other electrical or solid-state apparatus.
        - (b) Location on drawings, drawing sheets, number and area of switches and relays, and location of all contacts.
        - (c) Location of apparatus whether on controller, in well, or operating devices.
    - c) Maintenance and Operating Manuals:
      - 1) Description and sequence of operation of all equipment installed, including operating use for Building Personnel as well as system troubleshooting manuals for technicians.

- 2) Maintenance instructions and procedures of all vertical transportation equipment installed, including parts lists, for each escalator system.
- 3) Lubrication charts indicating all lubricating points and type of lubricant recommended for all equipment.
- 4) Complete parts catalogs for all replaceable parts.
- 5) Maintenance Control Program

C. Tools:

1. The following equipment shall be furnished upon completion before final payment:
  - a) Provide tools to allow performance of all necessary procedures to complete all safety tests as required by code and local governing authority.
  - b) The Escalator Contractor shall provide a backup copy of any software required for normal operation on an external storage medium.

D. Keys:

1. Four sets of keys for each type of lock shall be furnished upon completion.
2. Keys shall be properly tagged to identify related lock.

#### 1.4 PERMITS TESTS & CERTIFICATES

A. Permits:

1. The Contractor shall secure the necessary permits required for work to be performed, including work performed by sub-contractors.
2. The Contractor shall obtain and pay for all municipal and state permits necessary for execution of the work, including fees for permit renewals.
3. The Contractor shall be responsible for posting all permits.
4. The Contractor shall be responsible for obtaining final approval for completed work for each permit filed by them.

B. Tests and Inspections:

1. The Contractor shall perform all necessary tests as required by ASME A17.1 and A17.2.
2. The Contractor shall be responsible for scheduling the necessary tests as required by the local authorities.
  - a) Any fees associated with a missed appointment, or for expediting of test or overtime test due to delays caused by the Contractor shall be the responsibility of the Contractor.

C. Certificates:

1. The Contractor is responsible for obtaining and providing all temporary and final inspection certificates of the proper governing authorities.
2. The Contractor shall pay for all fees necessary for obtaining temporary and final inspection certificates.
3. Include copies of all certificates with closeout documentation.

#### 1.5 QUALITY ASSURANCE

A. Compliance with Regulatory Agencies:

1. Comply with most stringent provisions of codes, laws, and/or authorities, including revisions and changes in effect.
2. See Item 2.1 "REFERENCES"

**B. Progress Reviews:**

1. The Contractor's work is subject to review by the Consultant at any time.
2. Contractor to assist without cost.

**1.6 DELIVERY STORAGE & HOISTING****A. General:**

1. The protection of all equipment and exposed finishes shall be the responsibility of the Contractor during delivery, handling, and installation until final acceptance of escalator equipment.
2. The Contractor shall replace damaged materials with new, with no additional cost for material and labor.

**B. Delivery & Storage:**

1. It is the responsibility of the Contractor to safely store in designated space. Protect all materials to prohibit damage, stains, scratches, corrosion, weather, construction debris and environmental conditions.
2. Deliver materials to the site in the manufacturer's original and unopened containers and packaging, bearing labels as to type of material, brand name and manufacturer's name.
3. Store materials under cover in a dry and clean location, off the ground. Remove delivered materials that are damaged or not suitable for installation from the job site and replace with acceptable materials.

**C. Hoisting:**

1. All required hoisting and movement of equipment shall be the responsibility of the Contractor.

**1.7 COORDINATION****A. General:**

1. Coordinate the requirements of other trades.
2. Provide access to truss and controller areas for installation of life safety signals and equipment

**B. Cast-in-Place Concrete:**

1. Contractor to coordinate support location requirements.
2. Provide pit requirements, including location of sump pits or drains.

**C. Electric:**

1. Electrical service, outlets, lights, and switches in escalator machine space and pits.

**D. Sprinklers:**

1. Installation of sprinkler systems as per NFPA 13.

**E. HVAC:**

1. Provide necessary information to Contractor and coordinate installation of equipment for escalator including truss heating and cooling.

**F. Finishes:**

1. Balustrades, skirt panels, fixtures, walk on plates, truss cladding, signage, lighting, and guards.

## 1.8 WARRANTY

### A. Manufacturer's Warranty:

1. Manufacturer will repair, restore, or replace escalator equipment that fails due to defective materials or poor workmanship within specified warranty period.
2. Failures include but are not limited to:
3. Operation or control system failure and malfunctions
4. Performance outside specified ratings and ranges
5. Excessive wear
6. Unusual deterioration or aging of materials or finishes
7. Unsafe conditions
8. Need for excessive maintenance
9. Unusual noise or vibration
10. Unexpected or unsatisfactory conditions.

### B. Warranty Period:

1. In accordance with contract documents.
2. The Contractor shall guarantee that the materials and workmanship of the equipment installed by them and any subcontractor under this contract, shall be first class in every respect and that they will make good on any defects not due to ordinary wear and tear or improper use, which may develop within one year from the date of final acceptance of all equipment.
3. Manufacturer's warranty to repair or replace defective products or their components in the event of defects occur within specified warranty period.
4. Neither the final payment nor any provisions of the contract documents shall relieve the Contractor of any obligation provided by law. They shall remedy any defects and pay all expenses for any damage to other work.
5. The warranty as outlined above, for all devices, shall start from the date of final acceptance of each device, by the Consultant and the Owner, of all work specified and intended under these contract documents.

## 1.9 MAINTENANCE

### A. General:

1. All maintenance shall be performed according to the guidelines stated in manufacturer's Maintenance and Operations manuals.
2. Maintenance records for each device, including lubrication logs, check charts, shall be provided in each machine room.

### B. Warranty Maintenance:

1. Upon final acceptance of each device, after receiving written final acceptance from the governing authorities, each device shall be accepted for full operation.
2. The warranty maintenance period shall begin for each device when all conditions in the above paragraph are met and will continue for the specified period.
  - a) Warranty maintenance period will begin with the completion of the last escalator.
3. The warranty maintenance program shall include the following:
  - a) Monthly examinations, including adjustments, cleaning, and lubrication of equipment. Maintenance will be performed during normal working hours.

- b) 24-hour 7 days a week Emergency Call back service shall be provided at no additional cost to Owner. Call back response time no more than 30 minutes.
  - c) Replace components using only parts produced by the original manufacturer.
- C. Maintenance Specification:
- 1. Upon completion of the Warranty Maintenance period, the Escalator Contractor will provide the personnel to service the vertical transportation equipment.
    - a) Full-Service Maintenance Specification shall commence upon the completion of the warranty maintenance period for a term of five (5) years.
      - 1) The Contractor shall provide a proposal for a full-service coverage which includes the following:
        - (a) All required inspections and tests.
        - (b) 24-hour 7 days a week Emergency Call back service shall be provided at no additional cost to Owner. Call back response time no more than 30 minutes.

## **PART 2 – PRODUCTS**

### **2.1 REFERENCES**

- A. Definitions:
- 1. Terms used are defined in the latest edition of the Safety Code for Elevators and Escalators, ASME A17.1.
  - 2. Reference to a device or a part of the equipment applies to the number of devices or parts required to complete the installation.
  - 3. Provisions of this specification are applicable to all devices unless identified otherwise.
- B. American Society of Mechanical Engineers:
- 1. ASME A17.1 - Safety Code for Elevators and Escalators.
  - 2. ASME A17.2 – Guide for Inspection of Elevators and Escalators.
  - 3. ASME A17.5 – Elevator and Escalator Electrical Equipment.
- C. National Fire Protection Association (NFPA):
- 1. NFPA 70 – National Electric Code.
  - 2. NFPA 101 – Life Safety Code.
  - 3. NFPA 130 – Standard for Fixed Guideway Transit and Passenger Rail Systems

### **2.2 MANUFACTURERS**

- A. Subject to compliance with project requirements, provide products by one of the following:
- 1. KONE Corporation
  - 2. Otis Elevator Company
  - 3. Schindler Elevator Corporation
  - 4. TK Elevator

### **2.3 PERFORMANCE**

- A. Ride Quality:
- 1. Maximum 15 milli-g in all axes, measured in accordance with ISO 18738 standard.
- B. Step Speed:

1. Unit shall be capable of operating at rated speed under any loading condition in either direction of travel.
- C. Handrail Speed:
  1. Synchronize with steps.
- D. Speed Variation:
  1. Speed of steps and handrail shall not vary more than 2% from contract speed.
  2. Handrail speed must be synchronized with steps.
- E. Commercial Escalator Duty Type:
  1. Escalator system and all individual components or subsystems designed to operate under moderate loads and operation:
    - a) 1.5 persons per step.
    - b) Loading factor of 195 lbs. per step.
    - c) Continuous operation:
      - 1) 12 hours per day
      - 2) 7 days per week
  2. 100,000 hours of useful life preceding replacement or major component obsolescence.
- F. Designed Minimum Component Lifecycle Before Replacement:
  1. Components designed for 10 year (44,000 operating hours) minimum service life before replacement is required:
    - a) Bearings.
    - b) Step chain rollers.
    - c) Step rollers.
    - d) Step chains.
    - e) Main drive chains.
    - f) Belts.
    - g) Gear box: Bearings, ring, and pinion gears.
    - h) Step tracks.
    - i) Handrails.
  2. Components designed for 5 year (22,000 operating hours) minimum service life before replacement is required:
    - a) Handrail Drive.
- G. Noise and Vibration Control:
  1. Limit noise levels relating to escalator equipment and its operation to no more than 55 dBA, measured 3'-0" above escalator at any point of its length.
  2. Mechanically isolate escalator equipment from the building structure and other components to minimize noise and vibrations being transmitted to occupied areas of the building.

## 2.4 ESCALATORS

- A. Description:
  1. Escalator Identification: ESC 1-3.
  2. Size:
    - a) Escalators ESC 1-3: 40" Step, 2 flat steps.

3. Speed: 100 fpm.
4. Rise: Floor 01-02: 25'-6 ½"
5. Floors Served:
  - a) 01 Event Level -02 Main Concourse
6. Configuration: Linear.
7. Arrangement: Adjacent
8. Angle of Inclination: 30°
9. Operation: Reversible.
10. Drive Motor Gear Box: Worm,
11. Balustrade Height: 1000 mm (40")
12. Balustrade Panel Gap: Perpendicular to deck.
13. Balustrade Material: 1/2" Transparent Glass
14. Deck: Low inner and outer.
15. Deck Finish: Satin finish stainless steel
16. Molding and Trim: Match deck finish.
17. Skirt Panels: Match deck. Black low friction material applied to metal skirt panels.
18. Handrail Color: Black .
19. Step Tread and Riser: Cleated and meshed with adjacent step with replaceable tread demarcation, rear and sides.
20. Demarcation Color: Yellow.
21. Power Supply: 480 Volts, 3 Phase, 60 Hertz.
22. Additional Features:
  - a) Oilless step chain
  - b) Step demarcation lighting.
  - c) Emergency stop buttons.
  - d) Caution signs at each landing.
  - e) Comb plate lighting.
  - f) Under handrail LED lighting.
  - g) Deck Guards

## 2.5 MATERIALS

- A. General:
  1. All materials and finishes are subject to approval by Architect.
- B. Steel:
  1. Sheet Steel Furniture Steel for Exposed Work:
    - a) Stretcher-leveled, cold-rolled, commercial quality carbon steel, complying with ASTM A366, matte finish.
  2. Sheet Steel for Unexposed Work:
    - a) Hot-rolled, commercial quality carbon steel, pickled and oiled, complying with ASTM A568/A568M-03.
  3. Structural Steel Shapes and Plates:
    - a) ASTM A36.

- C. Stainless Steel:
1. Type 302 or 304 series complying with ASTM A240, with standard tempers and hardness required for fabrication, strength, and durability.
  2. Apply mechanical finish on fabricated work in the locations shown or specified, Federal Standard and NAAMM nomenclature, with texture and reflectivity required to match Architect's sample.
  3. No. 4 Satin:
    - a) Directional polish finish.
    - b) Graining directions as shown or, if not shown, in longest dimension.
  4. Protect with adhesive paper covering.
- D. Aluminum:
1. Extrusions per ASTM B221; sheet and plate per ASTM B209.
  2. Die Cast Aluminum – ASTM B108, Alloy 356.0, T6.
  3. Extruded Aluminum – FS QQ-A 200/8, Alloy 6061, T6.
- E. Paint Finishes:
1. General:
    - a) Clean exposed metal parts and assemblies of oil, grease, scale, and other foreign matter and factory paint one shop coat of standard rust-resistant primer.
    - b) Galvanized metal not painted.
  2. Prime Finish:
    - a) Apply one coat of rust-resistant primer followed by a filler coat over uneven surfaces.
    - b) Sand smooth and apply final coat of primer.
- F. All equipment and metal work installed under this contract, which does not have a baked enamel or special architectural finish, and which is exposed in the wellway, shall be cleaned, and painted one field coat of enamel.
- G. Escalator designation, number and/or letter, shall be prominently indicated on disconnect.

## 2.6 OPERATION

- A. Each unit shall be capable of operating smoothly and quietly at rated speed with synchronized step and handrail operation in both directions.
- B. Reduced speed and passenger approach activity:
1. When usage drops to below the code prescribed preset level, reduce step speed via variable motor speed operation.
  2. As passenger approach is detected, accelerate to rated speed.
  3. Provide means to monitor usage, including count of users over entry.
- C. Maintenance speed reduction:
1. Provide reduced speed maintenance operation via Plug-in Portable control station
  2. When plugged in the escalator shall operate on Inspection operation.
  3. Run via constant pressure on "up" or "down" button.
  4. The handset shall have a ten-foot (10) foot cord with plug connector. When plugged into special receptacle, there shall be no means of running the escalator except by the service handset. Receptacles shall be provided in top and bottom pits.

## D. Inspection:

1. Escalator design and inspection operation shall permit inspection of wellway interior, including step chains, while unit is running with steps removed.

**2.7 MACHINE SPACE**

## A. Driving Machine:

1. Worm geared, reduction unit coupled directly to AC Permanent Magnet Synchronous drive motor.
2. Handrail drive shall be directly coupled to drive machine.

## B. Drive Motor:

1. Three-phase, operating at no greater than 1800 rpm.
2. Designed to operate in confined spaces.
3. Motor insulation class "F".
4. Motor drive shall incorporate variable speed variable frequency control.

## C. Brake:

1. Electromechanical brake to safely decelerate, stop, and hold brake rated load.
2. Brake shall stop escalator operating in the down direction at an average rate not to exceed 3.0 feet/second□
3. Provide auxiliary brake for escalators not utilizing dynamic braking and a rise greater than 20 ft.

## D. Controller:

1. UL/CSA labeled.
2. NEMA 4 ingress rated enclosure.
3. Compartment:
  - a) Securely mount all assemblies, relays, power supplies, and chassis switches, in a substantial, self-supporting steel cabinet, removable from machine space for access to controls and wiring.
  - b) Include mainline circuit breaker, phase, and overload protection.
  - c) Completely enclose equipment with cover.
4. Relay Design:
  - a) Magnet operated with contact design and material to insure maximum conductivity, long life, and reliable operation without overheating or excessive wear.
  - b) Provide wiping action and means to prevent sticking and fusion.
  - c) Contacts carrying high inductive currents shall be provided with arc deflectors or suppressors.
5. Microprocessor Hardware:
  - a) Provide noise suppression devices that provide noise immunity on all solid-state hardware and devices.
  - b) Provide power supplies with noise suppression devices.
  - c) Isolate inputs from external devices.
  - d) System memory shall be retained in the event of power failure or disturbance.
  - e) Store 100 most recent fault events.

- f) Equipment shall be provided with Electro Magnetic Interference (EMI) shielding within FCC guidelines.
- 6. Wiring:
  - a) Neatly route all wiring interconnections and securely attach wiring connections to studs or terminals.
  - b) Provide labels for all devices, wiring, extra and spare wires, neatly organized in controller cabinet.
  - c) Permanently mark components with symbols shown on wiring diagrams.
- 7. Diagnostics:
  - a) Equip controller with standard ports, interface boards, and drivers to accept maintenance, data logging, fault finding diagnostic, and monitoring system computers, keyboards, modems, and programming tools.
  - b) Provide wireless connection to contractor's cellular provided at no additional cost.
- 8. Provide control panel compliant with UL 508A SB. SCCR of 5000A required.

## 2.8 WELLWAY EQUIPMENT

- A. Truss:
  - 1. Steel truss to carry entire load of escalator, including all code prescribed loads for components, full-capacity load and weight of exterior balustrade covering material.
  - 2. Provide clearly identified exterior cladding support attachment locations on exposed sides and bottom of the entire length of truss.
  - 3. Deflection of the loaded truss shall not exceed 1/1000 of the span dimension under code prescribed live loads.
- B. Truss Isolation:
  - 1. Provide pads at support locations to isolate truss and prevent transmission of vibration to building structure.
- C. Drip Pans:
  - 1. Liquid-tight steel pans with sufficient strength to withstand weight of workers entire width and length of truss.
- D. Sump and Drain Access:
  - 1. Provide hinged access to sump, drain, oil, oil/water separator or other equipment via lower pit pan.
- E. Step Tracks:
  - 1. Steel construction.
  - 2. Bolted sections including transitions to facilitate maintenance and replacement when required.
  - 3. Sections, including transitions, shall be factory installed and aligned to ensure smooth, quiet operation of running gear under all conditions.
  - 4. Thickness: 2.5 mm on incline and 5 mm on transition curves.
- F. Step Drive Assembly:
  - 1. Direct or indirect drive.
  - 2. Machine drive sprockets at each side which engage step chains.
  - 3. Step chain rollers to transmit motion from machine to steps.

4. When chain drives are used between machine and main drive shaft, provide emergency brake on drive assembly to automatically set when chain disengagement or failure occurs.
  5. Provide roller-type sealed bearings.
  6. Individual track sections, together with transition section, main drive shaft, and handrail drive shaft shall form a fully independent assembly.
- G. Step Chain:
1. Provide oilless step chain with hardened pins or cast links connecting adjacent steps and engaging step drive assembly.
  2. 3" synthetic roller assemblies with sealed bearings.
- H. Automatic Oiler:
1. Capability to adjust lubricant flow rate, based on hours of usage.
  2. Applied to all chains and rotating equipment via brush
- I. Step Guidance System:
1. Provide a step guidance system to control the horizontal and vertical movement of the steps.
- J. Lower Reversing Station Tension Carriage:
1. Fully independent, floating track system with spring tensioning device to maintain constant step band tension.
- K. Step Assembly:
1. Single piece die-cast aluminum fastened to the step chain.
  2. Step rollers shall have sealed bearings.
  3. Step roller contact surface shall be coated with synthetic composition material.
  4. Treads and riser shall be cleated.
  5. Steps shall be removable from unit without disassembly of balustrade.
  6. Provide renewable step demarcation inserts on trailing edge of each step tread and both sides of each step tread.
- L. Safety Devices:
1. Provide step and handrail safety devices:
    - a) Broken step chain.
    - b) Broken drive chain/drive belt.
    - c) Skirt obstruction.
    - d) Reversal stops.
    - e) Step up-thrust.
    - f) Handrail speed.
    - g) Missing step.
    - h) Step level.
    - i) Handrail entry.
    - j) Combplate impact.
    - k) Step Demarcation Lights.
    - l) Stop Button.
    - m) Speed Monitoring Devices.

- n) Disconnected Motor Safety.
  - o) Braking Distance Monitor.
- M. Electrical Wiring:
- 1. Conductors:
    - a) Copper throughout with individual wires coded and all connections identified on studs or terminal blocks.
    - b) Flexible cable may be utilized for wiring.
    - c) Provide conduit, junction boxes, connections, and mounting means per requirements of Division 16.
    - d) Provide painted or galvanized steel or aluminum conduit, minimum conduit size, 1/2".
    - e) No Flexible conduit exceeding 24" in length

## 2.9 HANDRAILS

- A. Construction:
- 1. Thermoplastic urethane on metal guides.
  - 2. Handrail shall be spliced and thermoplastic welded with smooth joint.
  - 3. Provide tensioning device and slack-tension switch.
- B. Under Handrail Lighting: RGB color changing continuous LED along the entire length of the escalator. Remote controller to easily change lighting color.
- C. Handrail Drive:
- 1. Friction drive wheel.
  - 2. Handrails shall be driven in both directions and synchronize precisely with step band

## 2.10 BALUSTRADE

- A. Interior Panel:
- 1. 1/2" Glass.
- B. Skirt Panels:
- 1. Reinforced composite panel with smooth surface.
  - 2. Low friction black composite finish material.
  - 3. Install to maintain loaded step gap clearance.
  - 4. Provide skirt brushes and matching mounting extrusion.
  - 5. Extend skirt panel beyond combplates and wrap base of newel.
  - 6. Install to fit flush with handrail inlet end caps.
- C. Deck Boards:
- 1. Reinforced metal.
  - 2. All deck section joints shall abut to provide a smooth surface to surface connection with curved transition, top and bottom, horizontal to incline sections.
- D. Newel Ends:
- 1. Continuous radiused metal guide at upper and lower end of the balustrade.
  - 2. Newel end shall include a handrail guide with integral multi-roller bearing system to minimize friction and provide smooth movement of handrail.

- E. Handrail Guides:
  - 1. For stationary sections of balustrade provide removable handrail guides.
- F. Finishes:
  - 1. Interior Panels:
    - a) Provide 1/2" Clear glass with gaps vertical to floor.
    - b) Satin finish stainless steel.
  - 2. Inner and Outer Deck:
    - a) Satin finish stainless steel.
- G. Trim and Moldings:
  - 1. Match deck finish.
- H. Ceiling Intersection Guards:
  - 1. Provide clear Plexiglas guards at floor.
- I. Deck Guards:
  - 1. Provide clear Plexiglas guards between adjacent units at top and bottom of trusses.

## 2.11 LANDINGS

- A. Flat Steps:
  - 1. Provide upper and lower landings with two flat steps.
- B. Step Demarcation Lighting:
  - 1. Provide minimum of two green LED step demarcation lights within the step band at upper and lower landings.
  - 2. Locate a maximum of 16" from combplates.
- C. Combplates:
  - 1. Plastic Composite provided with non-slip surface.
  - 2. Provide removable comb sections.
  - 3. Apply yellow powder coat finish.
- D. Combplate Lighting:
  - 1. Provide combplate LED lighting in skirt panel on both sides of units at both upper and lower landings.
- E. Landing Plates:
  - 1. Aluminum with non-slip surface.
  - 2. Plate shall extend from combplates to equipment access plates at upper and lower ends.
  - 3. Plates shall extend full width of truss.
- F. Equipment Access Plates:
  - 1. Aluminum with non-slip surface.
  - 2. Provide removable access plates to provide for entry into equipment spaces at upper and lower ends.
  - 3. Plates shall cover entire wellway openings.
  - 4. Access plates shall match material and finish of adjacent landing plates.
  - 5. Provide landing plate and access floor plate without manufacturer's name or logo.

**2.12 SIGNAL AND CONTROL FIXTURES**

- A. Operating Station:
1. Provide newel or inner deck mounted operating stations.
  2. Mount on right side when facing unit.
  3. Match deck finish.
  4. Function and operating positions of switches and buttons shall be identified with engraved characters which are easily visible from a standing position.
  5. Each station shall contain the following:
    - a) Red "emergency stop" button.
    - b) The button shall be covered with a transparent cover which can be readily lifted or pushed aside.
    - c) When the cover is moved, an audible warning signal shall be activated.
    - d) The signal shall have a minimum sound intensity of 80 dBA at the button location.
    - e) The cover shall be engraved "EMERGENCY STOP"; "MOVE COVER" or equivalent legend, and "PUSH BUTTON."
    - f) "EMERGENCY STOP" shall be in letters not less than 1/2" (13mm) high.
    - g) Other required wording shall be in letters not less than 3/16" (4.8mm) high.
    - h) The cover shall be spring loaded to return to closed position.
    - i) Key switch to "start" unit.
    - j) Key directional control switch.
- B. Fault Indicator:
1. Provide upper and lower fault indicator to display fault code without removal of equipment access plate.
  2. Locate indicator in handrail inlet box or deck board visible from landing plate.
- C. Diagnostic Access:
1. Provide diagnostic access port at upper and lower landings.

**2.13 SIGNS**

- A. Landing Signs:
1. Provide caution signs at top and bottom landings.

**2.14 EXAMINATION**

- A. Prior to beginning installation of equipment, examine wellway and pit areas.
1. Verify no irregularities exist which affect execution of work specified.
- B. Verify electrical power has been provided in correct locations and of correct characteristics.
- C. Do not proceed with installation until work in place conforms to project requirements.

**2.15 INSTALLATION**

- A. Install all equipment in accordance with Contractor's instructions, referenced codes, specification, and approved submittals.
- B. Install all equipment so it may be easily removed for maintenance and repair.
- C. Install all equipment for ease of maintenance.

- D. Install all equipment to afford maximum accessibility, safety, and continuity of operation.
- E. Remove oil, grease, scale, and other foreign matter from the following equipment and apply one coat of field-applied machinery enamel, for the following:
  - 1. All exposed equipment and metal work installed as part of this work which does not have architectural finish.
  - 2. Machine room equipment truss.
  - 3. Neatly touch up damaged factory-painted surfaces with original paint color.
  - 4. Protect machine-finish surfaces against corrosion.
- F. Clean all architectural finishes and replace or restore any surfaces damaged during construction to like new condition.

## 2.16 FIELD QUALITY CONTROL

- A. Acceptance Testing:
  - 1. On completion of escalator installation and before permitting escalator use, perform acceptance tests as required and recommended by ASME A17.1/CSA B44 and by governing regulations and agencies.
- B. Advise Owner, Architect, and authorities having jurisdiction in advance of dates and times that tests are to be performed on escalators.

## 2.17 ADJUSTING

- A. Track Alignment:
  - 1. Re-align factory installed tracks if required to ensure continuous 4-point contact with step and chain rollers.
  - 2. Secure joints without gaps and file any irregularities to a smooth surface.
- B. Lubricate all equipment in accordance with manufacturer's instructions.
- C. Adjust motors, brakes, controllers, stopping switches, and safety devices to achieve required performance levels.
- D. Adjust brakes and controlled descent devices to stop escalator with variable load.
- E. Drive machine brakes shall stop the down running escalator at a rate no greater than 3.0 feet/second□
- F. Adjust handrail speed to synchronize with step speed.

## 2.18 CLEANUP

- A. Keep work areas orderly and free from debris during progress of project.
- B. Remove packaging materials on a daily basis.
- C. Remove all loose materials and filings resulting from work.
- D. Clean machine room equipment, truss interior, and pit.
- E. Clean balustrades, deck boards, skirt panels, operating and signal fixtures, and trim.

## 2.19 TEST RESULTS

- A. Review procedures shall apply all escalators.

- B. Perform review and evaluation of all aspects of its work prior to requesting Consultant's final review. Work shall be considered ready for Consultant's final contract compliance review when all Contractor's tests are complete and all elements of work or a designated portion thereof are in place and escalator, or groups of escalators are deemed ready for service as intended.
- C. Furnish labor, materials, and equipment necessary for Consultant's review.
- D. Notify Consultant a minimum of five working days in advance when ready for final review of escalator or group.
- E. Equipment and Instruments:
  - 1. Furnish equipment and instruments to perform required tests.
  - 2. The following instruments may be necessary to complete the tests:
    - a) Multi meter.
    - b) 500 Volt Megger.
    - c) Alternating-current voltmeter and ammeter.
    - d) Celsius-calibrated thermometers (two minimum).
    - e) Precision tachometer.
    - f) Decibel meter for noise test.
    - g) Step Skirt index test equipment
- F. Consultant's written list of observed deficiencies of materials, equipment, and operating systems will be submitted to Contractor for corrective action.
  - 1. Consultant's review shall include as a minimum:
    - a) Workmanship and equipment compliance with Contract Documents.
    - b) Contract speed and performance comply with Contract Documents.
    - c) Performance of following is satisfactory:
      - 1) Starting and running.
      - 2) Stopping.
      - 3) Controlled descent.
      - 4) Equipment noise levels.
      - 5) Signal and operating devices.
      - 6) Overall ride quality.
      - 7) Handrail speed.
      - 8) Operations of safety devices.
  - 2. Operating Tests:
    - a) Overspeed Protection Device: Test by operating at rated speed, tripping overspeed device manually.
    - b) Handrail-Tension Device: Test manually.
    - c) Broken Drive Chain Devices: Test by operating at rated speed, tripping broken chain device manually.
- G. Test Results:
  - 1. In all test conditions obtain specified contract speed, handrail speed, controlled descent, performance, stopping, ride quality, and operation noise levels to satisfaction of Purchaser and Consultant.
- H. Performance Guarantee:

1. Should Consultant's review identify defects, poor workmanship, variance, or noncompliance with requirements of specified codes and/or ordinances, or variance or noncompliance with the requirements of Contract Documents, Contractor shall complete corrective work in an expedient manner to satisfaction of Purchaser and Consultant at no cost as follows:
  - a) Replace equipment which does not meet code or Contract Document requirements.
  - b) Perform work and furnish labor, materials, and equipment necessary to meet specified operation and performance.
  - c) Perform retesting required by Governing Code Authority, Purchaser, and Consultant.
  - d) A follow-up final contract compliance review shall be performed by Consultant after notification by Contractor that all deficiencies have been corrected.
  - e) Provide Consultant with copies of the initial deficiency report marked to indicate items which Contractor considers complete.
- I. A follow-up final contract compliance review shall be performed by Consultant after notification by Contractor that all deficiencies have been corrected.
  1. Provide Consultant with copies of the initial deficiency report marked to indicate items which Contractor considers complete.

END OF SECTION

**SECTION 14 42 00 - WHEELCHAIR LIFTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Inclined platform lifts.
- B. Related Requirements:
  - 1. Section 03 30 00 "Cast-in-Place Concrete" for setting sleeves, inserts, and anchoring devices in concrete.
  - 2. Section 04 20 00 "Unit Masonry" for setting sleeves, inserts, and anchoring devices in masonry.
  - 3. Section 09 91 13 "Exterior Painting" for field painting of lift equipment.

**1.2 DEFINITIONS**

- A. Definitions in ASME A18.1 apply to Work of this Section.

**1.3 ACTION SUBMITTALS**

- A. Product Data: For each type of product.
  - 1. Include construction details, material descriptions, dimensions of individual components, and finishes for lifts.
  - 2. Include rated capacities, operating characteristics, electrical characteristics, safety features, controls, finishes, and accessories.
- B. Shop Drawings: For each lift.
  - 1. Include plans, elevations, sections, attachment details, and required clearances.
  - 2. Indicate dimensions, weights, loads, and points of load to building structure.
  - 3. Include details of equipment assemblies, method of field assembly, components, and location and size of each field connection.
  - 4. Include diagrams for power, signal, and control wiring.
- C. Samples for Verification: For each type of exposed finish required, prepared on Samples of sizes indicated below:
  - 1. Metal Finish: Manufacturer's standard-size unit, not less than 3 inches square.
  - 2. Wood Finish: Manufacturer's standard-size unit, not less than 3 inches square.
  - 3. Fiberglass Finish: Manufacturer's standard-size unit, not less than 3 inches square.
  - 4. Tubular Products and Running Trim: Manufacturer's standard-size unit, 6 inches long.
  - 5. Glass and Glazing: Units 12 inches square.
  - 6. Hardware: Manufacturer's standard, exposed, door-operating device.

**1.4 INFORMATIONAL SUBMITTALS**

- A. Qualification Data: For manufacturer and Installer.
- B. Product Certificates: For each type of lift.
  - 1. Include statement that runway, ramp or pit, dimensions as shown on Drawings, and electrical service as shown and specified are adequate for lift being provided.
- C. Sample Warranty: For special warranty.

**1.5 CLOSEOUT SUBMITTALS**

- A. Operation and Maintenance Data: For each type of lift to include in operation and maintenance manuals.
  - 1. In addition to items specified in Section 01 78 23 "Operation and Maintenance Data," include the following:
    - a. Parts list with sources indicated.
    - b. Recommended parts inventory list.
- B. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction for normal, unrestricted use of lifts.

**1.6 QUALITY ASSURANCE**

- A. Manufacturer Qualifications: A qualified manufacturer that is certified for chain of custody by an FSC-accredited certification body.
- B. Vendor Qualifications: A vendor that is certified for chain of custody by an FSC-accredited certification body.
- C. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

**1.7 WARRANTY**

- A. Special Warranty: Manufacturer agrees to repair or replace components of lifts that fail in materials or workmanship within specified warranty period.
  - 1. Warranty Period: Five years from date of Substantial Completion.

**PART 2 - PRODUCTS****2.1 PERFORMANCE REQUIREMENTS**

- A. Accessibility Standard: Comply with applicable provisions in the USDOJ's "2010 ADA Standards for Accessible Design" and ICC/ANSI A117.1 or other locally enforced accessibility standards.
- B. Regulatory Requirements: Comply with ASME A18.1, "Safety Standard for Platform Lifts and Stairway Chairlifts."

**2.2 INCLINED PLATFORM LIFT**

- A. Inclined Platform Lift, General: Pre-engineered lift system.
  - 1. Basis-of-Design Product: Subject to compliance with requirements, provide Savaria Concord Lifts, Inc; Omega or comparable product by one of the following:
    - a. Butler Dynamics, LLC.
    - b. Garaventa Lift.
    - c. ThyssenKrupp Access.
- B. Number of Stops: As indicated on Drawings.
- C. Platform Size: 30-1/2 by 49-1/4 inches.
- D. Door Operation and Clear Opening Width: Low-energy, power-operated doors that remain open for 20 seconds minimum; end door with minimum 32-inch and side door with minimum 42-inch clear opening width.
- E. Emergency Operation: Provide manual operation to raise or lower units to a landing in case of malfunction or power loss.

- F. Platform: Steel sheet or galvanized-steel sheet with baked enamel finish and slip-resistant surface or coating.
- G. Automatic Folding Platforms: When not in use, platforms shall automatically fold up against wall to minimize projection into stairway.
- H. Platform Guarding: Guard platform with:
  1. Passenger-Restraining Arms: power operated.
- I. Ramp: Retractable ramp matching platform to provide transition from floor to lift platform. Ramp lowers to floor automatically when lifts reach landing and enclosure door opens. Ramp rises automatically when lift control is activated for lift to leave landing.
  1. Ramp Size: End ramps a minimum of 32 inches and side ramps a minimum of 42 inches wide; length as required for slope.
  2. Ramp Slope: Maximum 1:12.
  3. Ramp Finish: Finish ramps to match lift platform.
- J. Support to Structure: Provide framing and brackets to support vertical loads from floor or stair treads and only lateral loads from walls. Fabricate framing and brackets from stainless-steel rectangular tubing, plates, shapes, and bars.
- K. Guide Rails: Fabricate from stainless-steel tubing.
  1. Provide pedestrian handrail integrated with guide rails, and complying with accessibility requirements.
- L. Accessories: Provide units with the following accessories:
  1. Fold-down seat with seatbelt.
  2. Caution sign as required by ASME A18.1.
- M. Compact Drive Cabinet with Separate Control Box:
  1. Compact drive cabinet will house all mechanical drive system components and shall be located at the end of the tube system.
  2. Controller box will contain all the electrical components of the drive system and be located up to 50 feet away from the compact drive. Control box dimensions are 20 inches wide by 20 inches high by 12 inches deep.
  3. Provide an integrated lockable mains disconnect and breaker in the compact drive control box.

## 2.3 MATERIALS

- A. Steel Plates, Shapes, and Bars: ASTM A36/A36M.
- B. Steel Tubing: ASTM A500/A500M.
- C. Steel Pipe: ASTM A53/A53M; standard weight (Schedule 40) unless otherwise indicated or required by loads.
- D. Steel Sheet: ASTM A1008/A1008M, cold-rolled commercial steel (CS) or ASTM A1011/A1011M hot-rolled, commercial steel (CS); as required for each use.
- E. Galvanized-Steel Sheet: ASTM A653/A653M, G90 zinc coating.
- F. Galvanizing: Hot-dip galvanize items complying with the following:
  1. ASTM A123/A123M, for galvanizing steel and iron products.
  2. ASTM A153/A153M, for galvanizing steel and iron hardware.
- G. Stainless-Steel Bars and Shapes: ASTM A276/A276M, Type 304.
- H. Stainless-Steel Tubing: ASTM A554, Grade MT-304.
- I. Stainless-Steel Sheet, Strip, and Plate: ASTM A240/A240M or ASTM A666, Type 304.

- J. Expansion Anchors: Anchor-bolt-and-sleeve assembly of material indicated below with capability to sustain a load equal to 10 times the load imposed as determined by testing according to ASTM E 488 conducted by a qualified independent testing agency.
  - 1. Material: Group 1, Alloy 304 or Alloy 316, stainless-steel bolts and nuts complying with ASTM F 593 and ASTM F 594.
- K. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107/C1107M. Provide grout specifically recommended by manufacturer for interior and exterior applications.

## 2.4 GENERAL FINISH REQUIREMENTS

- A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## 2.5 FINISHES

- A. Galvanized-Steel Factory Finish:
  - 1. Baked-Enamel or Powder-Coat Finish: Clean, pretreat, and apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat with a minimum dry film thickness of 1 mil for topcoat.
  - 2. Color and Gloss: As selected by Architect from manufacturer's full range.
- B. Stainless-Steel Finishes: Directional satin finish No. 4.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, critical dimensions, and other conditions affecting performance of the Work.
- B. Minimum Headroom Clearance: Verify that installed lift will have a minimum headroom of 80 inches above any point on platform floor at any point of travel.
- C. Minimum Headroom Clearance: Verify that installed lift will have a minimum headroom of 60 inches at any point during travel and minimum of 79 inches where the platform is positioned for boarding.
- D. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION

- A. General: Comply with ASME A18.1 and manufacturer's written instructions for installation of lifts unless otherwise indicated.
- B. Secure lifts to building construction as follows unless otherwise indicated:
  - 1. For concrete and solid masonry anchorage, use post-installed anchors.
  - 2. For hollow masonry anchorage, use toggle bolts.
  - 3. For wood stud partitions, use hanger or lag bolts set into studs or wood backing between studs. Coordinate with carpentry work to locate backing members.

4. For steel-framed partitions, use hanger or lag bolts set into fire-retardant-treated wood backing between studs. Coordinate with stud installation to locate backing members.
  5. For steel-framed partitions, use self-tapping screws fastened to steel framing or to concealed steel reinforcements.
  6. For steel-framed partitions, use toggle bolts installed through flanges of steel framing or through concealed steel reinforcements.
- C. Wiring Method: Conceal conductors and cables within housings of units or building construction. Do not install conduit exposed to view in finished spaces. Bundle, lace, and route conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.
- D. Coordinate platform doors with platform travel and positioning.
- E. Adjust stops for accurate stopping and leveling at each landing, within required tolerances.
1. Leveling Tolerance: 1/4 inch up or down, regardless of load and direction of travel.
- F. Lubricate operating parts of lift, including drive mechanism, guide rails, hinges, safety devices, and hardware.
- G. Test safety devices and verify smoothness of required protective enclosures and other surfaces.

### **3.3 FIELD QUALITY CONTROL**

- A. Acceptance Testing: On completion of lift installation and before permitting use of lifts, perform acceptance tests as required and recommended by ASME A18.1 and authorities having jurisdiction.
- B. Operating Test: In addition to acceptance testing, load lifts to rated capacity and operate continuously for 30 minutes between lowest and highest landings served. Readjust stops, signal equipment, and other devices for accurate stopping and operation of system.
- C. Advise Owner, Architect, and authorities having jurisdiction in advance of dates and times tests are to be performed on lifts.

### **3.4 MAINTENANCE SERVICE**

- A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by skilled employees of lift Installer. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper lift operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

### **3.5 DEMONSTRATION**

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain lifts. Include a review of emergency systems and emergency procedures to be followed at time of operational failure and other building emergencies.
- B. Check operation of lifts with Owner's personnel present and before date of Substantial Completion. Determine that operating systems and devices are functioning properly.
- C. Check operation of lifts with Owner's personnel present not more than one month before end of warranty period. Determine that operating systems and devices are functioning properly.

END OF DIVISION 21 TABLE OF CONTENTS

12/11/2024

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 21 00 10 - GENERAL FIRE SUPPRESSION REQUIREMENTS****PART 1 - GENERAL REQUIREMENTS****1.1 DESCRIPTION OF WORK**

- A. This Division requires the furnishing and installing of complete functioning systems, and each element thereof, as specified or indicated on the Drawings and Specifications or reasonably inferred; including every article, device or accessory (whether or not specifically called for by item) reasonably necessary to facilitate each system's functioning as indicated by the design and the equipment specified. Elements of the work include materials, labor, supervision, supplies, equipment, transportation, and utilities.
- B. Division 21 of the Specifications and Drawings numbered with prefixes F generally describe these systems, but the scope of the Fire Suppression work includes all such work indicated in the Contract Documents: Instructions to Bidders; Proposal Form; General Conditions; Supplementary General Conditions; Architectural, Structural, Fire Suppression, Mechanical, Plumbing, Fire Alarm and Electrical Drawings and Specifications; and Addenda.
- C. The Drawings have been prepared diagrammatically intended to convey the scope of work, indicating the intended general location and arrangement of the equipment, piping, etc. without showing all the exact details as to elevations, offsets, pipe routing, and other installation requirements. The Contractor shall use the Drawings as a guide when laying out the work and shall verify that materials and equipment will fit into the designated spaces, and which, when installed per manufacturers requirements, will ensure a complete, coordinated, satisfactory and properly operating system.
- D. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 7 Section "Penetration Firestopping" for material and methods for firestopping systems.
  - 2. Division 21 Section 210500 "Common Work Results for Fire Suppression," for materials and methods for wall and floor penetrations.
  - 3. Division 21 Section 210515 "Basic Fire Suppression Piping Material and Methods," for general piping and fitting materials and methods.
  - 4. Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment" for labeling and identification of installed fire suppression equipment.
  - 5. Division 21 Section 211100 "Fire Suppression Water Service Piping" for fire suppression piping starting 5 feet outside the building to within the building.
  - 6. Division 21 Section 211200 "Fire Suppression Standpipes" for fire suppression standpipes inside the building.
  - 7. Division 21 Section 211313 "Water-Based Fire Suppression Systems" for fire suppression sprinkler systems inside the building.
  - 8. Division 21 Section 213113 "Electric-Drive, Centrifugal Fire Pumps" for electric-driven fire pumps.
  - 9. .

**1.2 QUALITY ASSURANCE**

- A. All work under this division shall be executed in a thorough professional manner by competent and experienced workmen licensed to perform the Work specified.
- B. All work shall be installed in strict conformance with manufacturer's requirements and recommendations. Equipment and materials shall be installed in a neat and professional manner and shall be aligned, leveled, and adjusted for satisfactory operation.

- C. Material and equipment shall be new, shall be of the best quality and design, shall be current model of the manufacturer, shall be free from defects and imperfections and shall have markings or a nameplate identifying the manufacturer and providing sufficient reference to establish quality, size and capacity. Material and equipment of the same type shall be made by the same manufacturer whenever practicable.
- D. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.
- E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- F. Threaded joints shall conform to ASME B1.20.1, Pipe Threads, General Purpose and the Pipe Fitters Handbook.
- G. Regulatory Requirements: Comply with all standards listed in Section 1.2 and all applicable local requirements.
- H. All electrical equipment provided and the wiring and installation of electrical equipment shall be in accordance with the requirements of this Section, Division 26 and Division 28.
- I. Through and Membrane Penetration Firestopping Systems Installer Qualifications: A firm experienced in installing penetration firestopping systems similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful performance. Qualifications include having the necessary experience, staff, and training to install manufacturer's products per specified requirements. Manufacturer's willingness to sell its penetration firestopping system products to Contractor or to Installer engaged by Contractor does not in itself confer qualification on buyer.

### 1.3 CODES REFERENCES AND STANDARDS

- A. Execute Work in accordance with the National Fire Protection Association Standards and all Local, State, and National codes, ordinances and regulations in force governing the particular class of Work involved. Obtain timely inspections by the constituted authorities, and upon final completion of the Work obtain and deliver to the Owner executed final certificates of acceptance from the Authority Having Jurisdiction.
- B. Any conflict between these Specifications and accompanying Drawings and the applicable Local, State and Federal codes, ordinances and regulations shall be reported to the Architect in sufficient time, prior to the submission of Bids, to prepare the Supplementary Drawings and Specification Addenda required to resolve the conflict.
- C. The governing codes are minimum requirements. Where these Drawings and Specifications exceed the code requirements, these Drawings and Specification shall prevail.
- D. All material, manufacturing methods, handling, dimensions, method or installation and test procedure shall conform to but not be limited to the following industry standards and codes.
  - 1. NFPA (National Fire Protection Association) 13, "Installation of Sprinkler Systems", 2019 Edition.
  - 2. NFPA 14, "Installation of Standpipes, Private Hydrants and Hose Systems", 2019 Edition.
  - 3. NFPA 20, "Installation of Stationary Pumps for Fire Protection", 2019 Edition.
  - 4. NFPA 24, "Private Fire Service Mains and their Appurtenances", 2019 Edition.
  - 5. NFPA 25, "Inspection, Testing and Maintenance of Water-Based Fire Protection Systems", 2020 Edition.
  - 6. Underwriters Laboratories, "Fire Protection Equipment Directory", Latest Edition.
  - 7. Alabama Building Code (IBC 2021), 2021 Edition with local amendments.
  - 8. Alabama Fire Code (IFC 2021), 2021 Edition with local amendments.
- E. Contractor shall comply with rules and regulations of public utilities and municipal departments affected by connections of services.

- F. All Fire Suppression work shall be performed in compliance with applicable safety regulations, including OSHA regulations. Safety lights, guards, shoring and warning signs required for the performance of the Fire Suppression work shall be provided by the Contractor.

#### 1.4 DEFINITIONS

A. General:

1. Furnish: The term "furnish" is used to mean "supply and deliver to the project site, ready for unloading, unpacking, assembly, installation and similar operations."
  2. Install: The term "install" is used to describe operations at the project site including the actual "unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations."
  3. Provide: The term "provide" means "to furnish and install, complete and ready for the intended use." When 'furnish', 'install', 'perform', or 'provide' is not used in connection with services, materials, or equipment in a context clearly requiring an obligation of Contractor, "provide" is implied.
  4. Furnished by Owner or Furnished by Others: The item will be furnished by the Owner or Others. It is to be installed and connected under the requirements of this Division, complete and ready for operation, including items incidental to the Work, including services necessary for proper installation and operation. The installation shall be included under the guarantee required by this Division.
  5. Engineer: Where referenced in this Division, "Engineer" is the Engineer of Record and the Design Professional for the Work under this Division, and is a Consultant to, and an authorized representative of, the Architect, as defined in the General and/or Supplementary Conditions. When used in this Division, it means increased involvement by, and obligations to, the Engineer, in addition to involvement by, and obligations to, the "Architect".
  6. AHJ: The local code and/or inspection agency (Authority) Having Jurisdiction over the Work.
  7. NRTL: Nationally Recognized Testing Laboratory, as defined and listed by OSHA in 29 CFR 1910.7 (e.g., UL, ETL, CSA, etc.), and acceptable to the Authority having Jurisdiction (AHJ) over this project. Nationally Recognized Testing Laboratories and standards listed are used only to represent the characteristics required and are not intended to restrict the use of other listed Manufacturers and models that meet the specified criteria.
  8. Substitution: Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents and proposed by Contractor. Substitutions include Value Engineering proposals.
    - a. Substitutions for Cause: Changes proposed by Contractor that are required due to changed Project conditions, such as unavailability of product, regulatory changes, or unavailability of required warranty terms.
    - b. Substitutions for Convenience: Changes proposed by Contractor or Owner that are not required in order to meet other Project requirements but may offer advantage to Contractor or Owner.
  9. Value Engineering: A systematic method to improve the "value" of goods and services by using an examination of function. Value, as defined, is the ratio of function to cost. Value can therefore be increased by either improving the function or reducing the cost. The goal of VE is to achieve the desired function at the lowest overall cost consistent with required performance.
- B. The terms "approved equal", "equivalent", or "equal" are used synonymously and shall mean "accepted by or acceptable to the Engineer as equivalent to the item or manufacturer specified". The term "approved" shall mean labeled, listed, or both, by an NRTL, and acceptable to the AHJ over this project.
- C. Pipe sizes used in this Specification are Nominal Pipe Size (NPS).
- D. Other definitions for fire protection systems are listed in NFPA Standards 13, 14, 20 and 24.

- E. Working Plans, also referred to as Fire Protection Drawings as used in this Section means those documents (including drawings and calculations) prepared pursuant to the requirements contained in NFPA 13 for obtaining approval of the Authority Having Jurisdiction.
- F. The following definitions apply to excavation operations:
  - 1. Additional Excavation: Where excavation has reached required subgrade elevations, if unsuitable bearing materials are encountered, continue excavation until suitable bearing materials are reached. The Contract Sum may be adjusted by an appropriate Contract Modification.
  - 2. Sub-base: as used in this Section refers to the compacted soil layer used in pavement systems between the subgrade and the pavement base course material.
  - 3. Subgrade: as used in this Section refers to the compacted soil immediately below the slab or pavement system.
  - 4. Unauthorized excavation consists of removal of materials beyond indicated subgrade elevations or dimensions without specific direction from the Architect.

### 1.5 COORDINATION

- A. The Contractor shall visit the site and ascertain the conditions to be encountered while installing the Work under this Division, verify all dimensions and locations before purchasing equipment or commencing work, and make due provision for same in the bid. Failure to comply with this requirement shall not be considered justification for omission, alteration, incorrect or faulty installation of Work under this Division or for additional compensation for Work covered by this Division.
- B. The Contractor shall refer to Drawings of the other disciplines and to relevant equipment drawings and shop drawings to determine the extent of clear spaces. The Contractor shall make offsets required to clear equipment, beams and other structural members; and to facilitate concealing piping in the manner anticipated in the design.
- C. The Contractor shall maintain a foreman on the jobsite at all times to coordinate their work with other contractors and subcontractors so that various components of the Fire Suppression systems will be installed at the proper time, will fit the available space, and will allow proper service access to the equipment. Carry on the work in such a manner that the work of the other contractors and trades will not be handicapped, hindered, or delayed at any time.
- D. Work of this Division shall progress according to the "Construction Schedule" as established by the Prime Contractor and their subcontractors and as approved by the Architect/Engineer. Cooperate in establishing these schedules and perform the Work under this Division, in a timely manner in conformance with the construction schedule so as to ensure successful achievement of schedule dates.
- E. The contractor shall coordinate work in this section with all related trades. Work and/or equipment provided in other sections and related to the fire protection system shall include, but not be limited to:
  - 1. Sprinkler monitoring equipment (water flow switches, valve tampers, etc) shall be provided by the fire sprinkler installer, but wired and connected by Division 28.
- F. System shall be complete and operational with power and control wiring provided to meet the design intent shown on the drawings and described within the specification sections.

### 1.6 MEASUREMENTS AND LAYOUTS

- A. The drawings are schematic in nature, but show the various components of the systems approximately to scale and attempt to indicate how they are to be integrated with other parts of the building. Figured dimensions shall be taken in preference to scale dimensions. Determine exact locations by job measurements, by checking the requirements of other trades, and by

reviewing the Contract Documents. The Contractor will be held responsible for errors which could have been avoided by proper checking and inspection.

## 1.7 COORDINATION DRAWINGS

- A. Coordination Drawings, General: Prepare coordination drawings according to the requirements of individual Sections. Additionally, prepare coordination drawings as required scope of installation is not completely shown on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one trade.
1. Information shall be project specific and drawn accurately to a scale large enough to resolve conflicts. Do not base coordination drawings on standard dimensional data.
  2. Prepare floorplans, sections, elevations, and details as needed to adequately describe relationship of various systems and components.
  3. Clearly indicate functional and spatial relationships of components of all systems specified in the Contract Documents, including but not limited to: architectural, structural, civil, mechanical, electrical, fire protection, and specialty systems.
  4. Indicate space requirements for routine maintenance and for anticipated replacement of components during the life of the installation.
  5. Show location and size of access doors required for access to concealed equipment, fittings, controls, terminations, and cabling.
  6. Indicate required installation sequence to minimize conflicts between entities.
  7. Indicate dimensions shown on the Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternate sketches to Contract Administrator indicating proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.
  8. The details of the coordination are the responsibility of the Contractor and, where indicated on the Drawings, minor adjustments in raceway routing, device placement, device type, or equipment arrangement are not to be considered changes to the Contract.
- B. Equipment Room Coordination Drawings: In accordance with the submittal procedures outlined within these Specifications, provide dimensioned layouts of electrical equipment locations within electrical rooms/closets, mechanical rooms, generator rooms, and fire pump rooms with equipment drawn to scale and identified therein.
1. Clearly identify all required working clearances and access provisions required for installation and maintenance.
  2. Equipment layouts should be arranged accounting for considerations for required door openings and the clearances required by the equipment manufacturer.
  3. Indicate path to allow for the future removal of each large piece of equipment (up to and including generators and unit sub-station transformers) without removal of non-related equipment or architectural elements.
  4. Include work provided by others routed through the equipment rooms.
- C. Coordination Digital Data Files: Prepare coordination digital data files according to the following requirements:
1. File Preparation Format: Same digital data software program, version, and operating system as original Drawings.
  2. BIM File Incorporation: Develop and incorporate coordination drawing files into Building Information Model established for Project.
    - a. Perform three-dimensional component conflict analysis as part of preparation of coordination drawings. Resolve component conflicts prior to submittal. Indicate where conflict resolution requires modification of design requirements by Contract Administrator.
  3. Where the Engineer's digital data files are provided to the Contractor for use in preparing coordination digital data files, the Engineer makes no representations as to the accuracy or completeness of digital data files as they relate to the Drawings or Specifications.

4. Submit coordination drawings in accordance with the submittal procedures outlined within these Specifications.

## 1.8 SUBMITTALS

- A. Refer to Division 01 and General Conditions for submittal requirements in addition to requirements specified herein.
- B. Refer to Division 01 for acceptance of electronic submittals. If not specified by Division 01, provide electronic submittals. If Division 01 requires paper submittals, provide the quantity of submittals required, but no fewer than seven (7) sets.
- C. For electronic submittals, Contractor shall submit the documents in accordance with this Section and the procedures specified in Division 01. Contractor shall notify the Contract Administrator and Engineer that the submittals have been posted. If electronic submittal procedures are not defined in Division 01, Contractor shall include the website, username and password information needed to access the submittals. For submittals sent by e-mail, Contractor shall copy the Contract Administrator's and Engineer's designated representatives. Contractor shall allow for the Engineer Review Time as specified. Contractor shall submit only the documents required to purchase the materials and/or equipment in the submittal.
- D. Engineer Review Time: Transmit submittals as early as required to support the project schedule. Allow two weeks for Engineer review time plus to/from mailing time via the Contract Administrator, plus a duplication of this time for resubmittal if required. Transmit submittals as soon as possible after Notice to Proceed and before Mechanical construction starts.
- E. Submittals and shop drawings shall not contain the firm name, logo, seal, or signature of the Engineer. They shall not be copies of the work product of the Engineer. If the Contractor desires to use elements of such product, the license agreement for transfer of information obtained from the Engineer must be used.
- F. Assemble and submit for review manufacturer product literature for material and equipment to be furnished and/or installed under this Division. Literature shall include shop drawings, manufacturer product data, performance sheets, samples, and other submittals required by this Division as noted in each individual Section. General product catalog data not specifically noted to be part of the specified product will be rejected and returned without review.
- G. Separate submittals according to individual specification sections. Only resubmit those sections requested for resubmittal.
- H. Provide submittals in sufficient detail so as to demonstrate compliance with these Contract Documents and the design concept. Highlight, mark, list or indicate the materials, performance criteria and accessories that are being proposed. Illegible submittals will be rejected and returned without review.
- I. Refer to individual Sections for additional submittal requirements.
- J. Before transmitting submittals and material lists, verify that the equipment submitted is mutually compatible with and suitable for the intended use. Verify that the equipment will fit the available space and maintain manufacturer recommended service clearances. If the size of equipment furnished makes necessary any change in location, or configuration, submit a shop drawing showing the proposed layout.
- K. Submittals shall contain the following information:
  1. The project name.
  2. The applicable specification section and paragraph.
  3. Equipment identification acronym as used on the drawings.
  4. The submittal date.

5. The Contractor's stamp, which shall certify that the stamped drawings have been checked by the Contractor, comply with the Drawings and Specifications, and have been coordinated with other trades.
  6. Submittals not so identified will be returned to the Contractor without action.
- L. The checking and subsequent acceptance by the Engineer and/or Contract Administrator of submittals shall not relieve responsibility from the Contractor for (1) deviations from Drawings and Specifications; (2) errors in dimensions, details, sizes of equipment, or quantities; (3) omissions of components or fittings; and (4) not coordinating items with actual building conditions and adjacent work. Contractor shall request and secure written acceptance from the Engineer and Contract Administrator prior to implementing any deviation.
- M. Provide shop drawings prepared in accordance with referenced standards identified as "Working Plans", including hydraulic calculations where applicable. Shop drawings shall be developed by minimum NICET Level III technician. Submit copies of the certification for the designer with submittal. Shop drawings consisting of the following shall be furnished at a minimum. Refer to NFPA 13 for additional requirements.
1. Scaled site plan indicating underground piping with sizes and hydrants utilized for flow test in relation to the building.
  2. Layout drawings of complete fire sprinkler system indicating relationship to all other trades. This shall include all equipment, piping and a reflected ceiling plan indicating sprinkler locations.
  3. Complete details and sections as required to clearly define and clarify the design indicated.
  4. Shop drawings shall be to a standard scale and not less than 3/32" = 1'-0".
  5. Shop drawings shall be produced using computer-aided design. Hand drawn documents will not be reviewed or approved.
  6. Hydraulic calculations shall be based on a water flow test conducted at the site within twelve (12) months of the submittal of plans for approval. The contractor shall be responsible for obtaining the flow test if existing data is not provided in contract documents. Flow test information shall be documented on shop drawings with an accompanying site plan to scale. Contractor shall verify with AHJ any minimum safety factor requirements. Demand shall not be less than 10 percent below the supply at the demand point.
    - a. Hydrant testing shall be in accordance with NFPA 13 and 291 requirements.
  7. Available fire-hydrant flow test records indicate the following conditions:
    - a. Date: 04/26/2024
    - b. Time: 7:00 a.m
    - c. Performed by: Water Utility Company .
    - d. Location of Residual Fire Hydrant: 249 S Lawrence ST.
    - e. Location of Flow Fire Hydrant: 244 S Claiborne ST.
    - f. Static Pressure at Residual Fire Hydrant: 70 psig.
    - g. Measured Flow at Flow Fire Hydrant: 2600.
    - h. Residual Pressure at Residual Fire Hydrant: 60 psig.
- N. Contractor shall prepare installation drawings (working shop drawings) based upon this design. Requests for deviations from the approved design shall be submitted in writing to the Engineer of Record for approval. Shop drawings showing deviations from the design without prior approval will not be approved.
- O. Provide Test Reports and Certificates including:
  1. "Contractor's Material & Test Certificate for Aboveground Piping"
  2. "Contractor's Material & Test Certificate for Underground Piping" as described in NFPA
    - a. Underground piping test certificate shall be obtained prior to connection of the aboveground system.
- P. Provide welders' qualification certificates.
- Q. BIM Incorporation: Develop and incorporate Shop Drawing files into BIM established for Project.

**1.9 ELECTRONIC DRAWING FILES**

- A. Contractor may request an electronic version of the contract drawing set in AutoCAD format from the Engineer for a fee of 250. Contact the Architect for written authorization. Contact the Engineer for the release agreement form and specify the shipping method and drawing format. Allow up to ten (10) working days for electronic file delivery after authorization and release agreements are completed and delivered to the Engineer.

**1.10 SUBSTITUTIONS**

- A. Refer to Division 1 and General Conditions for substitutions in addition to requirements specified herein.
- B. Materials, products, equipment, and systems described in the Bidding Documents establish a standard of required function, dimension, appearance and quality to be met by the proposed substitution.
- C. The base bid shall include only the products from manufacturers specifically named in the drawings and specifications.
- D. Request for Substitution:
  - 1. Complete and send the Substitution Request Form attached at the end of this section for each material, product, equipment, or system that is proposed to be substituted.
  - 2. The burden of proof of the merit of the proposed substitution is upon the proposer.
  - 3. Unless stated otherwise in writing to the Engineer by the Contractor, Contractor warrants to the Engineer, Architect, and Owner the following:
    - a. Proposed substitution has been fully investigated and determined to meet or exceed the specified Work in all respects.
    - b. Proposed substitution is consistent with the Contract Documents and will produce indicated results, including functional clearances, maintenance service, and sourcing of replacement parts.
    - c. Proposed substitution has received necessary approvals of authorities having jurisdiction.
    - d. Same warranty will be furnished for proposed substitution as for specified Work.
    - e. If accepted substitution fails to perform as required, Contractor shall replace substitute material or system with that originally specified and bear costs incurred thereby.
    - f. Coordination, installation and changes in the Work as necessary for accepted substitution will be complete in all respects.
- E. Substitution Consideration:
  - 1. No substitutions will be considered unless the Substitution Request Form is completed and attached with the appropriate substitution documentation.
  - 2. No substitutions will be considered prior to receipt of Bids unless written request for approval to bid has been received by the Engineer at least ten (10) calendar days prior to the date for receipt of Bids.
  - 3. If the proposed substitution is approved prior to receipt of Bids, such approval will be stated in an Addendum. Bidders shall not rely upon approvals made in any other manner. Verbal approval will not be given.
  - 4. No substitutions will be considered after the Contract is awarded unless specifically provided in the Contract Documents.

**1.11 OPERATION AND MAINTENANCE MANUALS**

- A. Refer to Division 1 and General Conditions for Operation and Maintenance Manuals in addition to requirements specified herein.

- B. Submit manuals prior to requesting the final punch list and before all requests for Substantial Completion.
- C. Instruct the Owner's permanent personnel in the proper operation of, startup and shutdown procedures and maintenance of the equipment and components of the systems installed under this Division.
- D. Prior to Substantial Completion for the project, furnish to the Architect, for Engineer's review, and for Owner's use, four (4) copies of Operation and Maintenance Manuals in labeled, hard-back three-ring binders, with cover, binding label, tabbed dividers and plastic insert folders for Record Drawings. Include local contacts, complete with address and telephone number, for equipment, apparatus, and system components furnished and installed under this Division of the specifications.
- E. Include the following sections with the appropriate information for each section:
  - 1. Typewritten Index.
  - 2. Qualifications. Provide designer and installer qualification.
  - 3. Bill of Materials. Provide complete nomenclature, model number and vendor information for all parts.
  - 4. Operating Instructions. Complete instructions detailing operation and maintenance of all equipment installed.
  - 5. Product Data: Provide product cut-sheets for all equipment utilized and installed.
  - 6. Guarantee. Copy of all guarantees and warranties issued.
  - 7. Testing/Certification: Provide all completed testing and certification forms as required per NFPA 13 and 25.
  - 8. Contact list with minimum three service representative phone numbers.
- F. Refer to Division 1 for acceptance of electronic manuals for this project. For electronic manuals, Contractor shall submit the documents in accordance with this Section and the procedures specified in Division 1. Contractor shall notify the Architect and Engineer that the manuals have been posted. If electronic manual procedures are not defined in Division 1, Contractor shall include the website, user name and password information needed to access the manuals. For manuals sent by e-mail, Contractor shall copy the Architect and Engineer's designated representatives.

#### **1.12 SPARE PARTS**

- A. Provide to the Owner the spare parts specified in the individual sections in Division 21 specifications.

#### **1.13 RECORD DRAWINGS**

- A. Refer to Division 01 and General Conditions for Record Drawings in addition to requirements specified herein.
- B. A set of work prints of the Contract Documents shall be kept on the jobsite during construction for the purpose of noting changes. During the course of construction, the Contractor shall indicate on these Documents changes made from the original Contract Documents. Particular attention shall be paid to those items which need to be located for servicing. Underground utilities shall be located by dimension from column lines.
- C. At the completion of the project, the Contractor shall obtain, at their expense, reproducible copies of the final drawings and incorporate changes noted on the jobsite work prints onto these drawings. These changes shall be done by a skilled drafter. Each sheet shall be marked "Record Drawing", along with the date. These drawings shall be delivered to the Architect/Engineer.
- D. The fire shop drawings and all information contained therein shall be utilized as the basis for the Record Drawings.

**1.14 TRAINING**

- A. Provide training as indicated in each specific section. Schedule training with the Owner at least 7 days in advance. Video tape the training sessions in a format as agreed to with the Owner. Provide three copies of each session to the Owner and obtain written receipt from the Owner.

**1.15 PAINTING**

- A. Exposed ferrous surfaces, including pipe, pipe hangers, equipment stands and supports shall be painted by the Fire Suppression Contractor using materials and methods as specified under Division 9 of the Specifications; colors shall be as selected by the Architect.
- B. Factory finishes, shop priming and special finishes are specified in the individual equipment specification sections.
- C. Where factory finishes are provided and no additional field painting is specified, marred or damaged surfaces shall be touched up or refinished so as to leave a smooth, uniform finish.

**1.16 DELIVERY STORAGE AND HANDLING**

- A. Refer to Division 1 and General Conditions for Delivery, Storage and Handling in addition to requirements specified herein.
- B. Equipment and material shall be delivered to the job site in their original containers with labels intact, fully identified with manufacturer's name, model, model number, type, size, capacity and Underwriter's Laboratories, Inc. labels and other pertinent information necessary to identify the item.
- C. Deliver, receive, handle and store equipment and materials at the job site in the designated area and in such a manner as to prevent equipment and materials from damage and loss. Store equipment and materials delivered to the site on pallets and cover with waterproof, tear resistant tarp or plastic or as required to keep equipment and materials dry. Follow manufacturer's recommendations, and at all times, take every precaution to properly protect equipment and material from damage, to include the erection of temporary shelters to adequately protect equipment and material stored at the Site. Equipment and/or material which become rusted or damaged shall be replaced or restored by the Contractor to a condition acceptable to the Architect.
- D. The Contractor shall be responsible for the safe storage of their own tools, material and equipment.

**1.17 GUARANTEES AND WARRANTIES**

- A. Refer to Division 1 and General Conditions for Guarantees and Warranties in addition to requirements specified herein.
- B. Furnish service and maintenance of fire protection system for one year from date of substantial completion.
- C. Each system and element thereof shall be warranted against defects due to faulty workmanship, design or material for a period of 12 months from date of Substantial Completion, unless specific items are noted to carry a longer warranty in the Construction Documents or manufacturer's standard warranty. The Contractor shall remedy defects occurring within a period of one year from the date of Substantial Completion or as stated in the General Conditions.
- D. The following additional items shall be guaranteed:
  - 1. Piping shall be free from obstructions, holes or breaks of any nature.
  - 2. Proper sloping of pipe to drain in each piping system per NFPA 13.

- E. The above guarantees shall include labor (including travel expenses), troubleshooting and material; and repairs or replacements shall be made without additional cost to the Owner.
- F. The remedial work shall be performed promptly, upon written notice from the Architect or Owner.
- G. At the time of Substantial Completion, deliver to the Owner warranties with terms extending beyond the one year guarantee period, each warranty instrument being addressed and stating the commencement date and term.

#### **1.18 PRO ECT CONDITIONS**

- A. Conditions Affecting Excavations: The following project conditions apply:
  - 1. Maintain and protect existing building services which transit the area affected by selective demolition.
  - 2. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by excavation operations.
  - 3. Use of explosives is not permitted.
- B. Environmental Conditions: Apply joint sealers under temperature and humidity conditions within the limits permitted by the joint sealer manufacturer. Do not apply joint sealers to wet substrates.

### **PART 2 - PRODUCTS AND MATERIALS**

#### **2.1 GENERAL**

- A. Electrical Contractors shall provide all motors, starters, disconnects, wire, conduit, etc. as specified in the Construction Documents. If, however, the Fire Suppression Contractor furnishes a piece of equipment requiring a different motor, starter, disconnect, wire size, etc. than what is shown and/or intended on the Construction Documents, the Fire Suppression Contractor shall coordinate the requirements with any other Contractor and shall be responsible for any additional cost incurred by any other Contractor that is associated with installing the different equipment and related accessories for proper working condition.
- B. Refer to Division 26, "Common Work Results for Electrical" for specification of motor connections.
- C. Refer to Division 26, "Enclosed Switches and Circuit Breakers" for specification of disconnect switches.
- D. Refer to Division 28, "Fire Detection and Alarm" for specification of sprinkler monitoring equipment connections.
- E. All fire protection equipment shall be UL listed for its intended use and in conformance with the applicable NFPA codes.
- F. System Pressures: All system components shall be listed for the actual designed system pressures.
  - 1. Standard-Pressure Piping System Component: Listed for 175-psig minimum working pressure.

#### **2.2 SOIL MATERIALS**

- A. Subbase Material: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, crushed slag, or natural or crushed sand.
- B. Drainage Fill: Washed, evenly graded mixture of crushed stone, or crushed or uncrushed gravel, with 100 percent passing a 1-1/2-inch sieve, and not more than 5 percent passing a No. 4 sieve.

- C. Backfill and Fill Materials: Materials complying with ASTM D2487 soil classification groups GW, GP, GM, SM, SW, and SP; free of clay, rock, or gravel larger than 2 inches in any dimension; debris; waste; frozen materials; and vegetable and other deleterious matter.

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. The Contractor shall install, and test all new equipment identified in this contract and revise existing equipment as noted.
- B. Installation shall be in accordance with NFPA requirements and the Contractor shall have employed or enlist the design services of at least one minimum NICET Level II certified technician.
- C. Installer: Company specializing in the products indicated in this section with minimum three years documented experience. Shall be bondable and licensed contractor and employ full-time factory-trained and certified installers and technicians. Installers shall provide with the fire sprinkler submittal proof of factory training for each installer.
- D. The Contractor shall provide all required equipment, sprinklers and piping for a complete and operational fire protection system. All components shall be installed in accordance with the guidelines of these specifications and documents as well as the NFPA codes and standards listed in these specifications.
- E. The General Contractor is the central authority governing the total responsibility of all trade contractors. Therefore, deviations and clarifications of this schedule are permitted provided the General Contractor assumes responsibility to coordinate the trade contractors different than as indicated herein. If deviations or clarifications to this schedule are implemented, submit a record copy to the Engineer.

#### **3.2 PERMITS**

- A. Secure and pay for permits required in connection with the installation of the Fire Suppression Work. Arrange with the various utility companies for the installation and connection of required utilities for this facility and pay charges associated therewith including connection charges and inspection fees, except where these services or fees are designated to be provided by others.

#### **3.3 PREPARATION**

- A. Perform fire-hydrant flow test according to NFPA 13 and NFPA 291. Use results for system design calculations required in "Quality Assurance" Section.
- B. Report test results promptly and in writing.

#### **3.4 EXISTING UTILITIES**

- A. Schedule and coordinate with the Utility Company, Owner and with the Engineer connection to, or relocation of, or discontinuation of normal utility services from existing utility lines. Premium time required for any such work shall be included in the bid.
- B. Existing utilities damaged due to the operations of utility work for this project shall be repaired to the satisfaction of the Owner or Utility Company without additional cost.
- C. Utilities shall not be left disconnected at the end of a work day or over a weekend unless authorized by representatives of the Owner or Engineer.
- D. Repairs and restoration of utilities shall be made before workmen leave the project at the end of the workday in which the interruption takes place.

- E. Contractor shall include in their bid the cost of furnishing temporary facilities to provide services during interruption of normal utility service.

### 3.5 SELECTIVE DEMOLITION

- a. Not used.

### 3.6 EXCAVATION AND BACKFILLING

- A. Perform excavation of every description, of whatever substance encountered and to the depth required in connection with the installation of the work under this Division. Excavation shall be in conformance with applicable Division and section of the General Specifications.
- B. Roads, alleys, streets and sidewalks damaged during this work shall be restored to the satisfaction of Authorities Having Jurisdiction.
- C. Trenches close to walks or columns shall not be excavated without prior consultation with the Architect.
- D. The Contractor shall erect barricades around excavations, for safety, and shall place an adequate number of amber lights on or near the work and shall keep them burning from dusk to dawn. The Contractor shall be held responsible for any damage that any parties may sustain in consequence of neglecting the necessary precautions in prosecuting the work.
- E. Slope sides of excavations to comply with local, state and federal codes and ordinances. Shoring and Bracing: Establish requirements for trench shoring and bracing to comply with local, state and federal codes and authorities. Maintain shoring and bracing in excavations regardless of time period excavations will be open.
  - 1. Remove shoring and bracing when no longer required. Where sheeting is allowed to remain, cut top of sheeting at an elevation of 30 inches below finished grade elevation.
- F. Install sediment and erosion control measures in accordance with local codes and ordinances.
- G. Dewatering: Prevent surface water and subsurface or ground water from flowing into excavations and from flooding project site and surrounding area.
  - 1. Do not allow water to accumulate in excavations. Remove water to prevent softening of bearing materials. Provide and maintain dewatering system components necessary to convey water away from excavations.
  - 2. Establish and maintain temporary drainage ditches and other diversions outside excavation limits to convey surface water to collecting or run-off areas. Do not use trench excavations as temporary drainage ditches. In no case shall sewers be used as drains for such water.
- H. Material Storage: Stockpile satisfactory excavated materials where directed, until required for backfill or fill. Place, grade, and shape stockpiles for proper drainage.
  - 1. Locate and retain soil materials away from edge of excavations. Do not store within drip-line of trees indicated to remain.
  - 2. Remove and legally dispose of excess excavated materials and materials not acceptable for use as backfill or fill.
- I. Excavation for Underground Tanks, Basins, and Fire Suppression Structures: Conform to elevations and dimensions shown within a tolerance of plus or minus 0.10 foot; plus a sufficient distance to permit placing and removal of concrete formwork, installation of services, other construction, and for inspection.
  - 1. Excavate, by hand, areas within drip-line of large trees. Protect the root system from damage and dry-out. Maintain moist conditions for root system and cover exposed roots with burlap. Paint root cuts of 1 inch in diameter and larger with emulsified asphalt tree paint.
  - 2. Take care not to disturb bottom of excavation. Excavate by hand to final grade just before concrete reinforcement is placed.

- J. Trenching: Excavate trenches for Fire Suppression installations as follows:
1. Excavate trenches to the uniform width, sufficiently wide to provide ample working room and a minimum of 6 to 9 inches clearance on both sides of pipe and equipment.
  2. Excavate trenches to depth indicated or required for piping to establish indicated slope and invert elevations. Beyond building perimeter, excavate trenches to an elevation below frost line.
  3. Limit the length of open trench to that in which pipe can be installed, tested, and the trench backfilled within the same day.
  4. Where rock is encountered, carry excavation below required elevation and backfill with a layer of crushed stone or gravel prior to installation of pipe. Provide a minimum of 6 inches of stone or gravel cushion between rock bearing surface and pipe.
  5. Excavate trenches for piping and equipment with bottoms of trench to accurate elevations for support of pipe and equipment on undisturbed soil.
    - a. For pipes or equipment 6 inches or larger in nominal size, shape bottom of trench to fit bottom 1/4 of the circumference. Fill unevenness with tamped sand backfill. At each pipe joint over-excavate to relieve the bell or pipe joint of the pipe of loads, and to ensure continuous bearing of the pipe barrel on the bearing surface.
- K. Cold Weather Protection: Protect excavation bottoms against freezing when atmospheric temperature is less than 35°F.
- L. Backfilling and Filling: Place soil materials in layers to required subgrade elevations for each area classification listed below, using materials specified in Part 2 of this Section.
1. Under walks and pavements, use a combination of subbase materials and excavated or borrowed materials.
  2. Under building slabs, use drainage fill materials.
  3. Under piping and equipment, use subbase materials where required over rock bearing surface and for correction of unauthorized excavation.
  4. For piping less than 30 inches below surface of roadways, provide 4-inch-thick concrete base slab support. After installation and testing of piping, provide a 4-inch thick concrete encasement (sides and top) prior to backfilling and placement of roadway subbase.
  5. Other areas, use excavated or borrowed materials.
- M. Backfill excavations as promptly as work permits, but not until completion of the following:
1. Inspection, testing, approval, and locations of underground utilities have been recorded.
  2. Removal of concrete formwork.
  3. Removal of shoring and bracing, and backfilling of voids.
  4. Removal of trash and debris.
- N. Placement and Compaction: Place backfill and fill materials in layers of not more than 8 inches in loose depth for material compacted by heavy equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.
- O. Before compaction, moisten or aerate each layer as necessary to provide optimum moisture content. Compact each layer to required percentage of maximum dry density or relative dry density for each area classification specified below. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
- P. Place backfill and fill materials evenly adjacent to structures, piping, and equipment to required elevations. Prevent displacement of piping and equipment by carrying material uniformly around them to approximately same elevation in each lift.
- Q. Compaction: Control soil compaction during construction, providing minimum percentage of density specified for each area classification indicated below.
1. Percentage of Maximum Density Requirements: Compact soil to not less than the following percentages of maximum density for soils which exhibit a well-defined moisture-density relationship (cohesive soils), determined in accordance with ASTM D 1557 and not less than the following percentages of relative density, determined in accordance with ASTM D

2049, for soils which will not exhibit a well-defined moisture-density relationship (cohesionless soils).

- a. Areas under structures, building slabs, steps, and pavements: Compact top 12 inches of subgrade and each layer of backfill or fill material to 90 percent maximum density for cohesive material, or 95 percent relative density for cohesionless material.
  - b. Areas under walkways: Compact top 6 inches of subgrade and each layer of backfill or fill material to 90 percent maximum density for cohesive material, or 95 percent relative density for cohesionless material.
  - c. Other areas: Compact top 6 inches of subgrade and each layer of backfill or fill material to 85 percent maximum density for cohesive soils, and 90 percent relative density for cohesionless soils.
2. Moisture Control: Where subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water. Apply water in minimum quantity necessary to achieve required moisture content and to prevent water appearing on surface during, or subsequent to, compaction operations.
- R. Subsidence: Where subsidence occurs at Fire Suppression installation excavations during the period 12 months after Substantial Completion, remove surface treatment (i.e., pavement, lawn, or other finish), add backfill material, compact to specified conditions, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent areas.

### 3.7 CUTTING AND PATCHING

- A. The Contractor shall do necessary cutting of walls, floors, ceilings and roofs.
- B. No structural member shall be cut without permission from Architect and Structural Engineer.
- C. Patch around openings to match adjacent construction.
- D. After the final waterproofing membrane has been installed, roofs may be cut only with written permission by the Architect.

### 3.8 CLEANING

- A. Dirt and refuse resulting from the performance of the work shall be removed from the premises as required to prevent accumulation. The Fire Suppression Contractor shall cooperate in maintaining reasonably clean premises at all times.
- B. Immediately prior to the final inspection, the Fire Suppression Contractor shall clean material and equipment installed under the Fire Suppression Contract. Dirt, dust, plaster, stains, and foreign matter shall be removed from surfaces including components internal to equipment. Damaged finishes shall be touched-up and restored to their original condition.

### 3.9 SUBSTANTIAL COMPLETION REVIEW

- A. Prior to requesting inspection for "CERTIFICATE OF SUBSTANTIAL COMPLETION", the Contractor shall complete the following items:
  1. Submit complete Operation and Maintenance Manuals.
  2. Submit complete Record Drawings.
  3. Perform special inspections.
  4. Start-up testing of systems.
  5. Removal of temporary facilities from the site.
  6. Comply with requirements for Substantial Completion in the "General Conditions".
- B. The Contractor shall request in writing a review for Substantial Completion. The Contractor shall give the Architect/Engineer at least seven (7) days notice prior to the review.

- C. The Contractor's written request shall state that the Contractor has complied with the requirements for Substantial Completion.
- D. Upon receipt of a request for review, the Architect/Engineer will either proceed with the review or advise the Contractor of unfulfilled requirements.
- E. If the Contractor requests a site visit for Substantial Completion review prior to completing the above mentioned items, they shall reimburse the Architect/Engineer for time and expenses incurred for the visit.
- F. Upon completion of the review, the Architect/Engineer will prepare a "final list" of outstanding items to be completed or corrected for final acceptance.
- G. Omissions on the "final list" shall not relieve the Contractor from the requirements of the Contract Documents.
- H. Prior to requesting a final review, the Contractor shall submit a copy of the final list of items to be completed or corrected. The Contractor shall state in writing that each item has been completed, resolved for acceptance or the reason it has not been completed.

END OF SECTION

**SUBSTITUTION REQUEST FORM**

To Project Engineer: \_\_\_\_\_ Request # (GC Determined): \_\_\_\_\_

Project Name: \_\_\_\_\_

Project No/Phase: \_\_\_\_\_ Date: \_\_\_\_\_

Specification Title: \_\_\_\_\_

Section Number: \_\_\_\_\_ Page: \_\_\_\_\_ Article/Paragraph: \_\_\_\_\_

Proposed Substitution: \_\_\_\_\_

Manufacturer: \_\_\_\_\_ Model No.: \_\_\_\_\_

Address: \_\_\_\_\_ Phone: \_\_\_\_\_

History:  New product  1-4 years old  5-10 years old  More than 10 years old

Differences between proposed substitution and specified Work: \_\_\_\_\_

Point-by-point comparative data attached – REQUIRED BY ENGINEER  
Comparative data may include but not be limited to performance, certifications, weight, size, durability, visual effect, sustainable design characteristics, warranties, and specific features and requirements. Include all information necessary for an evaluation.

**Substitution Certification Statement:**

Unless stated otherwise in writing to the Engineer by the Contractor, Contractor warrants to the Engineer, Architect, and Owner that the:

- ▲ A. Proposed substitution has been fully investigated and determined to meet or exceed the specified Work in all respects.
- B. Proposed substitution is consistent with the Contract Documents and will produce indicated results.
- C. Proposed substitution does not affect dimensions and functional clearances.
- D. Proposed substitution has received necessary approvals of authorities having jurisdiction.
- E. Same warranty will be furnished for proposed substitution as for specified Work.
- F. Same maintenance service and source of replacement parts, as applicable, is available.
- G. Proposed substitution will not adversely affect other trades or delay construction schedule.
- H. Coordination, installation, and changes in the Work as necessary for accepted substitution will be complete in all respects.

**SECTION 21 05 00 - COMMON WORK RESULTS FOR FIRE SUPPRESSION****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes limited scope general construction materials and methods for application with Fire Suppression installations as follows:
1. Access panels and doors in walls, ceilings, and floors for access to Fire Suppression materials and equipment.
  2. Concrete for bases and housekeeping pads.
  3. Non-shrink grout for equipment installations.
  4. Miscellaneous metals for support of Fire Suppression materials and equipment.
  5. Wood grounds, nailers, blocking, fasteners, and anchorage for support of Fire Suppression materials and equipment.
  6. Joint sealers for sealing around Fire Suppression materials and equipment.
- B. Related Sections: The following sections contain requirements that relate to this Section:
1. Division 7 Section "Penetration Firestopping" for material and methods for firestopping systems.
  2. Division 21 Section 210010 "General Fire Suppression Requirements" for requirements for hydraulic calculations, fire flow test data, obtaining electronic drawings files, shop drawings and record drawings.
  3. Division 21 Section 210515 "Basic Fire Suppression Piping Material and Methods," for general piping and fitting materials and methods.
  4. Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment" for labeling and identification of installed fire suppression equipment.
  5. Division 21 Section 211100 "Fire Suppression Water Service Piping" for fire suppression piping starting 5 feet outside the building to within the building.
  6. Division 21 Section 211200 "Fire Suppression Standpipes" for fire suppression standpipes inside the building.
  7. Division 21 Section 211313 "Water-Based Fire Suppression Systems" for fire suppression sprinkler systems inside the building.
  8. Division 21 Section 213113 "Electric-Drive Centrifugal Fire Pumps" for electric-driven fire pumps.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Division 1 and Division 21 Section "General Fire Suppression Requirements".
1. Product data for the following products:
    - a. Access panels and doors.
    - b. Through and membrane-penetration firestopping systems.
  2. Schedules indicating proposed methods and sequence of operations for selective demolition prior to commencement of Work. Include coordination for shut-off of utility services and details for dust and noise control.
    - a. Coordinate sequencing with construction phasing and Owner occupancy specified in Division 1 Section "Summary of Work."

**1.3 QUALITY ASSURANCE**

- A. Fire-Resistance Ratings: Where a fire-resistance classification is indicated, provide access door assembly with panel door, frame, hinge, and latch from manufacturer listed in the UL "Building Materials Directory" for rating shown.

1. Provide UL Label on each fire-rated access door.

## **PART 2 - PRODUCTS AND MATERIALS**

### **2.1 ACCESS TO EQUIPMENT**

- A. Acceptable Manufacturers:
  1. Bar-Co., Inc.
  2. Elmdor Stoneman.
  3. JL Industries
  4. Jay R. Smith Mfg. Co.
  5. Karp Associates, Inc.
  6. Milcor
  7. Nystrom Building Products
  8. Wade
  9. Zurn
- B. Access Doors:
  1. Provide access doors for all concealed equipment, except where above lay-in ceilings. Refer to Section "Identification for Fire Suppression Piping and Equipment" for labeling of access doors.
  2. Access doors shall be adequately sized for the devices served with a minimum size of 18 inches x 18 inches, furnished by the respective Contractor or Subcontractor and installed by the General Contractor.
  3. Access doors must be of the proper construction for type of construction where installed.
  4. The exact location of all access doors shall be verified with the Architect prior to installation.
  5. Steel Access Doors and Frames: Factory-fabricated and assembled units, complete with attachment devices and fasteners ready for installation. Joints and seams shall be continuously welded steel, with welds ground smooth and flush with adjacent surfaces.
  6. Frames: 16-gauge steel, with a 1-inch-wide exposed perimeter flange for units installed in unit masonry, pre-cast, or cast-in-place concrete, ceramic tile, or wood paneling.
    - a. For installation in masonry, concrete, ceramic tile, or wood paneling: 1-inch-wide exposed perimeter flange and adjustable metal masonry anchors.
    - b. For installation in gypsum wallboard or plaster: perforated flanges with wallboard bead.
    - c. For installation in full-bed plaster applications: galvanized, expanded metal lath and exposed casing bead, welded to perimeter of frame.
  7. Flush Panel Doors: 14-gauge sheet steel, with concealed spring hinges or concealed continuous piano hinge set to open 175 degrees; factory-applied prime paint.
    - a. Fire-Rated Units: Insulated flush panel doors, with continuous piano hinge and self-closing mechanism.
  8. Locking Devices: Flush, screwdriver-operated cam locks.

### **2.2 FIRE SUPPRESSION EQUIPMENT NAMEPLATE DATA**

- A. For each piece of power operated Fire Suppression equipment, provide a permanent operational data nameplate indicating manufacturer, product name, model number, serial number, capacity, operating and power characteristics, labels of tested compliance's, and similar essential data. Locate nameplates in an accessible location.

### **2.3 CONCRETE EQUIPMENT BASES HOUSEKEEPING PADS**

- A. Provide concrete equipment bases and housekeeping pads for various pieces of floor mounted Fire Suppression equipment. Concrete equipment bases/housekeeping pads shall generally

conform to the shape of the piece of equipment it serves with a minimum 4" margin around the equipment and supports.

- B. Form concrete equipment bases and housekeeping pads using framing lumber or steel channel with form release agent. Chamfer top edges and corners. Trowel tops and sides of each base/pad to a smooth finish, equal to that of the floors.
- C. Concrete equipment bases and housekeeping pads shall be made of a minimum 28 day, 4000 psi concrete conforming to American Concrete Institute Standard Building Code for Reinforced Concrete (ACI 318-99) and the latest applicable recommendations of the ACI standard practice manual. Concrete shall be composed of cement conforming to ASTM C 150 Type I, aggregate conforming to ASTM C33, and potable water. All exposed exterior concrete shall contain 5 to 7 percent air entrainment.
- D. Unless otherwise specified or shown on the structural drawings, reinforce equipment bases and housekeeping pads with No. 4 reinforcing bars conforming to ASTM A 615 or 6x6 – W2.9 x W2.9 welded wire mesh conforming to ASTM A185. Reinforcing bars shall be placed 24" on center with a minimum of two bars each direction.
- E. Provide galvanized anchor bolts for all equipment placed on concrete equipment bases and housekeeping pads or on concrete slabs. Anchor bolts size, number and placement shall be as recommended by the Manufacturer of the equipment.
- F. Concrete equipment bases and housekeeping pads shall have minimum heights in accordance with the following table:

Equipment	Minimum Height
Pumps and Equipment Less than or equal to 20 tons and Other Equipment Not Listed – Note 1	3-1/2"
Pumps 30 HP to 75 HP (See Note 1)	7-1/4"
Pumps greater than 75 HP (See Note 1)	11-1/4"

**NOTES:**

1. Height of equipment bases applies to equipment installed on slab-on-grade. For equipment installed on floors above grade and/or roof, reference the drawings.

## **2.4 GROUT**

- A. Provide nonshrink, nonmetallic grout conforming to ASTM C 1107, Grade B, in premixed and factory-packaged containers.
- B. Grout shall have post-hardening, volume-adjusting, dry, non-staining, non-corrosive, non-gaseous, hydraulic-cement characteristics and shall be as recommended by manufacturer for interior and exterior applications.
- C. Grout shall have 5,000 psi, 28-day compressive strength design mix.

## **2.5 MISCELLANEOUS METALS**

- A. Steel plates, shapes, bars, and bar grating: ASTM A 36.
- B. Cold-Formed Steel Tubing: ASTM A 500.
- C. Hot-Rolled Steel Tubing: ASTM A 501.
- D. Steel Pipe: ASTM A 53, Schedule 40, welded.
- E. Fasteners: Zinc-coated, type, grade, and class as required.

**2.6 MISCELLANEOUS LUMBER**

- A. Framing Materials: Standard Grade, light-framing-size lumber of any species. Number 3 Common or Standard Grade boards complying with WCLIB or AWPA rules, or Number 3 boards complying with SPIB rules. Lumber shall be preservative treated in accordance with AWPB LP-2, and kiln dried to a moisture content of not more than 19 percent.
  - 1. Framing materials shall be fire resistant treated for use in Type I and II buildings.
- B. Construction Panels: Plywood panels; APA C-D PLUGGED INT, with exterior glue; thickness as indicated, or if not indicated, not less than 15/32 inches.
  - 1. Framing materials shall be fire resistant treated for use in Type I and II buildings.

**2.7 JOINT SEALERS**

- A. General: Joint sealers, joint fillers, and other related materials compatible with each other and with joint substrates under conditions of service and application.
- B. Colors: As selected by the Architect from manufacturer's standard colors.
- C. Elastomeric Joint Sealers: Provide the following types:
  - 1. One-part, nonacid-curing, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for masonry, glass, aluminum, and other substrates recommended by the sealant manufacturer. Provide one of the following:
    - a. "Dow Corning 790," Dow Corning Corp.
    - b. "Silglaze II SCS 2801," General Electric Co.
    - c. "Silpruf SCS 2000," General Electric Co.
    - d. "864," Pecora Corp.
    - e. "Rhodia 5C," Rhone-Poulenc, Inc.
    - f. "Spectrem 1," Tremco, Inc.
    - g. "Spectrem 2," Tremco, Inc.
    - h. "Dow Corning 795," Dow Corning Corp.
    - i. "Rhodia 7B," Rhone-Poulenc, Inc.
    - j. "Rhodia 7S," Rhone-Poulenc, Inc.
    - k. "OmniSeal," Sonneborn Building Products Div.
  - 2. One-part, mildew-resistant, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for glass, aluminum, and nonporous joint substrates; formulated with fungicide; intended for sealing interior joints with nonporous substrates; and subject to in-service exposure to conditions of high humidity and temperature extremes. Provide one of the following:
    - a. "Dow Corning 786," Dow Corning Corp.
    - b. "Sanitary 1700," General Electric Co.
    - c. "898 Silicone Sanitary Sealant," Pecora Corp.
    - d. "OmniPlus," Sonneborn Building Products Div.
- D. Acrylic-Emulsion Sealants: One-part, nonsag, mildew-resistant, paintable complying with ASTM C 834 recommended for exposed applications on interior and protected exterior locations involving joint movement of not more than plus or minus 5 percent.
  - 1. Products: Subject to compliance with requirements, provide one of the following:
    - a. "Chem-Calk 600," Bostik Construction Products Div.
    - b. "AC-20," Pecora Corp.
    - c. "Sonolac," Sonneborn Building Products Div.
    - d. "Tremflex 834," Tremco, Inc.

**2.8 ACOUSTICAL SEALANTS**

- A. General: Penetrations by pipes through surfaces that are around and between noise critical spaces shall be sleeved, packed and sealed airtight with foam rod, non-hardening sealant and/or packing material as described herein.

- B. Foam Rod: Foam backer rod shall be closed cell polyethylene suitable for use as a backing for non-hardening sealant.
- C. Non-Hardening Sealant: Sealant for penetrations shall be non-hardening polysulphide type. Permanently flexible, approved firestop putty may be used in lieu of the sealant on foam rod in noise critical walls that are also fire rated.
- D. Packing Material: Mineral fiber; non-combustible; resistant to water, mildew and vermin. Expanding resilient foams manufactured for this purpose are an acceptable alternative only if the material density is at least 15 pcf (40 kg/m<sup>3</sup>).

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION OF ACCESS DOORS**

- A. Set frames accurately in position and securely attached to supports, with face panels plumb and level in relation to adjacent finish surfaces.
- B. Adjust hardware and panels after installation for proper operation.

#### **3.2 ERECTION OF METAL SUPPORTS AND ANCHORAGE**

- A. Cut, fit, and place miscellaneous metal fabrications accurately in location, alignment, and elevation to support and anchor Fire Suppression materials and equipment.
- B. Field Welding: Comply with AWS "Structural Welding Code."

#### **3.3 ERECTION OF WOOD SUPPORTS AND ANCHORAGE**

- A. Cut, fit, and place wood grounds, nailers, blocking, and anchorage accurately in location, alignment, and elevation to support and anchor Fire Suppression materials and equipment.
- B. Select fastener sizes that will not penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood members.
- C. Attach to substrates as required to support applied loads.

#### **3.4 PREPARATION FOR JOINT SEALERS**

- A. Surface Cleaning for Joint Sealers: Clean surfaces of joints immediately before applying joint sealers to comply with recommendations of joint sealer manufacturer.
- B. Apply joint sealer primer to substrates as recommended by joint sealer manufacturer. Protect adjacent areas from spillage and migration of primers, using masking tape. Remove tape immediately after tooling without disturbing joint seal.

#### **3.5 APPLICATION OF JOINT SEALERS**

- A. General: Comply with joint sealer manufacturers' printed application instructions applicable to products and applications indicated, except where more stringent requirements apply.
  - 1. Comply with recommendations of ASTM C 962 for use of elastomeric joint sealants.
  - 2. Comply with recommendations of ASTM C 790 for use of acrylic-emulsion joint sealants.
- B. Tooling: Immediately after sealant application and prior to time shinning or curing begins, tool sealants to form smooth, uniform beads; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

**3.6 PENETRATIONS**

- A. New Construction:
  - 1. Coordinate with Divisions 03 and 04 for installation of sleeves and sleeve seals integrally in cast-in-place, precast, and masonry walls and horizontal slabs where indicated on the Drawings or as required to support piping penetrations.
- B. Provide sleeves and/or box frames for openings in all concrete and masonry construction and fire or smoke partitions, for all mechanical work that passes through such construction; Coordinate with other trades and Divisions to dimension and lay out all such openings.
- C. The General Contractor will provide only those openings specifically indicated on the Architectural or Structural Drawings as being provided under the General Contractor's work.
- D. The cutting of new or existing construction shall not be permitted except by written approval of the Architect.
- E. Floor sleeves shall be fitted with means for attachment to forms and shall be of length to extend at least two inches above the floor level.
- F. Cut sleeves to length for mounting flush with both surfaces of walls.
- G. Seal space outside of sleeves with grout for penetrations of concrete and masonry.
- H. Seal space outside of sleeves with approved joint compound for penetrations of gypsum board assemblies.
- I. All openings sleeved through underground exterior walls shall be sealed with mechanical sleeve seals as specified in Division 21 Section "Basic Fire Suppression Piping Materials and Methods

END OF SECTION

**SECTION 21 05 15 - BASIC FIRE SUPPRESSION PIPING MATERIALS AND METHODS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section specifies piping materials and installation methods common to more than one Section of Division 21 and includes piping, joining materials, piping specialties and basic piping installation instructions.
- B. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 21 Section 210010 "General Fire Suppression Requirements" for requirements for hydraulic calculations, fire flow test data, obtaining electronic drawings files, shop drawings and record drawings.
  - 2. Division 21 Section 210500 "Common Work Results for Fire Suppression," for materials and methods for wall and floor penetrations.
  - 3. Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment" for labeling and identification of installed fire suppression equipment.
  - 4. Division 21 Section 211100 "Fire Suppression Water Service Piping" for fire suppression piping starting 5 feet outside the building to within the building.
  - 5. Division 21 Section 211200 "Fire-Suppression Standpipes" for fire-suppression standpipes inside the building.
  - 6. Division 21 Section 211313 "Water-Based Fire Suppression Systems" for fire-suppression sprinkler systems inside the building.
  - 7. Division 21 Section 213113 "Electric-Drive Centrifugal Fire Pumps" for electric-driven fire pumps.

**1.2 SUBMITTALS**

- A. Refer to Division 1 and Division 21 "General Fire Suppression Requirements" for administrative and procedural requirements for submittals.
- B. Product Data: Submit product data on the following items:
  - 1. Piping and Fittings
  - 2. Escutcheons
  - 3. Dielectric Unions and Fittings
  - 4. Sleeves and Mechanical Sleeve Seals
  - 5. Wall Pipes

**1.3 QUALITY ASSURANCE**

- A. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.
- B. Soldering and Brazing procedures shall conform to ANSI B9.1 Standard Safety Code for Plumbing Refrigeration.
- C. Threaded joints shall conform to ASME B1.20.1, Pipe Threads, General Purpose and the Pipe Fitters Handbook.
- D. UL I Compliance: Fire protection system materials and components shall be Underwriter's Laboratories listed and labeled for fire service.
- E. Pipe, piping specialties and fittings shall be manufactured in plants located in the United States.

**PART 2 - PRODUCTS AND MATERIALS****2.1 GENERAL REQUIREMENTS**

- A. All fire suppression system materials and components essential to successful system operation shall be listed for their intended purpose.
- B. General: Refer to the individual piping system specification sections in Division 21 for specifications on piping and fittings relative to that particular system.

**2.2 STEEL PIPE AND FITTINGS**

- A. All piping 2-inch and smaller:
  - 1. With the use of welded or roll grooved fittings: ASTM A135 or 795, Grade A, Schedule 10 or 40, seamless or ERW, black steel pipe.
  - 2. With the use of threaded fittings: ASTM A135 or 795, Grade A, Schedule 40, seamless or ERW, black steel pipe.
- B. All piping 2-1/2" and larger: ASTM A135 or 795, Grade A, Schedule 10, ERW, black steel pipe, roll grooved ends.
- C. Piping used in dry pipe and preaction sprinkler systems shall be ASTM A135 or 795, Type E, Grade A, Schedule 40, black steel pipe, threaded or roll grooved ends.
- D. All piping on the exterior of the building shall be externally galvanized or painted.
- E. Acceptable alternatives to Schedule 40 and Schedule 10 pipe shall be manufactured to standards recognized by NFPA 13. Threaded pipe shall have a corrosion resistance rating (CRR) of 1.0 or greater. Crimp type couplings shall not be used. Threadable thinwall pipe with CRR less than 1.0 not permitted.
- F. Cast-Iron Threaded Fittings: ANSI B16.4, Class 125, standard pattern, for threaded joints. Threads shall conform to ANSI B1.20.1.
- G. Black Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, standard-weight, seamless steel pipe with threaded ends.
- H. Steel Couplings: ASTM A 865, threaded
- I. Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.
- J. Malleable-Iron Threaded Fittings: ANSI B16.3, Class 150, standard pattern, for threaded joints. Threads shall conform to ANSI B1.20.1.
- K. Malleable- or Ductile-Iron Unions: UL 860.
- L. Cast-Iron Flanges: ASME 16.1, Class 125.
- M. Steel Flanges and Flanged Fittings: ASME B16.5, Class 150.
- N. Steel Welding Fittings: ASTM A 234/A 234M and ASME B16.9.
- O. Grooved-Joint, Steel-Pipe Appurtenances
  - 1. Grooved-End Fittings for Steel Piping: ASTM A 47/A 47M, malleable-iron casting or ASTM A 536, ductile-iron casting; with dimensions matching steel pipe.
  - 2. Grooved-End-Pipe Couplings for Steel Piping: AWWA C606 and UL 213, rigid pattern, unless otherwise indicated, for steel-pipe dimensions. Include ferrous housing sections, EPDM-rubber gasket, and bolts and nuts.
  - 3. Grooved mechanical couplings including gaskets used on dry-pipe systems shall be listed for dry-pipe service.

**2.3 COPPER TUBE AND FITTINGS**

- A. Hard Copper Tube: ASTM B 88, Type L, water tube, drawn temper.
- B. Cast-Copper, Solder-Joint Fittings: ASME B16.18, pressure fittings.
- C. Wrought-Copper, Solder-Joint Fittings: ASME B16.22, pressure fittings.
- D. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends.
- E. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

**2.4 JOINING MATERIALS**

- A. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch thick or ASME B16.21, nonmetallic and asbestos free.
  - 1. Class 125, Cast-Iron Flanges and Class 150, Bronze Flat-Face Flanges: Full-face gaskets.
  - 2. Class 250, Cast-Iron Flanges and Class 300, Steel Raised-Face Flanges: Ring-type gaskets.
- B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.
- C. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.
- D. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

**2.5 LISTED FIRE-PROTECTION VALVES**

- A. General Requirements:
  - 1. Valves shall be UL listed approved.
  - 2. Minimum Pressure Rating for Standard-Pressure Piping: 175 psig.
- B. Check Valves:
  - 1. Description: Swing-check type, rubber-face checks unless otherwise indicated, and ends matching piping.
  - 2. Standard: UL 312.
  - 3. Pressure Rating: 250 psig minimum.
  - 4. Type: Swing check.
  - 5. Body Material: Cast iron.
  - 6. End Connections: Flanged or grooved.
- C. Bronze OS&Y Gate Valves:
  - 1. Description: Bronze body and bonnet and bronze stem.
  - 2. Standard: UL 262.
  - 3. Pressure Rating: 175 psig.
  - 4. Body Material: Bronze.
  - 5. End Connections: Threaded or grooved.
- D. Iron OS&Y Gate Valves:
  - 1. Description: Iron body and bonnet and bronze seating material.
  - 2. Standard: UL 262.
  - 3. Pressure Rating: 250 psig minimum.
  - 4. Body Material: Cast or ductile iron.
  - 5. End Connections: Flanged or grooved.
- E. Indicating-Type Butterfly Valves:
  - 1. Standard: UL 1091.
  - 2. Pressure Rating: 175 psig minimum.

3. Valves NPS 2 and Smaller:
  - a. Valve Type: Ball or butterfly.
  - b. Body Material: Bronze.
  - c. End Connections: Threaded or grooved.
4. Valves NPS 2-1/2 and Larger:
  - a. Valve Type: Butterfly.
  - b. Body Material: Cast or ductile iron.
  - c. End Connections: Flanged or grooved.
5. Valve Operation: Integral, prewired supervisory switch and visual indicating device.

## 2.6 TRIM AND DRAIN VALVES

- A. General Requirements:
  1. Standard: UL's "Fire Protection Equipment Directory" listing .
  2. Pressure Rating: 175 psig minimum.
- B. Automatic (Ball Drip) Drain Valves:
  1. Standard: UL 1726.
  2. Pressure Rating: 175 psig minimum.
  3. Type: Automatic draining, ball check.
  4. Size: NPS 3/4.
  5. End Connections: Threaded.

## 2.7 AUTOMATIC AIR RELEASE VALVE

- A. Standard: UL 2573
- B. Pressure Rating: 175 psig minimum.

## 2.8 PIPING SPECIALTIES

- A. Escutcheons: Inside diameter shall closely fit pipe outside diameter, or outside of pipe insulation where pipe is insulated. Outside diameter shall completely cover the opening in floors, walls, or ceilings.
  1. One-Piece, Cast-Brass Type: With polished, chrome-plated finish and setscrew fastener.
  2. One-Piece, Stamped-Steel Type: With chrome-plated finish and spring-clip fasteners.
  3. Split-Casting Brass Type: With polished, chrome-plated finish and with concealed hinge and setscrew.
  4. Split-Plate, Stamped-Steel Type: With chrome-plated finish, concealed hinge, and spring-clip fasteners.
- B. Floor Plates: Inside diameter shall closely fit pipe outside diameter. Outside diameter shall completely cover the opening in floors, walls, or ceilings.
  1. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.
  2. Split-Casting Floor Plates: Cast brass with concealed hinge.
- C. Unions: Malleable-iron, Class 150 for low pressure service and class 250 for high pressure service; hexagonal stock, with ball-and-socket joints, metal-to-metal bronze seating surfaces; female threaded ends.
- D. Dielectric Unions and Fittings: Provide factory-fabricated dielectric unions and fittings with appropriate end connections for the pipe materials in which installed (screwed, soldered, or flanged), which effectively isolate dissimilar metals, prevent galvanic action, and stop corrosion.
- E. Pressure Gauges
  1. Standard: UL 393.
  2. Dial Size: 3-1/2- to 4-1/2-inch diameter.
  3. Pressure Gage Range: 0 to 300 psig.

4. Water System Piping Gage: Include "WATER" or "AIR/WATER" label on dial face.
5. Air System Piping Gage: Include "AIR" or "AIR/WATER" label on dial face.

## 2.9 PENETRATIONS

- A. Sleeves:
  1. Steel Sleeves: Schedule 40 galvanized, welded steel pipe, ASTM A-53 grade A or 12 gauge (0.1084 inches) welded galvanized steel formed to a true circle concentric to the pipe.
  2. Sheet-Metal Sleeves: 10 gauge (0.1382 inches), galvanized steel, round tube closed with welded longitudinal joint.
  3. Frames for rectangular openings attached to forms and of a maximum dimension established by the Architect. For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches, provide 18 gauge (0.052 inches) welded galvanized steel. For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches and 1 or more sides equal to, or greater than, 16 inches, provide 10 gauge (0.1382 inches) welded galvanized steel. Notify the General Contractor or Architect before installing any box openings not shown on the Architectural or Structural Drawings.
  4. Box Frames: Frames for rectangular openings shall be of welded 12 gauge steel attached to forms and of a maximum dimension established by the Architect. Contractor shall notify the General Contractor or Architect before installing any box openings not shown on the Architectural or Structural Drawings.
- B. Wall Pipes
  1. Cast-iron sleeve with integral clamping flange with clamping ring, bolts, and nuts for membrane flashing.
    - a. Underdeck Clamp: Clamping ring with setscrews.
- C. Mechanical Sleeve Seals: Modular Plumbing type, consisting of interlocking synthetic rubber links shaped to continuously fill annular space between pipe and sleeve, connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation.
  1. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
    - a. Pressure Plates: Carbon steel or stainless steel.
    - b. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, or Stainless steel of length required to secure pressure plates to sealing elements.

## PART 3 - EXECUTION

### 3.1 PREPARATION

- A. Ream ends of pipes and tubes, and remove burrs. Bevel plain ends of steel pipe.
- B. Remove scale, slag, dirt, and debris for both inside and outside of piping and fittings before assembly.

### 3.2 PIPING INSTALLATIONS

- A. General Locations and Arrangements: Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of the piping systems. Location and arrangement of piping layout take into consideration pipe sizing and friction loss, expansion, pump sizing, and other design considerations. So far as practical, install piping as indicated. Refer to individual system specifications for requirements for coordination drawing submittals.

- B. Coordinate installation of horizontal piping with other components. Allow sufficient space above removable ceiling panels to allow for panel removal (minimum 6" clearance).
- C. Install system such that all piping is rigidly secured and supported. All ductwork, lights, structural members and main runs of piping shall take precedence over sprinkler piping. Cutting of structural members for passage of sprinkler pipes or hangers shall not be permitted. All horizontal piping in ceiling space shall be at an elevation above the top of light fixtures and air outlets to allow for access to light fixtures and air outlets without removing horizontal piping. Route all sprinkler piping and provide all offsets, bends, and elbows around all mechanical, electrical, and structural members as required.
- D. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated otherwise. In areas with ceilings, piping shall be routed concealed, above ceiling. In areas without ceilings, piping shall extend as high as possible.
- E. Install piping free of sags and bends and with ample space between piping to permit proper insulation applications.
- F. Install exposed piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated on the Drawings.
- G. Locate groups of pipes parallel to each other, spaced to permit applying full insulation and servicing of valves.
- H. Support piping from structure. Do not support piping from ceilings, equipment, ductwork, conduit and other non-structural elements.
- I. Install sprinkler piping to provide for system drainage in accordance with NFPA 13. Install drains at low points in mains, risers, and branch lines consisting of a tee fitting, NPS 3/4 ball valve, and short NPS 3/4 threaded nipple and cap.
- J. Coordinate pipe routing near electrical equipment in accordance with NFPA 70.
- K. Verify final equipment locations for roughing in.
- L. Deviations from approved "Working Plans" for sprinkler piping require written approval of the Authority Having Jurisdiction. Written approval shall be on file with the Engineer prior to deviating from the approved "Working Plans."
- M. Install escutcheons for exposed piping penetrations of walls, ceilings, and floors.

### 3.3 JOINT CONSTRUCTION

- A. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.
- B. Use approved fittings to make all changes in direction, branch takeoffs from mains, and reductions in pipe sizes.
- C. Install unions in pipes NPS 2 and smaller, adjacent to each valve. Unions are not required on flanged devices or in piping installations using grooved mechanical couplings.
- D. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 and larger end connections.
- E. Install dielectric unions to connect piping materials of dissimilar metals in dry piping systems.
- F. Non-ferrous Pipe Joints:
  - 1. Brazed and Soldered Joints: For copper tube and fitting joints, braze joints in accordance with ANSI B31.9 - Standard Code for Building Services Piping.

2. Thoroughly clean tube surface and inside surface of the cup of the fittings, using very fine emery cloth, prior to making soldered or brazed joints. Wipe tube and fittings clean and apply flux. Flux shall not be used as the sole means for cleaning tube and fitting surfaces.
- G. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.
- a. Shop weld pipe joints where welded piping is indicated. Do not use welded joints for galvanized-steel pipe.
- H. Threaded Joints: Conform to ANSI B1.20.1, tapered pipe threads for field cut threads and Pipe Fitter's Handbook. Join pipe, fittings, and valves as follows:
1. Note the internal length of threads in fittings or valve ends, and proximity of internal seat or wall, to determine how far pipe should be threaded into joint.
  2. Align threads at point of assembly.
  3. Apply appropriate tape or thread compound to the external pipe threads.
  4. Assemble joint to appropriate thread depth. When using a wrench on valves place the wrench on the valve end into which the pipe is being threaded.
  5. Damaged Threads: Do not use pipe with threads that are corroded, or damaged. If a weld opens during cutting or threading operations, that portion of pipe shall not be used.
- I. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9. Align flanged surfaces parallel. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible. Use suitable lubricants on bolt threads. Tighten bolts gradually and uniformly to appropriate torque specified by the bolt manufacturer.
- J. Mechanical Grooved Joints: Roll grooves on pipe ends dimensionally compatible with the couplings. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe joints.
- K. Joints for other piping materials are specified within the respective piping system sections.

### 3.4 ALARM DEVICE INSTALLATION

- A. General: Comply with NFPA 24 for devices and methods of valve supervision.
- B. Supervisory Switches: Supervise valves in open position unless noted otherwise.
1. Valves: Grind away portion of exposed valve stem. Bolt switch, with plunger in stem depression, to OS&Y gate-valve yoke.
  2. Indicator Posts: Drill and thread hole in upper-barrel section at target plate. Install switch, with toggle against target plate, on barrel of indicator post.
- C. Locking and Sealing: Secure unsupervised valves as follows:
1. Valves: Install chain and padlock on open OS&Y gate valve.
  2. Post Indicators: Install padlock on wrench on indicator post.
- D. Water-Flow Indicators: Install in fire suppression piping where indicated. Select indicator with saddle and vane matching pipe size. Drill hole in pipe, insert vane, and bolt saddle to pipe.
- E. Connect alarm devices to building's fire-alarm system. Wiring and fire-alarm devices are specified in Division 28 Sections.

### 3.5 PIPING PROTECTION

- A. Protect piping during construction period, to avoid clogging with dirt and debris, and to prevent damage from traffic and construction work.
- B. Place plugs in ends of uncompleted piping at the end of each day or whenever work stops.

**3.6 PENETRATIONS**

- A. Fire suppression penetrations occur when piping penetrate concrete slabs, concrete or masonry walls, or fire / smoke rated floor and wall assemblies.
- B. Above Grade Concrete or Masonry Penetrations
1. Provide sleeves for pipes passing through above grade concrete or masonry walls, concrete floor or roof slabs. Sleeves are not required for core drilled holes in existing masonry walls, concrete floors or roofs. Provide sleeves as follows:
    - a. Provide schedule 40 galvanized steel pipe for sleeves smaller than 6 inches in diameter.
    - b. Provide galvanized sheet metal for sleeves 6 inches in diameter and larger, thickness shall be 10 gauge (0.1382 inches).
    - c. Provide welded galvanized sheet metal for rectangular sleeves with the following minimum metal thickness:
      - 1) For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches, thickness shall be 18 gauge (0.052 inches).
      - 2) For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches and 1 or more sides equal to, or greater than, 16 inches, thickness shall be 10 gauge (0.1382 inches).
    - d. Schedule 40 PVC pipe sleeves are acceptable for use in areas without return air plenums.
  2. Seal elevated floor, exterior wall and roof penetrations watertight and weathertight with non-shrink, non-hardening commercial sealant. Pack with mineral wool and seal both ends with minimum of ½" of sealant.
- C. Underground, Exterior-Wall Penetrations: Install cast-iron wall pipes for sleeves. Size sleeves to allow for 1-inch (or larger, if required by the mechanical sleeve manufacturer) annular clear space between pipe and sleeve. Provide mechanical sleeve seal.
1. Use type and number of sealing elements recommended by manufacturer for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
  2. Inspect installed sleeve and sleeve-seal installations for damage and faulty work. Verify watertight integrity of sleeves and seals installed below grade to seal against hydrostatic pressure.
- D. Elevated Floor Penetrations of Waterproof Membrane:
1. Provide cast-iron wall pipes for sleeves, extend top of wall pipe minimum 1" above finish floor. Size wall pipe for minimum ½" annular space between pipe and wall pipe.
  2. Extend pipe insulation for insulated pipe through wall pipe. The vapor barrier shall be maintained. Size wall pipe for a minimum of 1" annular clear space between inside of sleeve and outside of insulation.
  3. Pack with mineral wool and seal both ends with minimum of ½" of waterproof sealant. Refer to Division 07 Section "Joint Sealants" for materials and installation.
  4. Secure waterproof membrane flashing between clamping flange and clamping ring. Comply with requirements for flashing specified in Division 7 Section "Sheet Metal Flashing and Trim."
  5. Extend bottom of wall pipe below floor slab as required and secure underdeck clamp to hold wall pipe rigidly in place.
- E. Interior Foundation Penetrations: Provide sleeves for horizontal pipe passing through or under foundation. Sleeves shall be cast iron soil pipe two nominal pipe sizes larger than the pipe served.
- F. Concrete Slab on Grade Penetrations:
1. Provide schedule 40 PVC pipe sleeves for vertical pressure pipe passing through concrete slab on grade. Sleeves shall be one nominal pipe size larger than the pipe served and two pipe sizes larger than pipe served for ductile iron pipes with restraining rods. Seal watertight with silicone caulk.

2. Provide 1/2-inch thick cellular foam insulation around perimeter of non-pressure pipe passing thru concrete slab on grade. Insulation shall extend to 2-inch above and below the concrete slab.
- G. Interior Penetrations of Non-Fire-Rated Walls: Seal annular space between sleeve and pipe or duct, using joint sealant appropriate for size, depth, and location of joint. Pack with mineral wool and seal both ends with minimum of 1/2-inch of sealant. Refer to Division 21 Section "Common Work Results for Fire Suppression" for materials and installation.
1. Extend pipe insulation for insulated pipe through sleeve. The vapor barrier shall be maintained. Size sleeve for a minimum of 1-inch annular clear space between inside of sleeve and outside of insulation.
- H. Exterior Wall Penetrations: Seal annular space between sleeve and pipe or duct, using joint sealant appropriate for size, depth, and location of joint. Pack with mineral wool and seal both ends with minimum of 1/2-inch of waterproof sealant. Refer to Division 07 Section "Joint Sealants" for materials and installation.
1. Extend pipe insulation for insulated pipe through sleeve. The vapor barrier shall be maintained. Size sleeve for a minimum of 1-inch annular clear space between inside of sleeve and outside of insulation.
- I. Fire / Smoke Rated Floor and Wall Assemblies: Seal around penetrations of fire rated assemblies to maintain fire resistance rating of assemblies. Coordinate fire ratings and locations with the architectural drawings. Install sealants in compliance with the manufacturer's UL listing. Refer to Division 21 Section "Common Work Results for Fire Suppression" for firestopping and materials.

### 3.7 ACOUSTICAL PENETRATIONS

- A. General: There shall be no direct contact of piping with shaft walls, floor slabs and/or partition. All openings around pipes in the structure surrounding the Fire Suppression equipment and surrounding noise-critical spaces shall be sealed, packed with caulking for the full depth of the penetration, as described herein. This includes all slab penetrations and penetrations of noise critical walls.
- B. Fire Sprinkler Piping
1. Where a pipe passes through a wall, ceiling or floor slab of a noise critical space, a steel sleeve shall be cast or grouted into the structure. The internal diameter of the sleeve shall be 2 inches larger than the external diameter of the pipe passing through it. After all of the piping is installed in that area, the Contractor shall check the clearance and correct it, if necessary, to within 1/2 inch. Pack the void full depth with packing material sealed at both ends, 1 inch deep, with non-hardening sealant backed by foam rod.

### 3.8 PIPE FIELD QUALITY CONTROL

- A. Testing: Refer to individual piping system specification sections.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 21 05 53 - IDENTIFICATION FOR FIRE-SUPPRESSION PIPING AND EQUIPMENT****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. Extent of Fire Suppression work to be identified as required by this Section is indicated on drawings and/or specified in other Division 21 Sections.
- B. Types of identification devices specified in this Section include the following:
  - 1. Equipment labels.
  - 2. Valve tags.
  - 3. Hydraulic placards.
- C. Related Sections
  - 1. Division 21 Section 210010 "General Fire Suppression Requirements" for requirements for hydraulic calculations, fire flow test data, obtaining electronic drawings files, shop drawings and record drawings.
  - 2. Division 21 Section 210500 "Common Work Results for Fire Suppression," for materials and methods for wall and floor penetrations.
  - 3. Division 21 Section 210515 "Basic Fire Suppression Piping Material and Methods," for general piping and fitting materials and methods.
  - 4. Division 21 Section 211100 "Fire Suppression Water Service Piping," for fire suppression piping starting 5 feet outside the building to within the building.
  - 5. Division 21 Section 211200 "Fire-Suppression Standpipes" for fire-suppression standpipes inside the building.
  - 6. Division 21 Section 211313 "Water-Based Fire Suppression Systems" for fire-suppression sprinkler systems inside the building.
  - 7. Division 21 Section 213113 "Electric-Drive Centrifugal Fire Pumps" for electric-driven fire pumps.

**1.2 CODES AND STANDARDS**

- A. ANSI Standards: Comply with ANSI A13.1 for lettering size, length of color field, colors, and viewing angles of identification devices.
- B. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13.

**1.3 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical product data and installation instructions for each identification material and device required.
- B. Maintenance Data: For each piping system to include in maintenance manuals.

**PART 2 - PRODUCTS****2.1 EQUIPMENT LABELS**

- A. Metal Labels for Equipment:
  - 1. Material and Thickness: Brass, aluminum, or anodized aluminum, 0.032 inch thick, with predrilled holes for attachment hardware.
  - 2. Background/Letter Color: Red/White or Bare Metal/Black.
  - 3. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

4. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
  5. Fasteners: Stainless-steel rivets or self-tapping screws.
  6. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- B. Plastic Labels for Equipment:
1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/16 inch thick, with predrilled holes for attachment hardware.
  2. Background/Letter Color: Red/White
  3. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
  4. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch
  5. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
  6. Fasteners: Stainless-steel rivets or self-tapping screws.
  7. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- C. Label Content: Include equipment's Drawing designation or unique equipment number,

## 2.2 VALVE TAGS

- A. Valve Tags: Stamped or engraved with 1/4-inch (6.4-mm) letters for piping-system abbreviation and 1/2-inch (13-mm) numbers.
1. Tag Material: Brass, stainless steel, aluminum or anodized aluminum, 0.032 inch thick, with predrilled holes for attachment hardware.
  2. Fasteners: Brass wire-link chain, beaded chain or S-hook.
  3. Valve-Tag Color: Red.
  4. Letter Color: White.

## 2.3 HYDRAULIC PLACARDS

- A. Provide hydraulic calculation placard attached to each riser in accordance with NFPA 13. Placard shall include location of design area or areas, discharge densities over the design area or areas, required flow and pressures at the base of riser, occupancy classification and maximum permitted storage height and configuration, hose stream allowance included in addition to the sprinkler demand and name of installing contractor. Information shall be permanently and clearly displayed on placard.

## PART 3 - EXECUTION

### 3.1 PREPARATION

- A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

### 3.2 EQUIPMENT IDENTIFICATION

- A. General: Install metal or plastic equipment marker on or near each major item of fire protection equipment and each operational device, as specified herein if not otherwise specified for each item or device. Provide signs for the following general categories of equipment and operational devices:

1. Pumps
2. Backflow Preventers

**3.3 VALVE-TAG INSTALLATION**

- A. Install tags on valves and control devices in fire suppression systems

**3.4 LABEL INSTALLATION**

- A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
- B. Coordinate installation of identifying devices with locations of access panels and doors.
- C. Install or permanently fasten labels on each major piece of equipment.
- D. Locate equipment labels where accessible and visible.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 21 11 00 - FIRE SUPPRESSION WATER SERVICE PIPING****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. The extent of this fire suppression water service piping shall be as specified herein. Contractor shall be responsible for preparation of design drawings, fabrication and installation for complete fire suppression water service piping for the building.
- B. This section specifies:
  - 1. Materials and equipment for fire suppression water service piping and related components starting 5-feet outside the building and the following:
    - a. Service entrance piping through floor into the building.
- C. This section includes:
  - 1. Pipe and fittings
  - 2. Valves
  - 3. Backflow preventers
  - 4. Fire department connection
  - 5. Alarm devices
  - 6. Accessories
- D. Provide facility fire suppression water service piping during construction in accordance with code.
- E. Related Documents: Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 21 Specifications Sections, apply to this section.
- F. Related Sections:
  - 1. .
  - 2. Division 21 Section 210010 "General Fire Suppression Requirements" for requirements for hydraulic calculations, fire flow test data, obtaining electronic drawings files, shop drawings and record drawings.
  - 3. Division 21 Section 210500 "Common Work Results for Fire Suppression," for materials and methods for wall and floor penetrations.
  - 4. Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment" for labeling and identification of installed fire suppression equipment.
  - 5. Division 21 Section 211200 "Fire Suppression Standpipes" for fire suppression standpipes inside the building.
  - 6. Division 21 Section 211313 "Water-Based Fire Suppression Systems" for fire suppression sprinkler systems inside the building.
  - 7. Division 21 Section 213113 "Electric-Drive Centrifugal Fire Pumps" for electric-driven fire pumps.

**1.2 SUBMITTALS**

- A. Submit shop drawings prepared in accordance with Division 21 Section 210010 "General Fire Suppression Requirements."
- B. Detail precast concrete vault assemblies and indicate dimensions, method of field assembly, and components.

**1.3 QUALITY ASSURANCE**

- A. Contractor shall be responsible for all permits and fees associated with preparation and approval of Drawings and the installation and approval of the Facility Fire Suppression Water Service Piping.

- B. Regulatory Requirements:
  - 1. Comply with requirements of utility company supplying water. Include tapping of water mains and backflow prevention.
  - 2. Comply with standards of authorities having jurisdiction for fire suppression water service piping, including materials, hose threads, installation, and testing.
- C. Piping materials shall bear label, stamp, or other markings of specified testing agency.
- D. NFPA 24, "Private Fire Service Mains and their Appurtenances", Latest Edition. Comply with NFPA 24 for materials, installations, tests, flushing, and valve and hydrant supervision for fire suppression water service piping.

#### 1.4 DELIVERY STORAGE AND HANDLING

- A. Preparation for Transport: Prepare valves according to the following:
  - 1. Ensure that valves are dry and internally protected against rust and corrosion.
  - 2. Protect valves against damage to threaded ends and flange faces.
  - 3. Set valves in best position for handling.
- B. During Storage: Use precautions for valves, including fire hydrants, according to the following:
  - 1. Do not remove end protectors unless necessary for inspection; then reinstall for storage.
  - 2. Protect from weather. Store indoors and maintain temperature higher than ambient dew point temperature. Support off the ground or pavement in watertight enclosures when outdoor storage is necessary.
- C. Handling: Use sling to handle valves if size requires handling by crane or lift. Rig valves to avoid damage to exposed parts. Do not use hand wheels or stems as lifting or rigging points.
- D. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.
- E. Protect stored piping from moisture and dirt. Elevate above grade. Do not exceed structural capacity of floor when storing inside.
- F. Protect flanges, fittings, and specialties from moisture and dirt.
- G. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

#### 1.5 PROJECT CONDITIONS

- A. Interruption of Existing Fire Suppression Water Service Piping: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water distribution service according to requirements indicated:
  - 1. Notify Construction Manager no fewer than seven days in advance of proposed interruption of service.
  - 2. Do not proceed with interruption of service without Construction Manager's written permission.

### PART 2 - PRODUCTS AND MATERIALS

#### 2.1 GENERAL

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for general piping fittings and piping specialty requirements.

**2.2 DUCTILE-IRON PIPE AND FITTINGS.**

- A. Mechanical-Joint, Cement Lined Ductile-Iron Pipe: AWWA C151/C104, with mechanical-joint bell and plain spigot end.
- B. Mechanical-Joint, Cement Lined Ductile-Iron Fittings: AWWA C110/C104, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
  - 1. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.
- C. Flanges: ASME B16.1, Class 125, cast iron.
- D. Ductile-Iron Deflection Fittings:
  - 1. Description: Compound, ductile-iron coupling fitting with sleeve and one or two flexing sections for up to 15-degree deflection, gaskets, and restrained-joint ends complying with AWWA C110 or AWWA C153. Include AWWA C111, ductile-iron glands, rubber gaskets, and steel bolts.
  - 2. Pressure Rating: 250 psig minimum.

**2.3 SERVICE ENTRANCE ASSEMBLY**

- A. At Contractor's option, the service entrance is permitted to utilize a one-piece riser assembly to enter the building.
  - 1. Assembly shall be Ames Fire and Waterworks Series IBR or approved equivalent. In-Building Riser shall be composed of a single extended 90 degree fitting of fabricated 304 stainless steel tubing, maximum working pressure 200 psi. The fitting shall have a grooved-end connection on the outlet (building) side and a CIPS coupler on the inlet (underground) side. The grooved end shall include a coupler and cap to facilitate testing of the underground piping.

**2.4 ENCASEMENT FOR PIPING**

- A. Standard: ASTM A 674 or AWWA C105.
- B. Material: Linear low-density PE film of 0.008-inch (0.20-mm) or High-density, cross-laminated PE film of 0.004-inch (0.10-mm) minimum thickness.
- C. Form: Sheet or tube.

**2.5 GATE VALVES**

- A. UL Listed Approved Gate Valves:
  - 1. UL listed , Iron, Non-rising Stem Gate Valves:
    - a. Description: Iron body and bonnet, bronze seating material, and inside screw.
    - b. Standards: UL 262 listing .
    - c. Pressure Rating: 175 psigminimum.
    - d. End Connections: Mechanical or push-on joint.
  - 2. UL-Listed Approved, Iron, OS&Y, Gate Valves:
    - a. Description: Iron body and bonnet and bronze seating material.
    - b. Standards: UL 262 listing .
    - c. Pressure Rating: 175 minimum.
    - d. End Connections: Flanged or grooved.

**2.6 CHECK VALVES**

- A. UL listed approved Check Valves:

1. Description: Swing-check type with pressure rating, rubber-face checks unless otherwise indicated, and ends matching piping.
2. Standards: UL 312 listing.
3. Pressure Rating: 175 psig minimum.

## 2.7 BACKFLOW PREVENTERS

- A. Double Check Detector Backflow Preventer Assembly:
1. Standards: ASSE 1048 and UL's "Fire Protection Equipment Directory" listing.
  2. Operation: Continuous-pressure applications.
  3. Body Material: Cast iron with interior lining complying with AWWA C550 or that is FDA approved; Steel with interior lining complying with AWWA C550 or that is FDA approved; or Stainless steel.
  4. End Connections: Threaded, flanged or grooved.
  5. Accessories:
    - a. Supervised butterfly or OS&Y gate valves. Backflow preventer and valves shall be listed as an assembly.
    - b. Bypass: With displacement-type water meter, shutoff valves, and backflow preventer.

## 2.8 FIRE DEPARTMENT CONNECTION

- A. Description: Freestanding, Siamese-type with cast-bronze body, thread inlets according to NFPA 1963 and matching local fire department hose threads, and threaded bottom outlet. Include lugged caps, gaskets, and chains; lugged swivel connection and drop clapper for each hose connection inlet; 18-inch high brass sleeve; and round escutcheon plate.
1. Standard: UL 405.
  2. Connections: Four NPS 2-1/2 inlets and one NPS 46 outlet.
  3. Inlet Alignment: Inline Horizontal .
  4. Finish Including Sleeve: Polished chrome plated
  5. Caps: Polished chrome plated
  6. Escutcheon Plate Marking: "AUTO SPKR&STANDPIPE" as applicable.

## PART 3 - EXECUTION

### 3.1 EARTHWORK

- A. Comply with excavating, trenching, and backfilling requirements in Section 312000 "Earth Moving."

### 3.2 PREPARATION FOUNDATION FOR BELOW GROUND WATER DISTRIBUTION PIPE AND FITTINGS

- A. Grade trench bottoms to provide a smooth, firm, and stable foundation, free from rock, throughout the length of the pipe.
- B. Remove unstable, soft, and unsuitable materials at the surface upon which pipes are to be laid and backfill with clean sand or pea gravel to indicated elevation.
- C. Pipe Beds:
1. Ductile Iron Pipe: Shape bottom of trench to fit bottom of pipe for 90-degrees (bottom 1/4 of the circumference). Fill unevenness with tamped sand backfill. At each pipe joint dig bell holes to relieve the bell of the pipe of all loads, and to ensure continuous bearing of the pipe barrel on the foundation. Provide first layer of pea gravel backfill 6-inch above pipe, tamp backfill with mechanical tamper to 85% to 95% compaction. For piping with

rock trench bottoms, provide sand pipe bed 6-inch underneath and around sides of pipe up to middle half of the pipe, including fittings.

- D. Provide backfill above top of pipe bed as required for field conditions. Refer to Division 21 Section 210010 "General Fire Suppression Requirements" for materials and methods for backfill.

### 3.3 PIPE APPLICATIONS

- A. Piping below grade: Provide cement lined ductile iron pipe and fittings with mechanical joints.

### 3.4 PIPING INSTALLATION

- A. Comply with NFPA 24 for fire service main piping materials and installation.
- B. Water main connection: Arrange with water utility company for tap of size and in location indicated in water main or tap water main according to the requirements of the water utility company.
- C. Install ductile-iron, water service piping according to AWWA C600 and AWWA M41.
  - 1. Install encasement for piping according to ASTM A 674 or AWWA C105.
- D. Bury piping with depth of cover over top of piping at least 30-inches, with top at least 12-inches below level of maximum frost penetration, and according to the following:
  - 1. Under Driveways: With at least 36-inches of cover over top.
- E. Install piping by tunneling or jacking, or combination of both, under streets and other obstructions that cannot be disturbed.
- F. Extend fire suppression water service piping and connect to water supply source and building fire suppression water service piping systems at locations and pipe sizes indicated.
  - 1. Terminate fire suppression water service piping at building floor slab until building water piping systems are installed. Terminate piping with caps, plugs, or flanges as required for piping material. Make connections to building's fire suppression water service piping systems when those systems are installed.
- G. Install underground piping with restrained joints at horizontal and vertical changes in direction. Use restrained-joint piping, thrust blocks, anchors, tie-rods and clamps, and other supports.
- H. Comply with requirements in Section 211200 "Fire Suppression Standpipes," and Section 211313 "Water-Based Fire Suppression Systems," for fire suppression water piping inside the building.
- I. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 210515 "Basic Fire Suppression Piping Materials and Methods."
- J. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 210515 "Basic Fire Suppression Piping Materials and Methods."
- K. Make connections between underground and aboveground piping using an approved transition piece strapped or fastened to prevent separation.

### 3.5 JOINT CONSTRUCTION

- A. See Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for general joint construction requirements.
- B. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure rating same as or higher than systems pressure rating for aboveground applications unless otherwise indicated.
- C. Remove scale, slag, dirt, and debris from outside and inside of pipes, tubes, and fittings before assembly.

- D. Ductile-Iron Piping, Gasketed-Joints for Fire Service Main Piping: UL 194.
- E. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with bolts according to ASME B31.9.

### **3.6 ANCHORAGE INSTALLATION**

- A. Anchorage, General: Install water distribution piping with restrained joints. Anchorages and restrained-joint types that may be used include the following:
  - 1. Locking mechanical joints.
  - 2. Bolted flanged joints.
- B. Install anchorages for tees, plugs and caps, bends, crosses, valves, and hydrant branches in fire suppression water service piping according to NFPA 24 and the following:
  - 1. Gasketed-Joint, Ductile-Iron, Water Service Piping: According to AWWA C600.
- C. Apply full coat of asphalt or other acceptable corrosion-resistant material to surfaces of installed ferrous anchorage devices.

### **3.7 VALVE INSTALLATION**

- A. See Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for general valve installation requirements.
- B. UL-Listed Valves Other Than Gate Valves: Comply with NFPA 24.
- C. Support valves and piping, not direct buried, on concrete piers. Comply with requirements for concrete piers in Division 03.

### **3.8 BACKFLOW PREVENTER INSTALLATIONS**

- A. Install backflow preventer at each fire protection entry in compliance with the plumbing code and Authority Having Jurisdiction. Locate in an accessible and testable location.
- B. Install backflow preventers of type, size, and capacity indicated. Include valves and test cocks.
- C. Do not install backflow preventers that have relief drain in vault or in other spaces subject to flooding.
- D. Do not install bypass piping around backflow preventers.
- E. Support NPS 2-1/2 and larger backflow preventers with pipe supports attached to the floor with anchor bolts where indicated on the drawings.
- F. Test backflow preventer per requirements of plumbing or division of cross connection control official.
  - 1. Reports: Prepare backflow preventer test reports signed by the plumbing or division of cross connection control official and turn over to the Architect upon completion of the project.

### **3.9 FIRE DEPARTMENT CONNECTION INSTALLATIONS**

- A. Install automatic (ball drip) drain valve at each check valve for fire department connection, to drain piping between fire department connection and check valve. Install drain piping to and discharge to outside building.
- B. Install connections between 18- and 36-inches above finished grade and as indicated on the Drawings.
- C. Install mechanical sleeve seal at pipe penetration in outside walls.
- D. Provide minimum 36-inch working clearance around connection for fire department access.

**3.10 FIELD QUALITY CONTROL**

- A. Flush, test, and inspect in accordance with NFPA 24.
- B. Leave uncovered and unconcealed all new, altered, extended, or replaced water distribution piping until it has been tested and approved. Expose all such work for testing that has been covered or concealed before it has been tested and approved.
- C. Replace piping system components that do not pass the test procedures specified, and retest repaired portion of the system.

**3.11 IDENTIFICATION**

- A. Install continuous underground detectable warning tape during backfilling of trench for underground fire suppression water service piping. Locate below finished grade, directly over piping. Underground warning tapes are specified in Section 312000 "Earth Moving."

**3.12 CLEANING**

- A. Clean fire suppression water service piping as follows:
  - 1. Flush new piping systems and parts of existing systems that have been altered, extended, or repaired before use.
  - 2. Use flushing procedure prescribed by authorities having jurisdiction or, if method is not prescribed by authorities having jurisdiction, use procedure described in NFPA 24 for flushing of piping. Flush piping system with clean, potable water until dirty water does not appear at points of outlet.
- B. Prepare reports of flushing activities.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 21 12 00 - FIRE SUPPRESSION STANDPIPES****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. The extent of the fire suppression standpipe system shall be as specified herein. Contractor shall be responsible for preparation of design drawings, hydraulic calculations, fabrication and installation for complete standpipe protection for the building.
- B. This section includes:
  - 1. Pipe and fittings
  - 2. Fire protection valves
  - 3. Hose connections
  - 4. Specialties
- C. Related Sections:
  - 1. Division 21 Section 210010 "General Fire Suppression Requirements" for requirements for hydraulic calculations, obtaining electronic drawings files, shop drawings and record drawings.
  - 2. Division 21 Section 210500 "Common Work Results for Fire Suppression," for materials and methods for wall and floor penetrations.
  - 3. Division 21 Section 210515 "Basic Fire Suppression Piping Material and Methods," for general piping and fitting materials and methods.
  - 4. Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment" for labeling and identification of installed fire suppression equipment.
  - 5. Division 21 Section 211100 "Fire Suppression Water Service Piping" for fire suppression piping starting 5 feet outside the building to within the building.
  - 6. Division 21 Section 211313 "Water-Based Fire Suppression Systems" for fire-suppression sprinkler systems inside the building.
  - 7. Division 21 Section 213113 "Electric-Drive Centrifugal Fire Pumps" for electric-driven fire pumps.

**1.2 DEFINITIONS**

- A. Standard Pressure Standpipe Piping: Fire suppression standpipe piping designed to operate at working pressure 175-psig maximum.

**1.3 SYSTEM DESCRIPTION**

- A. Automatic Wet-Type: Provide a complete automatic wet standpipe system as specified herein and as shown on drawings as applicable. The standpipe system shall be connected to an automatic water supply. Water shall be immediately available at all fire department hose connections at full design flow and pressure.
  - 1. Fire protection standpipe system is a Class I, Standpipe System with NPS 2-1/2 hose connections to supply water for use by fire departments and those trained in handling heavy fire streams.

**1.4 PERFORMANCE REQUIREMENTS**

- A. Standard Pressure, Fire Suppression Standpipe System Component: Listed for 175-psig minimum working pressure.

- B. Delegated Design: Design fire suppression standpipes, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- C. Fire suppression standpipe design shall be approved by authorities having jurisdiction.
  - 1. Minimum residual pressure at required flow at each hose-connection outlet is as follows:
    - a. NPS 2-1/2 Hose Connections: 100-psig.
  - 2. Maximum residual pressure at required flow at each hose-connection outlet is as follows unless otherwise indicated:
    - a. .
    - b. NPS 2-1/2 Hose Connections: 175-psig.
- D. Provide construction standpipe and fire protection system during construction in accordance with code.

### 1.5 SUBMITTALS

- A. Submit shop drawings prepared in accordance with NFPA 14 and as specified in Division 21 Section 210010 "General Fire Suppression Requirements."

### 1.6 QUALITY ASSURANCE

- A. Contractor shall be responsible for all permits and fees associated with preparation and approval of Drawings and the installation and approval of fire suppression standpipe system.
- B. Tests and Inspections: Arrange, test, and pay for all tests required by code and Authorities Having Jurisdiction.

### 1.7 PROJECT CONDITIONS

- A. Interruption of Existing Fire Suppression Standpipe Service: Do not interrupt fire suppression standpipe service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary fire suppression standpipe service according to requirements indicated:
  - 1. Notify Construction Manager no fewer than seven days in advance of proposed interruption of fire suppression standpipe service.
  - 2. Do not proceed with interruption of fire suppression standpipe service without Construction Manager's written permission.

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 EQUIPMENT

- A. All fire protection equipment shall be UL listed for its intended use and in conformance with the applicable NFPA documents.

### 2.2 PIPE AND FITTING MATERIALS

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for specifications on piping and fittings.

### 2.3 HANGERS

- A. Shall be UL-listed and shall meet requirements of NFPA 14 for type, dimension and location.

**2.4 GENERAL DUTY VALVES**

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for specifications on general duty valves.

**2.5 PIPE FITTINGS**

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for specifications on pipe fittings.

**2.6 SPECIALTY VALVES**

- A. General Requirements:
1. Standard: UL's "Fire Protection Equipment Directory" listing.
  2. Pressure Rating:
    - a. Standard Pressure Piping Specialty Valves: 175-psig minimum.
  3. Body Material: Cast- or ductile- iron.
  4. Size: Same as connected piping.
  5. End Connections: Flanged or grooved.
- B. Nonadjustable Valve Hose Connections:
1. Standard: UL 668 hose valve for connecting fire hose.
  2. Pressure Rating: 300-psig minimum.
  3. Material: Brass or bronze.
  4. Size: NPS 2-1/2.
  5. Inlet: Female pipe threads.
  6. Outlet: Male hose threads with lugged cap, gasket, and chain. Include hose valve threads according to NFPA 1963 and matching local fire-department threads.
  7. Pattern: Angle.
  8. Finish: Rough brass or bronze.
  9. Clearance: Minimum 12-inch clear radius around outlet to allow for wrench clearance. Provide minimum code required stairway clearance at each hose connection and standpipe.
  10. Cabinet: Provide connection installed within recessed valve cabinet unless Architectural Drawings indicate other mounting, modified with centered side inlet and 10-inch box depth. Cabinet shall have flush metal panel door, flat trim with square return, steel prime coated exterior, white enameled interior, continuous hinge, lever handle with cam catch, OSHA lettering, chrome plated steel escutcheon plate.

**2.7 ROOF MANIFOLD**

- A. Freestanding Unit: Rough brass freestanding unit with back inlet and two NPS 2-1/2-inch UL listed rough brass 300 lb. angle valves with brass cap and chain.
1. Size NPS 4x NPS 2-1/2p.

**2.8 ALARM DEVICES**

- A. General: Alarm device types shall match piping and equipment connections.
- B. Audible/Visual Alarm Notification Appliances (Horn/Strobe):
1. Standard: UL 1971 combination horn and strobe appliance.
  2. Audible/visual notification appliance shall be exterior, weatherproof with weatherproof backbox.
  3. Provide engraved lamacoid plate under Bell lettered "Building Fire Standpipe System."
- C. Water Flow Indicators:
1. Standard: UL 346.

2. Water-Flow Detector: Electrically supervised.
  3. Components: Two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-set, field-adjustable retard element to prevent false signals and tamperproof cover.
  4. Type: Paddle operated.
  5. Pressure Rating: 250-psig.
  6. Design Installation: Horizontal or vertical.
- D. Valve Supervisory Switches:
1. Standard: UL 346.
  2. Type: Electrically supervised.
  3. Components: Single-pole, double-throw switch with normally closed contacts and tamperproof cover.
  4. Design: Signals that controlled valve is in other than fully open position.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Examine rough-in for hose connections and stations to verify actual locations of piping connections before installation.
- B. Examine walls and partitions for suitable thickness, fire- and smoke-rated construction, framing for hose-station cabinets, and other conditions where hose connections and stations are to be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 WATER SUPPLY CONNECTION**

- A. Connect fire suppression standpipe piping to building's fire sprinkler system piping. Comply with requirements for fire sprinkler piping in Division 21 Section 211313 "Water Based Fire Suppression Systems."

#### **3.3 PIPE APPLICATIONS**

- A. Piping Below Grade: Refer to Division 21 Section 211100 "Fire Suppression Water Service Piping."
- B. Piping Above Grade:
  1. Black steel and fittings for all fire sprinkler system piping located inside the building, not exposed to the elements.
  2. Externally galvanized piping and fittings shall be used for all fire sprinkler system piping located on the exterior of the building, exposed to the elements.

#### **3.4 PIPING INSTALLATIONS**

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for general fire suppression standpipe piping installation requirements.
- B. Piping Standard: Comply with requirements in NFPA 14 for installation of fire suppression standpipe piping.
- C. Hangers and Supports: Comply with the requirements of NFPA 14. Hanger and support spacing and locations for piping joined with grooved mechanical couplings shall be in accordance with the grooved mechanical coupling manufacturer's written instructions, for rigid systems. Locate hangers at or directly adjacent to the joist panel points.

- D. Install pressure gauges on riser or feed main and at top of each standpipe. Provide pressure gauge with connection not less than NPS 1/4 and with soft metal seated globe valve, arranged for draining pipe between gauge and valve. Install gauges to permit removal, and install where they will not be subject to freezing.
- E. Install drain valves on standpipes.
  - 1. Extend drain piping to outside of building where the drain is located 60 inches or less above grade and along the exterior of the building.
  - 2. For all other locations, install a male,  $\frac{1}{2}$ -inch GHT connection on the discharge side of the drain valve.
- F. Install automatic (ball drip) drain valves to drain piping between fire department connections and check valves. Drain to floor drain or outside building.
- G. Fill wet-type standpipe system piping with water.
- H. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods"
- I. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods."

### 3.5 PIPE JOINT CONSTRUCTION

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for general fire suppression piping joint construction requirements.

### 3.6 VALVE AND SPECIALTIES INSTALLATION

- A. Install listed fire protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 14 and authorities having jurisdiction.
- B. Install listed fire protection shutoff valves supervised open, located to control sources of water supply except from fire department connections. Install permanent identification signs indicating portion of system controlled by each valve.
- C. Provide supervised control valve at the base of each standpipe.
  - 1. The control valve shall be supervised by the building fire alarm panel
- D. Specialty Valves:
  - 1. General Requirements: Install in vertical position for proper direction of flow, in main supply to system.

### 3.7 HOSE CONNECTION INSTALLATION

- A. Install connections between 36- and 48-inches above the floor, at each main intermediate level of each egress stairway and as indicated on the Drawings.
- B. Install freestanding hose connections for access and minimum passage restriction.
- C. Install NPS 2-1/2 hose outlet valves with brass cap and chain at each standpipe outlet for hose connections.
- D. Where pressure exceeds 175 PSI at Class I connections, provide NPS 2-1/2 UL listed pressure reducing and shutoff valve with bronze finish with brass cap and chain. Set valve to limit nozzle pressure to 150 PSI.

- E. Install sprinkler control valves, test assemblies, and drain risers adjacent to standpipes when sprinkler piping is connected to standpipes. Drain piping shall be routed to the exterior of the building unless noted otherwise.
- F. Install wall-mounted-type hose connections in cabinets. Include pipe escutcheons, with finish matching valves, inside cabinet where water-supply piping penetrates cabinet. Install valves at angle required for connection of fire hose.

### **3.8 IDENTIFICATION**

- A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 14 and Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment."

### **3.9 FIELD QUALITY CONTROL**

- A. Perform required tests and inspections.
- B. Tests and Inspections:
  - 1. Leak Test: After installation, charge systems and test for leaks. Repair leaks and retest until no leaks exist.
  - 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
  - 3. Flush, test, and inspect standpipe systems according to NFPA 14, "System Acceptance" Chapter.
  - 4. Energize circuits to electrical equipment and devices.
  - 5. Coordinate with fire alarm tests. Operate as required.
  - 6. Coordinate with fire pump tests. Operate as required.
  - 7. Verify that equipment hose threads are same as local fire department equipment.
- C. Replace piping system components that do not pass the test procedures specified, and retest repaired portion of the system.

### **3.10 DEMONSTRATION**

- A. Train Owner's maintenance personnel to adjust, operate, and maintain specialty valves and associated equipment for standpipe system.

### **3.11 COMMISSIONING**

- A. Test per NFPA 14, NFPA 25 and local authorities requirements. Submit Contractor's Material & Test Certificates for Above Ground Piping. Submit certificates of completion to authority having jurisdiction and Owner.

END OF SECTION

**SECTION 21 13 13 - WATER BASED FIRE SUPPRESSION SYSTEMS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. The extent of this fire sprinkler system shall be as specified herein. Contractor shall be responsible for preparation of design drawings, hydraulic calculations, fabrication and installation for complete fire sprinkler protection for the building.
- B. Section Includes:
  - 1. Pipes, fittings, and specialties.
  - 2. Fire protection valves.
  - 3. Sprinkler pipe fittings.
  - 4. Sprinklers.
  - 5. Alarm devices.
- C. Related Sections:
  - 1. Division 21 Section 210010 "General Fire Suppression Requirements" for requirements for hydraulic calculations, obtaining electronic drawings files, shop drawings and record drawings.
  - 2. Division 21 Section 210500 "Common Work Results for Fire Suppression," for materials and methods for wall and floor penetrations.
  - 3. Division 21 Section 210515 "Basic Fire Suppression Piping Material and Methods," for general piping and fitting materials and methods.
  - 4. Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment" for labeling and identification of installed fire suppression equipment.
  - 5. Division 21 Section 211100 "Fire Suppression Water Service Piping" for fire suppression piping starting 5 feet outside the building to within the building.
  - 6. Division 21 Section 211200 "Fire Suppression Standpipes" for fire-suppression standpipes inside the building.
  - 7. Division 21 Section 213113 "Electric-Drive Centrifugal Fire Pumps" for electric-driven fire pumps.

**1.2 SYSTEM DESCRIPTION**

- A. Fire protection system in the location or portion of the building is a Wet Pipe, Dry Pipe.
  - 1. Wet Pipe Sprinkler System: Automatic sprinklers are attached to piping containing water and that is connected to a water supply. Water discharges immediately from sprinklers when they are opened. Sprinklers open when heat melts a fusible link or destroys a frangible device. Hose connections are included if indicated.
  - 2. Dry Pipe Sprinkler System: Automatic sprinklers are attached to piping containing compressed nitrogen. Opening of sprinklers releases compressed air and permits water pressure to open a dry pipe valve. Water then flows into piping and discharges from sprinklers that are open.
- B. Provide system(s) as specified herein and as shown on drawings. The sprinkler system shall be supplied by the underground as shown on the Drawings.
- C. Provide dry pipe fire protection system for non-heated spaces and other areas of building subject to freezing including the loading docks and canopies, mansards, and balconies. Portions of systems subject to freezing or temperatures below 40°F shall be protected against freezing as required by NFPA 13. The Contractor shall be responsible for repairs and for all costs incurred from damage caused by freezing of the fire protection system.

**1.3 PERFORMANCE REQUIREMENTS**

- A. Delegated Design: Design fire suppression system, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- B. Standard Pressure, Fire Suppression System Component: Listed for 175-psig minimum working pressure.
- C. Performance Criteria
  - 1. Protect entire building, unless noted otherwise, with a sprinkler system designed in accordance with NFPA 13 for Light Hazard requirements.
  - 2. .
  - 3. Protect concourses, mechanical and electrical areas/rooms with a sprinkler system designed in accordance with NFPA 13 for Ordinary Hazard Group 1 requirements.
  - 4. Protect storage areas/rooms, unless noted otherwise, with a sprinkler system designed in accordance with NFPA 13 for Ordinary Hazard Group 2 requirement.
  - 5. Other Occupancy Hazard Classifications.
    - a. Restaurant Seating Areas: Light Hazard density with the approval of the AHJ.
    - b. Building Service Areas: Ordinary Hazard Group 1.
    - c. Suites: Ordinary Hazard, Group 1.
    - d. Ballrooms: Ordinary Hazard, Group 2.
    - e. Meeting rooms: Ordinary Hazard, Group 2.
    - f. Laundries: Ordinary Hazard, Group 1.
    - g. Machine Shops: Ordinary Hazard, Group 2.
    - h. Roof level above catwalks: Ordinary Hazard, Group 2.
    - i. Office and Public Areas: Light Hazard.
    - j. Restaurant Service Areas: Ordinary Hazard, Group 1.
  - 6. Design Criteria for Automatic-Sprinkler Piping Design:
    - a. Light Hazard Occupancy:
      - 1) Minimum Design Density: 0.10 gpm over 1,500 sq.ft. area.
      - 2) Maximum protection area per sprinkler: 225 sq.ft.
      - 3) Minimum Combined Hose Stream Demand Requirement: 100 gpm for 30 minutes.
    - b. Ordinary Hazard Group 1 Occupancy:
      - 1) Minimum Design Density: 0.15 gpm over 1,500 sq.ft. area.
      - 2) Maximum area per sprinkler: 130 sq.ft..
      - 3) Minimum Combined Hose Stream Demand: 250 gpm for 60 to 90 minutes.
    - c. Ordinary Hazard Group 2 Occupancy:
      - 1) Minimum Design Density: 0.20 gpm over 1,500 sq.ft. area.
      - 2) Maximum protection area per sprinkler: 130 sq.ft.
      - 3) Minimum Combined Hose Stream Demand: 250 gpm for 60 to 90 minutes.
    - d. Special Occupancy Hazard: Double Height entry lobby
      - 1) Minimum Design Density: 0.20 gpm over 2,000 sq.ft. area.
      - 2) Maximum protection area per sprinkler: 10' x 13' maximum spacing.
      - 3) Minimum Combined Hose Stream Demand: 250 gpm for 60 to 90 minutes.
- D. The criteria listed herein shall not preclude the use of extended coverage or special application fire sprinklers designed and installed in accordance with their listing and manufacturer's instructions.
- E. The hydraulic area of operation may not be reduced as allowed by NFPA 13 for areas utilizing quick response sprinklers in unfinished shell spaces. For all other areas, the hydraulic area of operation shall not be reduced as allowed by NFPA 13 for areas utilizing quick response sprinklers unless specifically approved by the Engineer via a formally submitted RFI.
- F. Sprinkler spacing shall conform to NFPA 13 and shall not exceed 256 SF per sprinkler in unfinished shell spaces.

- G. The hydraulic area of operation shall be increased by 30% without revising the density for areas with sloped ceilings with a pitch exceeding 1 in 6 (16.7% slope) in accordance with NFPA 13.
- H. The hydraulic area of operation shall be increased by 30% without revising the density for dry-pipe and double interlock preaction systems in accordance with NFPA 13.

#### **1.4 SUBMITTALS**

- A. Submit shop drawings prepared in accordance with NFPA 13 as specified in Division 21 Section 210010 "General Fire Suppression Requirements."

#### **1.5 QUALITY ASSURANCE**

- A. Contractor shall be responsible for all permits and fees associated with preparation and approval of Drawings and the installation and approval of a fire sprinkler system.
- B. Tests and Inspections: Arrange, test, and pay for all tests required by code and authorities having jurisdiction.

#### **1.6 PROJECT CONDITIONS**

- A. Interruption of Existing Fire Sprinkler Protection: Do not interrupt fire sprinkler system protection to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary fire sprinkler protection according to requirements indicated:
  - 1. Notify Construction Manager no fewer than two days in advance of proposed interruption of fire-sprinkler protection.
  - 2. Do not proceed with interruption of fire sprinkler protection without Construction Manager's written permission.

#### **1.7 COORDINATION**

- A. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including light fixtures, HVAC equipment, and partition assemblies.

#### **1.8 EXTRA MATERIALS**

- A. Sprinkler Wrenches: Furnish to Owner, 2 sprinkler wrenches for each type of sprinkler installed.
- B. Sprinklers: Furnish extra sprinklers of each style, type and finish included in the project as required by NFPA 13.
- C. Sprinkler Cabinet and Wrench: Provide a finished steel cabinet(s), suitable for wall mounting, with hinged cover and space for the quantity of spare sprinklers provided plus sprinkler wrench(es).
- D. Provide hydraulic calculation placard attached to each riser.

### **PART 2 - PRODUCTS AND MATERIALS**

#### **2.1 EQUIPMENT**

- A. All fire protection equipment shall be UL listed for its intended use and in conformance with the applicable NFPA documents.

**2.2 PIPE AND FITTING MATERIALS**

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for specifications on piping and fittings.

**2.3 HANGERS**

- A. Shall be UL listed and shall meet requirements of NFPA 13 for type, dimension and location.

**2.4 GENERAL DUTY VALVES**

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for specifications on general duty valves.

**2.5 SPECIALTY VALVES**

- A. General Requirements:
1. Standard: UL's "Fire Protection Equipment Directory" listing.
  2. Pressure Rating:
    - a. Standard Pressure Piping Specialty Valves: 175-psig minimum.
  3. Body Material: Cast- or ductile- iron.
  4. Size: Same as connected piping.
  5. End Connections: Flanged or grooved.
- B. Dry-Pipe Valves:
1. Standard: UL 260.
  2. Design: Differential-pressure type.
  3. Include UL 1486, quick-opening devices, trim sets for bypass, air supply, drain, priming level, alarm connections, ball drip valves, pressure gauges, drip cup assembly piped with check valve to main drain piping, priming chamber attachment, and fill-line attachment with strainer.
  4. Air-Pressure Maintenance Device:
    - a. Type: Automatic device to maintain minimum air pressure in piping.
    - b. Include shutoff valves to permit servicing without shutting down sprinkler piping, bypass valve for quick filling, pressure regulator or switch to maintain pressure, strainer, pressure ratings with 14- to 60-psig adjustable range, and 175-psig outlet pressure.
  5. Air Compressor:
    - a. Type: Oil-less, air-cooled
    - b. Standard: UL's "Fire Protection Equipment Directory" listing.
    - c. Motor Horsepower: Fractional.
    - d. Power: 120-V ac, 60 Hz, single phase, hard wired per NEC and manufacturer's requirements.
    - e. Provide combination fused disconnect switch and magnetic starter.
- C. Nitrogen Compressor:
1. SouthTek N2-Blast FPS 500, or owner approved equal.
  2. Additional Equipment:
    - a. N2Blast AutoPurge System.
    - b. BlastOff III – Early Warning System.
    - c. Quick Fill Air Compressor:
      - 1) Standard: UL's "Fire Protection Equipment Directory" Listing.
      - 2) Integral Type: Oil-less, air-cooled.
      - 3) Motor Horsepower: 2-HP.
      - 4) Power: 102-Vac, 60 Hz, single phase, hard wired per NEC, and manufacturer's requirements.
      - 5) Provide Combination fused disconnect switch and magnetic starter.

3. Optional Equipment to be owner approved:
  - a. BlastOff IV – Onboard Purity Alarm.
  - b. Quick-Check – 6 Zone Purity Manifold.
  - c. N2-Blast Preventative Maintenance Box.
- D. Air Release Valve:
  1. Provide for all wet pipe sprinkler systems utilizing metallic piping in accordance with one of the following options:
    - a. Manual ball valve with a minimum size of  $\frac{1}{2}$  inch (15 mm).
    - b. Listed and/or Factory Mutual Approved automatic valve.

## 2.6 PIPE FITTINGS

- A. Branch Outlet Fittings:
  1. Standard: UL 213.
  2. Pressure Rating: 175-psig minimum.
  3. Body Material: Ductile-iron housing with EPDM seals and bolts and nuts.
  4. Type: Mechanical-T and -cross fittings.
  5. Configurations: Snap-on and strapless, ductile-iron housing with branch outlets.
  6. Size: Of dimension to fit onto sprinkler main and with outlet connections as required to match connected branch piping.
  7. Branch Outlets: Grooved, welded or threaded.
- B. Flow Detection and Test Assemblies:
  1. Standard: UL's "Fire Protection Equipment Directory" listing.
  2. Pressure Rating: 175-psig minimum.
  3. Body Material: Cast- or ductile-iron housing with orifice, sight glass, and integral test valve.
  4. Size: Same as connected piping.
  5. Inlet and Outlet: Grooved or threaded.
- C. Sprinkler Inspector's Test Fittings:
  1. Standard: UL's "Fire Protection Equipment Directory" listing.
  2. Pressure Rating: 175-psig minimum.
  3. Body Material: Cast- or ductile-iron housing with sight glass.
  4. Size: Same as connected piping.
  5. Inlet and Outlet: Threaded.
- D. Flexible Piping Systems:
  1. At Contractor's option, UL listed and FM Global approved flexible piping connections to sprinklers may be used for both acoustical panel and gypsum board ceilings when suitable for their intended use.
  2. Description: Connections shall include a leak-tested sprinkler drop with a minimum internal corrugated hose diameter of 1 inch.
  3. Flexible piping lengths shall not exceed 6 feet.
  4. Installation shall not exceed the minimum bend radius and maximum allowable bends as specified by the manufacturer.
  5. Change in direction shall be gradual enough to allow flexible piping to bend without crimping, distorting or reducing internal diameter.

## 2.7 AUTOMATIC SPRINKLERS

- A. Sprinklers: type and style as indicated or required by application. Sprinkler operating temperatures to comply with NFPA 13. Sprinklers in Light Hazard areas shall be quick response type.
- B. General Requirements:
  1. Standard: UL's "Fire Protection Equipment Directory" listing .
  2. Pressure Rating for Automatic Sprinklers: 175-psig minimum.

- C. Automatic Sprinklers with Heat-Responsive Element:
  - 1. Early-Suppression, Fast-Response Applications: UL 1767.
  - 2. Nonresidential Applications: UL 199.
  - 3. Characteristics: Nominal 1/2-inch orifice with discharge coefficient K of 5.6, and for "Ordinary" temperature classification rating unless otherwise indicated or required by application.
- D. Use sprinkler types below for the following applications:
  - 1. Rooms without Ceilings: Upright sprinklers.
  - 2. Rooms with Suspended Ceilings: Recessed and concealed sprinklers as indicated on drawings.
  - 3. Rooms with Gypsum Board Ceilings: Recessed and concealed sprinklers as indicated on drawings.
  - 4. Wall Mounting: Sidewall sprinklers.
  - 5. Spaces Subject to Freezing: Dry pendent or dry sidewall sprinklers as indicated on drawings.
- E. Provide sprinkler types below with finishes indicated.
  - 1. Finished Areas:
    - a. Concealed Sprinklers: Rough brass, with cover plate factory painted to match ceiling. Coordinate ceiling color with architect.
    - b. Recessed Sprinklers: white painted with white escutcheon.
    - c. Upright, Pendent, and Sidewall Sprinklers: Bright chrome, with bright chrome escutcheon.
    - d. Unfinished Areas: Rough bronze in unfinished spaces not exposed to view.
- F. Coordinate sprinkler temperature ratings near heat-producing sources in accordance with NFPA 13.
- G. Sprinklers shall be wax coated where exposed to acids, chemicals, or other corrosive fumes.
- H. Sprinkler Guards: Provide sprinkler guard where sprinklers are less than 7-feet above finished floor; where subject to physical damage, and/or where indicated on drawings. Guard shall be UL 199 listed, wire cage type with fastening device for attaching to sprinkler.
- I. Sprinkler Cabinet and Wrench: Provide a finished steel cabinet, suitable for wall mounting, with hinged cover and space for the appropriate quantity of spare sprinklers plus sprinkler wrench(es).

## 2.8 ALARM DEVICES

- A. General: Alarm device types shall match piping and equipment connections.
- B. Audible/Visual Alarm Notification Appliances (Horn/Strobe):
  - 1. Standard: UL 1971 combination horn and strobe appliance.
  - 2. Audible/visual notification appliance shall be exterior, weatherproof with weatherproof backbox.
- C. Water Flow Indicators:
  - 1. Standard: UL 346.
  - 2. Water-Flow Detector: Electrically supervised.
  - 3. Components: Two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory set, field-adjustable retard element to prevent false signals and tamperproof cover.
  - 4. Type: Paddle operated.
  - 5. Pressure Rating: 250 psig.
  - 6. Design Installation: Horizontal or vertical.
- D. Pressure Switches – Water Flow Alarm Detection:
  - 1. Standard: UL 346.

2. Components: Two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory set, field adjustable retard element to prevent false signals and tamperproof cover.
  3. Type: Electrically supervised water flow switch with retard feature.
  4. Pressure Rating: 250 psig.
  5. Design Operation: Rising pressure signals water flow.
- E. Pressure Switches – Low/High Nitrogen Pressure Supervisory:
1. Standard: UL 346.
  2. Components: Two single-pole, double-throw circuit switches for isolated alarm contacts, 7 A, 125-V ac and 0.25 A, 24-V dc.
  3. Type: Electrically supervised pressure supervisory switch
  4. Pressure Rating: 250 psig.
  5. Design Operation: Rising pressure signals excessive supervisory gas pressure within the system piping, with lowering pressure signals lack of gas pressure within the system piping.
- F. Valve Supervisory Switches:
1. Standard: UL 346.
  2. Type: Electrically supervised.
  3. Components: Single-pole, double-throw switch with normally closed contacts and tamperproof cover.
  4. Design: Signals that controlled valve is in other than fully open position.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION GENERAL**

- A. Install in accordance with manufacturer's instructions.

#### **3.2 PREPARATION**

- A. Perform fire hydrant flow test according to NFPA 13 and NFPA 291. Use results for system design calculations required in "Quality Assurance" Article.

#### **3.3 WATER SUPPLY CONNECTION**

- A. Connect sprinkler piping to water service piping for service entrance to building. Do not connect to underground supply until provided with written documentation that piping has been flushed and pressure tested in accordance with NFPA 13. Comply with requirements for exterior piping in Division 21 Section 211100 "Fire Suppression Water Service Piping."
- B. Install shutoff valve, backflow preventer, pressure gage, drain, and other accessories indicated at connection to water-service piping. Comply with requirements for backflow preventers in Division 21 Section 211100 "Fire Suppression Water Service Piping."
- C. Wet pipe systems shall be equipped with a listed relief valve not less than  $\frac{1}{2}$ -inch in size and set to operate at 175 psi or 10 psi in excess of the maximum system pressure, whichever is greater.

#### **3.4 PIPE APPLICATIONS**

- A. Piping Below Grade: Refer to Division 21 Section 211100 "Fire Suppression Water Service Piping."
- B. Piping Above Grade: Refer to Division 21 Section 210515 "Basis Fire Suppression Piping Materials and Methods."

**3.5 PIPING INSTALLATIONS**

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for general fire suppression piping installation requirements.
- B. Piping Standard: Comply with requirements for installation of sprinkler piping in NFPA 13.
- C. Hangers and Supports: Comply with the requirements of NFPA 13. Hanger and support spacing and locations for piping joined with grooved mechanical couplings shall be in accordance with the grooved mechanical coupling manufacturer's written instructions, for rigid systems. Provide protection from damage where subject to earthquake if required by the applicable building code, designed in accordance with NFPA 13. Locate hangers at or directly adjacent to the joist panel points. Provide two nuts on threaded supports to securely fasten the support.
- D. Install test connections sized and located in accordance with NFPA 13 complete with shutoff valve. Test connections may also serve as drain pipes.
- E. Install pressure gauge on the riser or feed main at or near each test connection. Provide pressure gauge with a connection not less than 1/4 inch and having a soft metal seated globe valve, arranged for draining pipe between gauge and valve. Install gauges to permit removal, and install where they will not be subject to freezing.
- F. Install automatic (ball drip) drain valves to drain piping between fire department connections and check valves. Drain to floor drain or outside building.
- G. Drain dry-type sprinkler system piping.
- H. Fill wet-type sprinkler system piping with water.
- I. Connect nitrogen compressor to the following piping and wiring:
  - 1. Pressure gauges and controls.
  - 2. Electrical power system.
  - 3. Fire-alarm devices, including high- and low-pressure alarm.
- J. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods"
- K. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods."

**3.6 PIPE JOINT CONSTRUCTION**

- A. Refer to Division 21 Section 210515 "Basic Fire Suppression Piping Materials and Methods" for general pipe joint construction requirements.

**3.7 VALVE AND SPECIALTIES INSTALLATION**

- A. Install listed fire protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 13 and authorities having jurisdiction.
- B. Install listed fire protection shutoff valves supervised open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.
- C. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable water supply sources.

**3.8 SPRINKLER INSTALLATIONS**

- A. Use proper tools to prevent damage during installations.

- B. Install sprinklers in suspended ceilings in center of acoustical ceiling panels, in a symmetrical pattern with lights and outlets.
- C. Install sprinklers in a symmetrical pattern with lights and outlets in all other areas with ceilings.
- D. Install dry-type sprinklers with water supply from heated space. Do not install pendent or sidewall, wet-type sprinklers in areas subject to freezing.
- E. Install sprinklers into flexible, sprinkler hose fittings and install hose into bracket on ceiling grid.
- F. Do not install more than one sprinkler on a one inch outlet unless hydraulic calculations are included to verify performance.

### **3.9 IDENTIFICATION**

- A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13 and Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment."
- B. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

### **3.10 FIELD QUALITY CONTROL**

- A. Perform required tests and inspections.
- B. Tests and Inspections:
  - 1. Leak Test: After installation, charge systems and test for leaks. Repair leaks and retest until no leaks exist.
  - 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
  - 3. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
  - 4. Energize circuits to electrical equipment and devices.
  - 5. Start and run compressors.
  - 6. Coordinate with fire alarm tests. Operate as required.
  - 7. Coordinate with fire pump tests. Operate as required.
  - 8. Verify that equipment hose threads are same as local fire department equipment.
- C. Replace piping system components that do not pass the test procedures specified, and retest repaired portion of the system.

### **3.11 CLEANING**

- A. Clean dirt and debris from sprinklers.
- B. Remove and replace sprinklers with paint other than factory finish.

### **3.12 DEMONSTRATION**

- A. Train Owner's maintenance personnel to adjust, operate, and maintain specialty valves.

### **3.13 COMMISSIONING**

- A. Sprinkler Systems: Test per NFPA 13, NFPA 25 and local authorities requirements. Submit Contractor's Material & Test Certificates for Above Ground Piping. Submit certificates of completion to Authority Having Jurisdiction and Owner.
  - 1. After completion of all installation, tests, etc., and prior to the opening date, the Sprinkler Subcontractor shall instruct the building personnel in the operation of the sprinkler system. Special care shall be taken to make sure the building personnel:

- a. Will immediately recognize whether the system control valves are in an 'Open' position or a 'Closed' position.
  - b. Will know how to drain the system.
  - c. Will know how to test the flow switches, tamper switches and alarm system.
  - d. Will know how to test the dry pipe valve.
  - e. Will know how to make complete weekly inspection.
  - f. Will know how to perform periodic maintenance of the Fire Sprinkler System.
- B. Fire Alarm Equipment: Test per NFPA 25, NFPA 72 and local authorities requirements in the presence of the Owner. Submit certificates of completion to authority having jurisdiction and Owner.

END OF SECTION

**SECTION 21 31 13 - ELECTRIC-DRIVE CENTRIFUGAL FIRE PUMPS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. The extent of this fire pump system shall be as specified herein. Contractor shall be responsible for preparation of design drawings, hydraulic calculations, fabrication and installation for complete fire pump system for the building.
- B. Section Includes:
  - 1. Horizontal split case fire pumps.
  - 2. Fire pump accessories and specialties.
  - 3. Flowmeter systems.
  - 4. Controllers for fire pump drivers.
  - 5. Pressure-maintenance pumps.
  - 6. Controllers for pressure-maintenance pumps.
  - 7. Remote alarm panels.
- C. Related Sections:
  - 1. Division 21 Section 210010 "General Fire Suppression Requirements" for requirements for hydraulic calculations, obtaining electronic drawings files, shop drawings and record drawings.
  - 2. Division 21 Section 210500 "Common Work Results for Fire Suppression," for materials and methods for wall and floor penetrations.
  - 3. Division 21 Section 210515 "Basic Fire Suppression Piping Material and Methods," for general piping and fitting materials and methods.
  - 4. Division 21 Section 210553 "Identification for Fire Suppression Piping and Equipment" for labeling and identification of installed fire suppression equipment.
  - 5. Division 21 Section 211100 "Fire Suppression Water Service Piping" for fire suppression piping starting 5 feet outside the building to within the building.
  - 6. Division 21 Section 211200 "Fire Suppression Standpipes" for fire-suppression standpipes inside the building.
  - 7. Division 21 Section 211313 "Water Based Fire Suppression Systems" for fire suppression sprinkler systems inside the building.

**1.2 PERFORMANCE REQUIREMENTS**

- A. Pump Equipment, Accessory, and Specialty Pressure Rating: 175 psig minimum unless higher pressure rating is indicated.

**1.3 SYSTEM DESCRIPTION**

- A. General: Provide an electric, fire booster pump, complete with jockey pump, fire and jockey pump controllers and all necessary equipment and accessories to supply the sprinkler and/or standpipe system. The fire booster pump, associated equipment and piping shall be installed where indicated on the Drawings. Provide in accordance with the latest issue of NFPA 20.
- B. Pump Conditions: Remote indication of all monitor switches, circuit breaker open, low pump room temperature (below 45°F), power failure, phase reversal, pump running, and all signals required by NFPA 20. Reference: Division 26 Section "Wiring Devices."
- C. Quality Assurance: Pump manufacturer shall have unit responsibility for proper operation of the complete unit, and provide services of a factory trained technician to supervise installation, and to attend final field acceptance tests.

- D. Operation: The fire booster pump shall be connected to an automatic water supply and supply the fire sprinkler and/or standpipe system(s). Fire pump shall be automatic starting following pressure loss within the sprinkler system. All drains shall be piped to the exterior of the building.

#### 1.4 SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, performance curves, electrical characteristics, and furnished specialties and accessories. Highlight, mark, list or indicate the materials, performance criteria and accessories that are being proposed.
- B. Shop Drawings: For fire pumps, motor drivers, controllers, and fire pump accessories and specialties. Include plans, elevations, sections, details, and attachments to other work.
  - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 2. Wiring Diagrams: For power, signal, and control wiring.
- C. Product Certificates: For each fire pump, from manufacturer.
- D. Source quality-control reports.

#### 1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For fire pumps to include in operation and maintenance manuals.
- B. Manufacturer's written instructions for setting field-adjustable timers, controls, and status and alarm points.
- C. Manufacturer's written instructions for testing, adjusting, and reprogramming microprocessor-based logic controls.
- D. Field quality-control reports to include pump acceptance test documentation.

#### 1.6 QUALITY ASSURANCE

- A. Contractor shall be responsible for all permits and fees associated with preparation and approval of Drawings and the installation and approval of a fire booster pump.
- B. Tests and Inspections: Arrange, test, and pay for all tests required by code and authorities having jurisdiction.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. NFPA Compliance: Comply with NFPA 20, "Installation of Stationary Pumps for Fire Protection."
- E. Source Limitations: Obtain fire pump controllers and all associated equipment from single source or producer.

#### 1.7 DELIVERY STORAGE AND HANDLING

- A. Store controllers indoors in clean, dry space with uniform temperature to prevent condensation. Protect enclosed controllers from exposure to dirt, fumes, water, corrosive substances, and physical damage.
- B. If stored in areas subject to weather, protect controllers from weather, dirt, dust, corrosive substances, and physical damage. Remove loose packing and combustible materials from inside controllers.

**1.8 PROJECT CONDITIONS**

- A. Ambient Temperature Rating: Not less than 40 deg F (5 deg C) and not exceeding 122 deg F (50 deg C) unless otherwise indicated.

**1.9 COORDINATION**

- A. Coordinate sizes and locations of concrete bases with actual equipment provided.
- B. Coordinate layout and installation of controllers with other construction including conduit, piping, fire pump equipment, and adjacent surfaces. Maintain required clearances for workspace and equipment access doors and panels. Ensure that controllers are within sight of fire pump drivers.

**PART 2 - PRODUCTS****2.1 GENERAL REQUIREMENTS FOR CENTRIFUGAL FIRE PUMPS**

- A. General: UL 448, factory-assembled and -tested, electric-drive, centrifugal fire pumps capable of furnishing not less than 150 percent of rated capacity at not less than 65 percent of total rated head and with shutoff head limited to 120 percent of total rated head.
  - 1. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
  - 2. Nameplate: Complete with capacities, characteristics, and other pertinent data.
- B. Base: Fabricated and attached to fire pump and driver unit with reinforcement to resist movement of pump during seismic events when base is anchored to building substrate.

**2.2 HORIZONTALLY MOUNTED SINGLE-STAGE SPLIT-CASE FIRE PUMPS**

- A. Available Manufacturers:
  - 1. A-C Pump; ITT Industries.
  - 2. Armstrong Darling, Inc.
  - 3. Aurora Pump; Pentair Pump Group.
  - 4. Fairbanks Morse; Pentair Pump Group.
  - 5. Patterson Pump Company.
  - 6. Peerless Pump; Grundfos Group.
- B. Pump:
  - 1. Standard: UL 448, for split-case pumps for fire service.
  - 2. Casing: Axially split-case, cast iron with ASME B16.1 pipe-flange connections.
  - 3. Impeller: Cast bronze, statically and dynamically balanced, and keyed to shaft.
  - 4. Wear Rings: Replaceable bronze.
  - 5. Shaft and Sleeve: Steel shaft with bronze sleeve.
    - a. Shaft Bearings: Grease-lubricated ball bearings in cast-iron housing.
    - b. Seals: Stuffing box with minimum of four rings of graphite-impregnated braided yarn and bronze packing gland.
  - 6. Mounting: Pump and driver shafts are horizontal, with pump and driver on same base.
- C. Coupling: Flexible and capable of absorbing torsional vibration and shaft misalignment. Include metal coupling guard.
- D. Driver: open drip-proof, squirrel-cage, induction motor complying with NFPA 20 and NFPA 70. Include wiring compatible with controller used.
  - 1. Standard: UL 1004A.
  - 2. Type: Electric motor; NEMA MG 1, polyphase Design B.
  - 3. .

### 2.3 FIRE PUMP ACCESSORIES AND SPECIALTIES

- A. Automatic Air-Release Valves: Comply with NFPA 20 for installation in fire pump casing.
- B. Circulation Relief Valves: UL 1478, brass, spring loaded; for installation in pump discharge.
- C. Relief Valves:
  - 1. Description: UL 1478, bronze or cast-iron, spring loaded; for installation in fire suppression water supply piping.
- D. Inlet Fitting: Eccentric tapered reducer at pump suction inlet.
- E. Outlet Fitting: Concentric tapered reducer at pump discharge outlet.
- F. Hose Valve Manifold Assembly:
  - 1. Standard: Comply with requirements in NFPA 20.
  - 2. Header Pipe: ASTM A 53/A 53M, Schedule 40, galvanized steel with ends threaded according to ASME B1.20.1.
  - 3. Header Pipe Fittings: ASME B16.4, galvanized cast-iron threaded fittings.
  - 4. Automatic Drain Valve: UL 1726.
  - 5. Manifold:
    - a. Test Connections: Comply with UL 405 except provide outlets without clappers instead of inlets.
    - b. Body: Flush type, brass or ductile iron, with number of outlets required by NFPA 20.
    - c. Nipples: ASTM A 53/A 53M, Schedule 40, galvanized steel pipe with ends threaded according to ASME B1.20.1.
    - d. Adapters and Caps with Chain: Brass or bronze, with outlet threaded according to NFPA 1963.
    - e. Escutcheon Plate: Brass or bronze; rectangular.
    - f. Hose Valves: UL 668, bronze, with outlet threaded according to NFPA 1963.
    - g. Exposed Parts Finish: Rough
    - h. Escutcheon Plate Marking: Equivalent to "FIRE PUMP TEST."

### 2.4 FLOWMETER SYSTEMS

- A. Description: UL-listed, fire pump flowmeter system with capability to indicate flow to not less than 175 percent of fire pump rated capacity.
- B. Pressure Rating: 175 psig minimum.
- C. Sensor: Annubar probe, orifice plate, or venturi unless otherwise indicated. Sensor size shall match pipe, tubing, flowmeter, and fittings.
- D. Permanently Mounted Flowmeter: Compatible with flow sensor; with dial not less than 4-1/2 inches in diameter. Include bracket or device for wall mounting.
  - 1. Tubing Package: NPS 1/8 or NPS 1/4 soft copper or plastic tubing with copper or brass fittings and valves.

### 2.5 FIRE PUMP CONTROLLERS

- A. Available Manufacturers:
  - 1. Cutler-Hammer.
  - 2. Firetrol, Inc.
  - 3. Hubbell Industrial Controls, Inc.
  - 4. Joslyn Clark.
  - 5. Master Control Systems, Inc.
  - 6. Metron, Inc.
  - 7. Tornatech, Inc.

- B. General Requirements for Full-Service Controllers:
  - 1. Comply with NFPA 20 and UL 218.
  - 2. Listed by an NRTL for electric-motor driver for fire pump service.
  - 3. Combined automatic and manual operation.
  - 4. Factory assembled, wired, and tested; continuous-duty rated.
- C. Enclosure:
  - 1. Fire Pump Controllers, ATS, Remote Alarm Panels, and Low-Suction-Shutdown Panels: NEMA 250, to comply with environmental conditions at installed locations and NFPA 20.
    - a. Indoor, Dry and Clean Locations: Type 2.
  - 2. Enclosure Color: Manufacturer's standard "fire pump controller red"
  - 3. Nameplates: Comply with NFPA 20; complete with capacity, characteristics, approvals, listings, and other pertinent data.
- D. Method of Starting:
  - 1. Pressure switch actuated.
    - a. Water pressure actuated switch and pressure transducer with independent high- and low-calibrated adjustments responsive to water pressure in fire suppression piping.
    - b. Programmable minimum-run-time relay to prevent short cycling.
    - c. Programmable timer for weekly tests.
    - d. Controller Sensing Pipes: Fabricate pipe and fittings according to NFPA 20 with nonferrous-metal sensing piping, NPS 1/2, with globe valves for testing controller mechanism from system to pump controller as indicated. Include bronze check valve with 3/32-inch orifice in clapper or ground-face union with noncorrosive diaphragm having 3/32-inch orifice.
  - 2. Solid-State Controller: Reduced-voltage type.
  - 3. Emergency Start: Mechanically operated start handle that closes and retains the motor RUN contactor independent of all electric or pressure actuators.
- E. Method of Stopping: Manual
- F. Rate controllers for scheduled fire pump horsepower and short-circuit withstand rating at least equal to short-circuit current available at controller location. Take into account cable size and distance from substation or supply transformers.
- G. Method of Isolation and Overcurrent Protection: Interlocked isolating switch and non-thermal MCCB; with a common, externally mounted operating handle, and providing locked-rotor protection. Provide with a voltage surge arrestor.
- H. Door-Mounted Operator Interface and Controls:
  - 1. Monitor, display, and control the devices, alarms, functions, and operations listed in NFPA 20 as required for drivers and controller types used.
  - 2. Method of Control and Indication:
    - a. Microprocessor-based logic controller, with multiline digital readout.
    - b. Membrane keypad.
    - c. LED alarm and status indicating lights.
- I. Local and Remote Alarm and Status Indications:
  - 1. Power on.
  - 2. Motor running condition.
  - 3. Loss-of-line power.
  - 4. Line-power phase reversal.
  - 5. Line-power single-phase condition.
- J. Audible alarm, with silence push button.
- K. Manual START and STOP push buttons or switches.
- L. Nameplate: Complete with capacity, characteristics, approvals and listings, and other pertinent data.

- M. Automatic Transfer Switch (ATS)
1. Complies with NFPA 20, UL 218, and UL 1008.
  2. Integral with controller as a listed combination fire pump controller and power transfer switch.
  3. Automatically transfers fire pump controller from normal power supply to alternate power supply in event of power failure.
  4. Allows manual transfer from one source to the other.
  5. Alternate-Source Isolating and Disconnecting Means: Integral molded-case switch, with an externally mounted operating handle.
  6. Local and Remote Alarm and Status Indications:
    - a. Normal source available.
    - b. Alternate source available.
    - c. In normal position.
    - d. In alternate position.
    - e. Isolating means open.
  7. Audible alarm, with silence push button.
  8. Nonautomatic (manual, nonelectric) means of transfer.
  9. Engine test push button.
  10. Start generator output contacts.
  11. Timer for weekly generator tests.

## 2.6 PRESSURE MAINTENANCE PUMPS

- A. Available Manufacturers:
1. Aurora Pump; Pentair Pump Group.
  2. Crane Pumps & Systems, Inc.
  3. Fairbanks Morse; Pentair Pump Group.
  4. MTH Tool Co., Inc.
  5. Paco Pumps, Inc.
  6. Grundfos, Grundfos Group
- B. Description: Factory-assembled and -tested, vertical, multistage, open-line-shaft turbine pump as defined in HI 2.1-2.2 and HI 2.3; with pump motor mounted above pump head. Include base.
- C. Pump Construction:
1. Pump Head: Cast-iron, for surface discharge, with flange except connections may be threaded in sizes in which flanges are not available.
  2. Pump Head Seal: Stuffing box and stuffing.
  3. Line Shaft: Stainless steel or steel, with corrosion-resistant shaft sleeves.
  4. Line Shaft Bearings: Rubber sleeve, water lubricated.
  5. Impeller Shaft: Monel metal or stainless steel.
  6. Bowl Section: Multiple cast-iron bowls with closed-type bronze or stainless steel impellers.
- D. Motor:
1. Single speed with permanently lubricated ball bearings.
    - a. Motor Sizes: Minimum size as indicated; if not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
- E. Base: Cast-iron or steel with hole for electrical cable.
- F. Nameplate: Permanently attached to pump and indicating capacity and characteristics.

## 2.7 CONTROLLERS FOR PRESSURE-MAINTENANCE PUMPS

- A. Available Manufacturers:
1. Cutler-Hammer.
  2. Firetrol, Inc.

3. Hubbell Industrial Controls, Inc.
  4. Joslyn Clark.
  5. Master Control Systems, Inc.
  6. Metron, Inc.
- B. General Requirements for Pressure-Maintenance-Pump Controllers:
1. Type: UL 508 factory assembled, wired, and tested, across-the-line; for combined automatic and manual operation.
  2. Enclosure: UL 508 and NEMA 250, Type 2 for wall mounting.
  3. Factory assembled, wired, and tested.
  4. Finish: Manufacturer's standard color paint.
- C. Rate controller for scheduled horsepower and include the following:
1. Fusible disconnect switch.
  2. Pressure switch.
  3. Hand-off-auto selector switch.
  4. Pilot light.

## 2.8 GROUT

- A. Standard: ASTM C 1107, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
1. Characteristics: Nonshrink and recommended for interior and exterior applications.
  2. Design Mix: 5000-psi, 28-day compressive strength.
  3. Packaging: Premixed and factory packaged.

## 2.9 SOURCE QUALITY CONTROL

- A. Testing: Test and inspect fire pumps according to UL 448 requirements for "Operation Test" and "Manufacturing and Production Tests."
1. Verification of Performance: Rate fire pumps according to UL 448.
- B. Testing: Test and inspect fire pump controllers according to requirements in NFPA 20 and UL 218.
1. Verification of Performance: Rate controllers according to operation of functions and features specified.
- C. Fire pumps will be considered defective if they do not pass tests and inspections.
- D. Prepare test and inspection reports.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine equipment bases and anchorage provisions, with Installer present, for compliance with requirements and for conditions affecting performance.
- B. Examine roughing-in for fire suppression piping systems to verify actual locations and size of piping connections before fire pump installation.
- C. Examine equipment before installation. Reject equipment that is wet or damaged by moisture or mold or physically damaged.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2 INSTALLATION**

- A. Fire Pump Installation Standard: Comply with NFPA 20 for installation of fire pumps, relief valves, and related components.
- B. Provide direct feed power supply to fire pump controller from power source with no fuses or breakers in the circuit. See Electrical Specifications for electrical diagram submittal requirements.
- C. Locate controller as close to motor as practical and within sight. Provide controller with suitable protection as necessary to protect against water escaping from pump or connections. Elevate controller minimum of 12-inches above finished floor.
- D. Install pumps and controllers to provide access for periodic maintenance including removal of motors, impellers, couplings, and accessories. Provide no less than minimum as recommended by manufacturer.
- E. Equipment Mounting:
  - 1. Install fire pumps on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Division 03.
- F. Install fire pump suction and discharge piping equal to or larger than sizes required by NFPA 20.
- G. Support piping and pumps separately so weight of piping does not rest on pumps.
- H. Install valves that are same size as connecting piping. Comply with requirements for fire protection valves specified in Section 210515 "Basic Fire Suppression Piping Materials and Methods".
- I. Install pressure gauges on fire pump suction and discharge flange pressure-gauge tappings. Comply with requirements for pressure gauges specified in Section 210515 "Basic Fire Suppression Piping Materials and Methods".
- J. Install piping hangers and supports, anchors, valves, gauges, and equipment supports according to NFPA 20.
- K. Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not factory mounted. Furnish copies of manufacturers' wiring diagram submittals to electrical Installer.
- L. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.
- M. Install flowmeters and sensors. Install flowmeter system components and make connections according to NFPA 20 and manufacturer's written instructions.
- N. Install vertical-turbine, pressure-maintenance pumps according to HI 2.4.
- O. Wall-Mounting Controllers: Install controllers on walls with disconnect operating handles not higher than 79-inches above finished floor, and bottom of enclosure not less than 12-inches above finished floor unless otherwise indicated. Bolt units to wall or mount on lightweight structural-steel channels bolted to wall. For controllers not on walls, provide freestanding racks complying with Section 260529 "Hangers and Supports for Electrical Systems."
- P. Floor-Mounting Controllers: Install controllers on 4-inch nominal-thickness concrete bases, using floor stands high enough so that the bottom of enclosure cabinet is not less than 12-inches above finished floor. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
  - 1. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base, and anchor into structural concrete floor.
  - 2. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  - 3. Install anchor bolts to elevations required for proper attachment to supported equipment.

- Q. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- R. Comply with NEMA ICS 15.

### 3.3 ALIGNMENT

- A. Align pump and driver shafts after complete unit has been leveled on concrete base, grout has set, and anchor bolts have been tightened.
- B. After alignment is correct, tighten anchor bolts evenly. Fill baseplate completely with grout, with metal blocks and shims or wedges in place. Tighten anchor bolts after grout has hardened. Check alignment and make required corrections.
- C. Align piping connections.
- D. Align pump and driver shafts for angular and parallel alignment according to HI 1.4 and to tolerances specified by manufacturer.

### 3.4 CONNECTIONS

- A. Comply with requirements for piping and valves specified in Section 210515 "Basic Fire Suppression Piping Materials and Methods". Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to pumps and equipment to allow service and maintenance.
- C. Connect relief valve discharge to drainage piping or point of discharge.
- D. Provide drains for bases and seals, piped to and discharging into floor drains.
- E. Connect flowmeter system meters, sensors, and valves to tubing.
- F. Connect fire pumps and pressure-maintenance pump to their controllers.
- G. Connect controllers to their dedicated pressure-sensing lines.
- H. Provide for fire pump controller connection to building fire-alarm system. Refer to Division 28, "Fire Detection and Alarm".

### 3.5 IDENTIFICATION

- A. Identify system components. Comply with requirements for fire pump marking according to NFPA 20.

### 3.6 FIELD QUALITY CONTROL

- A. Test each fire pump with its controller as a unit. Comply with requirements for electric-motor driver fire pump controllers.
- B. Perform tests and inspections.
  - 1. Manufacturer's Field Service: Engage a factory authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Final Checks before Startup: Perform the following preventive maintenance operations and checks:
  - 1. Lubricate oil-lubrication-type bearings.
  - 2. Disconnect coupling and check electric motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.

3. Verify that pump is free to rotate by hand. If pump is bound or if it drags even slightly, do not operate until cause of trouble is determined and corrected.
  4. Inspect and Test each controller component:
    - a. Inspect wiring, components, connections, and equipment installations. Test and adjust components and equipment.
    - b. Test insulation resistance for each element, component, connecting supply, feeder, and control circuits.
    - c. Test continuity of each circuit.
- D. Tests and Inspections:
1. After installing components, assemblies, and equipment including controller, test for compliance with requirements.
  2. Test according to NFPA 20 for acceptance and performance testing.
  3. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
  4. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
  5. Verify and Test each Electric-Driver Controller:
    - a. Verify that voltages at controller locations are within plus 10 or minus 1 percent of motor nameplate rated voltages, with motors off. If outside this range for any motor, notify Engineer before starting the motor(s).
    - b. Test each motor for proper phase rotation.
  6. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
  7. Components, assemblies, and equipment will be considered defective if they do not pass tests and inspections.
  8. Prepare test and inspection reports.
- E. Field Acceptance Tests:
1. Do not begin field acceptance testing until suction piping has been flushed and hydrostatically tested and the certificate for flushing and testing has been submitted to Engineer and authorities having jurisdiction.
  2. Prior to starting, notify authorities having jurisdiction of the time and place of the acceptance testing.
  3. Furnish fire hoses in number, size, and length required to reach storm drain or other acceptable location to dispose of fire pump test water. Hoses are for tests only and do not convey to Owner.
  4. Furnish all equipment required to conduct field acceptance tests to include play pipes, hose monsters, pitot tubes, gauges, ammeter, voltmeter, tachometer, etc.

### 3.7 ADJUSTING

- A. Adjust controllers to function smoothly and as recommended by manufacturer.
- B. Set field-adjustable switches, auxiliary relays, time-delay relays, and timers.
- C. Program microprocessors for required operational sequences, status indications, alarms, event recording, and display features. Clear events memory after final acceptance testing and prior to Substantial Completion.
- D. Set field-adjustable pressure switches.

### 3.8 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until enclosed controllers are ready to be energized and placed into service.

- B. Replace controllers whose interiors have been exposed to water or other liquids prior to Substantial Completion.

**3.9 DEMONSTRATION**

- A. Train Owner's maintenance personnel to adjust, operate, and maintain fire pumps.

END OF DIVISION 22 TABLE OF CONTENTS

12/11/2024

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 00 10 - GENERAL PLUMBING REQUIREMENTS****PART 1 - GENERAL REQUIREMENTS****1.1 DESCRIPTION OF WORK**

- A. This Division requires the furnishing and installing of complete functioning systems, and each element thereof, as specified or indicated on the Drawings and Specifications or reasonably inferred; including every article, device or accessory (whether or not specifically called for by item) reasonably necessary to facilitate each system's functioning as indicated by the design and the equipment specified. Elements of the work include materials, labor, supervision, supplies, equipment, transportation, and utilities.
- B. Division 22 of the Specifications and Drawings numbered with prefixes P, MP and EP, or MEP generally describe these systems, but the scope of the Plumbing work includes all such work indicated in the Contract Documents: Instructions to Bidders; Proposal Form; General Conditions; Supplementary General Conditions; Architectural, Structural, Mechanical, Plumbing and Electrical Drawings and Specifications; and Addenda.
- C. The Drawings have been prepared diagrammatically intended to convey the scope of work, indicating the intended general arrangement of the equipment, fixtures, piping, etc. without showing all the exact details as to elevations, offsets, control lines, and other installation requirements. The Contractor shall use the Drawings as a guide when laying out the work and shall verify that materials and equipment will fit into the designated spaces, and which, when installed per manufacturers requirements, will ensure a complete, coordinated, satisfactory and properly operating system.

**1.2 QUALITY ASSURANCE**

- A. All work under this division shall be executed in a thorough professional manner by competent and experienced workmen licensed to perform the Work specified.
- B. All work shall be installed in strict conformance with manufacturer's requirements, recommendations, and installation instructions. Equipment and materials shall be installed in a neat and professional manner and shall be aligned, leveled, and adjusted for satisfactory operation.
- C. Material and equipment shall be new, shall be of the best quality and design, shall be current model of the manufacturer, shall be free from defects and imperfections and shall have markings or a nameplate identifying the manufacturer and providing sufficient reference to establish quality, size and capacity. Material and equipment of the same type shall be made by the same manufacturer whenever practicable.
- D. Unless specified otherwise, manufactured items shall have been installed and used, without modification, renovation, or repair for not less than one year prior to date of bidding for this project.

**1.3 CODES REFERENCES AND STANDARDS**

- A. Execute Work in accordance with the National Fire Protection Association and all Local, State, and National codes, ordinances and regulations in force governing the particular class of Work involved. Obtain timely inspections by the constituted authorities, and upon final completion of the Work obtain and deliver to the Owner executed final certificates of acceptance from the Authority Having Jurisdiction.
- B. Any conflict between these Specifications and accompanying Drawings and the applicable Local, State and Federal codes, ordinances and regulations shall be reported to the Architect in sufficient

time, prior to the opening of Bids, to prepare the Supplementary Drawings and Specification Addenda required to resolve the conflict.

- C. The governing codes are minimum requirements. Where these Drawings and Specifications exceed the code requirements, these Drawings and Specification shall prevail.
- D. All material, manufacturing methods, handling, dimensions, method or installation and test procedure shall conform to but not be limited to the following industry standards and codes:

IBC	International Building Code – 2021
IMC	International Mechanical Code – 2021
IPC	International Plumbing Code – 2021
IFGC	International Fuel Gas Code - 2021
IECC	International Energy Conservation Code – 2015
ADA	American Disabilities Act
AMCA	Air Movement and Control Association, Inc.
ANSI	American National Standards Institute
AHRI	Airc Conditioning, Heating and Refrigeration Institute
ASHRAE	American Society of Heating Refrigerating and Air Conditioning Engineers
ASME	American Society of Mechanical Engineers
ASSE	American Society of Sanitary Engineering
ASTM	American Society of Testing Materials
AWS	American Welding Society
AWWA	American Water Works Association
CISPI	Cast Iron Soil Pipe Institute
ETL	Electrical Testing Laboratories
FGI	Facilities Guideline Institute
HI	Hydraulic Institute
MSS	Manufacturer’s Standardization Society of the Valve and Fitting Industry
NBFU	National Board of Fire Underwriters
NEC	National Electrical Code
NFPA	National Fire Protection Association
NEMA	National Electrical Manufactures’ Association
OSHA	Occupational Safety and Health Act
PDI	Plumbing and Drainage Institute
UL	Underwriter's Laboratories

- E. Contractor shall comply with rules and regulations of public utilities and municipal departments affected by connections of services.
- F. All Plumbing work shall be performed in compliance with applicable safety regulations, including OSHA regulations. Safety lights, guards, shoring and warning signs required for the performance of the Plumbing work shall be provided by the Contractor.

#### 1.4 DEFINITIONS

A. General:

1. Furnish: When ‘furnish’, ‘install’, ‘perform’, or ‘provide’ is not used in connection with services, materials, or equipment in a context clearly requiring an obligation of Contractor, “provide” is implied.
2. Install: The term “install” is used to describe operations at the project site including the actual “unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations.”
3. Provide: The term “provide” means “to furnish and install, complete and ready for the intended use.” When ‘furnish’, ‘install’, ‘perform’, or ‘provide’ is not used in connection with services, materials, or equipment in a context clearly requiring an obligation of Contractor, “provide” is implied.

4. **Furnished by Owner or Furnished by Others:** The item will be furnished by the Owner or Others. It is to be installed and connected under the requirements of this Division, complete and ready for operation, including items incidental to the Work, including services necessary for proper installation and operation. The installation shall be included under the guarantee required by this Division.
  5. **Engineer:** Where referenced in this Division, "Engineer" is the Engineer of Record and the Design Professional for the Work under this Division, and is a Consultant to, and an authorized representative of, the Architect, as defined in the General and/or Supplementary Conditions. When used in this Division, it means increased involvement by, and obligations to, the Engineer, in addition to involvement by, and obligations to, the "Architect".
  6. **AHJ:** The local code and/or inspection agency (Authority) Having Jurisdiction over the Work.
  7. **NRTL:** Nationally Recognized Testing Laboratory, as defined and listed by OSHA in 29 CFR 1910.7 (e.g., UL, ETL, CSA, etc.), and acceptable to the Authority having Jurisdiction (AHJ) over this project. Nationally Recognized Testing Laboratories and standards listed are used only to represent the characteristics required and are not intended to restrict the use of other listed Manufacturers and models that meet the specified criteria.
  8. **Substitution:** Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents and proposed by Contractor. Substitutions include Value Engineering proposals.
    - a. **Substitutions for Cause:** Changes proposed by Contractor that are required due to changed Project conditions, such as unavailability of product, regulatory changes, or unavailability of required warranty terms.
    - b. **Substitutions for Convenience:** Changes proposed by Contractor or Owner that are not required in order to meet other Project requirements but may offer advantage to Contractor or Owner.
  9. **Value Engineering:** A systematic method to improve the "value" of goods and services by using an examination of function. Value, as defined, is the ratio of function to cost. Value can therefore be increased by either improving the function or reducing the cost. The goal of VE is to achieve the desired function at the lowest overall cost consistent with required performance.
- B. The terms "approved equal", "equivalent", or "equal" are used synonymously and shall mean "accepted by or acceptable to the Engineer as equivalent to the item or manufacturer specified". The term "approved" shall mean labeled, listed, or both, by an NRTL, and acceptable to the AHJ over this project.
- C. The following definitions apply to excavation operations:
1. **Additional Excavation:** Where excavation has reached required subgrade elevations, if unsuitable bearing materials are encountered, continue excavation until suitable bearing materials are reached. The Contract Sum may be adjusted by an appropriate Contract Modification.
  2. **Bedding:** as used in this Section refers to the compacted sand or pea gravel installed in the bottom of a pipe trench to immediately support a pipe and cover a pipe.
  3. **Subbase:** as used in this Section refers to the compacted soil layer used in pavement systems between the subgrade and the pavement base course material.
  4. **Subgrade:** as used in this Section refers to the compacted soil immediately below the slab or pavement system.
  5. **Unauthorized excavation** consists of removal of materials beyond indicated subgrade elevations or dimensions without specific direction from the Architect.
  6. **Building Fill:** as used in this section refers to borrowed fill material of rock 1" and larger used to fill foundation excavations.

**1.5 COORDINATION**

- A. The Contractor shall visit the site and ascertain the conditions to be encountered while installing the Work under this Division, verify all dimensions and locations before purchasing equipment or commencing work, and make due provision for same in the bid. Failure to comply with this requirement shall not be considered justification for omission, alteration, incorrect or faulty installation of Work under this Division or for additional compensation for Work covered by this Division.
- B. The Contractor shall refer to Drawings of the other disciplines and to relevant equipment drawings and shop drawings to determine the extent of clear spaces. The Contractor shall make offsets required to clear equipment, beams and other structural members; and to facilitate concealing piping and ductwork in the manner anticipated in the design.
- C. The Contractor shall confirm and coordinate the final location and routing of all mechanical, electrical, plumbing, fire protection, control and audio-visual systems with all architectural features, structural components, and other trades. The Contractor shall locate equipment, components, ductwork, piping, conduit, and related accessories to maintain the desired ceiling heights as indicated on the architectural drawings. The Contractor shall inform the Architect of any areas where conflicts may prevent the indicated ceiling height from being maintained. The Contractor shall not proceed with any installation in such areas until the architect has given written approval to proceed or has provided modified contract drawings or written instructions to resolve the apparent conflict.
- D. The Contractor shall provide materials with trim which will fit properly the types of ceiling, wall, or floor finishes actually installed.
- E. The Contractor shall maintain a foreman on the jobsite at all times to coordinate their work with other contractors and subcontractors so that various components of the Plumbing systems will be installed at the proper time, will fit the available space, and will allow proper service access to the equipment. Carry on the Work in such a manner that the Work of the other contractors and trades will not be handicapped, hindered, or delayed at any time.
- F. Work of this Division shall progress according to the "Construction Schedule" as established by the Prime Contractor and their subcontractors and as approved by the Architect. Cooperate in establishing these schedules and perform the Work under this Division, in a timely manner in conformance with the construction schedule so as to ensure successful achievement of schedule dates.

**1.6 MEASUREMENTS AND LAYOUTS**

- A. The drawings are schematic in nature, but show the various components of the systems approximately to scale and attempt to indicate how they are to be integrated with other parts of the building. Figured dimensions shall be taken in preference to scale dimensions. Determine exact locations by job measurements, by checking the requirements of other trades, and by reviewing the Contract Documents. The Contractor will be held responsible for errors which could have been avoided by proper checking and inspection.

**1.7 COORDINATION DRAWINGS**

- A. Coordination Drawings, General: Prepare coordination drawings according to the requirements of individual Sections. Additionally, prepare coordination drawings as required scope of installation is not completely shown on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one trade.
  - 1. Information shall be project specific and drawn accurately to a scale large enough to resolve conflicts. Do not base coordination drawings on standard dimensional data.

2. Prepare floorplans, sections, elevations, and details as needed to adequately describe relationship of various systems and components.
  3. Clearly indicate functional and spatial relationships of components of all systems specified in the Contract Documents, including but not limited to: architectural, structural, civil, mechanical, electrical, fire protection, and specialty systems.
  4. Indicate space requirements for routine maintenance and for anticipated replacement of components during the life of the installation.
  5. Show location and size of access doors required for access to concealed equipment, fittings, controls, terminations, and cabling.
  6. Indicate required installation sequence to minimize conflicts between entities.
  7. Indicate dimensions shown on the Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternate sketches to Contract Administrator indicating proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.
  8. The details of the coordination are the responsibility of the Contractor and, where indicated on the Drawings, minor adjustments in raceway routing, device placement, device type, or equipment arrangement are not to be considered changes to the Contract.
- B. Equipment Room Coordination Drawings: In accordance with the submittal procedures outlined within these Specifications, provide dimensioned layouts of electrical equipment locations within electrical rooms/closets, mechanical rooms, generator rooms, and fire pump rooms with equipment drawn to scale and identified therein.
1. Clearly identify all required working clearances and access provisions required for installation and maintenance.
  2. Equipment layouts should be arranged accounting for considerations for required door openings and the clearances required by the equipment manufacturer.
  3. Indicate path to allow for the future removal of each large piece of equipment (up to and including generators and unit sub-station transformers) without removal of non-related equipment or architectural elements.
  4. Include work provided by others routed through the equipment rooms.
- C. Coordination Digital Data Files: Prepare coordination digital data files according to the following requirements:
1. File Preparation Format: Same digital data software program, version, and operating system as original Drawings.
  2. BIM File Incorporation: Develop and incorporate coordination drawing files into Building Information Model established for Project.
    - a. Perform three-dimensional component conflict analysis as part of preparation of coordination drawings. Resolve component conflicts prior to submittal. Indicate where conflict resolution requires modification of design requirements by Contract Administrator.
  3. Where the Engineer's digital data files are provided to the Contractor for use in preparing coordination digital data files, the Engineer makes no representations as to the accuracy or completeness of digital data files as they relate to the Drawings or Specifications.
  4. Submit coordination drawings in accordance with the submittal procedures outlined within these Specifications.

## 1.8 SUBMITTALS

- A. Refer to Division 01 and General Conditions for submittal requirements in addition to requirements specified herein.
- B. Refer to Division 01 for acceptance of electronic submittals. If not specified by Division 01, provide electronic submittals. If Division 01 requires paper submittals, provide the quantity of submittals required, but no fewer than seven (7) sets.

- C. For electronic submittals, Contractor shall submit the documents in accordance with this Section and the procedures specified in Division 01. Contractor shall notify the Contract Administrator and Engineer that the submittals have been posted. If electronic submittal procedures are not defined in Division 01, Contractor shall include the website, user name and password information needed to access the submittals. For submittals sent by e-mail, Contractor shall copy the Contract Administrator's and Engineer's designated representatives. Contractor shall allow for the Engineer Review Time as specified. Contractor shall submit only the documents required to purchase the materials and/or equipment in the submittal.
- D. Engineer Review Time: Transmit submittals as early as required to support the project schedule. Allow two weeks for Engineer review time or time specified in the Engineer's Agreement with the Client, plus to/from mailing time via the Contract Administrator, plus a duplication of this time for resubmittal if required. Transmit submittals as soon as possible after Notice to Proceed and before Mechanical construction starts.
- E. Submittals and shop drawings shall not contain the firm name, logo, seal, or signature of the Engineer. They shall not be copies of the work product of the Engineer. If the Contractor desires to use elements of such product, the license agreement for transfer of information obtained from the Engineer must be used.
- F. Assemble and submit for review manufacturer product literature for material and equipment to be furnished and/or installed under this Division. Literature shall include shop drawings, manufacturer product data, performance sheets, samples, and other submittals required by this Division as noted in each individual Section. General product catalog data not specifically noted to be part of the specified product will be rejected and returned without review.
- G. Separate submittals according to individual specification sections. Only resubmit those sections requested for resubmittal.
- H. Provide submittals in sufficient detail so as to demonstrate compliance with these Contract Documents and the design concept. Highlight, mark, list or indicate the materials, performance criteria and accessories that are being proposed. Illegible submittals will be rejected and returned without review.
- I. Refer to individual Sections for additional submittal requirements.
- J. Before transmitting submittals and material lists, verify that the equipment submitted is mutually compatible with and suitable for the intended use. Verify that the equipment will fit the available space and maintain manufacturer recommended service clearances. If the size of equipment furnished makes necessary any change in location, or configuration, submit a shop drawing showing the proposed layout.
- K. Submittals shall contain the following information:
  - 1. The project name.
  - 2. The applicable specification section and paragraph.
  - 3. Equipment identification acronym as used on the drawings.
  - 4. The submittal date.
  - 5. The Contractor's stamp, which shall certify that the stamped drawings have been checked by the Contractor, comply with the Drawings and Specifications, and have been coordinated with other trades.
  - 6. Submittals not so identified will be returned to the Contractor without action.
- L. The checking and subsequent acceptance by the Engineer and/or Contract Administrator of submittals shall not relieve responsibility from the Contractor for (1) deviations from Drawings and Specifications; (2) errors in dimensions, details, sizes of equipment, or quantities; (3) omissions of components or fittings; and (4) not coordinating items with actual building conditions and adjacent work. Contractor shall request and secure written acceptance from the Engineer and Contract Administrator prior to implementing any deviation.
- M. Provide welders' qualification certificates.

- N. BIM Incorporation: Develop and incorporate Shop Drawing files into BIM established for Project.

### 1.9 ELECTRONIC DRAWING FILES

- A. In preparation of shop drawings or record drawings, Contractor may, at their option, obtain electronic drawing files in AutoCAD or DXF format from the Engineer for a shipping and handling fee of 200 for a drawing set up to 12 sheets and 15 per sheet for each additional sheet. Contact the Architect for Architect's written authorization. Contractor shall request and complete the Electronic File Release Agreement form from the Engineer. Send the form along with a check made payable to Henderson Engineers, Inc. Contractor shall indicate the desired shipping method and drawing format on the attached form. In addition to payment, Architect's written authorization and Engineer's release agreement form must be received before electronic drawing files will be sent.

### 1.10 SUBSTITUTIONS

- A. Refer to Division 01 and General Conditions for substitutions in addition to requirements specified herein.
- B. Materials, products, equipment, and systems described in the Bidding Documents establish a standard of required function, dimension, appearance and quality to be met by the proposed substitution.
- C. The base bid shall include only the products from manufacturers specifically named in the drawings and specifications.
- D. Request for Substitution:
  - 1. Complete and send the Substitution Request Form attached at the end of this section for each material, product, equipment, or system that is proposed to be substituted.
  - 2. The burden of proof of the merit of the proposed substitution is upon the proposer.
  - 3. Unless stated otherwise in writing to the Engineer by the Contractor, Contractor warrants to the Engineer, Architect, and Owner the following:
    - a. Proposed substitution has been fully investigated and determined to meet or exceed the specified Work in all respects.
    - b. Proposed substitution is consistent with the Contract Documents and will produce indicated results, including functional clearances, maintenance service, and sourcing of replacement parts.
    - c. Proposed substitution has received necessary approvals of authorities having jurisdiction.
    - d. Same warranty will be furnished for proposed substitution as for specified Work.
    - e. If accepted substitution fails to perform as required, Contractor shall replace substitute material or system with that originally specified and bear costs incurred thereby.
    - f. Coordination, installation and changes in the Work as necessary for accepted substitution will be complete in all respects.
- E. Substitution Consideration:
  - 1. No substitutions will be considered unless the Substitution Request Form is completed and attached with the appropriate substitution documentation.
  - 2. No substitution will be considered prior to receipt of Bids unless written request for approval to bid has been received by the Engineer at least ten (10) calendar days prior to the date for receipt of Bids.
  - 3. If the proposed substitution is approved prior to receipt of Bids, such approval will be stated in an Addendum. Bidders shall not rely upon approvals made in any other manner. Verbal approval will not be given.
  - 4. No substitutions will be considered after the Contract is awarded unless specifically provided in the Contract Documents.

**1.11 OPERATION AND MAINTENANCE MANUALS**

- A. Refer to Division 01 and General Conditions for Operation and Maintenance Manuals in addition to requirements specified herein.
- B. Submit manuals prior to requesting the final punch list and before all requests for Substantial Completion.
- C. Instruct the Owner's permanent personnel in the proper operation of, startup and shutdown procedures and maintenance of the equipment and components of the systems installed under this Division.
- D. Prior to Substantial Completion of the project, furnish to the Architect, for Engineer's review, and for the Owner's use, four (4) copies of Operation and Maintenance Manuals in labeled, hard-back three-ring binders, with cover, binding label, tabbed dividers and plastic insert folders for Record Drawings. Include local contacts, complete with address and telephone number, for equipment, apparatus, and system components furnished and installed under this Division of the specifications.
- E. Each manual shall contain data listed in Table 5.
- F. Refer to Division 01 for acceptance of electronic manuals for this project. For electronic manuals, Contractor shall submit the documents in accordance with this Section and the procedures specified in Division 01. Contractor shall notify the Architect and Engineer that the manuals have been posted. If electronic manual procedures are not defined in Division 01, Contractor shall include the website, user name and password information needed to access the manuals. For manuals sent by e-mail, Contractor shall copy the Architect and Engineer's designated representatives.

**1.12 SPARE PARTS**

- A. Provide to the Owner the spare parts specified in the individual sections in Division 22 of this specification. Refer to Table 2 at the end of this section for a list of specification sections in Division 22 that contain spare parts requirements.
- B. Owner or Owner's representative shall initial and date each section line in Table 2 when the specified spare parts for that section are received and shall sign at the bottom when all spare parts have been received.

**1.13 RECORD DRAWINGS**

- A. Refer to Division 01 and General Conditions for Record Drawings in addition to requirements specified herein.
- B. A set of work prints of the Contract Documents shall be kept on the jobsite during construction for the purpose of noting changes. During the course of construction, the Contractor shall indicate on these Documents changes made from the original Contract Documents. Particular attention shall be paid to those items which need to be located for servicing. Underground utilities shall be located by dimension, from column lines.
- C. At the completion of the project, the Contractor shall obtain, at their expense, reproducible copies of the final drawings and incorporate changes noted on the jobsite work prints onto these drawings. These changes shall be done by a skilled drafter. Each sheet shall be marked "Record Drawing", along with the date. These drawings shall be delivered to the Architect/Engineer.

**1.14 TRAINING**

- A. Provide training as indicated in each specific section. Schedule training with the Owner at least 7 days in advance. Video tape the training sessions in format as agreed to with the Owner. Provide three copies of each session to the Owner and obtain written receipt from the Owner.

**1.15 PAINTING**

- A. Exposed ferrous surfaces, including pipe, pipe hangers, equipment stands and supports and exposed insulated piping shall be painted by the Plumbing Contractor using materials and methods as specified under Division 9 of the Specifications; colors shall be as selected by the Architect.
- B. Factory finishes, shop priming and special finishes are specified in the individual equipment specification sections.
- C. Where factory finishes are provided and no additional field painting is specified, marred or damaged surfaces shall be touched up or refinished so as to leave a smooth, uniform finish.

**1.16 DELIVERY STORAGE AND HANDLING**

- A. Refer to Division 01 and General Conditions for Delivery, Storage and Handling in addition to requirements specified herein.
- B. Equipment and material shall be delivered to the job site in their original containers with labels intact, fully identified with manufacturer's name, model, model number, type, size, capacity and Underwriter's Laboratories, Inc. labels and other pertinent information necessary to identify the item.
- C. Deliver, receive, handle and store equipment and materials at the job site in the designated area and in such a manner as to prevent equipment and materials from damage and loss. Store equipment and materials delivered to the site on pallets and cover with waterproof, tear resistant tarp or plastic or as required to keep equipment and materials dry. Follow manufacturer's recommendations, and at all times, take every precaution to properly protect equipment and material from damage, to include the erection of temporary shelters to adequately protect equipment and material stored at the Site. Equipment and/or material which become rusted or damaged shall be replaced or restored by the Contractor to a condition acceptable to the Architect.
- D. The Contractor shall be responsible for the safe storage of their own tools, material and equipment.

**1.17 GUARANTEES AND WARRANTIES**

- A. Refer to Division 01 and General Conditions for Guarantees and Warranties in addition to requirements specified herein.
- B. Each system and element thereof shall be warranted against defects due to faulty workmanship, design or material for a period of 12 months from date of Substantial Completion, unless specific items are noted to carry a longer warranty in the Construction Documents or manufacturer's standard warranty. The Contractor shall remedy defects occurring within a period of one year from the date of Substantial Completion or as stated in the General Conditions.
- C. The following additional items shall be guaranteed:
  - 1. Piping shall be free from obstructions, holes or breaks of any nature.
  - 2. Insulation shall be effective.
  - 3. Proper circulation of fluid in each piping system.
- D. The above guarantees shall include both labor and material; and repairs or replacements shall be made without additional cost to the Owner.
- E. The remedial work shall be performed promptly, upon written notice from the Architect or Owner.
- F. At the time of Substantial Completion, deliver to the Owner warranties with terms extending beyond the one year guarantee period, each warranty instrument being addressed to the Owner and stating the commencement date and term. Refer to Table 3 at the end of this section for a list of specification sections in Division 22 that contain special warranties.

**1.18 TEMPORARY FACILITIES**

- A. Refer to Division 01 and General Conditions for Temporary Facilities requirements in addition to requirements specified herein.
- B. Temporary Utilities: The types of services required include, but are not limited to, water, sewerage, surface drainage and gas. When connecting to existing franchised utilities for required services, comply with service companies' recommendations on materials and methods, or engage service companies to install services. Locate and relocate services (as necessary) to minimize interference with construction operations.
  - 1. Water: Premises are supplied with water services which may be used in this work: Contractor shall make their own arrangements for water services.
  - 2. Sewer Sediment: Maintain sewers and temporary connecting sewers in a clean, nonclogged condition during construction period.
- C. Construction Facilities: Provide facilities reasonably required to perform construction operations properly and adequately.
  - 1. Enclosures: When temporary enclosures are required to ensure adequate workmanship, weather protection and ambient conditions required for the work, provide fire-retardant treated lumber and plywood; provide tarpaulins with UL label and flame spread of 15 or less; provide translucent type (nylon reinforced polyethylene) where daylighting of enclosed space would be beneficial for workmanship, and reduce use of temporary lighting.

**1.19 PRO ECT CONDITIONS**

- A. Conditions Affecting Excavations: The following project conditions apply:
  - 1. Maintain and protect existing building services which transit the area affected by selective demolition.
  - 2. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by excavation operations.
- B. Site Information: Subsurface conditions were investigated during the design of the Project. Reports of these investigations are available for information only; data in the reports are not intended as representations or warranties of accuracy or continuity of conditions. The Owner will not be responsible for interpretations or conclusions drawn from this information.
- C. Use of explosives is not permitted.
- D. Environmental Conditions: Apply joint sealers under temperature and humidity conditions within the limits permitted by the joint sealer manufacturer. Do not apply joint sealers to wet substrates.

**PART 2 - PRODUCTS AND MATERIALS****2.1 SOIL MATERIALS**

- A. Provide clean sand, pea gravel or flowable fill material (per the geotechnical engineer's or structural engineer's recommendations).
- B. Subbase Material: Where applicable, provide natural soils with 10% by volume of rocks less than 2" diameter or artificially crushed aggregate. Corrosive fill materials shall not be utilized. When CL clay, rock, or gravel is used, it shall not be larger than 2 inches in any dimension and be free of debris, waste, frozen materials, vegetable and other deleterious matter.

**EXECUTION**

## 2.2 PERMITS

- A. Secure and pay for permits required in connection with the installation of the Plumbing Work. Arrange with the various utility companies for the installation and connection of required utilities for this facility and pay charges associated therewith including connection charges and inspection fees, except where these services or fees are designated to be provided by others.

## 2.3 EXISTING UTILITIES

- A. Schedule and coordinate with the Utility Company, Owner and with the Engineer connection to, or relocation of, or discontinuation of normal utility services from existing utility lines. Premium time required for any such work shall be included in the bid.
- B. Existing utilities damaged due to the operations of utility work for this project shall be repaired to the satisfaction of the Owner or Utility Company without additional cost.
- C. Utilities shall not be left disconnected at the end of a work day or over a weekend unless authorized by representatives of the Owner or Engineer.
- D. Repairs and restoration of utilities shall be made before workmen leave the project at the end of the workday in which the interruption takes place.
- E. Contractor shall include in their bid the cost of furnishing temporary facilities to provide services during interruption of normal utility service.

## 2.4 EXCAVATION AND BACKFILLING

- A. Refer to Division 01, Division 02, and Division 31, Geotechnical Soils Report and General Conditions for Excavation and Backfilling in addition to the requirements specified herein.
- B. Perform excavation of every description, of whatever substance encountered and to the depth required in connection with the installation of the work under this Division. Excavation shall be in conformance with applicable Division and section of the General Specifications.
- C. Roads, alleys, streets and sidewalks damaged during this work shall be restored to the satisfaction of Authorities Having Jurisdiction.
- D. Trenches close to walks or columns shall not be excavated without prior consultation with the Architect.
- E. Erect barricades around excavations. Provide an adequate number of amber lights on or near the work and keep them burning from dusk to dawn. The Contractor shall be held responsible for any damage that any parties may sustain due to neglecting the necessary precautions when performing the work.
- F. Slope sides of excavations to comply with local, state and federal codes and ordinances. Shore and brace as required for stability of excavation.
- G. Shoring and Bracing: Establish requirements for trench shoring and bracing to comply with local, state and federal codes and authorities. Maintain shoring and bracing in excavations regardless of time period excavations will be open.
  - 1. Remove shoring and bracing when no longer required. Where sheeting is allowed to remain, cut top of sheeting at an elevation of 30 inches below finished grade elevation.
- H. Install sediment and erosion control measures in accordance with local codes and ordinances.
- I. Dewatering: Prevent surface water and subsurface or ground water from flowing into excavations and trenches.
  - 1. Do not allow water to accumulate in excavations and trenches. Remove water to prevent softening of bearing materials. Provide and maintain dewatering system components necessary to convey water away from excavations.

2. Establish and maintain temporary drainage ditches and other diversions outside excavation and trench limits to convey surface water to collecting or run-off areas. Do not use trench excavations as temporary drainage ditches. In no case shall sewers be used as drains for such water.
- J. Material Storage: Stockpile satisfactory excavated materials where directed, until required for backfill or fill. Place, grade, and shape stockpiles for proper drainage.
1. Locate and retain soil materials away from edge of excavations. Do not store within drip-line of trees indicated to remain.
  2. Remove and legally dispose of excess excavated materials and materials not acceptable for use as backfill or fill.
- K. Excavation for Underground Tanks, Basins, and Plumbing Structures: Conform to elevations and dimensions shown within a tolerance of plus or minus 0.10 foot; plus a sufficient distance to permit placing and removal of concrete formwork, installation of services, other construction, and for inspection.
1. Excavate, by hand, areas within drip-line of large trees. Protect the root system from damage and dry-out. Maintain moist conditions for root system and cover exposed roots with burlap. Paint root cuts of 1 inch in diameter and larger with emulsified asphalt tree paint.
  2. Take care not to disturb bottom of excavation. Excavate by hand to final grade just before concrete reinforcement is placed.
- L. Trenching: Excavate trenches for Plumbing installations as follows:
1. Excavate trenches to the uniform width, sufficiently wide to provide ample working room and a minimum of 6 to 9 inches clearance on both sides of pipe and equipment.
  2. Excavate trenches to depth indicated or required for piping to establish indicated slope and invert elevations. Beyond building perimeter, excavate trenches to an elevation below frost line.
  3. Limit the length of open trench to that in which pipe can be installed, tested, and the trench backfilled within the same day.
  4. Where rock is encountered, carry excavation below required elevation and backfill with a layer of crushed stone or gravel prior to installation of pipe. Provide a minimum of 6 inches of stone or gravel cushion between rock bearing surface and pipe.
  5. Excavate trenches for piping and equipment with bottoms of trench to accurate elevations for support of pipe and equipment on undisturbed soil.
- M. Cold Weather Protection: Protect excavation bottoms against freezing when atmospheric temperature is less than 35°F.
- N. Bedding:
1. Fill bottom of pipe trench and fill unevenness with compacted bedding material to ensure continuous bearing of the pipe barrel on the bearing surface. Additional bedding installation requirements are in the following piping specifications. Compact bedding as described below:
  2. Fill bottom of equipment trench and fill unevenness with compacted sand backfill to ensure continuous bearing of the equipment on the bearing surface. Compact bedding as described below.
- O. Backfilling and Filling: Place soil materials in layers to required subgrade elevations for each area classification listed below, using materials specified in Part 2 of this Section.
1. Under walks and pavements, use a combination of subbase materials and excavated or borrowed materials.
  2. Under building slabs, use drainage fill materials.
  3. Under piping and equipment, use subbase materials where required over rock bearing surface and for correction of unauthorized excavation.
  4. For piping less than 30 inches below surface of roadways, provide 4-inch-thick concrete base slab support after installation and testing of piping and prior to backfilling and placement of roadway subbase. Coordinate with AHJ for colored concrete requirements.

5. Other areas, use excavated or borrowed materials.
- P. Backfill excavations as promptly as work permits, but not until completion of the following:
1. Inspection, testing, approval, and locations of underground utilities have been recorded.
  2. Removal of concrete formwork.
  3. Removal of shoring and bracing, and backfilling of voids.
  4. Removal of trash and debris.
- Q. Drainage Fill: Where building fill is used in lieu of natural soils, provide drainage fill as subbase material. Provide filter fabric material to line the trench to support the bedding material and subbase materials to ensure that backfill materials will not segregate within the trench nor create voids and sags within the pipe trench.
- R. Placement and Compaction: Place subgrade backfill and fill materials in layers of not more than 8 inches in loose depth for material compacted by heavy equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.
- S. Before compaction, moisten or aerate each layer as necessary to provide optimum moisture content. Compact each layer to required percentage of maximum dry density or relative dry density for each area classification specified below. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
- T. Place backfill and fill materials evenly adjacent to structures, piping, and equipment to required elevations. Prevent displacement of piping and equipment by carrying material uniformly around them to approximately same elevation in each lift.
- U. Compaction: Place bedding backfill materials in maximum layers of not more than 6 inches loose depth for material compacted by hand-operated tampers. Place subbase backfill materials in maximum layers of not more than 8 inches in loose depth for material compacted by heavy equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers. Control soil compaction during construction, providing minimum percentage of density specified for each area classification indicated below.
1. Use of pneumatic backhoe as compaction method is not allowed as an acceptable process for compaction of excavations or trenches.
  2. For vertical and/or diagonal pipe installations greater than ½" rise/lf, thoroughly support pipes from permanent concrete structures or undisturbed earth at no less than 10-foot intervals, while placing backfill materials, so that pipes are not deflected, crushed, broken, or otherwise damaged by the backfill placement or settlement.
  3. Where subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water. Apply water in minimum quantity necessary to achieve required moisture content and to prevent water appearing on surface during, or subsequent to, compaction operations. Compact each layer to required percentage of maximum dry density or relative dry density for each area classification specified below. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
  4. Place backfill and/or drainage fill materials evenly adjacent to structures, piping, and equipment to required elevations. Coordinate with Architect and/or Civil Engineer backfill requirements prior to installation. Prevent displacement of pipes and equipment by carrying material uniformly around them to approximately same elevation in each layer or lift.
  5. Percentage of Maximum Density Requirements: Compact soil to not less than the following percentages of maximum density for soils which exhibit a well-defined moisture-density relationship (cohesive soils), determined in accordance with ASTM D 1557 or ASTM D 698 and not less than the following percentages of relative density, determined in accordance with ASTM D 4253, for soils which will not exhibit a well-defined moisture-density relationship (cohesionless soils).
    - a. Areas Under Structures, Building Slabs and Steps, Pavements: Compact top 12 inches of subgrade and each layer of backfill or fill material to 90 percent maximum density for cohesive material, or 95 percent relative density for cohesionless material.

- b. Areas Under Walkways: Compact top 6 inches of subgrade and each layer of backfill or fill material to 90 percent maximum density for cohesive material, or 95 percent relative density for cohesionless material.
  - c. Other Areas: Compact top 6 inches of subgrade and each layer of backfill or fill material to 85 percent maximum density for cohesive soils, and 90 percent relative density for cohesionless soils.
- V. Subsidence: Where subsidence occurs at Plumbing installation excavations during the period 12 months after Substantial Completion, remove surface treatment (i.e., pavement, lawn, or other finish), add backfill material, compact to specified conditions, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent areas.
- W. Additional Excavation: Where additional excavation may be required due to unsuitable bearing materials encountered, notify the architect immediately for resolution.

## 2.5 CUTTING AND PATCHING

- A. Cut walls, floors, ceilings, and other portions of the facility as required to install work under this Division.
- B. Obtain permission from the Architect prior to cutting. Do not cut or disturb structural members without prior approval from the Architect and Structural Engineer.
- C. For post-tension slabs, x-ray slab and closely coordinate all core drill locations with Architect and Structural Engineer prior to performing any work. Obtain approval from Architect and Structural Engineer for all core drills and penetrations at least four days prior to performing work.
- D. Penetrations shall be made as small as possible while maintaining required clearances between the building element penetrated and the system component.
- E. Patch around openings to match adjacent construction, including fire ratings, if applicable.
- F. Repair and refinish areas disturbed by work to the condition of adjoining surfaces in a manner satisfactory to the Architect.
- G. After the final waterproofing membrane has been installed, roofs may be cut only with written permission by the Architect.

## 2.6 CLEANING

- A. Dirt and refuse resulting from the performance of the work shall be removed from the premises as required to prevent accumulation. The Plumbing Contractor shall cooperate in maintaining reasonably clean premises at all times.
- B. Immediately prior to the final inspection, the Plumbing Contractor shall clean material and equipment installed under the Plumbing Contract. Dirt, dust, plaster, stains, and foreign matter shall be removed from surfaces including components internal to equipment. Damaged finishes shall be touched-up and restored to their original condition.

## 2.7 SUBSTANTIAL COMPLETION REVIEW

- A. Prior to requesting inspection for "CERTIFICATE OF SUBSTANTIAL COMPLETION", the Contractor shall complete the following items:
  - 1. Submit complete Operation and Maintenance Manuals.
  - 2. Submit complete Record Drawings.
  - 3. Perform special inspections. Refer to Table 4 at the end of this section for a list of specification sections in Division 22 that contain special inspection requirements.
  - 4. Start-up testing of systems.
  - 5. Removal of temporary facilities from the site.
  - 6. Comply with requirements for Substantial Completion in the "General Conditions".

- B. The Contractor shall request in writing a review for Substantial Completion. The Contractor shall give the Architect/Engineer at least seven (7) days notice prior to the review.
- C. The Contractor's written request shall state that the Contractor has complied with the requirements for Substantial Completion.
- D. Upon receipt of a request for review, the Architect/Engineer will either proceed with the review or advise the Contractor of unfulfilled requirements.
- E. If the Contractor requests a site visit for Substantial Completion review prior to completing the above mentioned items, The Contractor shall reimburse the Architect/Engineer for time and expenses incurred for the visit.
- F. Upon completion of the review, the Architect/Engineer will prepare a "final list" of outstanding items to be completed or corrected for final acceptance.
- G. Omissions on the "final list" shall not relieve the Contractor from the requirements of the Contract Documents.
- H. Prior to requesting a final review, the Contractor shall submit a copy of the final list of items to be completed or corrected. The Contractor shall state in writing that each item has been completed, resolved for acceptance or the reason it has not been completed.

**SUBSTITUTION REQUEST FORM**

To Project Engineer: \_\_\_\_\_ Request # (GC Determined): \_\_\_\_\_

Project Name: \_\_\_\_\_

Project No/Phase: \_\_\_\_\_ Date: \_\_\_\_\_

Specification Title: \_\_\_\_\_

Section Number: \_\_\_\_\_ Page: \_\_\_\_\_ Article/Paragraph: \_\_\_\_\_

Proposed Substitution: \_\_\_\_\_

Manufacturer: \_\_\_\_\_ Model No.: \_\_\_\_\_

Address: \_\_\_\_\_ Phone: \_\_\_\_\_

History:  New product  1-4 years old  5-10 years old  More than 10 years old

Differences between proposed substitution and specified Work: \_\_\_\_\_

Point-by-point comparative data attached – REQUIRED BY ENGINEER  
Comparative data may include but not be limited to performance, certifications, weight, size, durability, visual effect, sustainable design characteristics, warranties, and specific features and requirements. Include all information necessary for an evaluation.

Supporting Data Attached:  Drawings  Product Data  Samples  
 Tests  Reports  Other: \_\_\_\_\_

Reason for not providing specified item: \_\_\_\_\_

Similar Installation:  
Project: \_\_\_\_\_ Architect: \_\_\_\_\_

Address: \_\_\_\_\_ Owner: \_\_\_\_\_

\_\_\_\_\_ Date Installed: \_\_\_\_\_

Proposed substitution affects other parts of Work:  No  Yes; explain: \_\_\_\_\_

\_\_\_\_\_  
\_\_\_\_\_

**Substitution Certification Statement:**

Unless stated otherwise in writing to the Engineer by the Contractor, Contractor warrants to the Engineer, Architect, and Owner that the:

- ▲ A. Proposed substitution has been fully investigated and determined to meet or exceed the specified Work in all respects.
- B. Proposed substitution is consistent with the Contract Documents and will produce indicated results.
- C. Proposed substitution does not affect dimensions and functional clearances.
- D. Proposed substitution has received necessary approvals of authorities having jurisdiction.
- E. Same warranty will be furnished for proposed substitution as for specified Work.
- F. Same maintenance service and source of replacement parts, as applicable, is available.
- G. Proposed substitution will not adversely affect other trades or delay construction schedule.
- H. Coordination, installation, and changes in the Work as necessary for accepted substitution will be complete in all respects.

\_\_\_\_\_  
Submitting Contractor                      Date                      Company

**Manufacturer's Certification of Equal Quality:**

I \_\_\_\_\_ represent the manufacturer of the Proposed Substitution item and hereby certify and warrant to Architect, Engineer, and Owner that the function and quality of the Proposed Substitution meets or exceeds the Specified Item.

**SECTION 22 00 15 - COORDINATION****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section specifies the basic requirements for electrical components which are an integral part of packaged plumbing equipment. These components include, but are not limited to factory furnished motors, starters, and disconnect switches furnished as an integral part of packaged plumbing equipment.
- B. Specific electrical requirements (i.e. horsepower and electrical characteristics) for plumbing equipment are scheduled on the Drawings.
- C. System shall be complete and operational with power and control wiring provided to meet the design intent shown on the drawings and specified within the specification sections.

**1.2 SUBMITTALS**

- A. No separate submittal is required. Submit product data for motors, starters, and other electrical components with submittal data required for the equipment for which it serves, as required by the individual equipment specification Sections.

**1.3 QUALITY ASSURANCE**

- A. Electrical components and materials shall be UL labeled.
- B. All electrical equipment provided and the wiring and installation of electrical equipment shall be in accordance with the requirements of this Section and Division 26.

**PART 2 - PRODUCTS AND MATERIALS****2.1 GENERAL**

- A. The Contractors shall provide all motors, starters, disconnects, wire, conduit, etc. as specified in the Construction Documents. If, however, the Plumbing Contractor furnishes a piece of equipment requiring a different motor, starter, disconnect, wire size, etc. than what is shown and/or intended on the Construction Documents, the Plumbing Contractor shall coordinate the requirements with any other Contractor and shall be responsible for any additional cost incurred by any other Contractor that is associated with installing the different equipment and related accessories for proper working condition.
- B. Refer to Division 26, "Common Work Results for Electrical" for specification of motor connections
- C. Refer to Division 26, "Enclosed Switches and Circuit Breakers" for specification of disconnect switches.

**PART 3 - EXECUTION****3.1 CONTRACTOR COORDINATION**

- A. Unless otherwise indicated, all motors, equipment, controls, etc. shall be furnished, set in place and wired in accordance with Table 1. Any items not listed but shown on the drawings shall be considered part of the Contract Documents and brought to the attention of the Architect.

- B. The General Contractor is the central authority governing the total responsibility of all trade contractors. Therefore, deviations and clarifications of this schedule are permitted provided the General Contractor assumes responsibility to coordinate the trade contractors different than as indicated herein. If deviations or clarifications to this schedule are implemented, submit a record copy to the Engineer.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 05 00 - COMMON WORK RESULTS FOR PLUMBING****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes limited scope general construction materials and methods for application with Plumbing installations as follows:
1. Access panels and doors in walls, ceilings, and floors for access to Plumbing materials and equipment.
  2. Plumbing equipment nameplate data.
  3. Concrete for bases and housekeeping pads.
  4. Non-shrink grout for equipment installations.
  5. Sleeves for Plumbing penetrations.
  6. Miscellaneous metals for support of Plumbing materials and equipment.
  7. Wood grounds, nailers, blocking, fasteners, and anchorage for support of Plumbing materials and equipment.
  8. Joint sealers for sealing around Plumbing materials and equipment.
- B. Related Sections: The following sections contain requirements that relate to this Section:
1. Division 7 Section "Penetration Firestopping" for material and methods for firestopping systems.
  2. Division 22 Section "Basic piping Materials and Methods" for materials and methods for mechanical sleeve seals.
  3. Division 22 Section "Sanitary Drainage and Vent Piping and Specialties" for indirect drain piping and installation requirements.
  4. Division 23 Section "Direct Digital Controls for HVAC" for integration with building automation system of leak detection system "Water Present" alarm.
  5. Division 26 Section "Common Work Results for Electrical" required electrical devices.
  6. Division 26 Sections "Enclosed Switches and Circuit Breakers" for field-installed disconnects.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Division 01 and Division 22 Section "General Plumbing Requirements".
1. Product data for the following products:
    - a. Access panels and doors.
    - b. Through and membrane-penetration firestopping systems.
    - c. Joint sealers.
  2. Shop drawings detailing fabrication and installation for metal fabrications, and wood supports and anchorage for Plumbing materials and equipment.
  3. Welder certificates, signed by Contractor, certifying that welders comply with requirements specified under "Quality Assurance" article of this Section.
  4. Schedules indicating proposed methods and sequence of operations for selective demolition prior to commencement of Work. Include coordination for shut-off of utility services and details for dust and noise control.
    - a. Coordinate sequencing with construction phasing and Owner occupancy specified in Division 01 Section "Summary of Work."
  5. Through and Membrane Penetration Firestopping Systems Product Schedule: Submit a schedule for each piping system penetration that includes UL listing, location, wall or floor rating and installation drawing for each penetration fire stop system.
    - a. Where Project conditions require modification to a qualified testing and inspecting agency's illustration for a particular penetration firestopping condition, submit

illustration, with modifications marked, approved by penetration firestopping manufacturer's fire-protection engineer as an engineering judgment or equivalent fire-resistance-rated assembly.

### 1.3 QUALITY ASSURANCE

- A. Qualify welding processes and welding operators in accordance with AWS D1.1 "Structural Welding Code - Steel."
  - 1. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
- B. Fire-Resistance Ratings: Where a fire-resistance classification is indicated, provide access door assembly with panel door, frame, hinge, and latch from manufacturer listed in the UL "Building Materials Directory" for rating shown.
  - 1. Provide UL Label on each fire-rated access door.
- C. Through and Membrane Penetration Systems Installer Qualifications: A firm experienced in installing penetration firestopping systems similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful performance. Qualifications include having the necessary experience, staff, and training to install manufacturer's products per specified requirements. Manufacturer's willingness to sell its penetration firestopping system products to Contractor or to Installer engaged by Contractor does not in itself confer qualification on buyer.

### 1.4 NOISE CRITICAL SPACES

- A. Many areas of the building, referred to as "noise-critical spaces", require special attention (special acoustical provisions and restrictions). The table below designates the noise-critical spaces; noise levels due to equipment, ductwork, grilles, registers, terminal devices, diffusers, etc., shall permit attaining sound pressure levels in all 8 octave bands in occupied spaces conforming to RC levels per ASHRAE handbook as indicated.

<u>Space</u>	<u>RC Levels</u>
Sound/Lighting Control Rooms	25
A/V Spaces	25
TV Production Studio	25
Meeting/Banquet Rooms	30
Conference Rooms	30

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 ACCESS TO EQUIPMENT

- A. Manufacturer:
  - 1. Bar-Co., Inc.
  - 2. Elmdor Stoneman.
  - 3. JL Industries
  - 4. Jay R. Smith Mfg. Co.
  - 5. Karp Associates, Inc.
  - 6. Milcor
  - 7. Nystrom Building Products
  - 8. Wade
  - 9. Zurn
- B. Access Doors:

1. Provide access doors for all concealed equipment, except where above lay-in ceilings. Refer to Section "Identification for Plumbing Piping" for labeling of access doors.
2. Access doors shall be adequately sized for the devices served with a minimum size of 18 inches x 18 inches, furnished by the respective Contractor or Subcontractor and installed by the General Contractor.
3. Access doors must be of the proper construction for type of construction where installed.
4. The exact location of all access doors shall be verified with the Architect prior to installation.
5. Steel Access Doors and Frames: Factory-fabricated and assembled units, complete with attachment devices and fasteners ready for installation. Joints and seams shall be continuously welded steel, with welds ground smooth and flush with adjacent surfaces.
6. Frames: 16-gauge steel, with a 1-inch-wide exposed perimeter flange for units installed in unit masonry, pre-cast, or cast-in-place concrete, ceramic tile, or wood paneling.
  - a. For installation in masonry, concrete, ceramic tile, or wood paneling: 1-inch-wide exposed perimeter flange and adjustable metal masonry anchors.
  - b. For installation in gypsum wallboard or plaster: perforated flanges with wallboard bead.
  - c. For installation in full-bed plaster applications: galvanized, expanded metal lath and exposed casing bead, welded to perimeter of frame.
7. Flush Panel Doors: 14-gauge sheet steel, with concealed spring hinges or concealed continuous piano hinge set to open 175 degrees; factory-applied prime paint.
  - a. Fire-Rated Units: Insulated flush panel doors, with continuous piano hinge and self-closing mechanism.
8. Locking Devices: Flush, screwdriver-operated cam locks.
9. Locking Devices: Where indicated on the drawings or where access panels are installed in locations accessible to the public, provide 5-pin or 5-disc type cylinder locks, individually keyed; provide 2 keys.

## 2.2 PLUMBING EQUIPMENT NAMEPLATE DATA

- A. For each piece of power operated Plumbing equipment, provide a permanent operational data nameplate indicating manufacturer, product name, model number, serial number, capacity, operating and power characteristics, labels of tested compliance's, and similar essential data. Locate nameplates in an accessible location.

## 2.3 CONCRETE EQUIPMENT BASES HOUSEKEEPING PADS

- A. Provide concrete equipment bases and housekeeping pads for various pieces of floor mounted Plumbing equipment.. Concrete equipment bases/housekeeping pads shall generally conform to the shape of the piece of equipment it serves with a minimum 4" margin around the equipment and supports.
- B. Form concrete equipment bases and housekeeping pads using framing lumber or steel channel with form release agent. Chamfer top edges and corners. Trowel tops and sides of each base/pad to a smooth finish, equal to that of the floors.
- C. Concrete equipment bases and housekeeping pads shall be made of a minimum 28 day, 4000 psi concrete conforming to American Concrete Institute Standard Building Code for Reinforced Concrete (ACI 318-99) and the latest applicable recommendations of the ACI standard practice manual. Concrete shall be composed of cement conforming to ASTM C 150 Type I, aggregate conforming to ASTM C33, and potable water. All exposed exterior concrete shall contain 5 to 7 percent air entrainment.
- D. Unless otherwise specified or shown on the structural drawings, reinforce equipment bases and housekeeping pads with No. 4 reinforcing bars conforming to ASTM A 615 or 6x6 – W2.9 x W2.9 welded wire mesh conforming to ASTM A185. Reinforcing bars shall be placed 24" on center with a minimum of two bars each direction.

- E. Provide galvanized anchor bolts for all equipment placed on concrete equipment bases and housekeeping pads or on concrete slabs. Anchor bolts size, number and placement shall be as recommended by the Manufacturer of the equipment.
- F. Concrete equipment bases and housekeeping pads shall have minimum heights in accordance with the following table:

Equipment	Minimum Height
Water Heaters, Water Softeners and Equipment Less than or equal to 20 tons and Other Equipment Not Listed	3-1/2"

## 2.4 GROUT

- A. Provide nonshrink, nonmetallic grout conforming to ASTM C 1107, Grade B, in premixed and factory-packaged containers.
- B. Grout shall have post-hardening, volume-adjusting, dry, non-staining, non-corrosive, non-gaseous, hydraulic-cement characteristics and shall be as recommended by manufacturer for interior and exterior applications.
- C. Grout shall have 5,000 psi, 28-day compressive strength design mix.

## 2.5 PENETRATIONS

- A. Sleeves:
  1. Steel Sleeves: Schedule 40 galvanized, welded steel pipe, ASTM A-53 grade A or 12 gauge (0.1084 inches) welded galvanized steel formed to a true circle concentric to the pipe.
  2. Sheet-Metal Sleeves: 10 gauge (0.1382 inches), galvanized steel, round tube closed with welded longitudinal joint.
- B. Frames for rectangular openings attached to forms and of a maximum dimension established by the Architect. For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches, provide 18 gauge (0.052 inches) welded galvanized steel. For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches and 1 or more sides equal to, or greater than, 16 inches, provide 10 gauge (0.1382 inches) welded galvanized steel. Notify the General Contractor or Architect before installing any box openings not shown on the Architectural or Structural Drawings.
- C. Box Frames: Frames for rectangular openings shall be of welded 12 gauge steel attached to forms and of a maximum dimension established by the Architect. Contractor shall notify the General Contractor or Architect before installing any box openings not shown on the Architectural or Structural Drawings.

## 2.6 DRIP PANS

- A. Drip pans for pipes in protected areas shall be 20 gauge galvanized steel with 2" lapped and soldered joints. Drip pan shall have a depth of 2" and a width of 6" in addition to the diameter of the associated pipe. Provide 3/4" galvanized pipe with male NPT outlet at low point of drip pan.
- B. Drip pan supports shall be 1/4" X 2" galvanized bar stock welded to the drip pan without holes.

## 2.7 LEAK DETECTION SYSTEM

- A. Leak detection system with Rope style leak sensor and controller capable of connecting to a building automation system with audible and visual alarms for leak detection and cable failure in

all drip pans unless otherwise noted on drawings. Provide with factory 24V DC power supply with power plug, sensing cables, and accessories.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. RLE Technologies #LD1000

## 2.8 MISCELLANEOUS METALS

- A. Steel plates, shapes, bars, and bar grating: ASTM A 36.
- B. Cold-Formed Steel Tubing: ASTM A 500.
- C. Hot-Rolled Steel Tubing: ASTM A 501.
- D. Steel Pipe: ASTM A 53, Schedule 40, welded.
- E. Fasteners: Zinc-coated, type, grade, and class as required.

## 2.9 JOINT SEALERS

- A. General: Joint sealers, joint fillers, and other related materials compatible with each other and with joint substrates under conditions of service and application.
- B. Colors: As selected by the Architect from manufacturer's standard colors.
- C. Elastomeric Joint Sealers: Provide the following types:
  1. One-part, nonacid-curing, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for masonry, glass, aluminum, and other substrates recommended by the sealant manufacturer. Provide one of the following:
    - a. "Dow Corning 790," Dow Corning Corp.
    - b. "Silglaze II SCS 2801," General Electric Co.
    - c. "Silpruf SCS 2000," General Electric Co.
    - d. "864," Pecora Corp.
    - e. "Rhodia 5C," Rhone-Poulenc, Inc.
    - f. "Spectrem 1," Tremco, Inc.
    - g. "Spectrem 2," Tremco, Inc.
    - h. "Dow Corning 795," Dow Corning Corp.
    - i. "Rhodia 7B," Rhone-Poulenc, Inc.
    - j. "Rhodia 7S," Rhone-Poulenc, Inc.
    - k. "Omniseal," Sonneborn Building Products Div.
  2. One-part, mildew-resistant, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for glass, aluminum, metal or porcelain plumbing fixtures and nonporous joint substrates; formulated with fungicide; intended for sealing interior joints with nonporous substrates; and subject to in-service exposure to conditions of high humidity and temperature extremes. Provide one of the following:
    - a. "Dow Corning 786," Dow Corning Corp.
    - b. "Sanitary 1700," General Electric Co.
    - c. "898 Silicone Sanitary Sealant," Pecora Corp.
- D. Acrylic-Emulsion Sealants: One-part, nonsag, mildew-resistant, paintable complying with ASTM C 834 recommended for exposed applications on interior and protected exterior locations involving joint movement of not more than plus or minus 5 percent. Provide one of the following:
  1. Products: Subject to compliance with requirements, provide one of the following:
    - a. "Chem-Calk 600," Bostik Construction Products Div.
    - b. "AC-20," Pecora Corp.
    - c. "Sonolac," Sonneborn Building Products Div.
    - d. "Tremflex 834," Tremco, Inc.

**2.10 ACOUSTICAL SEALANTS**

- A. General: Penetrations by pipes through surfaces that are around and between noise critical spaces shall be sleeved, packed and sealed airtight with foam rod, non-hardening sealant and/or packing material as described herein.
- B. Foam Rod: Foam backer rod shall be closed cell polyethylene suitable for use as a backing for non-hardening sealant.
- C. Non-Hardening Sealant: Sealant for penetrations shall be non-hardening polysulphide type. Permanently flexible, approved firestop putty may be used in lieu of the sealant on foam rod in noise critical walls that are also fire rated.
- D. Packing Material: Mineral fiber; non-combustible; resistant to water, mildew and vermin. Expanding resilient foams manufactured for this purpose are an acceptable alternative only if the material density is at least 15 pcf (40 kg/m<sup>3</sup>).

**2.11 FIRESTOPPING**

- A. Sealants and accessories shall have fire-resistance ratings indicated, as established by testing identical assemblies in accordance with UL 2079 or ASTM E 814, or other NRTL acceptable to AHJ. Manufactured by:
  - 1. 3M Corp., Fire Barrier Sealant
  - 2. Hilti
  - 3. Owens Corning, Firestopping Insulation.
  - 4. Pecora, AC-20 FTR
  - 5. RectorSeal
  - 6. Specified Technologies Inc.,
  - 7. United States Gypsum Company SHEETROCK Firecode Compound
  - 8. Tremco, Tremstop Fyre-Sil.

**PART 3 - EXECUTION****3.1 INSTALLATION GENERAL**

- A. Install leak detection systems, access doors and sealants in accordance with manufacturer's installation instructions.

**3.2 INSTALLATION OF ACCESS DOORS**

- A. Set frames accurately in position and securely attached to supports, with face panels plumb and level in relation to adjacent finish surfaces.
- B. Adjust hardware and panels after installation for proper operation.

**3.3 ERECTION OF METAL SUPPORTS AND ANCHORAGE**

- A. Cut, fit, and place miscellaneous metal fabrications accurately in location, alignment, and elevation to support and anchor Plumbing materials and equipment.
- B. Field Welding: Comply with AWS "Structural Welding Code."

**3.4 PREPARATION FOR JOINT SEALERS**

- A. Surface Cleaning for Joint Sealers: Clean surfaces of joints immediately before applying joint sealers to comply with recommendations of joint sealer manufacturer.

- B. Apply joint sealer primer to substrates as recommended by joint sealer manufacturer. Protect adjacent areas from spillage and migration of primers, using masking tape. Remove tape immediately after tooling without disturbing joint seal.

### 3.5 APPLICATION OF JOINT SEALERS

- A. General: Comply with joint sealer manufacturers' printed application instructions applicable to products and applications indicated, except where more stringent requirements apply.
  - 1. Comply with recommendations of ASTM C 962 for use of elastomeric joint sealants.
  - 2. Comply with recommendations of ASTM C 790 for use of acrylic-emulsion joint sealants.
- B. Tooling: Immediately after sealant application and prior to time shinning or curing begins, tool sealants to form smooth, uniform beads; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

### 3.6 PENETRATIONS

- A. New Construction:
  - 1. Coordinate with Divisions 03 and 04 for installation of sleeves and sleeve seals integrally in cast-in-place, precast, and masonry walls and horizontal slabs where indicated on the Drawings or as required to support piping or ductwork penetrations.
- B. Construction in Existing Facilities:
  - 1. Saw cut or core drill existing walls and slabs to install sleeves and sleeve seals in existing facilities. Do not cut or drill any walls or slabs without first coordinating with, and receiving approval from, the Architect, Owner, or both. Seal sleeves and sleeve seals into concrete walls or slabs with a waterproof non-shrink grout acceptable to the Architect.
- C. Provide sleeves and/or box frames for openings in all concrete and masonry construction and fire or smoke partitions, for all mechanical work that passes through such construction; Coordinate with other trades and Divisions to dimension and lay out all such openings.
- D. The General Contractor will provide only those openings specifically indicated on the Architectural or Structural Drawings as being provided under the General Contractor's work.
- E. The cutting of new or existing construction shall not be permitted except by written approval of the Architect.
- F. Floor sleeves shall be fitted with means for attachment to forms and shall be of length to extend at least two inches above the floor level.
- G. Cut sleeves to length for mounting flush with both surfaces of walls.
- H. Extend sleeves installed in floors 2 inches above finished floor level.
- I. Seal space outside of sleeves with grout for penetrations of concrete and masonry.
- J. Seal space outside of sleeves with approved joint compound for penetrations of gypsum board assemblies.
- K. All openings sleeved through underground exterior walls shall be sealed with mechanical sleeve seals as specified in Division 22 Section "Basic Piping Materials and Methods".

### 3.7 DRIP PANS

- A. Provide drip pans in locations indicated on drawings.
- B. Provide drip pans for piping directly above a two hour rated ceiling of an elevator machine room.

- C. Provide drip pans, only with written approval obtained prior to installation, installed beneath piping above electrical rooms, telecom rooms, data rooms, servers or any other protected area not clearly indicated by drawings.
- D. Provide drip pan supports every 4'-0". Provide ¼" galvanized threaded rods through bar stock on each side of the drip pan and attached with 2 nuts per rod. Attach rods to structure with MSS SP-58 compliant components.
- E. Connect ¾" type "L" copper indirect drain line to drip pan outlet. Route and discharge to receptor with air gap outside of the protected area.
- F. Install leak detection rope in a zig-zag pattern covering entire length and width of the drip pan. Secure rope to pan per manufacturers recommendations.
- G. Mount leak detection controller on wall adjacent to exit of the room above which the drip pan is located unless otherwise indicated on drawings indicated on drawings.
- H. Coordinate disconnect and power supply for leak detection system and 120V dedicated receptacle adjacent to controller with Division 26. Power wiring and receptacles are specified in Division 26 Section "Common Work Results for Electrical" Disconnects are specified in Division 26 Section "Enclosed Switches and Circuit Breakers"
- I. Coordinate interlock of "Water Present" alarm and "Cable Fault alarm with Building Automation System. Refer to Division 23 Section "Direct Digital Controls for HVAC" for integration with building automation system and low voltage power wiring.

### 3.8 LEAK DETECTION SYSTEM FOR WATER HEATERS

- A. Provide leak detection rope all around perimeter of water heater drip pan. Secure rope to pan per manufacturers recommendations.
- B. Mount leak detection system controller where indicated on drawings.
- C. Interlock control panel with building automation system for alarm signal for "Leak at Water Heaters" and "Cable Fault" alarm. Upon receiving leak alarm signal from control panel, building automation system shall energize motorized ball valve "MBV" to close. Motorized ball valve "MBV" is indicated and specified on the drawings. Refer to Division 23 Section "Direct Digital Controls for HVAC" for integration with building automation system and low voltage power wiring.

### 3.9 ACOUSTICAL PENETRATIONS

- A. General: There shall be no direct contact of piping with shaft walls, floor slabs and/or partition. All openings around pipes in the structure surrounding the plumbing equipment and surrounding noise-critical spaces shall be sealed, packed with caulking for the full depth of the penetration, as described herein. This includes all slab penetrations and penetrations of noise critical walls.
- B. Domestic Water, Sewer, Drain and Vent Piping
  - 1. Where a pipe passes through a wall, ceiling or floor slab of a noise critical space, a steel sleeve shall be cast or grouted into the structure. The internal diameter of the sleeve shall be 2 inches larger than the external diameter of the pipe passing through it. After all of the piping is installed in that area, the Contractor shall check the clearance and correct it, if necessary, to within 1/2 inch. Pack the void full depth with packing material sealed at both ends, 1 inch deep, with non-hardening sealant backed by foam rod.

END OF SECTION

**SECTION 22 05 13 - COMMON MOTOR REQUIREMENTS FOR PLUMBING EQUIPMENT****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes the following:
  - 1. Single phase electric motors.
  - 2. Three phase electric motors.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with conditions of contract and Division 1 specification Sections.
  - 1. Product Data: Show nameplate data and ratings; characteristics; mounting arrangements; size and location of winding termination lugs, conduit entry, and grounding lug; and coatings.

**1.3 QUALITY ASSURANCE**

- A. All motors shall be UL listed.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Century
- B. General Electric
- C. Westinghouse
- D. Baldor
- E. Gould

**2.2 GENERAL CONSTRUCTION AND REQUIREMENTS**

- A. Motors Less Than 250 Watts, for Intermittent Service: Provide equipment manufacturer's standard. Motor's need not conform to these specifications.
- B. Electrical Service: All motors shall be supplied in accordance with the following voltage and phase unless noted otherwise on the Drawings.
  - 1. Motors 3/4 HP and Larger: 480 volts, three phase, 60 Hz.
  - 2. Motors 1/2 HP and Smaller: 120 volts, single phase, 60 Hz.
- C. Type:
  - 1. Open drip-proof except where noted otherwise.
  - 2. Motors: Design for continuous operation in 40 degrees C environment.
  - 3. Design for temperature rise in accordance with NEMA MG 1 limits for insulation class, service factor, and motor enclosure type.
  - 4. Motors with frame sizes 254T and larger: Energy Efficient Type.
- D. Visible Nameplate: Indicating motor horsepower, voltage, phase, cycles, RPM, full load amps, locked rotor amps, frame size, manufacturer's name and model number, service factor, power factor, efficiency.

- E. Wiring Terminations:
  - 1. Provide terminal lugs to match branch circuit conductor quantities, sizes, and materials indicated. Enclose terminal lugs in terminal box sized to NFPA 70, threaded for conduit.
  - 2. For fractional horsepower motors, provide flexible conduit connection in end frame. Maximum length of flexible conduit shall be five feet.

### **2.3 SINGLE PHASE POWER - PERMANENT-SPLIT CAPACITOR MOTORS**

- A. Starting Torque: Exceeding one fourth of full load torque.
- B. Starting Current: Up to six times full load current.
- C. Multiple Speed: Through tapped windings.
- D. Open Drip-proof or Enclosed Air Over Enclosure: Class A (50 degrees C temperature rise) insulation, minimum 1.0 Service Factor, prelubricated sleeve or ball bearings, automatic reset overload protector.

### **2.4 SINGLE PHASE POWER - CAPACITOR START MOTORS**

- A. Starting Torque: Three times full load torque.
- B. Starting Current: Less than five times full load current.
- C. Pull-up Torque: Up to 350 percent of full load torque.
- D. Breakdown Torque: Approximately 250 percent of full load torque.
- E. Motors: Capacitor in series with starting winding; provide capacitor-start/capacitor-run motors with two capacitors in parallel with run capacitor remaining in circuit at operating speeds.
- F. Drip-proof Enclosure: Class A (50 degrees C temperature rise) insulation, NEMA Service Factor, prelubricated ball bearings.
- G. Enclosed Motors: Class A (50 degrees C temperature rise) insulation, 1.0 Service Factor, prelubricated ball bearings.

### **2.5 THREE PHASE POWER - SQUIRREL CAGE MOTORS**

- A. Starting Torque: Between 1 and 1-1/2 times full load torque.
- B. Starting Current: Six times full load current.
- C. Power Output, Locked Rotor Torque, Breakdown or Pull Out Torque: NEMA Design B characteristics.
- D. Design, Construction, Testing, and Performance: Conform to NEMA MG 1 for Design B motors.
- E. Insulation System: NEMA Class B or better.
- F. Drip-proof Enclosure: NEMA Service Factor.
- G. All motors controlled by variable frequency controllers shall have a 1.15 Service Factor.
- H. Testing Procedure: In accordance with IEEE 112. Load test motors to determine free from electrical or mechanical defects in compliance with performance data.
- I. Motor Frames: NEMA Standard T-Frames of steel, aluminum, or cast iron with end brackets of cast iron or aluminum with steel inserts.
- J. Thermistor System (Motor Frame Sizes 254T and Larger): Three PTC thermistors imbedded in motor windings and epoxy encapsulated solid state control relay for wiring into motor starter; refer to Division 16 - Motor Controlling Equipment.

- K. Bearings: Grease lubricated anti-friction ball bearings with housings equipped with plugged provision for relubrication, rated for minimum AFBMA 9, L-10 life of 20,000 hours. Calculate bearing load with NEMA minimum V-belt pulley with belt center line at end of NEMA standard shaft extension. Stamp bearing sizes on nameplate.
- L. Sound Power Levels: To NEMA MG 1.
- M. Variable Frequency Drive Motors: Motors controlled by variable frequency drives shall be rated for voltage peaks and minimum rise times in accordance with NEMA MG1, Part 31.
  - 1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width modulated inverters.
  - 2. Inverter-Duty Motors: Class B temperature rise; Class F insulation.
  - 3. Grounding: Provide shaft grounding system equal to AEGIS SGR Bearing Protection Ring, Inpro/Seal Current Diverter Ring (CDR) or approved equal. Install system in accordance with manufacturer's recommendations.
- N. Nominal Efficiency: Motors shall have minimum efficiency meeting the requirements of the Energy Policy Act of 1992 and as scheduled at full load and rated voltage when tested in accordance with IEEE 112.
- O. Nominal Power Factor: As scheduled at full load and rated voltage when tested in accordance with IEEE 112.

## 2.6 CAPACITORS

- A. Furnish capacitors for power factor correction as specified herein on motors furnished under Division 22 that are not connected to variable frequency drives. KVAR size shall be as required to correct motor power factor to 90 percent or better and shall be installed on all motors 1 horsepower and larger, that have an uncorrected power factor of less than 85 percent at rated load.
- B. Features:
  - 1. Individual unit cells.
  - 2. All welded steel housing.
  - 3. Each capacitor internally fused.
  - 4. Non-flammable synthetic liquid impregnated.
  - 5. Craft tissue insulation.
  - 6. Aluminum foil electrodes.

## PART 3 - EXECUTION

### 3.1 APPLICATION

- A. Single phase motors for pumps and air compressors: Capacitor start type.

### 3.2 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Install securely on firm foundation.
- C. Check line voltage and phase and ensure agreement with nameplate.

**3.3 NEMA OPEN MOTOR SERVICE FACTOR SCHEDULE**

HP	3600 RPM	1800 RPM	1200 RPM	900 RPM
1/6-1/3	1.35	1.35	1.35	1.35
1/2	1.25	1.25	1.25	1.15
3/4	1.25	1.25	1.15	1.15
1	1.25	1.15	1.15	1.15
1.5-150	1.15	1.15	1.15	1.15

**3.4 PERFORMANCE SCHEDULE THREE PHASE - OPEN DRIP-PROOF**

HP	RPM(Sync)	NEMA Frame	Minimum Percent Efficiency	Minimum Power Factor
1	1200	145T	80	72
1-1/2	1200	182T	84	73
2	1200	184T	85.5	75
3	1200	213T	86.5	60
5	1200	215T	87.5	65
1	1800	143T	82.5	84
1-1/2	1800	145T	84	85
2	1800	145T	84	85
3	1800	182T	86.5	86
5	1800	184T	87.5	87
1-1/2	3600	143T	82.5	85
2	3600	145T	84	87
3	3600	145T	84	85
5	3600	182T	85.5	86
7-1/2	3600	184T	87.5	88
<b>10</b>	<b>3600</b>	<b>213T</b>	<b>88.5</b>	<b>86</b>
15	3600	215T	89.5	89

**3.5 PERFORMANCE SCHEDULE: THREE PHASE-ENERGY EFFICIENT, TOTALLY ENCLOSED, FAN COOLED**

HP	RPM(Sync)	NEMA Frame	Minimum Percent Efficiency	Minimum Power Factor
1	1200	145T	80	72
1-1/2	1200	182T	85.5	65
2	1200	184T	86.5	68
3	1200	213T	87.5	63
5	1200	215T	87.5	66

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 05 15 - BASIC PIPING MATERIALS AND METHODS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section specifies piping materials and installation methods common to more than one Section of Division 22 and includes joining materials, piping specialties and basic piping installation instructions.
- B. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 22 Section "Common Work Results for Plumbing," for materials and methods for sleeve materials.

**1.2 DEFINITIONS**

- A. Lead Free: Refers to the wetted surface of pipe, fittings and fixtures in potable water systems that have a weighted average lead content  $\leq 0.25\%$  per Safe Drinking Water Act as amended January 4th 2011 Section 1417.

**1.3 SUBMITTALS**

- A. Refer to Division 1 and Division 22 Section "General Plumbing Requirements" for administrative and procedural requirements for submittals.
- B. Product Data: Submit product data on the following items:
  - 1. Escutcheons
  - 2. Dielectric Unions
  - 3. Dielectric Waterway Fittings
  - 4. Dielectric Flanges and Flange Kits
  - 5. Mechanical Sleeve Seals
  - 6. Wall Pipes
  - 7. Strainers
  - 8. Flexible Connectors
- C. Quality Control Submittals:
  - 1. Submit welders' certificates specified in Quality Assurance below.
- D. Submit certification that specialties and fittings for domestic water distribution comply with NSF 61 Annex G and / or NSF 372.
- E. Submit a schedule of dissimilar metal joints and dielectric waterway fittings, unions, flanges or flange kits. Include joint type materials, connection method and proposed dielectric waterway fittings, unions and flanges to isolate dissimilar metals. Include minimum and maximum torque requirements for flange connections to valves. Refer to the individual piping system specification sections in Division 22 for specifications for piping materials and fittings relative to that particular system and additional requirements.
- F. Submit certification that fittings and specialties are manufactured in plants located in the United States or certified that they comply with applicable ANSI and ASTM standards.

**1.4 QUALITY ASSURANCE**

- A. Welder's Qualifications: All welders shall be qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX, Welding and Brazing Qualifications.

- B. Welding procedures and testing shall comply with ANSI Standard B31.9 - Standard Code for Building Services Piping and The American Welding Society, Welding Handbook.
- C. Soldering and Brazing procedures shall conform to ANSI B9.1 Standard Safety Code for Plumbing Refrigeration.
- D. Pipe specialties and fittings shall be manufactured in plants located in the United States or certified to meet the specified ASTM and ANSI standards.
- E. Comply with NSF 61 Annex G and / or NSF 372 for wetted surfaces of specialties and fittings containing no more than 0.25% lead by weight for domestic water distribution.

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 MANUFACTURERS

- A. Manufacturer: Subject to compliance with requirements, provide piping materials and specialties from one of the following:
  - 1. Pipe Escutcheons:
    - a. AWI Manufacturing.
    - b. Keeney Manufacturing Company
    - c. Wal-Rich Corp.
    - d. Jones Stephens Corp.
  - 2. Dielectric Waterway Fittings:
    - a. Elster Perfection Corporation.
    - b. Grinnell Mechanical Products; Tyco Fire Products LP
    - c. Precision Plumbing Products, Inc.
  - 3. Dielectric Unions:
    - a. JOMAR International
    - b. Smith Cooper International
    - c. Watts Regulator Co.
    - d. Zurn Industries
  - 4. Dielectric Flanges and Flange Kits:
    - a. Advance Products & Systems
    - b. Calpico, Inc.
    - c. Pipeline Seal & Insulator, Inc.
    - d. Tampa Rubber and Gasket Co., inc.
    - e. Watts Industries Inc.; Water Products Div.
    - f. Zurn Industries, Inc.; Wilkins Div.
  - 5. Strainers – 2" and smaller:
    - a. Apollo
    - b. Hammond
    - c. Milwaukee
    - d. NIBCO
  - 6. Strainers – 2-1/2" and larger:
    - a. Metraflex Co.
    - b. Watts Regulator Co.
    - c. Zurn Industries, Inc.; Wilkins Div.
  - 7. Mechanical Sleeve Seals:
    - a. Advance Products & Systems
    - b. Calpico, Inc.
    - c. GPT Industries/Link Seal
    - d. Metraflex Co.
    - e. Proco Products, Inc.
  - 8. Metal Flexible Connectors:
    - a. United Flexible, Inc.
    - b. Hyspan

- c. Mason Industries, Inc.
  - d. Mercer Rubber Co.
  - e. Metraflex Co.
  - f. Proco Products, Inc.
  - g. Resistoflex
  - h. Tyler Pipe; Gustin-Bacon Div.
9. Rubber Flexible Connectors:
- a. General Rubber Corp.
  - b. Mason Industries, Inc.
  - c. Mercer Rubber Co.
  - d. Metraflex Co.
  - e. Proco Products, Inc.
  - f. Uniflex, Inc.
10. Wall Pipes
- a. Josam Mfg. Co.
  - b. Smith (Jay R) Mfg. Co.
  - c. Tyler Pipe/Wade Div.; Subs. of Tyler Corp.
  - d. Watts Industries, Inc.
  - e. Zurn Industries, Inc.; Hydromechanics Div.

## 2.2 PIPE AND FITTINGS

- A. Refer to the individual piping system specification sections in Division 22 for specifications on piping and fittings relative to that particular system.
- B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

## 2.3 JOINING MATERIALS

- A. Refer to individual Division 22 Piping Sections for special joining materials not listed below.
- B. Welding Materials: AWS D10.12; Comply with Section II, Part C, ASME Boiler and Pressure Vessel Code for welding materials appropriate for the wall thickness and chemical analysis of the pipe being welded.
- C. Brazing Materials: AWS A5.8; Comply with SFA-5.8, Section II, ASME Boiler and Pressure Vessel Code for brazing filler metal materials appropriate for the materials being joined.
- D. Soldering Materials: ASTM B32; Refer to individual piping system specifications for solder appropriate for each respective system.
- E. Gaskets for Flanged Joints: ASME B16.21; Gasket material shall be full-faced for cast-iron flanges and raised-face for steel flanges. Select materials to suit the service of the piping system in which installed and which conform to their respective ANSI Standard (A21.11, B16.20, or B16.21). Provide materials that will not be detrimentally affected by the chemical and thermal conditions of the fluid being carried.

## 2.4 PIPING SPECIALTIES

- A. Escutcheons: Chrome-plated, stamped steel, hinged, split-ring escutcheon, with set screw. Inside diameter shall closely fit pipe outside diameter, or outside of pipe insulation where pipe is insulated and of depth adequate to conceal protruding piping. Outside diameter shall completely cover the opening in floors, walls, or ceilings.
- B. Unions:
  - 1. Malleable-iron, Class 150 for low pressure service and class 300 for high pressure service; hexagonal stock, with ball-and-socket joints, metal-to-metal bronze seating surfaces; female threaded ends.

2. Bronze, Class 125, with lead free cast bronze body meeting ASTM B584, for low pressure service and class 250 for high pressure service; hexagonal stock, with ball-and-socket joints, metal-to-metal bronze seating surfaces; solder or female threaded ends.
- C. Dielectric Unions: Factory-fabricated with lead free cast bronze body meeting ASTM B584 and galvanized steel body with plastic dielectric gasket, class 125 for low pressure service and class 250 for high pressure service, and appropriate end connections for the pipe materials in which installed (screwed or soldered) to effectively isolate dissimilar metals, prevent galvanic action, and stop corrosion.
- D. Dielectric Waterway Fittings: Electroplated steel or brass nipple, with an inert and non-corrosive, thermoplastic lining.
- E. Dielectric Flanges and Flange Kits:
  1. Full faced gasket with same outside diameter and bolt hole arrangement as the flange. Pressure rating of 200psi for low pressure service and 400 psi for high pressure service at a continuous operating temperature of 180F.
  2. Steel washers, thermoplastic washers and bolt isolation sleeves or thermoplastic combination washers and bolt sleeves.
  3. Lead free cast bronze meeting ASTM B584, class 125 solder type or cast iron class 125 threaded type for low pressure service and bronze class 250 solder type or cast iron class 250 threaded type for high pressure service.
- F. Y-Type Strainers: Provide strainers full line size of connecting piping, with ends matching piping system materials. Screens for 4" and smaller shall be Type 304 stainless steel mesh with 0.062" perforations and screens for 5" and larger shall be Type 304 stainless steel, with 0.125" perforations.
  1. For low pressure applications, cast iron strainers shall have 125 psi working pressure rating and cast bronze strainers shall have 150 psi working pressure rating. For high pressure applications, cast iron strainers shall have 250 psi working pressure rating and cast bronze strainers shall have 300 psi working pressure rating.
  2. Solder Ends, 2" and Smaller: Lead free cast bronze body meeting ASTM B584, screwed screen retainer with centered blowdown fitted with pipe plug.
  3. Threaded Ends, 2" and Smaller: Cast bronze body, screwed screen retainer with centered blowdown fitted with pipe plug.
  4. Flanged Ends, 2-1/2" and Larger: Cast-iron body, with FDA fused epoxy coating, bolted screen retainer with off-center blowdown fitted with pipe plug.
- G. Mechanical Sleeve Seals: Modular Plumbing type, consisting of interlocking synthetic rubber links shaped to continuously fill annular space between pipe and sleeve, connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation.
- H. Flexible Connectors: Fabricated from materials suitable for system fluid and that will provide flexible pipe connections.
  1. Stainless-Steel-Hose, Flexible Connectors: For 2" and smaller, corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Include ANSI 150# 304 stainless-steel nipples with screwed connections, welded to hose.
  2. Bronze Hose, Flexible Connectors: For 2" and smaller, corrugated bronze inner tubing covered with bronze wire braid. Include ANSI 150# brass nipples with screwed connections, braised to hose.
  3. Stainless-Steel-Hose, Flexible Connectors: For 2-1/2" and larger, corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Include ANSI 150# 304 stainless-steel nipples or flanges, welded to hose.

## 2.5 WALL PIPES

- A. Cast-iron sleeve with integral clamping flange with clamping ring, bolts, and nuts for membrane flashing.

1. Underdeck Clamp: Clamping ring with setscrews.

## 2.6 WALL SLEEVES

1. Steel sleeve of schedule 40 pipe meeting ASTM A53B with 2" wide metal plate meeting ASTM A36 welded all around. Hot dip galvanized inside and out.

## PART 3 - EXECUTION

### 3.1 INSTALLATION GENERAL

- A. Install in accordance with manufacturer's installation instructions.

### 3.2 PREPARATION

- A. Ream ends of pipes and tubes, and remove burrs. Bevel plain ends of steel pipe.
- B. Remove scale, slag, dirt, and debris for both inside and outside of piping and fittings before assembly.

### 3.3 INSTALLATIONS

- A. General Locations and Arrangements: Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of the piping systems. Location and arrangement of piping layout take into consideration pipe sizing and friction loss, expansion, pump sizing, and other design considerations. So far as practical, install piping as indicated. Refer to individual system specifications for requirements for coordination drawing submittals.
- B. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated otherwise.
- C. Install piping free of sags and bends and with ample space between piping to permit proper insulation applications.
- D. Install exposed piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated on the Drawings.
- E. Install horizontal piping as high as possible allowing for specified slope and coordination with other components. Install vertical piping tight to columns or walls. Provide space to permit insulation applications, with 1" clearance outside the insulation. Allow sufficient space above removable ceiling panels to allow for panel removal.
- F. Locate groups of pipes parallel to each other, spaced to permit applying full insulation and servicing of valves.
- G. Support piping from structure. Do not support piping from ceilings, equipment, ductwork, conduit and other non-structural elements.
- H. Install drains at low points in mains, risers, and branch lines consisting of a tee fitting, 3/4" ball valve, and short 3/4" threaded nipple and cap.
- I. Verify final equipment locations for roughing in.

### 3.4 PIPING PROTECTION

- A. Protect piping during construction period, to avoid clogging with dirt and debris, and to prevent damage from traffic and construction work.
- B. Place plugs in ends of uncompleted piping at end of day or whenever work stops.

**3.5 PENETRATIONS**

- A. Plumbing penetrations occur when piping penetrate concrete slabs, concrete or masonry walls, or fire / smoke rated floor and wall assemblies.
- B. Provide escutcheons for exposed pipe penetrations of interior floors, walls, ceilings and under cabinets and millwork. Use deep pattern escutcheons where required.
- C. Above Grade Concrete or Masonry Penetrations
  - 1. Provide sleeves for pipes passing through above grade concrete or masonry walls, concrete floor or roof slabs. Sleeves are not required for core drilled holes in existing masonry walls, concrete floors or roofs. Provide sleeves as follows:
    - a. Provide schedule 40 galvanized steel pipe for sleeves smaller than 6 inches in diameter.
    - b. Provide galvanized sheet metal for sleeves 6 inches in diameter and larger, thickness shall be 10 gauge (0.1382 inches).
    - c. Provide welded galvanized sheet metal for rectangular sleeves with the following minimum metal thickness:
      - 1) For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches, thickness shall be 18 gauge (0.052 inches).
      - 2) For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches and 1 or more sides equal to, or greater than, 16 inches, thickness shall be 10 gauge (0.1382 inches).
    - d. Schedule 40 PVC pipe sleeves are acceptable for use in areas without return air plenums.
  - 2. Extend pipe insulation for insulated pipe through floor, wall and roof penetrations, including fire rated walls and floors. The vapor barrier shall be maintained. Size sleeve for a minimum of 1" annular clear space between inside of sleeve and outside of insulation.
  - 3. Seal elevated floor, exterior wall and roof penetrations watertight and weathertight with non-shrink, non-hardening commercial sealant. Pack with mineral wool and seal both ends with minimum of ½" of sealant.
- D. Underground, Exterior-Wall Penetrations: Provide galvanized steel wall sleeve. Wall sleeve is not required for existing concrete walls with core drilled penetrations. Size wall sleeves to allow for 1-inch or larger, if required by the mechanical sleeve seal manufacturer) annular clear space between pipe and sleeve. Provide mechanical sleeve seal.
  - 1. Use type and number of sealing elements recommended by manufacturer for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
  - 2. Verify sleeve and mechanical sleeve seal installations for damage and faulty work. Verify watertight integrity of sleeves and mechanical sleeve seals installed below grade to seal against hydrostatic water pressure. If sleeve and or sleeve seal are not watertight, provide new wall sleeve and mechanical sleeve seal.
- E. Elevated Floor Penetrations of Waterproof Membrane:
  - 1. Provide cast-iron wall pipes for sleeves, extend top of wall pipe minimum 1" above finish floor. Size wall pipe for minimum ½" annular space between pipe and wall pipe.
  - 2. Extend pipe insulation for insulated pipe through wall pipe. The vapor barrier shall be maintained. Size wall pipe for a minimum of 1" annular clear space between inside of sleeve and outside of insulation.
  - 3. Pack with mineral wool and seal both ends with minimum of ½" of waterproof sealant. Refer to Division 07 Section "Joint Sealants" for materials and installation.
  - 4. Secure waterproof membrane flashing between clamping flange and clamping ring. Comply with requirements for flashing specified in Division 7 Section "Sheet Metal Flashing and Trim."
  - 5. Extend bottom of wall pipe below floor slab as required and secure underdeck clamp to hold wall pipe rigidly in place.

- F. Interior Foundation Penetrations: Provide sleeves for horizontal pipe passing through or under foundation. Sleeves shall be cast iron soil pipe two nominal pipe sizes larger than the pipe served.
- G. Concrete Slab on Grade Penetrations:
  - 1. Provide schedule 40 PVC pipe sleeves for vertical pressure pipe passing through concrete slab on grade. Sleeves shall be one nominal pipe size larger than the pipe served and two pipe sizes larger than pipe served for ductile iron pipes with restraining rods. Seal water-tight with silicone caulk.
  - 2. Provide ½" thick cellular foam insulation around perimeter of non-pressure pipe passing thru concrete slab on grade. Insulation shall extend to 2" above and below the concrete slab.
- H. Interior Penetrations of Non-Fire-Rated Walls: Seal annular space between sleeve and pipe , using joint sealant appropriate for size, depth, and location of joint. Pack with mineral wool and seal both ends with minimum of ½" of sealant. Refer to Division 07 Section "Joint Sealants" for materials and installation.
  - 1. Extend pipe insulation for insulated pipe through sleeve. The vapor barrier shall be maintained. Size sleeve for a minimum of 1" annular clear space between inside of sleeve and outside of insulation.
- I. Exterior Wall Penetrations: Seal annular space between sleeve and pipe, using joint sealant appropriate for size, depth, and location of joint. Pack with mineral wool and seal both ends with minimum of ½" of waterproof sealant. Cover exterior sealant with grout, minimum ½" thick and paint grout to match exterior color, with color selection by the architect. Refer to Division 07 Section "Joint Sealants" for materials and installation.
  - 1. Extend pipe insulation for insulated pipe through sleeve. The vapor barrier shall be maintained. Size sleeve for a minimum of 1" annular clear space between inside of sleeve and outside of insulation.
- J. Fire / Smoke Rated Floor and Wall Assemblies: Seal around penetrations of fire rated assemblies to maintain fire resistance rating of fire-rated assemblies. Coordinate fire ratings and locations with the architectural drawings. Install sealants in compliance with the manufacturer's UL listing. Refer to Division 22 Section "Common Work Results for Plumbing" for firestoppings and materials.

### 3.6 FITTINGS AND SPECIALTIES

- A. Use fittings for all changes in direction and all branch connections.
- B. Remake leaking joints using new materials.
- C. Install components with pressure rating equal to or greater than system operating pressure.
- D. Install strainers on the supply side of each control valve, pressure reducing or regulating valve, solenoid valve, mixing valve, backflow preventer and elsewhere as indicated.
- E. Install unions at the final connection to each piece of equipment adjacent to each isolation valve or valve assembly for connections 2" and smaller. Install unions where indicated elsewhere on the drawings.
- F. Install flanges at the final connection to each piece of equipment, adjacent to each isolation valve or valve assembly in piping 2-1/2" and larger. Install flanges at each valve 2-1/2" and larger.
- G. Install dielectric unions for piping 2" and smaller to connect piping materials of dissimilar metals in dry piping systems (gas) for copper or brass connected to carbon steel, cast or ductile iron.
- H. Install dielectric flanges for piping 2-1/2" and larger to connect piping materials of dissimilar metals in dry piping systems (gas) for copper or brass connected to carbon steel, cast or ductile iron.
- I. Install dielectric unions for piping 2" and smaller to connect piping materials of dissimilar metals in wet piping systems (water) (except do not install dielectric unions in concealed spaces, instead,

install dielectric waterway fittings) for copper or brass connected to carbon steel, cast or ductile iron.

- J. Install dielectric flanges for piping 2-1/2" and larger to connect piping materials of dissimilar metals in wet piping systems (water) (except do not install dielectric unions in concealed spaces, instead, install dielectric waterway fittings) for copper or brass connected to carbon steel, cast or ductile iron.
- K. Install dielectric waterway fittings for piping 2" and smaller for copper or brass pipe connections to carbon steel equipment connections.
- L. Install dielectric flanges for piping 2-1/2" and larger for copper or brass pipe connections to carbon steel equipment connections, steel, ductile iron or cast iron valves and fittings.
- M. Dielectric Flange Installation:
  - 1. Provide brass nipples between the equipment connection and dielectric flange for screwed connections. Provide an iron flange for the equipment side and a bronze flange for the copper or brass piping side of the joint.
  - 2. Provide a bronze flange for the copper or brass piping connection to a cast iron, ductile iron or steel flange.
  - 3. Provide full face gasket with pressure rating equal to system served.
  - 4. At each bolt provide, steel washers, thermoplastic washers and bolt isolation sleeves or thermoplastic combination washers and bolt sleeves.

### 3.7 JOINTS

- A. Steel Pipe Joints:
  - 1. Pipe 2" and Smaller: Thread pipe with tapered pipe threads in accordance with ANSI B2.1. Cut threads full and clean using sharp dies. Ream threaded ends to remove burrs and restore full inside diameter. Apply pipe joint lubricant or sealant suitable for the service for which the pipe is intended on the male threads at each joint and tighten joint to leave not more than 3 threads exposed.
  - 2. Pipe Larger Than 2":
    - a. Weld pipe joints (except for exterior water service pipe) in accordance with ASME Code for Pressure Piping, B31.
    - b. Weld pipe joints of exterior water service pipe in accordance with AWWA C206.
    - c. Install flanges on all valves, apparatus, and equipment. Weld pipe flanges to pipe ends in accordance with ASME B31.9 Code for Building Services Piping. Clean flange faces and install gaskets. Tighten bolts to torque specified by manufacturer of flange and flange bolts, to provide uniform compression of gaskets.
- B. Non-ferrous Pipe Joints:
  - 1. Brazed And Soldered Joints: For copper tube and fitting joints, braze joints in accordance with ANSI B31.9 - Standard Code for Building Services Piping and ANSI B9.1 - Standard Safety Code for Plumbing Refrigeration.
  - 2. Thoroughly clean tube surface and inside surface of the cup of the fittings, using very fine emory cloth, prior to making soldered or brazed joints. Wipe tube and fittings clean and apply flux. Flux shall not be used as the sole means for cleaning tube and fitting surfaces.
- C. Joints for other piping materials are specified within the respective piping system Sections.

### 3.8 FLEXIBLE CONNECTORS

- A. Install flexible connectors for piping system connections on equipment side of shutoff valves for all Plumbing equipment, pumps, and where indicated on Drawings.
  - 1. Install stainless steel connectors for domestic water copper equipment connections 2" and smaller.

2. Install bronze connectors for non-domestic water copper equipment connections 2" and smaller.
  3. Install flanged stainless steel connectors for flanged equipment connections 2-1/2" and larger.
- B. Install connectors according to manufacturer's recommendations.

### **3.9 PIPE FIELD QUALITY CONTROL**

- A. Testing: Refer to individual piping system specification sections.
- B. Inspection Report Form: Refer to the inspection report form at the end of this section for inspection data to be completed for each piping system. Submit completed forms to the Owner and Engineer.

**SECTION 22 05 19 - METERS AND GAUGES FOR PLUMBING PIPING****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes the following types of meters and gauges:
1. Temperature gauges and fittings.
  2. Pressure gauges and fittings.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with conditions of Contract and Division 1 Specification Sections.
1. Product data for each type of meter and gauge. Include scale range, ratings, and calibrated performance curves, certified where indicated. Submit meter and gauge schedule showing manufacturer's figure number, scale range, location, and accessories for each meter and gauge.
  2. Product certificates signed by manufacturers of meters and gauges certifying accuracy under specified operating conditions and products' compliance with specified requirements.
  3. Maintenance data for each type of meter and gauge for inclusion in Operating and Maintenance Manuals specified in Division 1 and Division 22 Section "General Plumbing Requirements."

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Glass Tube Industrial Thermometers:
    - a. H. O. Trerice Co.
    - b. Marshalltown Instruments, Inc.
    - c. Miljoco Corporation
    - d. Weiss Instruments, Inc.
    - e. Weksler Instruments Corp.
    - f. Winters Instruments
  2. Thermometer Wells: Same as for thermometers.
  3. Pressure Gauges:
    - a. Ametek, U.S. Gauge Div.
    - b. Ashcroft Dresser Industries Instrument Div.
    - c. Ernst Gage Co.
    - d. H. O. Trerice Co.
    - e. Marsh Instrument Co., Unit of General Signal.
    - f. Marshalltown Instruments, Inc.
    - g. Miljoco Corporation
    - h. Weiss Instruments, Inc.
    - i. Weksler Instruments Corp.
    - j. WIKA Instruments Corp.
    - k. Winters Instruments
  4. Pressure Gauge Accessories: Same manufacturers as for pressure gauges.

**2.2 THERMOMETERS GENERAL**

- A. Accuracy: Plus or minus 1 percent of range span or plus or minus one scale division to maximum of 1.5 percent of range span.
- B. Scale range: Temperature ranges for services listed as follows:
  - 1. Domestic Hot Water: 30 to 240 deg with 2-degree scale divisions (0 to 115 deg C with 1-degree scale divisions).
  - 2. Domestic Cold Water: 0 to 100 deg F with 2-degree scale divisions (minus 18 to 38 deg C with 1-degree scale divisions).

**2.3 GLASS TUBE INDUSTRIAL THERMOMETERS**

- A. Case: Die cast, aluminum finished, in baked epoxy enamel, glass front, spring secured, 9 inches long.
- B. Adjustable Joint: Finished to match case, 180-degree adjustment in vertical plane, 360-degree adjustment in horizontal plane, with locking device.
- C. Tube: Non-red color reading, non-toxic organic spirit-filled glass tube, magnifying lens.
- D. Scale: Satin-faced, nonreflective aluminum, with permanently etched markings.
- E. Stem: Copper-plated steel, aluminum or brass, for separable socket, length to suit installation.

**2.4 THERMOMETER WELLS**

- A. Thermometer Wells: Brass or stainless steel, pressure rated to match piping system design pressure; with 2-inch extension for insulated piping and threaded cap nut with chain permanently fastened to well and cap.

**2.5 PRESSURE GAUGES**

- A. Type: General use, ASME B40.1, Grade A, phosphor bronze bourdon-tube type, bottom connection.
- B. Case: Cast aluminum or stainless steel case, glass lens, 4-1/2-inches diameter.
- C. Connector: Brass, 1/4-inch NPS.
- D. Scale: White coated aluminum, with permanently etched markings.
- E. Accuracy: Plus or minus 1 percent of range span.
- F. Range: Conform to the following:
  - 1. All fluids: 2 times operating pressure.
- G. Liquid-Filled: Provide liquid filled gauges where specified in Part 3 of this section.

**2.6 PRESSURE GAUGE ACCESSORIES**

- A. Snubber: 1/4-inch NPS brass bushing with corrosion-resistant porous metal disc. Disc material shall be suitable for fluid served and rated pressure.

**PART 3 - EXECUTION****3.1 THERMOMETERS INSTALLATION**

- A. Install in the following locations and elsewhere as indicated:
  - 1. At inlet and outlet of each domestic water heater.

2. At inlet and outlet of each thermal storage tank.
- B. Thermometer Wells: Install in piping tee where thermometers are indicated, in vertical position. Fill well with oil or graphite and secure cap.

### **3.2 INSTALLATION OF PRESSURE GAUGES**

- A. Install in the following locations, and elsewhere as indicated:
1. Provide liquid-filled gauge at suction and discharge of each pump.
  2. At discharge of each pressure-reducing valve.
  3. At building water service entrance.
- B. Pressure Gauge Needle Valves: Install in piping tee with snubber.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 05 23 - GENERAL DUTY VALVES FOR PLUMBING PIPING****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes general duty valves common to most plumbing water distribution piping systems.
  - 1. Special purpose valves are specified in individual piping system specifications.
- B. Contractors Option:
  - 1. The Division 22 contractor may provide mechanically joined plumbing piping systems to connect mechanical joints, couplings, fittings, valves and related components as an option in lieu of, in whole or in part, copper sweat, brazing, threaded or flanged piping methods. Mechanically joined plumbing piping systems to connect plumbing piping where used shall be provided in compliance with specification Section 221111 "Mechanically Joined Plumbing Piping Systems".

**1.2 DEFINITIONS**

- A. Lead Free: Refers to the wetted surface of pipe, fittings and fixtures in potable water systems that have a weighted average lead content  $\leq 0.25\%$  per Safe Drinking Water Act as amended January 4th, 2011 Section 1417.

**1.3 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.
  - 1. Product data, including body material, valve design, pressure and temperature classification, end connection details, seating materials, trim material and arrangement, dimensions and required clearances, and installation instructions.
- B. Submit certification that valves for domestic water distribution comply with NSF 61 Annex G and / or NSF 372.

**1.4 QUALITY ASSURANCE**

- A. Single Source Responsibility: Provide products specified in this section from the same manufacturer where products are available and conform to the specification requirements.
- B. American Society of Mechanical Engineers (ASME) Compliance: Comply with ASME B31.9 for building services piping and ASME B31.1 for power piping.
- C. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS) Compliance: Comply with the MSS Standard Practices below:
  - 1. MSS SP 67 "Butterfly Valves"
  - 2. MSS SP 70 "Gray Iron Gate Valves, Flanged and Threaded Ends"
  - 3. MSS SP 71 "Gray Iron Swing Check Valves, Flanged and Threaded Ends"
  - 4. MSS SP 72 "Ball Valves with Flanged or Butt Welding Ends"
  - 5. MSS SP 80 "Bronze Gate, Globe, Angle and Check Valves"
  - 6. MSS SP 85 "Gray Iron Globe and Angle Valves, Flanged and Threaded Ends"
  - 7. MSS SP 110 "Ball Valves, Threaded, Socket Welding, Solder Joint, Grooved and Flared Ends"
  - 8. MSS SP 125 "Check Valves: Gray Iron and Ductile Iron, In-Line, Spring Loaded, Center-Guided"

9. MSS SP 139 "Copper Alloy Gate, Globe, Angle and Check Valves for Low Pressure/Low Temperature Plumbing Applications"
- D. Valves shall be manufactured in plants located in the United States or certified that they comply with applicable ANSI, ASTM and MSS standards.
- E. Comply with NSF 61 Annex G and / or NSF 372 for wetted surfaces of valves containing no more than 0.25% lead by weight compliance for valves for domestic water distribution.

## **PART 2 - PRODUCTS AND MATERIALS**

### **2.1 MANUFACTURERS**

- A. Manufacturer: Subject to compliance with requirements, provide products from one of the manufacturers listed in valve schedule.

### **2.2 VALVE FEATURES GENERAL**

- A. Valve Design: Rising stem or rising outside screw and yoke stems.
  1. Non-rising stem valves may be used where headroom prevents full extension of rising stems.
- B. Pressure and Temperature Ratings: As scheduled and required to suit system pressures and temperatures.
- C. Sizes: Same size as upstream pipe, unless otherwise indicated.
- D. Operators: Provide the following special operator features:
  1. Handwheels, fastened to valve stem, for valves other than quarter turn.
  2. Lever handles, on quarter-turn valves 6-inch and smaller.
  3. Gear drive operators, on quarter-turn valves 8-inch and larger.
- E. Extended Stems: Where insulation is indicated or specified, provide extended stems arranged to receive insulation.
- F. End Connections: As indicated in the valve specifications.
  1. Threads: Comply with ANSI B1.20.1.
  2. Flanges: Comply with ANSI B16.1 for cast iron, ANSI B16.5 for steel, and ANSI B16.24 for bronze valves.
  3. Solder-Joint: Comply with ANSI B16.18.
    - a. Caution: Where soldered end connections are used, use solder having a melting point below 840 deg F for gate, globe, and check valves; below 421 deg F for ball valves.

### **2.3 GATE VALVES**

- A. Gate Valves, 2-1/2-Inch and Larger: Meeting MSS SP-70 and lead free with FDA epoxy coating; Class 125, 200-psi CWP, iron body, lead free bronze mounted, with body and bonnet conforming to ASTM A 126 Class B; with lead free brass stem, with flanged ends, non-asbestos composition packing, and two-piece packing gland assembly.

### **2.4 BALL VALVES**

- A. Ball Valves, 2 Inch and Smaller: Meeting MSS SP 110, Class150, 600-psi CWP; two-piece construction; with ASTM B 584 cast lead free bronze, full port, blowout-proof stem and chrome-plated lead free brass ball with replaceable "Teflon" or "TFE" seats and seals, solder ends and vinyl-covered steel handle.

**2.5 GLOBE VALVES**

- A. Globe Valves, 2-Inch and Smaller: Meeting MSS SP-80; Class 125, 300-psi CWP; body, disc and screwed bonnet of ASTM B 584 lead free cast bronze; brass replaceable composition disc and stem of ASTM B 283 alloy C46400 naval brass, brass packing gland, with solder ends, non-asbestos composition packing, and malleable iron handwheel.
- B. Globe Valves, 2-1/2-Inch and Larger: Meeting MSS SP-85; Class 125, 200-psi CWP; iron body and bolted bonnet conforming to ASTM A 126, Class B; with FDA epoxy coating, outside screw and yoke, lead free bronze mounted, lead free bronze shaft, flanged ends, and non-asbestos composition packing, and two-piece backing gland assembly.

**2.6 BUTTERFLY VALVES**

- A. Butterfly Valves, 2-1/2-Inch and Larger: Meeting MSS SP-67 and lead free; 200-psi CWP; lug-type body constructed of ductile iron conforming to ASTM A 536. Provide valves with field replaceable EPDM sleeve/seat, aluminum-bronze disc, 416 stainless steel stem, and EPDM O-ring stem seals. Provide lever operators, (10 position minimum), with lock and stops with locks for sizes 2-1/2 through 6 inches and gear operators with position indicator for sizes 8 inch and larger. Drill and tap valves on dead-end service or requiring additional body strength. Valves must be rated for dead end service at 150 psi with no downstream flange required.

**2.7 CHECK VALVES**

- A. Swing Check Valves, 2-Inch and Smaller: Meeting MSS SP-80; Class 125, 200-psi CWP, body and cap of ASTM B 584 cast lead free bronze; with horizontal swing, Y-pattern, disc and disc holder of ASTM B 283 alloy C46400 naval brass; solder ends. Provide valves capable of being reground while the valve remains in the line.
- B. Swing Check Valves, 2-1/2-Inch and Larger: Meeting MSS SP-71 and lead free; Class 125 200-psi CWP, cast iron body and bolted cap conforming to ASTM A 126, Class B; with FDA epoxy coating, horizontal swing, lead free bronze disc with lead free bronze disc face ring, and bronze seat ring; and flanged ends. Provide valves capable of being refitted while the valve remains in the line.
- C. Wafer Check Valves: Meeting MSS SP 125, Class 125, 200-psi CWP, lead free cast-iron body, with FDA epoxy coating, replaceable bronze seat, and non-slam design lapped and balanced twin bronze flappers and stainless steel trim and torsion spring. Provide valves designed to open and close at approximately one foot differential pressure.
- D. Lift Check Valves, 2-Inch and Smaller: Meeting MSS SP-139; 250-psi CWP, body, disc holder and cap of ASTM B 584 cast lead free bronze; horizontal or angle pattern, lift-type valve, with stainless steel spring, renewable "Teflon" disc and solder ends. Provide valves capable of being refitted and ground while the valve remains in the line.
- E. Silent Check Valves, 2-1/2" and Larger: Meeting MSS SP 125, Class 125, 200-psi CWP, lead free cast-iron body, enamel coating, stainless steel spring, 316 stainless steel set screws, Buna-N O-ring, lead free bronze seat and disc.

**PART 3 - EXECUTION****3.1 INSTALLATIONS**

- A. Install valves in accordance with manufacturer's installation instructions.
- B. Locate valves for easy access and provide separate support where necessary. Provide access doors and fire rated access doors as required.

- C. Install valves and unions for each fixture and item of equipment arranged to allow equipment removal without system shutdown. Unions are not required on flanged devices.
- D. Install three-valve bypass around each pressure reducing valve using throttling-type valves.
- E. Install valves in horizontal piping with stem at or above the center of the pipe.
- F. Install valves in a position to allow full stem movement.
- G. Installation of Check Valves: Install for proper direction of flow as follows:
  1. Swing Check Valves: Horizontal position with hinge pin level.
  2. Wafer Check Valves: Horizontal or vertical position, between flanges.
  3. Lift Check Valve: With stem upright and plumb.

### 3.2 VALVE ENDS SELECTION

- A. Select valves with the following ends or types of pipe/tube connections:
  1. Copper Tube Size, 2-Inch and Smaller: Solder ends.
  2. Copper Tube Sizes 2-1/2 Inch and Larger: Flanged ends.

### 3.3 VALVE PRESSURE TEMPERATURE CLASSIFICATION SCHEDULES

- A. Domestic Hot and Cold Water Service

<u>VALVE TYPE</u>	<u>2" AND SMALLER</u>	<u>2-1/2" AND LARGER</u>
Ball	150	200
Butterfly	N/A	200
Gate	N/A	125
Globe	125	125
Check	125	125

### 3.4 VALVE SCHEDULE

- A. Gate Valves - 2-1/2 inch and larger:

<u>MANUFACTURER</u>	<u>OS&amp;Y RS</u>	<u>NRS</u>
Apollo	611F-LFA	610F-LFA

- B. Ball Valves (full port) – 2 inch and smaller:

<u>MANUFACTURER</u>	<u>SOLDER ENDS</u>	<u>THREADED ENDS</u>
Apollo (Conbraco)	77C-LF-200	77C-LF-100
Hammond	UP8311A	UP8301A
Milwaukee	UPBA-450	UPBA-400
NIBCO	S-585-80-LF	T-585-80-LF

- C. Globe Valves - 2-1/2 inch and larger:

<u>MANUFACTURER</u>	<u>STRAIGHT BODY</u>	<u>ANGLE BODY</u>
Apollo	711F-LFA	N/A

## D. Globe Valves – 2 inch and smaller:

<u>MANUFACTURER</u>	<u>SOLDER ENDS</u>
Apollo	120S-LF
Hammond	UP-418
Milwaukee	UP1502
NIBCO	S113

## E. Butterfly Valves (aluminum-bronze disc) - 2-1/2 inch and larger:

<u>MANUFACTURER</u>	<u>LEVER</u>	<u>GEAR</u>
Apollo (Conbraco)	LD141 xx BE1	LD141 xx BE2
Hammond	6411-01	6411-03
NIBCO	LD-2000-3	LD-2000-5
Watts	XXBF-03-121-15	XBF-03-121-1G
xx	Valve Size	

## F. Swing Check Valves – 2 inch and smaller:

<u>MANUFACTURER</u>	<u>SOLDER ENDS</u>	<u>THREADED ENDS</u>
Apollo	161S-LF	161T-LF
Milwaukee	UP1509	UP509
NIBCO	S-413-Y-LF	T-413-Y-LF

## G. Swing Check Valves - 2-1/2 inch and larger – Class 125:

<u>MANUFACTURER</u>	<u>Flanged Ends</u>
Apollo	910F-LFA

## H. Wafer Check Valves – Class 125:

<u>MANUFACTURER</u>	<u>MODEL</u>
Apollo	910WB-LF

## I. Lift Check Valves – 2 inch and smaller:

<u>MANUFACTURER</u>	<u>SOLDER ENDS</u>	<u>THREADED ENDS</u>
Hammond	UP947	UP943
Milwaukee	UP1548T	UP548T
NIBCO	S-480-Y-LF	T-480-Y-LF

## J. Silent Check Valves – 2-1/2" and larger

<u>MANUFACTURER</u>	<u>MODEL</u>
NIBCO	F-910-LF

**3.5 APPLICATION SCHEDULE**

- A. General Application: Use gate, ball, and butterfly valves for shutoff duty; globe, ball, and butterfly for throttling duty. Refer to piping system Specification Sections for specific valve applications and arrangements.
- B. Domestic Water Systems: Use the following valve types:
  - 1. Gate Valves, 2-1/2" and larger: Class 125 with cast-iron body.
  - 2. Ball Valves, 2" and Smaller: Class 150, 600-psi CWP, with stem extension if installed in insulated pipe.
  - 3. Globe Valves, 2" and smaller: Class 125, with cast bronze body and bronze or teflon disc.
  - 4. Globe Valves, 2-1/2" and larger: Class 125, with cast iron body and bronze or teflon disc.
  - 5. Butterfly Valves, 2-1/2" and larger 200-psi working pressure with cast or ductile iron body
  - 6. Swing Check, 2" and smaller: Class 125, cast bronze, with rubber seat.
  - 7. Check Valves, 2-1/2" and larger: Class 125, swing or wafer type as indicated.

**3.6 FIELD QUALITY CONTROL**

- A. Tests: After piping systems have been tested and put into service, but before final adjusting and balancing, inspect valves for leaks. Adjust or replace packing to stop leaks; replace valves if leak persists.

**3.7 ADJUSTING AND CLEANING**

- A. Cleaning: Clean mill scale, grease, and protective coatings from exterior of valves and prepare valves to receive finish painting or insulation.
- B. Inspect valves for leaks after piping systems have been tested and put into service, but before final adjusting and balancing. Adjust or replace packing, as required, on valves with leaks. Replace valve if leak persists.

END OF SECTION

**SECTION 22 05 29 - HANGERS AND SUPPORTS FOR PLUMBING PIPING****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Support and attachment components.
- B. Horizontal-piping hangers and supports.
- C. Shields
- D. Vertical piping clamps
- E. Pipe alignment guides.
- F. Pipe anchors.
- G. Pre-engineered roof supports
- H. Anchors and fasteners.
- I. Miscellaneous materials.
- J. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 22 Section "Plumbing Insulation", for high density insulation for protecting insulation vapor barrier and materials and methods for piping hanger installations.
  - 2. Division 22 "Water Distribution Piping and Specialties", for pipe hanger types and spacing for horizontal and vertical domestic water distribution and heat traced piping of sizes and materials indicated.
  - 3. Division 22 "Sanitary Drainage & Vent Piping and Specialties", for pipe hanger types and spacing for heat traced and cold sanitary piping of sizes and materials indicated.
  - 4. Division 22 "Storm Drainage & Piping and Specialties", for pipe hanger types and spacing for horizontal and vertical storm drainage piping of sizes and materials indicated.

**1.2 ADMINISTRATIVE REQUIREMENTS**

- A. Coordination:
  - 1. Coordinate sizes and arrangement of supports and bases with the actual equipment and components to be installed.
  - 2. Coordinate the work with other trades to provide additional framing and materials required for installation.
  - 3. Coordinate compatibility of support and attachment components with mounting surfaces at the installed locations.
  - 4. Coordinate the arrangement of supports with ductwork, piping, equipment and other potential conflicts installed under other sections or by others.
  - 5. Notify Architect of any conflicts with or deviations from Contract Documents. Obtain direction before proceeding with work.
- B. Sequencing:
  - 1. Do not install products on or provide attachment to concrete surfaces until concrete has fully cured.

**1.3 SUBMITTALS**

- A. Product Data : Provide manufacturer's standard catalog pages and data sheets for each type of hanger and support. Include a hanger and support schedule showing manufacturer's figure number, size, location, and features for each hanger and support. Submit style and type to Structural Engineer for approval prior to installation.

- B. Product Certificates: Signed by the manufacturer of hangers and supports certifying the products meet the specified requirements.
- C. Welder Certificates: Signed by Contractor certifying that welders comply with requirements specified under "Quality Assurance" Article.
- D. Maintenance Data: For inclusion in Operating and Maintenance manual specified in Division 01 and Division 22 Section "General Plumbing Requirements."
- E. Shop Drawings: Include details for fabricated hangers and supports where materials or methods other than those indicated are proposed for substitution. Include dimensions, weights, required clearances, and method of assembly.
  - 1. Application of protective inserts, and shields at pipe hangers for each type of insulation and hanger.
- F. Installer's Qualifications: Include evidence of compliance with specified requirements.
- G. Manufacturer's Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.
- H. Deferred Submittals: Submit signed and sealed drawings that indicate the design and installation requirements of pre-engineered roof supports can withstand the design criteria listed in this specification. Include installation requirements for anchoring to the roof structure. The Engineer is not responsible and will not provide the seal and signature. Deliver submittal to the local AHJ for approval prior to installation of the contractor provided, pre-engineered roof supports.

#### **1.4 QUALITY ASSURANCE**

- A. Comply with applicable building code.
- B. Maintain at the project site a copy of each referenced document that prescribes execution requirements.
- C. Installer Qualifications for Field-Welding:
  - 1. Qualify welding processes and welding operators in accordance with AWS D1.1 "Structural Welding Code - Steel."
  - 2. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
  - 3. Qualify welding processes and welding operators in accordance with ASME BPVC Section IX, "Welding and Brazing Qualifications."
- D. Flame/Smoke Ratings: Provide hangers and supports with flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by UL 723 or ASTM E84 (NFPA 255) method.
- E. Product Listing Organization Qualifications: An organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.
- F. Deferred Submittals: Signed and sealed by a professional engineer or National Institute for Certification in Engineering Technologies (NICET) stamp and signature. The professional engineer shall be licensed in the same state in which the project is located.

#### **1.5 DELIVERY STORAGE AND HANDLING**

- A. Receive, inspect, handle, and store products in accordance with manufacturer's instructions.

#### **1.6 DEFINITIONS**

- A. Terminology used in this Section is defined in MSS SP-90.

**PART 2 - PRODUCTS AND MATERIALS****2.1 SUPPORT AND ATTACHMENT COMPONENTS**

- A. General Requirements:
1. Comply with MSS SP-58.
  2. Provide all required hangers, supports, anchors, fasteners, fittings, accessories, and hardware as necessary for the complete installation of work.
  3. Provide products listed, classified, and labeled as suitable for the purpose intended, where applicable.
  4. Where support and attachment component types and sizes are not indicated, select in accordance with manufacturer's application criteria as required for the load to be supported. Include consideration for vibration, equipment operation, and shock loads where applicable.
  5. Do not use wire, chain, perforated pipe strap, or wood for permanent supports unless specifically indicated or permitted.
  6. Materials: Products and materials listed in this specification are based on indoor, dry locations. Use corrosion resistant materials suitable for the environment where installed.
    - a. Indoor Dry Locations: Painted carbon steel, galvanized steel or zinc-plated steel. Where supports will be field painted in exposed locations, provide carbon steel.
    - b. Indoor Damp or Wet Locations: Galvanized steel or type 304 stainless steel.
    - c. Hydrotherapy pool environments: Type 316 stainless steel.
    - d. Outdoor Locations: Galvanized steel or type 304 stainless steel.
    - e. Dielectrics Barriers: Provide dielectric barriers between metallic supports and metallic piping and associated items of dissimilar type. Acceptable barriers include rubber, or copper-plated coatings where attachments are in direct contact with copper.
    - f. Zinc-Plated Steel: Electroplated in accordance with ASTM B633.
    - g. Galvanized Steel: Hot-dip galvanized after fabrication in accordance with ASTM A123/A123M or ASTM A153/A153M.
    - h. Stainless Steel: Type 304 or 316 in accordance with ASTM A240.
- B. Metal Channel (Strut) Framing Systems:
1. Manufacturers:
    - a. Cooper B-Line.
    - b. Ferguson Enterprises/FNW.
    - c. PHD Manufacturing.
    - d. Thomas & Betts Corporation.
    - e. Unistrut, a brand of Atkore International Inc.
    - f. Source Limitations: Furnish channels (struts) and associated fittings, accessories, and hardware produced by a single manufacturer.
  2. Factory-fabricated continuous-slot metal channel (strut) and associated fittings, accessories, and hardware required for field-assembly of supports.
  3. Comply with MSS SP-69, Type 59, MSS SP-89, and MFMA-4. Welds shall comply with AWS D1.1.
  4. Channel Material:
    - a. Indoor Dry Locations: Galvanized steel or zinc-plated steel.
    - b. Indoor Damp or Wet Locations: Galvanized steel or type 304 stainless steel.
    - c. Outdoor Locations: Galvanized steel or type 304 stainless steel.
    - d. Natatorium or other treated pool environments: Type 316 stainless steel.
    - e. All nuts, brackets, and clamps shall have the same finish as the channel.
  5. Minimum Channel Thickness: Steel sheet, 14 gage, 0.0747 inch.
  6. Minimum Channel Dimensions: 1-5/8 inch width by 13/16 inch height with factory-punched attachment holes.
  7. Provide plastic galvanic isolators for connecting bare copper pipe for use with pre-engineered support strut system where indicated.

- C. Hanger Rods:
1. Material:
    - a. Indoor Dry Locations: Zinc-plated steel.
    - b. Indoor Damp or Wet Locations or Outdoor Locations: Zinc-plated steel or type 304 stainless steel.
    - c. Natatorium or other treated pool environments: Type 316 stainless steel.
  2. Threaded both ends or continuously threaded.
  3. Minimum Size: Reference piping specification sections for rod thicknesses.
  4. Threaded Rods: Threaded rods are not allowed for floor supports except when the maximum length of the rod is less than 12". Threaded rod sizes shall be the same size diameter as specified for pipe hanger rods based upon pipe size being supported. Refer to system piping specification sections for rod size requirements.

## 2.2 HORIZONTAL PIPING HANGERS AND SUPPORTS

- A. MANUFACTURERS
1. ASC Engineered Solutions.
  2. Cooper B-Line, Inc.
  3. Elite Components
  4. ERICO/Michigan Hanger Co./Caddy
  5. Ferguson/FNW.
  6. Halfen-DEHA.
  7. Hilti.
  8. National Pipe Hanger Corporation.
  9. PHD Manufacturing.
  10. Power-Strut.
  11. Unistrut.
- B. Single Hangers:
1. Split Ring: Carbon steel, adjustable swivel, split ring type.
  2. Split Ring 2 inch and smaller: Copper alloy, split ring type.
  3. Clevis Hanger: Carbon steel, adjustable, clevis type.
  4. Roll Support Hanger: Adjustable steel yoke, cast iron roll.
- C. Trapeze and Strut-mounted Supports:
1. Two-piece clamp: Designed for use with channel strut, held in place at channel shoulder when clamp attachment nut is tightened.
  2. Roll Support: Adjustable cast iron roll attached to metal channel strut framing system with brackets and nuts.
- D. Hangers and strut-mounted supports with pre-manufactured polymer inserts:
1. Manufacturers:
    - a. ASC Engineered Solutions.
    - b. Holdrite.
    - c. Klo-Shure.
  2. Strut-mounted pipe clamps and clevis hangers with pre-manufactured polymer inserts designed to receive butted insulation internally. Inserts shall support piping independent of insulation to avoid crushing. Installed system shall provide equal thermal and vapor barrier performance as systems with continuous unbroken insulation. Metal shields are not required with clevis hangers of this type.
- E. Spring Hangers:
1. Reference Section "Vibration Isolation for Plumbing Piping and Equipment" for spring isolation hangers.
- F. Wall Supports:
1. Two-hole strap, galvanized steel or copper to suit pipe material. Provide rigid insulation between strap and pipe to maintain continuous insulation and vapor barrier where required.

2. Welded steel bracket reinforced with angle or strut. Support pipe from bracket using horizontal pipe hanger or support appropriate for the pipe type.
- G. Floor Supports:
1. Pipe Saddle: Cast iron adjustable pipe saddle, lock nut, nipple, floor flange, and concrete pier or steel support.
  2. Roller Support: Adjustable cast iron roll and stand, steel screws, and concrete pier or steel support.
- H. Pre-Insulated Supports:
1. Manufacturers:
    - a. Aeroflex USA, Inc.
    - b. ASC Engineered Solutions
    - c. Armacell.
    - d. Buckaroos, Inc.
    - e. Cooper B-Line, Inc.
    - f. Pipe Shields, Inc.
  2. General Construction and Requirements:
    - a. Flexible elastomeric insulation with integral high-density pipe support insert shall conform to ASTM C534, Type I.
    - b. Surface Burning Characteristics: Assembly shall have a flame spread index/smoke developed index of 25/50, maximum, when tested in accordance with ASTM E84 or UL 723.
    - c. Waterproof calcium silicate insulation shall conform to ASTM C795.
    - d. Rigid phenolic foam insulation shall conform to ASTM C1126, Type III.
    - e. Insulation inserts shall be surrounded by a 360 degree jacket or shield.
  3. Pipe insulation protection shields to be provided at the hanger points and guide locations on pipes requiring insulation as indicated on drawings.

**2.3 SHIELDS**

- A. Insulation Protection Shield:
1. Sheet metal construction, meeting SP-58 Type 40, of 18 gauge for 5-1/2" inside dimension and smaller, 16 gauge for 6-1/2" to 10-3/4" inside dimension 14 gauge for 11-3/4" to 17" inside dimension, and 12 gauge for 18" to 28" inside dimension.
  2. Shield shall cover half of the circumference of the pipe and shall be of length indicated by manufacturer for pipe size and thickness of insulation.
  3. Lengths for pipes greater than 2 inches: Minimum 8 inch long section at each support.
  4. For pipes 2 inch and smaller using fiberglass or flexible elastomeric insulation without pre-insulated supports, provide insulation protection shields installed between hanger and pipe which meets the following minimum length requirements:

Pipe Size (NPS)	Insulation Thickness (inches)	Minimum Shield Length, (in) Hanger Spacing, (ft)					
		5	6	7	8	9	10
≤ 1	0.5	5	6	8	-	-	-
	1	3	5	5	-	-	-
	1.5	3	5	5	-	-	-
	2	3	3	3	-	-	-
	3	3	3	3	-	-	-
≤ 2	0.5	8	8	11	11	12	14
	1	5	6	8	9	11	11
	1.5	5	6	8	8	9	9
	2	5	5	6	6	8	8
	3	5	5	6	6	6	8

- B. 360° Insulation Protection Shield: Shield shall cover all of the circumference of the pipe with two half circumference sections held together with bolts and nuts and shall be of length indicated by manufacturer for pipe size and thickness of insulation.
- C. Plastic Shields:
  - 1. Manufacturers:
    - a. Armacell.
    - b. Eaton.
    - c. Hydra-Zorb.
    - d. PHD Manufacturing.
    - e. Zsi Foster.
  - 2. Polymer-based, snap-on or clip-on design, with non-adhesive surface and lip to allow lateral movement of piping without damaging insulation, field-paintable.

## 2.4 VERTICAL-PIPING SUPPORTS

- A. Manufacturers:
  - 1. ASC Engineered Solutions.
  - 2. Cooper B-Line, Inc.
  - 3. Halfen-DEHA.
  - 4. Hilti.
  - 5. ERICO/Michigan Hanger Co.
  - 6. National Pipe Hanger Corporation.
  - 7. PHD Manufacturing.
  - 8. Power-Strut.
  - 9. Unistrut.
- B. Components shall be factory fabricated of materials, design, and manufacturer complying with MSS SP-58.
  - 1. Components shall have galvanized coatings where installed for piping and equipment that will not have factory applied or field-applied finish.
  - 2. Pipe attachments shall be copper-plated or have nonmetallic coating for electrolytic protection where attachments are in direct contact with copper tubing.
  - 3. Components as listed below shall be made of 304 stainless steel where installed in corrosive environments and/or where indicated on the drawings.
- C. Riser Clamps with pre-manufactured polymer insert:
  - 1. Manufacturers:
    - a. Hydra-Zorb; Titan Riser Clamp.
    - b. National Pipe Hanger.
    - c. Pipe Hangers, Inc.
- D. Riser clamp with pre-manufactured polymer inserts designed to withstand vertical loading and receive butted insulation internally. Inserts shall support piping independent of insulation to avoid crushing. Installed system shall provide equal thermal and vapor barrier performance as systems with continuous unbroken insulation.

## 2.5 PIPE ALIGNMENT GUIDES

- A. Factory fabricated, constructed of cast semi-steel or heavy fabricated steel when applied to steel pipe and copper when applied to copper. Guide shall consist of bolted two-section outer cylinder and base with two-section guiding spider that bolts tightly to pipe. Length of guides shall be as recommended by manufacturer to allow indicated travel.
  - 1. Pipe Diameter 8 inches and Smaller: Spider or sleeve type.
  - 2. Pipe Diameter 10 inches and Larger: Roller type.
  - 3. Pipe Diameter 18 to 30 inches: 1 inch U-bolt.

**2.6 PIPE ANCHORS**

- A. Pre-Insulated Anchors: Galvanized steel or stainless steel assembly with high density insulation insert and no metal-to-metal contact.
- B. Anchor Clamps: Assembly with multi-piece clamp, constructed of compatible material with piping or with dielectric barrier.

**2.7 PRE-ENGINEERED ROOF PIPE SUPPORTS**

- A. Manufacturers:
  - 1. Airtec.
  - 2. ASC Engineered Solutions.
  - 3. Cooper B-Line, Inc.
  - 4. Elite Components.
  - 5. ERICO/Michigan Hanger Co./Caddy.
  - 6. Ferguson/FNW.
  - 7. Miro.
  - 8. PHP Systems/Design.
  - 9. PHD Manufacturing.
  - 10. Roof Top Blox.
  - 11. Unistrut, a brand of Atkore International Inc.
  - 12. Zsi Foster.
- B. General: Pre-engineered devices with embedded pipe support fixtures as specified.
- C. Pedestals: Steel pedestals with thermoplastic or rubber base with the following dimensions:
  - 1. Up to 12 inch strut length support: 18 inch x 18 inch.
  - 2. Up to 16 inch strut length support: 24 inch x 18 inch.
  - 3. Up to 24 inch strut length support: 30 inch x 18 inch.
  - 4. Thickness: Minimum 3/16 inch thick.
- D. Block Bases: Closed-cell polyethylene blocks with the following dimensions.
  - 1. Length: Nominal 10 inch, 12 inch, 16 inch, or 24 inch
  - 2. Width: Nominal 4 inches.
- E. Attachment/Support Fixtures: As recommended by manufacturer, same type as indicated for equivalent indoor hangers and supports.
- F. Mounting Height: Provide minimum clearance of 6 inches under supported component to top of roofing.

**2.8 ANCHORS AND FASTENERS**

- A. Manufacturers:
  - 1. Hilti, Inc.
  - 2. Illinois Tool Works, Inc.
  - 3. Phillips.
  - 4. Powers Fasteners, Inc.
  - 5. Rawl.
  - 6. Simpson Strong-Tie Company Inc.
- B. Unless otherwise indicated and where not otherwise restricted, use the anchor and fastener types indicated for the specified applications.
  - 1. Concrete: Use preset concrete inserts or expansion anchors.
  - 2. Solid or Grout-Filled Masonry: Use expansion anchors.
  - 3. Hollow Masonry: Use toggle bolts.
  - 4. Hollow Stud Walls: Use toggle bolts.
  - 5. Steel: Use beam clamps.

6. Sheet Metal: Use sheet metal screws.
  7. Wood: Use wood screws.
  8. Plastic and lead anchors are not permitted.
  9. Hammer-driven anchors and fasteners are permitted only as follows:
    - a. Nails are permitted for attachment of nonmetallic boxes to wood frame construction.
    - b. Staples are permitted for attachment of nonmetallic-sheathed cable to wood frame construction.
- D. Preset Concrete Inserts: Continuous metal channel (strut) and spot inserts specifically designed to be cast in concrete ceilings, walls, and floors.
1. Comply with MFMA-4.
  2. Channel Material: Use galvanized steel.
  3. Minimum Channel Thickness: Steel sheet, 12 gauge, 0.1046 inch minimum base metal thickness.
  4. Spot Inserts: Carbon steel with zinc plating or galvanized steel body and base plate, with protective sleeve for anchor rod insert, sized to accommodate anchor rod dimensions.
  5. Manufacturers:
    - a. Same as manufacturer of metal channel (strut) framing system.
    - b. DeWalt "Bang-It" concrete inserts.
- E. Beam Clamps: MSS SP-58 C-Type or adjustable, Types 19 through 23, 25 or 27 through 30 based on required load.
1. Material: ASTM A36/A36M carbon steel or ASTM A181/A181M forged steel.
  2. Provide clamps with hardened steel cup-point set screws and lock-nuts for anchoring in place.
- F. Vibration Isolation Anchors: Reference Division 22 Section "Vibration Isolation for Plumbing Piping and Equipment" for vibration isolation anchors.

## 2.9 MISCELLANEOUS MATERIALS

- A. Steel Plates, Shapes, and Bars: ASTM A 36.
- B. Malleable Iron: ASTM A47
- G. Cement Grout: Portland cement (ASTM C 150, Type I or Type III) and clean uniformly graded, natural sand (ASTM C 404, Size No. 2). Mix ratio shall be 1.0 part cement to 3.0 parts sand, by volume, with minimum amount of water required for placement and hydration.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Verify that field measurements are as indicated.
- B. Verify that mounting surfaces are ready to receive support and attachment components.
- C. Verify that conditions are satisfactory for installation prior to starting work.

### 3.2 INSTALLATION GENERAL

- A. Install hangers and supports in accordance with manufacturer's installation instructions.
- B. Install anchors and fasteners in accordance with ICC Evaluation Services, LLC (ICC-ES) evaluation report conditions of use where applicable.
- C. Provide independent support from building structure. Do not provide support from piping, ductwork, conduit, or other systems.

- D. Unless specifically indicated or approved by Architect, do not provide support from suspended ceiling support system or ceiling grid.
- E. Unless specifically indicated or approved by Architect, do not provide support from roof deck.
- F. Do not penetrate or otherwise notch or cut structural members without approval of Structural Engineer.
- G. Provide thermal insulated pipe supports complete with hangers and accessories. Install thermal insulated pipe supports during the installation of the piping system.

### 3.3 INSTALLATION OF HANGERS AND SUPPORTS

- A. Install in accordance with ASME B31.9, ASTM F708, or MSS SP-58 unless indicated otherwise.
- B. If type of hanger or support for a particular situation is not indicated, select appropriate type using MSS SP-58 recommendations.
- C. Space attachments within maximum piping span length specified in Division 22 piping sections.
- D. Install hangers to provide minimum 1/2 inch space between finished covering and adjacent work.
- E. Install hangers, supports, clamps and attachments to support piping properly from building structure.
- F. Do not attach to ceilings, equipment, ductwork, conduit and other non-structural elements such as floor and roof decking.
- G. Hanger and clamps sizing:
  - 1. Cold Piping: Provide pipe hangers sized for the pipe outside diameter plus insulation thickness.
  - 2. Hot Piping: Provide pipe hangers sized for the pipe outside diameter.
  - 3. Vertical Piping: Provide clamps sized for the pipe outside diameter and extend clamp through insulation.
  - 4. Refer to Division 22 Section "Plumbing Insulation" for definition of hot and cold piping and required insulation thickness.
- H. Where several pipes can be installed in parallel and at the same elevation, Contractor has option to provide metal channel strut framing. Install supports with maximum spacing specified within Division 22 piping sections.
  - 1. Space strut framing at the required distance for the smallest pipe size or install intermediate supports for smaller diameter pipe as specified above for individual pipe hangers.
  - 2. Where strut systems are attached to walls, install anchor bolts per manufacturer's recommendations.
    - a. Uninsulated Copper Pipe: Install with plastic galvanic isolators
    - b. Insulated Tube or Pipe: Install with 360° insulation protection shields or pre-engineered thermal hanger-shield inserts as specified in Division 22 Section "Plumbing Insulation".
- I. Install building attachments within concrete or to structural steel.
  - 1. Install additional attachments at concentrated loads, including valves, flanges, guides, strainers, expansion joints, and at changes in direction of piping as specified in Division 22 piping sections.
  - 2. Install concrete inserts before concrete is placed; fasten insert to forms. Where concrete with compressive strength less than 2,500 psi is indicated, install reinforcing bars through openings at top of inserts.
- J. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories. Provide two nuts on threaded supports to securely fasten the support.

- K. Install appropriate types of hangers and supports to allow controlled movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends and similar units.
- L. Load Distribution: Install hangers and supports so that piping live and dead loading and stresses from movement will not be transmitted to connected equipment.
- M. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes, and so that maximum pipe deflections allowed by ASME B31.9 Building Services Piping Code is not exceeded.
- N. Insulated Piping: Comply with the following installation requirements.
  - 1. Riser Clamps: Attach riser clamps to piping with riser clamps projecting through insulation. Do not use riser clamps to support horizontal, insulated piping. Seal insulation for hot piping and protect vapor barrier for cold piping as specified in Division 22 Section "Plumbing Insulation".
    - a. Contractor's Option: Provide riser clamps with pre-manufactured polymer insert for cold piping 2-1/2 inches and larger.
  - 2. Insulation Protection Shield: Install insulation protection shield with high density insulation insert where vapor barrier is indicated, sized for the insulation thickness used as specified in Division 22 Section "Plumbing Insulation". Do not use polymer-based shields for hot piping.
    - a. Exception for horizontal cold-piping with fiberglass or flexible elastomeric insulation 2 inch and smaller: Rest fiberglass insulated pipe on hanger shield with length specified for pipe size and insulation thickness to prevent puncture or other damage.
  - 3. Contractor's Option: Provide pre-engineered thermal hanger inserts for piping insulated with flexible elastomeric insulation at pipe supports for piping 2-1/2 inches and larger.
  - 4. Contractor's Option: Provide strut-mounted pipe clamps and clevis hangers with pre-manufactured polymer inserts.
- O. Strut Framing Systems: Channel strut systems can be used at the Contractors option in lieu of individual hangers for horizontal pipes. Arrange for grouping of parallel runs of horizontal piping. Space channel strut systems at the required distance for the smallest pipe supported. Provide channel gauge and hanger rods per the manufacturer's recommendations for the piping supported. Where strut systems are attached to walls, install anchor bolts per manufacturer's recommendations.
  - 1. Uninsulated Copper Pipe: Install with plastic galvanic isolators
  - 2. Insulated Tube or Pipe: Install with 360 degree insulation protection shields or pre-engineered thermal hanger-shield inserts as specified in Division 22 Section "Plumbing Insulation".
- P. Vertical Piping Risers:
  - 1. Reference Section "Vibration Isolation for Plumbing Piping and Equipment" for piping riser supports.
- Q. Pre-Engineered Roof Pipe Supports: Set supports on an 18" X 18" x 3/16" thick roof walkway material compatible with the roof material.

### 3.4 INSTALLATION OF PIPE ALIGNMENT GUIDES

- A. Install pipe alignment guides on piping that adjoins expansion joints, as required by expansion joint manufacturer, and elsewhere as indicated on plans and specification sections to eliminate binding and torsional stress on piping systems. Install guides per ASME B31.9 unless noted otherwise. Install pipe insulation at guide to not interfere with movement of pipe within the guide.
- B. Install guide to accommodate 1/2 the thermal movement at the adjacent expansion joint.
- C. Anchor to building substrate.

**3.5 INSTALLATION OF ANCHORS**

- A. Install anchors at proper locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.
- B. Fabricate and install anchors by welding steel shapes, plates, and bars to piping and to structure. Comply with ASME B31.9 and with AWS Standards D1.1.
- C. Spacing: Where not otherwise indicated, install anchors at ends of principal pipe runs, at intermediate points in pipe runs between expansion loops and bends. Make provisions for preset of anchors as required to accommodate both expansion and contraction of piping.

**3.6 INSTALLATION OF PRE-ENGINEERED ROOF PIPE SUPPORTS**

- A. Install pre-engineered roof pipe supports to rest on the roofing membrane without attachment to the roof structure or penetration through the roofing assembly.
- B. Install pre-engineered roof pipe supports anchored to the roof structure.
  - 1. Install supports to meet the specified design criteria.
    - a. Building Design Risk Category: II III or IV .
    - b. Design Wind Speed: XXX mph.
  - 2. Coordinate with the pre-engineered roof pipe support manufacturer to anchor the pipe supports directly to the roof structure in accordance with the manufacturer's installation instructions or provide intermediate pipe supports engineered to meet the design criteria.
  - 3. Submit design and installation requirements as a Deferred Submittal.

**3.7 EQUIPMENT SUPPORTS**

- A. Use metal fabricated supports or supports assembled from metal channel (strut) to support equipment as required.
- B. Use metal channel (strut) secured to studs to support equipment surface-mounted on hollow stud walls.
- C. Use metal channel (strut) to support surface-mounted equipment in wet or damp locations to provide space between equipment and mounting surface.
- D. Securely fasten floor-mounted equipment. Do not install equipment such that it relies on its own weight for support.
- E. Preset Concrete Inserts and Expansion Anchors: Use manufacturer provided closure strips to inhibit concrete seepage during concrete pour.
  - 1. Where concrete slabs form finished ceiling, locate anchors flush with slab surface.
- F. Secure fasteners according to manufacturer's recommended torque settings.
- G. Remove temporary supports.
- H. Fabricate structural steel stands to suspend equipment from structure above or support equipment above floor.
- I. Grouting: Place grout under supports for piping and equipment.

**3.8 METAL FABRICATION**

- A. Cut, drill, and fit miscellaneous metal fabrications for pipe anchors and equipment supports. Install and align fabricated anchors in indicated locations.

- B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.
- C. Field Welding: Comply with AWS D1.1 for procedures of manual shielded metal-arc welding, appearance and quality of welds made, methods used in correcting welding work, and the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately.
  - 4. Finish welds at exposed connections so that no roughness shows after finishing, and so that contours welded surfaces to match adjacent contours.

### 3.9 FIELD QUALITY CONTROL

- A. Examine support and attachment components for damage and defects.
- B. Hanger Adjustment: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.
- C. Repair cuts and abrasions in galvanized finishes using zinc-rich paint recommended by manufacturer. Replace components that exhibit signs of corrosion.
- D. Touch-Up Painting: Immediately after erection of anchors and supports, clean field welds and abraded areas of shop paint and paint exposed areas with same material as used for shop painting to comply with SSPC-PA-1 requirements for touch-up of field-painted surfaces. Comply with Division 09 Section "Painting."
  - 1. Apply by brush or spray to provide a minimum dry film thickness of 2.0 mils.
- E. For galvanized surfaces clean welds, bolted connections and abraded areas and apply galvanizing repair paint to comply with ASTM A 780.
- F. Correct deficiencies and replace damaged or defective support and attachment components.

### 3.10 HANGER AND SUPPORT SCHEDULE

- A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.
- B. Provide the following acceptable hangers and supports for each type of piping system. Hangers and supports may be single type or strut-mounted:
- C. Single Hangers:
  - 1. All pipe sizes 1-1/2 inch and less:
    - a. Band hanger.
    - b. Swivel split ring.
    - c. Clevis hanger.
  - 2. Cold and Hot pipe sizes 2 to 4 inches: Clevis hanger.
  - 3. Cold and Hot pipe sizes 6 inches and greater: Roll support hanger.
  - 4. All drainage pipe sizes: Clevis hanger.
- D. Trapezes and Strut-mounted Supports:
  - 1. All pipe sizes less than 6 inches: Two-piece clamp.
  - 2. Pipe sizes 6 inches and greater: Roll support.
- E. Wall Supports:
  - 1. Pipe sizes 3 inches and less:
    - a. Two-hole strap mounted to wall.
    - b. Welded steel bracket with reinforced angle or strut.
  - 2. Pipe sizes 4 inch and greater:

- c. U-bolt
  - d. Welded steel bracket with reinforced angle or strut.
- F. Floor Supports:
- 1. Pipe sizes 4 inch and less: Pipe saddle.
  - 2. Pipe sizes 6 inch and greater: Roll support.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 05 33 - HEAT TRACING FOR PLUMBING PIPING****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes pipe freeze protection system, grease waste temperature maintenance system, and installation instructions.
- B. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 22 Section "Plumbing Insulation" for piping insulation and installation requirements.
  - 2. Division 23 Section "Direct-Digital Control for HVAC" for interlock of alarms with building automation system and alarm wiring.
  - 3. Division 26 Section "Common Work Results for Electrical" required electrical devices.
  - 4. Division 26 Sections "Enclosed Switches and Circuit Breakers" for field-installed disconnects.

**1.2 SUBMITTALS**

- A. Refer to Division 1 and Division 22 Section "General Plumbing Requirements" for administrative and procedural requirements for submittals.
- B. Product Data: Submit product data on the following items:
  - 1. Pipe Freeze Protection System
  - 2. Grease Waste Flow Maintenance
- C. Submit complete heat trace calculations and drawings including:
  - 1. Floor plans designating pipes to be heat traced
  - 2. Control panel quantities and locations
  - 3. Pipe heat loss and required heat trace cable watts per foot and number of runs
  - 4. Total cable length, maximum cable length and required number of circuits
  - 5. Electrical requirements

**1.3 QUALITY ASSURANCE**

- A. Pipe freeze protection system shall be listed and classified by Underwriter's Laboratories, Inc. as suitable for purpose intended.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Manufacturer: System components shall be factory tested with manufacturers' standard tests to ensure that all devices, components, and systems are in proper working order before shipment. Coordinate with Division 23 contractor to provide single manufacturer for all Division 22 and Division 23 heat trace components. Subject to compliance with requirements, provide piping materials and specialties from one of the following:
  - 1. Pipe Freeze Protection System and Grease Waste Flow Maintenance
    - a. Chromalox
    - b. Nextron
    - c. Nelson
    - d. Tyco Thermal Controls/Raychem
    - e. Thermon

**2.2 PIPE FREE HE PROTECTION SYSTEM AND GREASE WASTE FLOW MAINTENANCE**

- A. In general the system shall include the following items:
1. Heating cable control panel.
  2. Transformer(s).
  3. Outdoor ambient thermostat(s). Pipe mounted temperature sensor.
  4. Junction boxes.
  5. Parallel circuit heating cable.
  6. Branch circuit wiring and conduit.
  7. Other items necessary for a complete system.
- B. Heating Cable and Accessories:
1. Parallel circuit, jacketed cable, self-limiting, designed to operate on voltage as specified on the drawings. Cable shall consist of two nickel-copper bus wires embedded in parallel in a self regulating polymer core. Cable shall be capable of varying its output along its length. Provide wattage as required for piping and insulation involved per manufacturer's recommendations.
  2. Heating cable shall be covered by a polyolefin dielectric jacket.
  3. Heating cable shall be grounded with a braid of tinned copper.
  4. Where indicated on the drawings, heating cable shall have polyolefin outer jacket for protection against aqueous inorganic chemicals. Where indicated on the drawings, heating cable shall have fluoropolymer outer jacket for protection against organic chemicals or corrosives.
  5. Termination fittings for direct connection to junction boxes.
  6. Junction Boxes: Junction boxes shall be NEMA 4X Watertight, even where located indoors.
- C. Control Panel:
1. NEMA 4X Fiberglass Reinforced Plastic enclosure for outdoor installation with hinged access door with window and furnished with the following:
  2. Microprocessor based controller with LED display with keypad interface and non-volatile memory.
  3. Ground fault circuit protection capable of checking heating cable circuit faults
  4. LED Indicator Lights: Current mode, heater on, alarm conditions and receive / transmit data.
  5. Alarm Conditions: RTD failure, high/low temperature, high/low current, hi/low resistance and high/low voltage, ground fault alarm, trip, loss of programmed values and electromechanical relay failure.
  6. Alarm Contacts: One single pole single throw rated at 0.75 amp 120 to 277 volt relay and one dry pilot duty only relay rated at 48 VAC / DC 50 milliamps, 10VA maximum resistive switching
  7. Power strip for connecting 277 volt single phase at 30 amps maximum.
  8. Temperature Control Sensors: Total of two three wire 100 Ohm RTD's with 10 foot long stainless steel sheath, ambient temperature range of  $-76^{\circ}\text{F}$  to  $1058^{\circ}\text{F}$  with an accuracy of  $\pm 3^{\circ}\text{F}$  and a repeatability of  $\pm 3^{\circ}\text{F}$ .
- D. Temperature Control Sensor
1. Provide outdoor ambient thermostat with adjustable contacts set to close on decreasing temperature.
  2. Provide pipe mounted sensor with adjustable setpoint set to close on decreasing temperature.

**PART 3 - EXECUTION****3.1 PIPE FREEZE PROTECTION AND GREASE WASTE FLOW MAINTENANCE SYSTEM INSTALLATION**

- A. Furnish and install a pipe freeze protection system and grease waste flow maintenance to prevent the following piping from freezing, and to maintain proper flow in grease waste systems where located in unheated areas:
1. Domestic water piping.
  2. Sanitary P-traps.
  3. Horizontal and vertical storm piping
  4. Architectural sheet metal downspouts
- B. Installation:
1. Cut cable to length as required to suit pipe lengths and watt per foot requirements.
  2. Install and test heating cable after pipe is pressure tested and before pipe is insulated.
  3. Secure cable to pipe with cable ties or belts and install according to manufacturer's instructions.
  4. Install cable on piping in accordance with manufacturer's recommendations for a minimum ambient temperature of minus 20 degrees F.
  5. For grease waste maintenance, install cable on piping in accordance with the manufacturer's recommendations for a minimum maintenance temperature.
  6. Install junction boxes where necessary.
  7. Install control panels at the locations indicated.
  8. For plastic piping, apply heating cable using aluminum tape.
- C. Connections:
1. Electrical wiring and connections are specified in Division 26 Section "Common Work Results for Electrical".
  2. Coordinate interlock of heat trace system control panel alarm conditions with the building automation system. Alarm wiring and alarm interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".
- D. Insulation:
1. Install and test electric heat trace prior to installation of insulation. Insulation is specified in Division 22 section "Plumbing Insulation".
- E. Factory Tests:
1. Conduct manufacturers' standard tests on all system components to assure that all devices, components, and systems are in proper working order before shipment.
- F. Field Tests:
1. Before and after installation of the thermal insulation, test heating cable with megohmmeter between the heating cable bus wires and metallic braid. Minimum insulation resistance shall be 20 megohms regardless of length.
  2. Submit test report of megohmmeter readings to the Owner.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 05 50 - VIBRATION ISOLATION FOR PLUMBING PIPING AND EQUIPMENT****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. It is the intent of this specification to provide vibration isolation supports for Plumbing equipment as scheduled at the end of this Section.
- B. This work shall include all materials and labor required for the installation of the vibration isolation devices.
- C. Vibration isolators shall be selected by the weight distribution to produce reasonably uniform deflection. Deflections shall be as noted on the equipment schedule included at the end of this Section.
- D. All vibration isolation equipment shall be furnished by one manufacturer unless specifically approved otherwise in writing by the Engineer.
- E. All vibration isolation devices shall be treated for corrosion resistance using galvanization for exterior applications and painting for interior applications.
- F. Related Sections:
  - 1. Division 22 Section "Common Work Results for Plumbing" for materials and methods for concrete equipment pads.
  - 2. Division 22 Section "Basic Piping Material and Methods," for materials and methods for flexible connectors.
  - 3. Division 22 Section "Hangers and Supports for Plumbing Piping," for materials and methods for hangers and supports.
  - 4. Division 22 Section "Domestic Water Pumps," for materials and methods for domestic booster pumps.

**1.2 WORK INCLUDED**

- A. Provide complete vibration isolation systems as shown or specified and in accordance with the requirements of the Contract Documents. System shall be complete with:
  - 1. Foundations, vibration isolation, and supports for rigidly supported equipment.
  - 2. Vibration Isolation

**1.3 CONTRACTOR S RESPONSIBILITY**

- A. Consult all other Section to determine the extent of work specified elsewhere but related to this Section. This work shall be properly coordinated to produce an installation satisfactory to the Owner. The Contractor shall be responsible for verifying the completeness of the isolation installation and the overall suitability of the equipment to meet the intent of this specification. Any additional equipment needed to meet the intent of this specification, even if not specifically mentioned herein or in the Contract Documents, shall be provided by the Contractor without claim for additional payment.
- B. Performance or waiving of inspection, testing or surveillance for any portion of the Work shall not relieve the Contractor of the responsibility to conform strictly to the Contract Documents. The Contractor shall not construe performance or waiving of inspection, testing or surveillance by the Owner or Architects to relieve the Contractor from total responsibility to perform in strict accordance with the Contract Documents.

**1.4 MANUFACTURER S RESPONSIBILITIES**

- A. Manufacturer of vibration isolation equipment shall have the following responsibilities:
  - 1. Determine vibration isolation for all equipment and systems in accordance with the local governing code.
  - 2. Provide piping and equipment isolation systems as scheduled or specified.
  - 3. Guarantee specified isolation system deflection.
  - 4. Provide installation instructions, drawings and field supervision to assure proper installation and performance.
  - 5. The vibration isolation systems shall be guaranteed to have deflection indicated on the schedule on the drawings. Mounting sizes shall be determined by the mounting manufacturer, and the sizes shall be installed in accordance with the manufacturer's instructions.
  - 6. The vibration isolator vendor shall ensure that all equipment to be isolated has sufficient support structure to distribute equipment loads onto isolators. Where additional support structure is required, this shall be provided by vibration isolator vendor.

**1.5 SUBMITTALS**

- A. Submittal data shall show type, size, and deflection of each isolator proposed. Include clearly outlined procedures for installing and adjusting the isolators.
- B. Submit a vibration isolation system schedule indicating the following:
  - 1. Manufacturer, type, model number, size
  - 2. Height when uncompressed and static deflection of each isolation element
  - 3. Spring constant of each isolation element
  - 4. Estimated imposed load on each isolation element
  - 5. Spring o.d., free operating, and solid heights
  - 6. Design of supplementary bases.
  - 7. Layout of isolator hangers, mounts, and other elements shown on an outline of the isolated equipment, including complete details of attachment to load-bearing structure or supplementary framing.
  - 8. Piping isolators shown and identified on piping layout drawings.
  - 9. All concrete foundations and supports (and required reinforcing and forms) will be furnished and installed by another trade. However, this trade shall furnish shop drawings showing adequate concrete reinforcing steel details and templates for all concrete foundations and supports, and all required hanger bolts and other appurtenances necessary for the proper installation of the Contractor's equipment. Although another trade will complete all concrete work, all such work shall be shown in detail on the shop drawings, prepared by this trade which drawings shall be submitted showing the complete details of all foundations including necessary concrete and steel work, vibration isolation devices, etc.

**1.6 QUALITY ASSURANCE**

- A. It is the objective of this Specification to provide for the control of vibration due to the operation of machinery or equipment, and/or due to interconnected piping or conduit.
- B. The installation of all vibration isolation systems shall be under the supervision of the manufacturer's representative.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. All vibration isolation equipment and materials shall be provided by a single manufacturer. The following manufacturers are approved provided systems are in compliance with the specified design and performance requirements:
1. Amber Booth.
  2. Kinetics Noise Control.
  3. Mason Industries, Inc.
  4. Vibration Eliminator Co., Inc.
  5. Vibration Mounting and Controls.

**2.2 GENERAL**

- A. All equipment provided for vibration isolation shall be new and manufactured specifically for the purpose intended.

**2.3 VIBRATION ISOLATORS****A. GENERAL**

1. The static deflection of isolators shall be as given in the equipment schedule and specified below. The isolator schedule shall take precedence.
2. Vibration isolator sizes and layout shall be determined by the vibration isolator supplier.
3. All vibration isolators shall have either known undeflected heights or calibration markings so that, after adjustment, the amount of deflection can be verified, thus determining that the load is within the proper range of the device and that the correct degree of vibration isolation is being provided according to the design.
4. All isolators shall operate in the linear portion of their load versus deflection curve. Load versus deflection curves shall be furnished by the manufacturer, and must be linear over a deflection range of not less than 50% above the design deflection.
5. The theoretical vertical natural frequency for each support point, based upon load per isolator and isolator stiffness, shall not differ from the design objectives for the equipment as a whole by more than  $\pm 10\%$ .
6. All neoprene mountings shall have a Shore hardness of 30 to 60  $\pm 5$ , or as specified herein, after minimum aging of 20 days or corresponding over-aging.
7. Housed or caged spring isolators are not acceptable.
8. Where steel spring isolation systems are described in the specifications, the mounting assemblies shall utilize bare springs with the spring diameter not less than 0.8 of the loaded operating height of the spring. Each spring isolator shall be designed and installed so that the ends of the spring remain parallel during and after the spring installation. All isolators shall operate in the linear portion of their load versus deflection curve and have 50% excess capacity without becoming coil bound.
9. All mounting systems exposed to weather and other corrosive environments shall be protected with factory corrosion resistance. All metal parts of mountings (except springs and hardware) shall be hot dip galvanized. Springs shall be cadmium plated and neoprene coated. Nuts and bolts shall be cadmium plated.

**B. ISOLATOR TYPE WP**

1. Type WP (Waffle Pads) shall be 5/16 inch thick neoprene pads ribbed or waffled on both sides. The pads shall be manufactured with bridge bearing quality neoprene, and selected for a maximum durometer of 50 and designed for 15% strain. Where required, steel load-spreading plates shall be incorporated between the equipment and the neoprene pad.
2. If the isolator is bolted to the structure, a neoprene vibration isolation washer and sleeve (Uniroyal Type 620/660 or as approved) shall be installed under the bolt head between the steel washer and the base plate.

3. (Type WP: Mason Industries Type W or as approved.)
- C. ISOLATOR TYPE MWP
1. Type MWP (Metal and Waffle Sandwich Pads) shall consist of two 5/16 inch thick ribbed or waffle neoprene pads sandwiching a 16 gauge stainless steel shim plate. The pad shall be manufactured with bridge bearing quality neoprene, and selected for a maximum durometer of 50 and designed for 15% strain.
  2. If the isolator is bolted to the structure, a neoprene vibration isolation washer and sleeve (Uniroyal Type 620/660, or as approved) shall be installed under the bolt head between the steel washer and the base plate.
  3. (Type MWP: Mason Industries Type WSW or as approved.)
- D. ISOLATOR TYPE DDNM
1. Type DDNM (Double Deflection Neoprene Mounts) shall be laterally stable, double deflecting, molded neoprene isolators. All metal surfaces shall be covered with neoprene. The top and bottom surfaces shall be ribbed and bolt holes shall be provided in the base. The mounts shall have leveling bolts rigidly secured to the equipment.
  2. The isolator shall be manufactured with bridge bearing quality neoprene, and selected for a maximum durometer of 50 and designed for 15% strain. DDNM mounts shall be selected for a static deflection of 3/8 inch unless otherwise specified.
  3. (Type DDNM: Mason Industries Type ND or as approved.)
- E. ISOLATOR TYPE DDNH
1. Type DDNH (Double Deflection Neoprene Hangers) shall consist of a molded neoprene isolating element in a steel hanger box. A neoprene sleeve shall be provided where the lower hanger rod passes through the steel hanger box, such that the hanger rod cannot contact the steel hanger. The diameter of the clear hole in the hanger box shall be at least 3/4 inch larger than the diameter of the hanger rod and permit the hanger rod to swing through a 30 degree arc. When installed, the hanger box shall be allowed to rotate through a full 360 degrees without encountering any obstructions.
  2. The isolator shall be manufactured with bridge bearing quality neoprene, and selected for a maximum durometer of 50 and designed for 15% strain. Unless otherwise specified, the static deflection of DDNH hangers shall be 0.3 inches.
  3. (Type DDNH: Mason Industries Type HD or as approved.)
- F. ISOLATOR TYPE SPNM
1. Type SPNM (Spring and Neoprene Mounts) shall have a free-standing and laterally stable steel spring without any housing. Springs shall be designed so that the ratio of the horizontal to vertical spring constant is between one and two. The spring diameter shall be not less than 80% of the compressed height of the spring at rated load. Loaded springs shall have a minimum additional travel to solid equal to 50% of the specified static deflection.
  2. Unless otherwise specified, the minimum static deflection of SPNM isolators for equipment mounted on grade slabs shall be 1 inch, and the minimum static deflection for equipment mounted above grade level shall be 2 inches.
  3. Two Type WP isolation pads sandwiching a 16 gauge stainless or galvanized steel separator plate shall be bonded to the isolator baseplate.
  4. Unless otherwise specified, isolators need not be bolted to the floor for indoor installations. If the base plates are bolted to the structure, a neoprene vibration isolation washer and sleeve (Uniroyal Type 620/660 or as approved) shall be installed under the bolt head between the steel washer and the base plate.
  5. (Type SPNM: Mason Industries Type SLFH or as approved.)
- G. ISOLATOR TYPE SPNH
1. Type SPNH (Spring and Neoprene Hangers) shall consist of a steel spring in series with a neoprene isolating element. The spring shall have a minimum additional travel to solid equal to 50% of the specified deflection. The neoprene element shall have a static deflection of not less than 0.3 inches with a strain not exceeding 15%.

2. Unless otherwise specified, the static deflection of SPNH hangers shall be 2 inches.
  3. Spring diameter and hanger box hole size shall be large enough to permit the hanger rod to swing through a 30 degree arc. A neoprene sleeve shall be provided where the lower hanger rod passes through the steel hanger box, such that the hanger rod cannot contact the steel hanger. The diameter of the clear hole in the hanger box shall be at least 3/4 inch larger than the diameter of the hanger rod. When installed, the spring element shall not be cocked, and the hanger box shall be allowed to rotate through a full 360 degree arc without encountering any obstructions.
  4. (Type SPNH: Mason Industries Type 30N or as approved.)
- H. BASE TYPE CIB
1. Inertia base Type CIB (Concrete Inertia Base) shall have an integral rectangular structural steel form into which concrete is poured.
  2. Perimeter members shall be beams of depth equal to 10% of the longest span of the base, but not more than 12 inches nor less than 6 inches deep. Forms shall include motor slide base and all reinforcing steel. Where anchor bolt locations fall in concrete, the reinforcing steel shall include drilled members with sleeves welded below the steel to accept the anchor bolts. Height saving steel brackets shall be used in all mounting locations.
  3. When the concrete base is "T" shaped, isolators shall be located under the projections as well as under the main body in order to prevent cantilever distortion.
  4. The structural perimeter frame, mounting templates, height saving brackets, and spring system shall be provided as an assembly by the vibration control vendor.
  5. (Base Type CIB: Mason Industries Type KSL or as approved)
- I. NEOPRENE MOUNTING SLEEVES
1. Neoprene mounting sleeves for hold-down applications of equipment with vibration isolators shall be Uniroyal Type 620/660 or as approved.
- J. PIPE FLEXIBLE CONNECTORS
1. Refer to Section "Basic Piping Materials and Methods" for requirements for flexible pipe connectors.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. All equipment, piping, etc. shall be mounted on or suspended from approved foundations and supports, all as specified herein, or as shown on the drawings.
- B. All floor-mounted equipment shall be erected on concrete equipment pads over the complete floor area of the equipment, unless otherwise specified herein. Refer to Section "Common Work Results for Plumbing" for concrete equipment pad requirements. These pads shall be integrally keyed to structural slab. Wherever vibration eliminating devices and/or concrete inertia blocks are specified, these items shall, in all cases, be mounted on concrete equipment pads unless otherwise specified herein.
- C. Furnish and install neoprene mounting sleeves for hold-down bolts to prevent any metal to metal contact.
- D. All equipment shall be provided with lateral restraining isolators as required to limit horizontal motion to 1/4" maximum, under all operating conditions. Lateral restraining isolators shall have the same static deflection as the vertical isolators for the equipment being isolated.
- E. Unless otherwise indicated, all equipment mounted on vibration isolators shall have a minimum operating clearance of 2 inches between the bottom of the equipment or inertia base (and height-saving bracket) and the concrete equipment pad (or bolt heads) beneath the equipment. The clearance shall be checked by the Contractor to ensure that no material has been left to short-circuit the vibration isolators. There shall be a minimum 4 inch clearance between isolated

equipment and the walls, ceiling, floors, columns and any other equipment not installed on vibration isolators.

- F. Piping or plumbing equipment shall be supported from building structure, not hung from or supported on other equipment, pipes, or ductwork.
- G. Equipment connected to water or other fluid piping shall be erected on isolators or isolated foundations at correct operating heights prior to connection of piping, and blocked-up with temporary shims to final operating height. When the system is assembled and fluid is added, the isolators shall be adjusted to allow removal of the shims.
- H. All plumbing equipment not specifically identified in this specification that contains rotating or vibrating elements, and any associated electrical apparatus installed by this division that contains transformers or inductors shall be installed on Type DDNM neoprene isolators as appropriate.
- I. All wiring connections to plumbing equipment on isolators shall be made with a minimum 18 inch long flexible conduit in a "U" shaped loop.
- J. Elastomeric isolators that will be exposed to temperatures below 32 degrees F shall be fabricated from natural rubber instead of neoprene.
- K. Springs shall be designed and installed so that ends of springs remain parallel and all springs installed with adjustment bolts.
- L. Springs shall be sized to be non-resonant with equipment forcing frequencies or support structure natural frequencies.
- M. Refer to Vibration Isolation Schedule at the end of this Section.

### 3.2 INLINE PUMPS

- A. Inline pumps shall be supported on Type SPNH spring isolators. Provide flexible pipe couplings on each side of pump. The vertical load shall be carried by the supports, not by the flexible couplings.

### 3.3 DOMESTIC BOOSTER PUMPS

- A. Packaged domestic booster pumps installed on slab on grade shall be bolted and grouted thru their factory provided equipment frames to equipment pads and be provided with vibration isolators as scheduled in the table at the end of this section.

### 3.4 SUPPORT OF PIPING

- A. The following water and condensate piping shall be resiliently supported:
  - 1. Piping within 50 feet of connected rotating equipment.
  - 2. Piping installed below or adjacent to noise sensitive areas.
- B. Pipes connected to equipment installed on spring vibration isolators shall be suspended or supported by Type SPNM or Type SPNH isolators. Provide vibration isolation anchors and guides as specified elsewhere in this section. The first isolator both upstream and downstream of equipment on springs shall have a static deflection equal to 1.5 times that of the equipment isolators, up to a maximum of 2 inches. The static deflection of the remaining pipe isolators shall be 1 inch.
- C. Piping that is connected only to machinery installed on neoprene isolators shall be either supported from the floor on Type DDNM mounts or suspended from the structure on Type DDNH hangers.
- D. Where a pipe run connects multiple items of equipment in the mechanical room the pipe isolators for the entire run shall be chosen to suit the connected equipment of greatest static deflection.

- E. Resilient diagonal mountings or other approved devices shall be provided as required to limit piping motion due to equipment startup or shut down, to a maximum of 1/8".
- F. Water piping hanger rod isolators shall contain a steel spring in series with a 1/4" acoustical neoprene pad within a steel box retainer. The hanger rod isolator assembly shall be rigidly supported from the spring sub-assembly and shall not contact the steel box retainer. Clearances in the isolator design shall be capable of accepting a 15 degree misalignment in any direction from the vertical.
- G. The steel spring element of the assembly shall be designed to have a minimum surge frequency of 340 HZ and a minimum deflection of 3/4".
- H. Hanger rod isolators for steam and condensate piping including steam pressure reducing valve stations shall be supported by means of neoprene-in-shear mountings providing a minimum static deflection of 1/2".
- I. Where supplementary steel is required to support piping, the supplementary steel shall be sized so that maximum deflection between supports does not exceed 0.08" and shall be resiliently supported from the building structure with mountings as described above. Supported piping from the supplementary steel shall be rigidly suspended or supported.
- J. Pre-compressed type hanger rod isolators shall be provided for all water piping greater than 12" diameter and all supplementary steel supports. The pre-compression shall be factory set at 75% of rated deflection.
- K. Where isolated water piping 8" and larger is supported directly below exposed steel beams, attachment to the beam shall be made by means of welded channel beam attachments located directly under the web of the beam. For piping 6" and smaller, beam clamps may be used in lieu of welding subject to approval of beam clamp selection.
- L. Except as noted elsewhere in this section, all 2-inch and smaller domestic water piping that is installed outside equipment rooms shall be isolated from the structure with sponge neoprene, felt or glass/mineral fiber sleeves between the pipe and pipe clamp or with Type WP pads between the clamp and the structure. The sleeve shall be not less than 1/8-inch in thickness when compressed.

### 3.5 PIPING ANCHORS GUIDES AND SUPPORTS

- A. General: Pipe riser guides, anchors and supports including piping anchors in mechanical equipment rooms or occupied spaces shall be isolated from the building structure such that there shall be no direct metal to metal contact of the piping with the building structure.
- B. Piping Anchors and Guides
  1. The all directional pipe anchor isolation mountings shall consist of a telescoping arrangement of two sizes of steel tubing separated by a minimum of 1/2" thick heavy duty neoprene and canvas duct isolation pad. Vertical restraints shall be provided by similar material arranged to prevent vertical travel in either direction. The allowable load on the isolation material shall not exceed 500 psi.
  2. Steel guides shall be welded to the pipe at a maximum spacing of 90°. The outside diameter of the opposing guide bars shall be smaller than the inside diameter of the pipe riser clamp in accordance with standard field construction practice. Each end of the pipe guide shall be rigidly attached to an all directional pipe anchor isolation mounting which in turn, shall be rigidly fastened to the steel framing within the shaft.
  3. Low temperature piping guides shall be constructed with a 360 degree 10 gauge metal sleeve around the piping. The thermal insulation requirements for the piping shall be provided between the piping and the sleeve. Heavy duty neoprene and canvas duct isolation pad of thickness equal to thermal insulation requirements shall space the metal sleeve away from the piping with urethane or other suitable thermal insulation provided in the voids between the pipe-sleeve and isolation pan material. The metal sleeve outside

diameter shall be smaller than the pipe riser clamp inside diameter in accordance with standard field construction practice. The pipe riser clamp shall be rigidly attached to the steel framing within the shaft.

C. Piping Supports:

1. Piping supports within shafts shall be provided with suitable bearing plates and two layers 1/4" thick ribbed or waffled neoprene pad loaded for 50 psi maximum. The isolation pads shall be separated with 1/4" steel plate. The isolation pads shall be Type WP or approved equal.
2. Piping isolation supports at the base of risers shall be two layers of 1/2" thick heavy duty neoprene and canvas duct isolation pad separated by 1/4" thick steel plate. Suitable bearing plates sized to provide a pad loading of 500 psi maximum shall be provided. The stanchion between the pipe and isolation support shall be welded to the pipe and welded or bolted to the isolation support. The isolation support shall be bolted to the floor slab with resilient sleeves and washers. All pipe support resilient materials shall be HL Mason Industries, Inc., or as approved.

### 3.6 FLEXIBLE PIPING CONNECTORS

- A. Flexible piping connectors shall be installed to connect piping diameter 2" or greater to reciprocating or rotating equipment.

### 3.7 PIPE RISER SUPPORTS

- A. Where pipes rise in a vertical chase and are supported from a structure with type SPNH or DDNH isolators and require lateral bracing, neoprene riser guides shall be mounted around the pipe to limit lateral movement and to prevent direct contact with the supporting structure.
- B. Support vertical pipe risers subjected to thermal expansion and/or contraction with spring isolators and central anchors designed to ensure loading within design limits at support points. Perform design calculations for sizing the riser supports incorporating the initial load, initial deflection, change in deflection, final load and change in load at support locations. Design calculations must include anchor loads when installed, cold filled and at operating temperature and pipe stress at end connections and branch locations. Design system for an initial spring deflection of at least 4 times the thermal movement. Design must be stamped and signed by a licensed professional engineer.

### 3.8 WIRING

- A. All wiring connections to plumbing equipment on vibration isolators (either spring or neoprene type) shall be made with a minimum 18 inch long flexible conduit in a "U" shaped loop. This Contractor shall coordinate wiring connections with the Electrical Contractor.

### 3.9 FIELD QUALITY

- A. Contractor shall work in accord with best trade practices, shall fabricate and install all items in accordance with manufacturer's recommendations and Architect's directions, and shall consult with trades doing adjoining work in order to provide an installation of first class quality.

### 3.10 ADJUSTMENT AND TESTING

- A. Site Access: During installation of equipment, Contractor shall arrange for access as necessary for inspection of isolation and noise control equipment by Architect and the Contractor's representatives.
- B. Contractor's Vibration Isolation Report: The vibration isolation vendor shall inspect and approve the installation of the vibration isolators and shall submit a report to the Architect which verifies

that all of the isolation equipment has been properly installed and that the installation is in full conformance with the specification. The report shall record the vibration isolator identification and model or type. For isolators containing steel springs the report shall also record the size and uncompressed height, design static deflection and measured static deflection of the isolators provided.

- C. Consultant's Inspection: Upon completing installation and adjustment for suitable operation of all work specified under this section, the Contractor shall notify the Architect in writing. The letter shall certify that all work specified under this section is complete, operational and adjusted in every respect, and that all work is ready for the completion checkout. The notification letter shall be accompanied by the vibration isolation report.

### 3.11 GUARANTEE

- A. If, in the actual installation, any equipment fails to meet the vibration control requirements specified herein, that equipment shall be corrected or replaced without claim for additional payment, inclusive of all labor and material costs. Such corrective measures shall be done within a time schedule specified by the Owner.

### 3.12 SCHEDULE OF VIBRATION ISOLATORS

EQUIPMENT	BASE TYPE	ISOLATOR TYPE	STATIC DEFLECTION
In-Line Pumps □ HP & Larger		SPNH	1.75"
Domestic Booster Pumps (Slab on Grade)	Equipment Pad	MWP	0.25
Piping		Isolation as per specification.	

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 05 53 - IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. Extent of Plumbing work to be identified as required by this Section is indicated on drawings and/or specified in other Division 22 Sections.
- B. Types of identification devices specified in this Section include the following:
  - 1. Plastic Pipe Markers
  - 2. Plastic Tape
  - 3. Underground-Type Plastic Line Marker
  - 4. Valve Tags
  - 5. Valve Schedule Frames
  - 6. Engraved Plastic-Laminate Signs
  - 7. Plastic Equipment Markers
  - 8. Plasticized Tags

**1.2 CODES AND STANDARDS**

- A. ANSI Standards: Comply with ANSI A13.1 for lettering size, length of color field, colors, and viewing angles of identification devices.

**1.3 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical product data and installation instructions for each identification material and device required.
- B. Samples: Submit samples of each color, lettering style and other graphic representation required for each identification material or system.
- C. Schedules: Submit valve schedule for each piping system, typewritten and reproduced on 8-1/2" x 11" bond paper. Tabulate valve number, piping system, system abbreviation (as shown on tag), location of valve (room or space), and variations for identification (if any). Mark valves which are intended for emergency shut-off and similar special uses, by special "flags", in margin of schedule. In addition to mounted copies, furnish extra copies for Maintenance Manuals as specified in Division 1.
- D. Maintenance Data: Include product data and schedules in Maintenance Manuals as specified in Division 1 and Section "General Plumbing Requirements."

**1.4 SPARE PARTS**

- A. Furnish minimum of 5% extra stock of each plumbing identification material required, including additional numbered valve tags (not less than 3) for each piping system, additional piping system identification markers, and additional plastic laminate engraving blanks of assorted sizes.
  - 1. Where stenciled markers are provided, clean and retain stencils after completion of stenciling and include used stencils in extra stock, along with required stock of stenciling paints and applicators.

**PART 2 - PRODUCTS AND MATERIALS****2.1 ACCEPTABLE MANUFACTURERS**

- A. Manufacturer: Subject to compliance with requirements, provide plumbing identification materials of one of the following:
1. Advanced Graphic Engraving, LLC.
  2. Brady Co.
  3. Brimar Industries, Inc.
  4. Craftmark.
  5. Kolbi Pipe Marker Co.
  6. Seton

**2.2 PLUMBING IDENTIFICATION MATERIALS**

- A. General: Provide manufacturer's standard products of categories and types required for each application as referenced in other Division 22 sections. Where more than single type is specified for application, selection is Installer's option, but provide single selection for each product category.

**2.3 PLASTIC PIPE MARKERS**

- A. Snap-On Type: Provide manufacturer's standard pre-printed, semi-rigid snap-on, color-coded pipe markers, complying with ANSI A13.1
- B. Pressure-Sensitive Type: Provide manufacturer's standard pre-printed, permanent adhesive, color-coded, pressure-sensitive vinyl pipe markers, complying with ANSI A13.1
- C. Insulation: Furnish 1" thick molded fiberglass insulation with jacket for each plastic pipe marker to be installed on uninsulated pipes subjected to fluid temperatures of 125 degrees F (52 degrees C) or greater. Cut length to extend 2" beyond each end of plastic pipe marker.
- D. Small Pipes: For external diameters less than 6" (including insulation if any), provide full-band pipe markers, extending 360 degrees around pipe at each location, fastened by one of the following methods:
1. Snap-on application of pre-tensioned semi-rigid plastic pipe marker.
  2. Adhesive lap joint in pipe marker overlap.
  3. Laminated or bonded application of pipe marker to pipe (or insulation).
  4. Taped to pipe (or insulation) with color-coded plastic adhesive tape, not less than 3/4" wide; full circle at both ends of pipe marker, tape lapped 1-1/2".
- E. Large Pipes: For external diameters of 6" and larger (including insulation if any), provide either full-band or strip-type pipe markers, but not narrower than 3 times letter height (and of required length), fastened by one of the following methods:
1. Laminated or bonded application of pipe marker to pipe (or insulation).
  2. Taped to pipe (or insulation) with color-coded plastic adhesive tape, not less than 1-1/2" wide; full circle at both ends of pipe marker, tape lapped 3".
  3. Strapped-to-pipe (or insulation) application of semi-rigid type, with manufacturer's standard stainless steel bands.
- F. Arrows: Print each pipe marker with arrows indicating direction of flow, either integrally with piping system service lettering (to accommodate both directions), or as a separate unit of plastic.
- G. Lettering: Manufacturer's standard pre-printed nomenclature which best describes piping system in each instance, as selected by Architect/Engineer in cases of variance with names as shown or specified.
- H. Lettering: Comply with piping system nomenclature as specified, scheduled, or shown, and abbreviate only as necessary for each application length.

**2.4 PLASTIC TAPE**

- A. General: Provide manufacturer's standard color-coded pressure-sensitive (self-adhesive) vinyl tape, not less than 3 mils thick.
- B. Width: Provide 1-1/2" wide tape markers on pipes with outside diameters (including insulation, if any) of less than 6", 2-1/2" wide tape for larger pipes.
- C. Color: Comply with ANSI A13.1, except where another color selection is indicated.

**2.5 UNDERGROUND-TYPE PLASTIC LINE MARKER**

- A. General: Manufacturer's standard permanent, bright-colored, continuous-printed plastic tape, intended for direct-burial service; not less than 6" wide x 4 mils thick. Provide tape with printing which most accurately indicates the type of service of buried pipe.
  - 1. Provide multi-ply tape consisting of solid aluminum foil core between 2-layers of plastic tape.

**2.6 VALVE TAGS**

- A. Brass Valve Tags: Provide 19-gauge polished brass valve tags with stamp-engraved piping system abbreviation in 1/4" high letters and sequenced valve numbers 1/2" high, and with 5/32" hole for fastener.
  - 1. Provide 1-1/2" diameter tags, except as otherwise indicated.
  - 2. Fill tag engraving with black enamel.
- B. Valve Tag Fasteners: Provide manufacturer's standard solid brass chain (wire link or beaded type), or solid brass S-hooks of the sizes required for proper attachment of tags to valves, and manufactured specifically for that purpose.

**2.7 CEILING TACKS**

- A. Description: Steel with 3/4" diameter color coded head.
- B. Color:
  - 1. Comply with ANSI A13.1, except where another color selection is indicated.

**2.8 ACCESS PANEL MARKERS**

- A. Access Panel Markers: Provide manufacturer's standard 1/16" thick engraved plastic laminate access panel markers, with abbreviations and numbers corresponding to concealed valve. Include 1/8" center hole to allow attachment.

**2.9 VALVE SCHEDULE FRAMES**

- A. General: For each page of valve schedule, provide glazed display frame, with screws for removable mounting on masonry walls. Provide frames of finished hardwood or extruded aluminum, with SSB-grade sheet glass.

**2.10 ENGRAVED PLASTIC-LAMINATE SIGNS**

- A. General: Provide engraving stock melamine plastic laminate, complying with ASTM D 709, in the sizes and thickness indicated, engraved with engraver's standard letter style of the sizes and wording indicated, black with white core (letter color) except as otherwise indicated, punched for plumbing fastening except where adhesive mounting is necessary because of substrate.
- B. Thickness: 1/16" for units up to 20 sq. in. or 8" length; 1/8" for larger units.

- C. Fasteners: Self-tapping stainless steel screws, except contact-type permanent adhesive where screws cannot or should not penetrate the substrate.

## 2.11 PLASTIC EQUIPMENT MARKERS

- A. General: Provide manufacturer's standard laminated plastic, color coded equipment markers. Conform to the following color code:
  - 1. Green: Cooling equipment and components.
  - 2. Yellow: Heating equipment and components.
  - 3. Yellow/Green: Combination cooling and heating equipment and components.
  - 4. Brown: Energy reclamation equipment and components.
  - 5. Blue: Equipment and components that do not meet any of the above criteria.
  - 6. For hazardous equipment, provide colors and designs recommended by ANSI A13.1.
- B. Nomenclature: Include the following, matching terminology on schedules as closely as possible:
  - 1. Name and plan number.
  - 2. Equipment service.
  - 3. Design capacity.
  - 4. Other design parameters such as pressure drop, entering and leaving conditions, rpm, etc.
- C. Size: Provide 2-1/2" x 4" markers for control devices, dampers, and valves; and 4-1/2" x 6" for equipment.

## 2.12 PLASTICIZED TAGS

- A. General: Manufacturer's standard pre-printed or partially pre-printed accident-prevention tags, of plasticized card stock with matt finish suitable for writing. Tags shall be minimum 3-1/4" x 5-5/8" in size, provided with brass grommets and wire fasteners, and with appropriate pre-printed wording including large-size primary wording (as examples; DANGER, CAUTION, DO NOT OPERATE).

## 2.13 LETTERING AND GRAPHICS

- A. General: Coordinate names, abbreviations and other designations used in plumbing identification work, with corresponding designations shown, specified or scheduled. Provide numbers, lettering and wording as indicated or, if not otherwise indicated, as recommended by manufacturers or as required for proper identification and operation/maintenance of plumbing systems and equipment.
  - 1. Multiple Systems: Where multiple systems of same generic name are shown and specified, provide identification which indicates individual system number as well as service (as examples; Boiler No. 3, Air Supply No. 1H, Standpipe F12).

## PART 3 - EXECUTION

### 3.1 GENERAL INSTALLATION REQUIREMENTS

- A. Coordination: Where identification is to be applied to surfaces which require insulation, painting or other covering or finish, including valve tags in finished plumbing spaces, install identification after completion of covering and painting. Install identification prior to installation of acoustical ceilings and similar removable concealment.

### 3.2 PIPING SYSTEM IDENTIFICATION

- A. General: Install pipe markers of one of the following types on each system indicated to receive identification, and include arrows to show normal direction of flow:
  - 1. Plastic pipe markers, with application system as indicated under "Materials" in this section. Install on pipe insulation segment where required for hot non-insulated pipes.

- B. Application: Provide piping system identification for the following systems:
1. Domestic cold water piping.
  2. Domestic hot water piping.
  3. Domestic hot water recirculating piping.
  4. Non potable water piping
  5. Lawn irrigation piping.
  6. Sanitary and waste piping.
  7. Storm water piping.
  8. Vent piping.
  9. Insulated and non-insulated storm water piping.
  10. Sump pump discharge
  11. Natural gas piping.
- C. Location: Install pipe markers and color bands in the following locations where piping is exposed to view, concealed only by a removable ceiling system, installed in machine rooms, installed in accessible maintenance spaces (shafts, tunnels, plenums) and exterior non-concealed locations.
1. Within 5 feet of each valve and control device.
  2. Within 5 feet of each branch, excluding take-offs less than 25 feet in length for fixtures; mark flow direction of each pipe at branch connection.
  3. Within 5 feet where pipes pass through walls, floors or ceilings or enter non-accessible enclosures. Provide identification on each side of wall, floor or ceiling.
  4. At access doors, manholes and similar access points which permit view of concealed piping.
  5. Within 5 feet of major equipment items and other points of origination and termination.
  6. Spaced intermediately at maximum spacing of 50' along each piping run, except reduce spacing to 25' in congested areas of piping and equipment where there are more than two piping systems or pieces of equipment.

### 3.3 UNDERGROUND PIPING IDENTIFICATION

- A. General: During back-filling/top-soiling of each exterior underground piping systems, install continuous underground-type plastic line marker, located directly over buried line at 6" to 8" below finished grade. Where multiple small lines are buried in common trench and do not exceed overall width of 16", install single line marker. For tile fields and similar installations, mark only edge pipe lines of field.

### 3.4 VALVE IDENTIFICATION

- A. General: Provide valve tag on every valve, cock and control device in each piping system; exclude check valves, valves within factory-fabricated equipment units, plumbing fixture faucets, convenience and lawn-watering hose bibbs, and shut-off valves at plumbing fixtures and similar rough-in connections of end-use fixtures and units.
- B. List each tagged valve in valve schedule for each piping system. Mount valve schedule frames and schedules in machine rooms where indicated or, if not otherwise indicated, where directed by Architect/Engineer.
1. Where more than one major machine room is shown for project, install mounted valve schedule in each major machine room, and repeat only main valves which are to be operated in conjunction with operations of more than single machine room.

### 3.5 CEILING TACK INSTALLATION

- C. Install ceiling tacks to locate valves above lay-in panel ceilings. Locate in corner of panel closest to equipment.

**3.6 PLUMBING EQUIPMENT IDENTIFICATION**

- A. General: Install engraved plastic laminate sign or plastic equipment marker on or near each major item of plumbing equipment and each operational device, as specified herein if not otherwise specified for each item or device. Provide signs for the following general categories of equipment and operational devices:
1. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
  2. Meters, gauges, thermometers and similar units.
  3. Pumps
  4. Water heaters, tanks and pressure vessels.
  5. Strainers, water treatment systems and similar equipment.
- B. Optional Sign Types: Where lettering larger than 1" height is needed for proper identification, because of distance from normal location of required identification, stenciled signs may be provided in lieu of engraved plastic, at Installer's option.
- C. Lettering Size: Minimum 1/4" high lettering for name of unit where viewing distance is less than 2'-0", 1/2" high for distances up to 6'-0", and proportionately larger lettering for greater distances. Provide secondary lettering of 2/3 to 3/4 of size of the principal lettering.
- D. Text of Signs: In addition to name of identified unit, provide lettering to distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.
1. Optional Use of Plasticized Tags: At Installer's option, where equipment to be identified is concealed above acoustical ceilings or similar concealment, plasticized tags may be installed within concealed space to reduce amount of text in exposed sign (outside concealment).
  2. Operational valves and similar minor equipment items located in non-occupied spaces (including machine rooms) may, at Installer's option, be identified by installation of plasticized tags in lieu of engraved plastic signs.

END OF SECTION

**SECTION 22 07 00 - PLUMBING INSULATION****PART 1 - GENERAL REQUIREMENTS****1.1 SECTION INCLUDES**

- A. Piping Insulation.
- B. Equipment Insulation.

**1.2 RELATED REQUIREMENTS**

- A. Division 22 Section "Hangers and Supports for Plumbing Piping," for insulation shields and high-density insulation inserts.

**1.3 DEFINITIONS**

- A. Cold Pipe: Piping that carries fluid with a minimum operating temperature less than 60 degrees F.
- B. Hot Pipe: Piping that carries fluid with a minimum operating temperature greater than 105 degrees F.
- C. Cold Equipment: Equipment that carries fluids with a minimum operating temperature less than 60 degrees F.
- D. Hot Equipment: Equipment that carries fluids with a minimum operating temperature greater than 105 degrees F.
- E. Exposed: Insulation that is visible from the occupied space.
- F. Exposed to Weather: Insulation that is exposed to potential damage caused by weather, including sunlight, moisture, wind, and solar radiation.
- G. Exterior: Locations outside of or within the building envelope (walls, roof, floors, etc) as defined by the architectural drawings and specifications.
- H. NAIMA: North American Insulation Manufacturers Association

**1.4 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of Plumbing insulation.
- B. Insulation Schedule: Include product name, conductivity k-value, thickness, and furnished accessories for each service.
- C. Maintenance Data: Submit maintenance data and replacement material lists for each type of Plumbing insulation. Include this data and product data in maintenance manual.
- D. Manufacturer's Instructions: Include installation instructions for storage, handling, protection, examination, preparation, and installation of the product.

**1.5 QUALITY ASSURANCE**

- A. Manufacturer Qualification: Company specializing in manufacturing the products specified in this section with not less than three years of documented experience.

- B. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- C. Flame/Smoke Ratings: Provide composite plumbing insulation (insulation, jackets, coverings, sealers, mastics and adhesives) with flame-spread index of 25 or less and smoke-developed index of 50 or less, as tested by UL 723 or ASTM E84 (NFPA 255) method.
  - 1. Exception: Exterior plumbing insulation may have flame spread index of 75 and smoke developed index of 150.

## 1.6 DELIVERY STORAGE AND HANDLING

- A. Accept materials on site, labeled with manufacturer's identification, product density, and thickness.
- B. Protect insulation from weather and construction traffic, dirt, water, chemical, and mechanical damage; store in original wrapping.

## 1.7 FIELD CONDITIONS

- A. Maintain ambient conditions required by manufacturers of each product.
- B. Maintain temperature before, during, and after installation for minimum of 24 hours.

## PART 2 - PRODUCTS

### 2.1 PIPING INSULATION MATERIALS

- A. Mineral Fiber (rock, slag, or glass):
  - 1. Manufacturers:
    - a. CertainTeed Corp.
    - b. Knauf Insulation
    - c. Johns Manville
    - d. Owens Corning
  - 2. Insulation: ASTM C547, Type I or II, rigid mineral fiber, pre-formed for the application.
    - a. K-value: ASTM C518 or C177, maximum 0.24 at 75 degrees F.
    - b. Minimum Service Temperature: 0 degrees F
    - c. Maximum Service Temperature: 850 degrees F for Type I, 1200 degrees F for Type II.
    - d. Density: Between 3 to 6 pounds per cubic foot for Type I, between 6 to 8 pounds per cubic foot for Type II.
  - 3. Factory Applied Jacket: ASTM C1136, Type I.
    - a. All-Service Jacket (ASJ): Paper/Foil/Scrim, water vapor permeance of 0.02 perms and self-sealing lap.
    - b. Poly ASJ: Paper/Foil/Scrim with polymer coating, water vapor permeance of 0.01 perms and self-sealing lap.
    - c. Color: White.
- B. Flexible Elastomeric:
  - 1. Manufacturers:
    - a. Aeroflex USA, Inc.
    - b. Armacell LLC.
    - c. K-Flex USA.
  - 2. Insulation: ASTM C534, Grade I, flexible elastomeric cellular rubber insulation, pre-formed for the application.
    - a. K-value: ASTM C518 or C177, maximum 0.28 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 297 degrees F

- c. Maximum Service Temperature: 220 degrees F for Grade I, 300 degrees F for Grade II.
  - 3. Factory Applied Jacket:
    - a. Polymeric Coating: Multi-ply, polymeric blend coating, 16 mils thick, designed to prevent damage to underlying insulation from sunlight, installation, and physical abuse, with water vapor permeance of 0.03 perms. Reference Jacket requirements in Part 3 of this specification for application of this jacket.
  - C. Field-Applied Jacket:
    - 1. Semi-rigid PVC: One-piece, pre-molded PVC cover conforming to ASTM D1784, including factory-furnished, pre-cut insulation blanket inserts for fittings.
      - a. Outdoor Applications: Provide minimum 30 mils thickness and UV protection.
      - b. Manufacturers:
        - 1) Johns Manville Zeston PVC Jacketing and 2000 Series Fitting Covers
        - 2) Proto Corp LoSmoke PVC Jacketing and Pro Fitting Covers.
        - 3) Or approved equal.
    - 2. Rigid Aluminum Shell: One-piece, pre-formed cover conforming to ASTM C1729 with weather-proof construction. Shell shall have the following minimum thickness based on the outer insulation diameter:
 

Outer Insulation Diameter (in)	Minimum Aluminum Jacket Thickness, (in)	
	Non-Rigid Insulation	Rigid Insulation
Finish		
≤ 8	0.016	0.016
Stucco		
12	0.020	0.016
Stucco		
≤ 24	0.024	0.016
Stucco		
    - a. Banding:
      - 1) For piping less than or equal to 8 inches, provide 0.020 inch thick, 3/4 inch wide aluminum bands.
      - 2) For piping larger than 8 inches, provide 0.020 inch thick, 3/4 inch wide stainless steel bands.
  - 3. Multilayer Laminate Vapor Barrier Cladding: UV-resistant multi-ply outer layer and cold weather acrylic adhesive. Provide VentureClad Plus 1579 CW, or approved equal.
    - a. Water Vapor Transmission: 0.0 perms per ASTM E96.
    - b. Puncture Resistance: Minimum 65 pounds per ASTM D1000.
- D. Pipe Insulation Accessories: Provide staples, bands, wires, cement, and other appurtenances as recommended by insulation manufacturer for applications indicated.
- E. Adhesives, Sealers, Mastics, and Protective Finishes: As recommended by insulation manufacturer for applications indicated.
  - 1. Lagging Adhesive: Comply with MIL-A-3316C, Class 1, Grade A. Provide Foster 30-36, Childers CP-50AHV2, or equal.
  - 2. Weather Barrier Breather Mastic: Permeance shall be 1.0 perms or less at 62 mils dry per ASTM E96, Procedure B. Provide Foster 46-50, Childers CP-10/11 or equal.
  - 3. Solvent-Based Vapor Barrier Mastic: Comply with MIL-PRF-19565C, Type II, with water vapor permeance 0.05 perms or less at 35 mils dry per ASTM F 1249.
  - 4. Water-Based Vapor Barrier Mastic: Comply with MIL-PRF-19565C, Type II, with water vapor permeance in accordance with ASTM C755 for insulation application. Provide Foster 30-80, Childers CP-38, or equal.

Table: Recommended Maximum Permeance of Water Vapor Retarders (Note 1)

Insulation Application	Insulation Permeability, Less than 4.0 perm-in. (Note 2)	Insulation Permeability, 4.0 or greater perm-in. (Note 2)

	Vapor Retarder perms	Vapor Retarder perms
Pipe and vessels (33 F to ambient)	0.05	0.05
Pipe and vessels (-40 F to 32 F)	0.02	0.02

## Notes:

1. Water vapor permeance of the vapor retarder in perms when tested in accordance with Test Methods E96.
  5. Water vapor permeability of the insulation material when tested in accordance with Test Methods E96.
- F. Insulation Diameters: Comply with ASTM C585 for inner and outer diameters of rigid thermal insulation.
- G. Pipe, Valve and Fitting Covers: Comply with ASTM C450 for fabrication of fitting covers for pipe, valves and fittings.
- H. High Density Insulation Billets:
1. Calcium Silicate: ASTM C533 and C795.

**2.2 EQUIPMENT INSULATION MATERIALS**

- A. Flexible Mineral Fiber (rock, slag, or glass):
1. Manufacturers:
    - a. CertainTeed Corp.
    - b. Johns Manville.
    - c. Knauf Insulation.
    - d. Owens Corning.
  2. Insulation: ASTM C553, Type I and II or ASTM C547 Type II, flexible mineral fiber blanket.
    - a. K-value: ASTM C518 or C177, maximum 0.31 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 20 degrees F
    - c. Maximum Service Temperature: 450 degrees F for ASTM C553 Types I and II, 1200 degrees F for ASTM C547 Type II.
    - d. Density: Minimum 1.5 pounds per cubic foot.
  3. Factory Applied Vapor Barrier Jacket: ASTM C1136, Type II.
    - a. All-Service Jacket (ASJ): Paper/Foil/Scrim, water vapor permeance of 0.02 perms.
    - b. Color: White.
- B. Flexible Removeable and Reusable Blanket Insulation:
1. Manufacturers:
    - a. Auburn Manufacturing.
    - b. Approved equal.
  2. Insulation: ASTM C553, Type V, flexible, noncombustible.
    - a. Comply with ASTM C1695.
    - b. K-value: ASTM C518 or C177, maximum 0.37 at 100 degrees F.
    - c. Minimum Service Temperature: 32 degrees F
    - d. Maximum Service Temperature: 500 degrees.
- C. Rigid Mineral Fiber (rock, slag, or glass):
1. Manufacturers:
    - a. Johns Manville.
    - b. Knauf Insulation.
    - c. Owens Corning.
  2. Insulation: ASTM C612, Type IA or IB, rigid mineral fiber board.
    - a. K-value: ASTM C518 or C177, maximum 0.25 at 75 degrees F.
    - b. Minimum Service Temperature: 0 degrees F
    - c. Maximum Service Temperature: 450 degrees.
    - d. Density: Minimum 3.0 pounds per cubic foot.
  3. Factory Applied Vapor Barrier Jacket: ASTM C1136, Type II.

- a. All-Service Jacket (ASJ): Paper/Foil/Scrim, water vapor permeance of 0.02 perms.
  - b. Color: White.
- D. Flexible Elastomeric:
- 1. Manufacturers:
    - a. Aeroflex USA, Inc.
    - b. Armacell LLC.
    - c. K-Flex USA.
  - 2. Insulation: ASTM C534, Grade I or II, flexible elastomeric cellular rubber insulation, sheet form.
    - a. K-value: ASTM C518 or C177, maximum 0.28 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 40 degrees F
    - c. Maximum Service Temperature: 220 degrees F for Grade I, 300 degrees F for Grade II.
- E. Field-Applied Jacket:
- 1. Aluminum: ASTM B209, 3003 alloy, H-14 temper, with 3-mil thick polyfilm moisture barrier to interior surface.
    - a. Thickness: 0.032 inch sheet.
    - b. Finish: Smooth.
    - c. Joining: Longitudinal slip joints and 2 inch laps.
    - d. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel.
  - 2. Multilayer Laminate Vapor Barrier Cladding: UV-resistant multi-ply outer layer and cold weather acrylic adhesive. Provide VentureClad Plus 1579 CW, or approved equal.
    - a. Water Vapor Transmission: 0.0 perms per ASTM E96.
    - b. Puncture Resistance: Minimum 65 pounds per ASTM D1000.
- F. Equipment Insulation Accessories: Provide staples, bands, wire, wire netting, tape, corner angles, anchors, stud pins, and other appurtenances as recommended by insulation manufacturer for applications indicated.
- G. Adhesives, Sealers, Mastics, and Protective Finishes: Provide cements, adhesives, coating, sealers, mastics, and protective finishes as recommended by insulation manufacturer for applications indicated.
- 1. Mineral Fiber Lagging Adhesive: Comply with ASTM C916, Type 2 or MIL-A-3316C, Class 2, Grade A. Provide Foster 85-60, Childers CP-127, or equal water-based adhesive.
  - 2. Water-Based Vapor Barrier Mastic: Comply with MIL-PRF-19565C, Type II, with water vapor permeance 0.05 perms or less at 47 mils dry per ASTM E96. Provide Foster 30-80, Childers CP-38, Design Polymerics 3040, or equal.
  - 3. Lagging Adhesive: Comply with MIL-A-3316C, Class 1, Grade A. Provide Foster 30-36. Childers CP-50AHV2 or equal.
  - 4. Tie Wire: Annealed steel, 16 gauge, 0.0508 inch diameter.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION**

- A. Test piping and ductwork for design pressure, liquid tightness, and continuity prior to applying insulation materials.
- B. Verify that surfaces are clean and dry, with foreign material removed.

**3.2 PROTECTION AND REPLACEMENT**

- A. Provide all required protection for insulation (installed and uninstalled) throughout the duration of construction to avoid exposure to plaster, dust, dirt, paint, moisture, deterioration, and physical damage.
- B. Repair existing plumbing insulation that is damaged during this construction period. Use insulation of same type and thickness as existing insulation. Install new jacket lapping and sealed over existing.
- C. Replace damaged insulation which cannot be repaired satisfactorily at no additional expense to the Owner, including insulation with vapor barrier damage and insulation that has been exposed to moisture during shipping, storage, or installation. Drying the insulation is not acceptable. Dry surfaces prior to installation of new insulation that replaces the damaged or wet insulation.

**3.3 INSTALLATION GENERAL**

- A. Install in accordance with manufacturer's installation instructions.
- B. Install in accordance with NAIMA National Insulation Standards.

**3.4 PLUMBING PIPING SYSTEM INSULATION**

- A. Maintain continuous thermal and vapor-retarder integrity throughout entire installation and protect it from puncture and other damage.
- B. Install insulation on pipe systems subsequent to installation of heat tracing, painting, testing, and acceptance of tests.
- C. Install insulation materials with smooth and even surfaces. Insulate each continuous run of piping with full-length units of insulation, with a single cut piece to complete run. Do not use cut pieces or scraps abutting each other.
- D. Exposed Piping: Locate insulation and cover seams in least visible locations.
- E. Cold Piping Insulation:
  - 1. Insulate entire system, including fittings, valves, unions, flanges, strainers, flexible connections, pump bodies, and expansion joints.
  - 2. Provide with factory applied vapor barrier jacket.
  - 3. Provide high density insulation material under supports or pre-insulated supports. Protect insulation with shields to prevent puncture or other damage. Refer to Section "Hangers and Supports for Plumbing Piping" for pre-insulated supports and insulation shields. and for exception where high density insulation inserts are not required.
  - 4. High density insulation material shall extend a minimum 2 inches past the pipe shield on each side.
  - 5. Secure all-service jacket with self-sealing longitudinal laps.
- F. Butt pipe insulation tightly at insulation joints. Apply wet coat of vapor barrier lap cement on joint and seal with 3 inch wide vapor barrier tape or band and coat all taped seams and staple penetrations with vapor barrier coating to prevent moisture infiltration.
- G. Hot Piping Insulation:
  - 1. Insulate entire system, including fittings, valves, unions flanges, strainers, flexible connections, pump bodies, and expansion joints.
  - 2. Provide jackets without vapor barrier. Jackets with factory applied vapor barrier are allowed.
  - 3. Provide high density insulation material or pre-insulated supports where supports are installed outside of the insulation. Protect insulation with shields to prevent puncture or other damage. Refer to Section "Hangers and Supports for Plumbing Piping" for pre-

- insulated supports and insulation shields and for exception where high density insulation inserts are not required.
4. High density insulation material shall extend a minimum 2 inches past the pipe shield on each side.
  5. Secure all-service jacket with self-sealing longitudinal laps.
  6. Butt pipe insulation tightly at insulation joints and wrap insulation around supports. Apply 3 inch wide vapor barrier tape or band over joint.
- H. Exterior piping:
1. Encase exterior piping insulation with aluminum weather-proof jackets.
  2. Insulate exterior cold water and non-potable water piping as previously described.
  3. Insulate and heat trace exterior sanitary p-traps, sanitary, grease waste, storm, and overflow storm piping as described below. Refer to Division 22 Section "Heat Tracing for Plumbing Piping" for heat trace system material and installation requirements.
    - a. Fiberglass: 2" thickness.
- I. Interior piping with heat trace:
1. Insulate and heat trace grease waste piping and grease waste P-traps as described below. Refer to Division 22 Section "Heat Tracing for Plumbing Piping" for heat trace system material and installation requirements.
    - a. Fiberglass: 2" thickness.

### 3.5 EQUIPMENT INSULATION

- A. Cold Equipment (Below Ambient Temperature):
1. Application Requirements: Insulate the following cold equipment:
    - a. Drip pans under chilled equipment.
    - b. Roof drain bodies.
  2. Insulate each item of equipment specified above with one of the following types and thicknesses of insulation:
    - a. Fiberglass: 2" thick for cold surfaces above 35 degrees F (2 degrees C) and 3" thick for surfaces 35 degrees F (2 degrees C) and lower.
    - b. Flexible Elastomeric: 1" thick.
- B. Hot Equipment (Above Ambient Temperature):
1. Application Requirements: Insulate the following hot equipment:
    - a. Hot water storage tanks.
    - b. Condensate pumps.
  2. Insulate each item of equipment specified above with one of the following types and thicknesses of insulation:
    - a. Fiberglass: 2" thick, except 3" thick for steam-jacketed heat exchangers.
    - b. Flexible Elastomeric: 1" thick for equipment operating up to 180 degrees F (82 degrees C). and 300F (149C) for high-temperature formula for 181 degrees F and higher.

### 3.6 INSTALLATION OF PIPING INSULATION

- A. General: Install insulation products in accordance with manufacturer's written instructions, and in accordance with recognized industry practices to ensure that insulation serves its intended purpose.
- B. Maintain continuous thermal and vapor-retarder integrity throughout entire installation unless otherwise indicated.
- C. Install insulation on pipe systems subsequent to installation of heat tracing, painting, testing, and acceptance of tests.

- D. Install insulation materials with smooth and even surfaces. Insulate each continuous run of piping with full-length units of insulation, with a single cut piece to complete run. Do not use cut pieces or scraps abutting each other.
- E. Clean and dry pipe surfaces prior to insulating.
- F. Pipe insulation:
  - 1. Insulate all cold piping to prevent moisture condensation on exterior surfaces.
  - 2. Provide high density insulation material under supports or pre-insulated supports. Refer to Division 22 Section "Hangers and Supports for Plumbing Piping" for pre-insulated supports.
  - 3. Protect insulation with shields to prevent puncture or other damage. Refer to division 22 Section "Hangers and Supports for Plumbing Piping" for insulation shields.
  - 4. High density insulation material shall extend a minimum 2 inches past the pipe shield on each side.
  - 5. Butt insulation to hanger or riser clamp for vertical pipe. Butt pipe insulation tightly at insulation joints.
  - 6. For hot pipes, apply 3" wide vapor barrier tape or band over the butt joints.
  - 7. For cold pipes, apply wet coat of vapor barrier lap cement on joint and seal with 3 inch wide vapor barrier tape or band and coat all taped seams and staple penetrations with vapor barrier coating to prevent moisture ingress.
- G. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:
  - 1. Install insulation over fittings, valves (except balancing and flow control valves), strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity unless otherwise indicated.
  - 2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Butt tightly against adjoining pieces and bond with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
  - 3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
  - 4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
  - 5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below-ambient services, provide a design that maintains vapor barrier.
  - 6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
  - 7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below-ambient services and a breather mastic for above-ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
  - 8. For services not specified to receive a field-applied jacket except for flexible elastomeric, install fitted PVC cover over elbows, tees, strainers, valves (except balancing and flow control valves), flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.

9. Stencil or label the outside insulation jacket of each union with the word "union." Match size and color of pipe labels.
- H. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.
- I. Install removable insulation covers at locations indicated. Installation shall conform to the following:
  1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
  2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
  3. Construct removable valve insulation covers in same manner as for flanges, except divide the two-part section on the vertical center line of valve body.
  4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
- J. Extend piping insulation without interruption through walls, floors, and similar piping penetrations, except where otherwise indicated.
- K. Exterior Piping and Piping Exposed to Weather:
  1. General: Provide piping jacket around insulation as scheduled in the Piping Jacket Schedule. Jacket material shall be approved by the jacket manufacturer for use with the specific insulation material that it covers. Locate longitudinal seams of outer shell (aluminum, flexible elastomeric, or cladding as applicable) at bottom of pipe. Provide insulation shields so that the piping supports cannot puncture, cut or break the jacket.
  2. Paintable Coating: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.
  3. Rigid aluminum shell: Space attachment bands 12 inches on center and directly centered over end joints.
  4. Multilayer Laminate Vapor Barrier Cladding: Install cladding only when ambient temperature is above 50 degrees F. Provide low-temp products for installation in low ambient temperatures down to 10 degrees F.
- L. Heat Traced Piping
  1. Heat Traced Piping: Insulate fittings, joints, and valves with insulation of like material, thickness, and finish as adjoining pipe. Size large enough to enclose pipe and heat tracer. Cover with aluminum jacket with seams located on bottom side of horizontal piping. Provide insulation shields so that the piping supports cannot puncture, cut or break the jacket.

### 3.7 INSTALLATION OF EQUIPMENT INSULATION

- A. General: Install equipment thermal insulation products in accordance with manufacturer's written instructions, and in compliance with recognized industry practices to ensure that insulation serves intended purpose.
- B. Install insulation materials with smooth and even surfaces and on clean and dry surfaces. Redo poorly fitted joints. Do not use mastic or joint sealer as filler for gapping joints and excessive voids resulting from poor workmanship.

- C. Maintain integrity of vapor-barrier on equipment insulation and protect it to prevent puncture and other damage.
- D. Do not apply insulation to equipment, breechings, or stacks while hot.
- E. Apply insulation using the staggered joint method for both single and double layer construction, where feasible. Apply each layer of insulation separately.
- F. Coat insulated surfaces with layer of insulating cement, troweled in workmanlike manner, leaving a smooth continuous surface. Fill in scored block, seams, chipped edges and depressions, and cover over wire netting and joints with cement of sufficient thickness to remove surface irregularities.
- G. Cover insulated surfaces with all-service jacketing neatly fitted and firmly secured. Lap seams at least 2". Apply over vapor barrier where applicable.
- H. Do not insulate boiler manholes, handholes, cleanouts, ASME stamp, and manufacturer's nameplate. Provide neatly beveled edge at interruptions of insulation.
- I. Provide removable insulation sections to cover parts of equipment which must be opened periodically for maintenance; include metal vessel covers, fasteners, flanges, frames, and accessories.

### 3.8 PROTECTION AND REPLACEMENT

- A. Replace damaged insulation which cannot be repaired satisfactorily, including units with vapor barrier damage and moisture saturated units.
- B. Protection: Insulation Installer shall advise Contractor of required protection for insulation work during remainder of construction period, to avoid damage and deterioration.

### 3.9 PIPING SYSTEM INSULATION SCHEDULE

- A. Reference Pipe Insulation Thickness Schedule at the end of this specification for thickness requirements based on insulation conductivity.
- B. Do not apply insulation to piping that operates outside of the minimum and maximum service temperature range.
- C. Omit insulation on the following:
  - 1. Flexible connections and expansion joints in pipes with fluids above ambient temperatures.
  - 2. Chrome-plated exposed piping
  - 3. Water Hammer Arrestors
  - 4. Balancing and flow valves
  - 5. Drain lines from water coolers
  - 6. Drainage piping located in crawl spaces or tunnels
  - 7. Exterior condensate drain piping
  - 8. Buried piping
  - 9. Pre-insulated equipment.
- D. Exterior Piping Exposed to Weather: Insulate all exterior plumbing piping exposed to weather with:
  - 1. Flexible elastomeric
- E. Cold Piping (minimum operating temperature less than 60 degrees F.)
  - 1. Service
    - a. Potable cold water piping.
    - b. Non-potable cold water piping
    - c. Potable chilled water piping.
    - d. Plumbing vents within 6 lineal feet of roof outlet.

- e. Horizontal interior above-ground storm drainage piping and vertical run from roof drain to horizontal run.
  - f. Horizontal and vertical interior above-ground storm drainage piping and vertical run from roof drain to horizontal run.
  - g. Horizontal and vertical interior above-ground overflow storm drainage piping and vertical run from roof drain to horizontal run.
  - h. Lawn irrigation piping.
  - i. Condensate piping inside the building.
  - j. Trap arms, waste branches and dedicated stacks serving chilled water waste or condensate drains.
2. Insulate each piping system specified above with one of the following types of insulation.
- a. Mineral fiber.
- F. Hot Temperature Piping (105 degrees to 180 degrees F (40 to 82 degrees C)):
- 1. Service:
    - a. Hot water supply and return piping.
  - 2. Insulate each piping system specified above with one of the following types of insulation.
    - a. Mineral fiber.
    - b.

### 3.10 PIPE INSULATION THICKNESS SCHEDULE

- A. P-traps:
- 1. Insulate P-traps receiving chilled water waste and P-traps of water coolers as described below:
    - a. Flexible Elastomeric: 1" thick for pipe sizes up to and including 2", 1-1/2" thick for pipe sizes 2" to 6" (largest size permitted).
  - 2. Insulate P-traps receiving hot water waste above 140F as described below:
    - a. Fiberglass: 1" thickness.
    - b. Calcium Silicate: 1-1/2" thickness.
    - c. Flexible Elastomeric (high temp formula up to 300F): 1" thickness.
- B. Piping Inside Masonry Wall Units:
- 1. Insulate cold, hot, and hot water recirculation piping installed inside of masonry walls where the piping needs to be insulated as the wall is constructed as described below:
    - a. Flexible Elastomeric: 1/2" thick for pipe sizes up to and including 2", 1" thick for pipe sizes 2-1/2" to 6" (largest size permitted).
- C. Exterior Heat Traced Piping Systems
- 1. Refer to Division 22 Section "Heat Tracing for Plumbing Piping" for heat trace system material and installation requirements.
  - 2. Freeze Protection: Insulate P-traps in waste systems with mineral fiber insulation 2" thick insulation where indicated on the drawings. Insulate waste piping systems with mineral fiber insulation 2" thick insulation where indicated on the drawings.]
  - 3. Grease Waste Flow Maintenance: Insulate grease waste P-traps and piping with mineral fiber insulation 2" thick insulation where indicated on the drawings.
- D. Exterior Exposed to Weather Heat Traced Piping Systems
- 1. Refer to Division 22 Section "Heat Tracing for Plumbing Piping" for heat trace system material and installation requirements.
  - 2. Freeze Protection: Insulate P-traps in waste systems with flexible elastomeric 1" thick insulation where indicated on the drawings. Insulate waste piping systems with flexible elastomeric 1" thick insulation where indicated on the drawings.]
  - 3. Grease Waste Flow Maintenance: Insulate grease waste P-traps and piping with flexible elastomeric 1" thick insulation where indicated on the drawings.
- E. IECC – 2015 Requirements, Pipe Insulation

Fluid Operating Temp. Range (°F) And Usage	Minimum Pipe Insulation Thickness						
	Insulation Conductivity		Nominal Pipe or Tube Size (in.)				
	Conductivity, Btu·in./(hr·ft <sup>2</sup> ·°F)	Mean Rating Temp., °F.	1	1 to 1-1/2	1-1/2 to 4	4 to 8	≥8
			Insulation Thickness, in.				
141°F–200°F	0.25–0.29	125	1.5	1.5	2.0	2.0	2.0
105°F–140°F	0.21–0.28	100	1.0	1.0	1.5	1.5	1.5
40°F–60°F	0.21–0.27	75	0.5	0.5	1.0	1.0	1.0

**Notes:**

- a. For piping smaller than 1-1/2 inch and located in partitions within conditioned spaces, reduction of these thicknesses by 1 inch shall be permitted (before thickness adjustment required in footnote b) but not to a thickness less than 1 inch.
- b. For insulation outside the stated conductivity range, the minimum thickness (T) shall be determined as follows:  $T = r(1 + t/r)(K/k) - 1$  where
  - 1) T minimum insulation thickness (in.),
  - 2) r actual outside radius of pipe (in.),
  - 3) t insulation thickness listed in this table for applicable fluid temperature and pipe size,
  - 4) K conductivity of alternate material at mean rating temperature indicated for the applicable fluid temperature (Btu·in./hr·ft<sup>2</sup>·°F); and
  - 5) k the upper value of the conductivity range listed in this table for the applicable fluid temperature.
- c. Insulation thicknesses are based on energy efficiency considerations only. Add insulation where noted on the drawings.
- d. The table is based on steel pipe. Non-metallic pipes schedule 80 thickness or less shall use the table values. For other non-metallic pipes having thermal resistance greater than that of steel pipe, reduced thicknesses are permitted if documentation is provided showing that the pipe with the proposed insulation has no more heat transfer per foot than a steel pipe of the same size with the insulation thickness shown on the table.

**3.11 PIPING JACKET SCHEDULE**

- A. Exposed piping within mechanical rooms (below 10 feet):
  1. Semi-rigid PVC.
  2. Rigid aluminum shell.
- B. Exposed piping within mechanical rooms (above 10 feet):
  1. Semi-rigid PVC.
  2. Rigid aluminum shell.
  3. All-service jacket.
- C. Exposed piping:
  1. All-service jacket.
  2. Semi-rigid PVC.
- D. Piping within return air plenums:
  1. All-service jacket.
- E. Exterior Piping Exposed to Weather
  1. Aluminum with stucco finish.

END OF SECTION

**SECTION 22 11 00 - WATER DISTRIBUTION PIPING AND SPECIALTIES****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes domestic cold water, hot water, and hot water recirculation piping, fittings, and specialties within the building to a point 5 feet outside the building.
- B. Contractors Option:
1. The Division 22 contractor may provide mechanically joined plumbing piping systems to connect mechanical joints, couplings, fittings, valves, and related components as an option in lieu of, in whole or in part, copper sweat, brazing, threaded or flanged piping methods. Mechanically joined water distribution piping systems where used shall be provided in compliance with specification Section 221111 "Mechanically Joined Plumbing Piping Systems".
  2. The Division 22 contractor may provide stainless steel water distribution piping systems in lieu of, in whole or in part, for copper tube water distribution systems 3" and larger. Stainless steel water distribution piping systems are specified in Division 22 Section 221114 "Stainless steel Water Distribution Piping and Specialties".
- C. Related Sections: The following sections contain requirements that relate to this Section:
1. Division 22 Section "General Plumbing Requirements," for trenching and backfilling materials and methods for underground piping installations.
  2. Division 2 Section "Water Service Systems," for water service piping beginning from 5'-0" outside the building.
  3. Division 7 Section "Joint Sealers," for materials and methods for sealing pipe penetrations through basement and foundation walls, and fire and smoke barriers.
  4. Division 11 Section "Kitchen and Food Service Equipment," for faucets and valves furnished with the food service and kitchen equipment.
  5. Division 22 Section "Identification, for Plumbing Piping and Equipment" for labeling and identification of water distribution piping.
  6. Division 22 Section "Common Work Results for Plumbing," for materials and methods for fire barrier penetrations, wall penetrations and equipment pads.
  7. Division 22 Section "Basic Piping Material and Methods," for materials and methods for strainers, flexible connectors, unions, dielectric unions, dielectric flanges, and mechanical sleeve seals.
  8. Division 22 Section "General Duty Valves for Plumbing Piping," for materials and methods for installing water distribution piping valves.
  9. Division 22 Section "Hangers and Supports for Plumbing Piping," for insulation shields, materials, and methods for hanging and supporting water distribution piping.
  10. Division 22 Section "Plumbing Insulation," for materials and methods for insulating water distribution piping.
  11. Division 22 Section "Sanitary Drainage and Vent Piping and Specialties," for material and methods for trap primer outlet piping.
  12. Division 23 Section "Direct-Digital Control for HVAC" for interlock of pilot operated flood control valve water shutoff alarm with building management system.
- D. Products installed but not furnished under this Section include water meters that will be provided by the utility company to the site and ready for installation. Following is the name and address of the utility company:

Mobile Area Water and Sewer System (MAWSS)

4725 Moffett Rd,  
Mobile, AL 36618

## 1.2 DEFINITIONS

- A. Water Distribution Pipe: A pipe within the building or on the premises that conveys water from the water service pipe or meter to the points of usage.
- B. Water Service Pipe: The pipe from the water main or other source of potable water supply to the water distribution pipe of the building served.
- C. Pipe sizes used in this Specification are nominal pipe size (NPS).
- D. Lead Free: Refers to the wetted surface of pipe, fittings and fixtures in potable water systems that have a weighted average lead content  $\leq 0.25\%$  per Safe Drinking Water Act as amended January 4th, 2011 Section 1417.

## 1.3 SUBMITTALS

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specifications Sections.
  - 1. Product data for each piping specialty and valve specified.
  - 2. Welder Certificates signed by Contractor certifying that welders comply with requirements specified in Article "Quality Assurance" below.
  - 3. Certification of Compliance with ASME and UL fabrication requirements specified in Article "Quality Assurance" below.
  - 4. Maintenance data for each piping specialty and valve specified for inclusion in Maintenance Manual specified in Division 1 and Division 22 Section "General Plumbing Requirements."
  - 5. Test reports specified in Part 3 of this Section.
  - 6. Submit certification that specialties and fittings for domestic water distribution for drinking or cooking comply with NSF 61 Annex G and / or NSF 372. The following specialties need not comply:
    - a. Hose bibbs
    - b. Wall, yard, and roof hydrants
    - c. Backflow preventers isolating irrigation or mechanical make-up systems
    - d. Emergency mixing valves
    - e. Trap primers

## 1.4 QUALITY ASSURANCE

- A. Qualify welding processes and welding operators in accordance with ASME Boiler and Pressure Vessel Code, Section IX, "Welding and Brazing Qualifications."
- B. Regulatory Requirements: Comply with the provisions of the following codes:
  - 1. ASME B31.9 "Building Services Piping" for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label.
  - 2. ASME Boiler and Pressure Vessel Code, Section IX, "Welding and Brazing Qualifications" for Qualifications for Welding Processes and Operators.
- C. Comply with NSF 61 Annex G and / or NSF 372 for wetted surfaces of specialties and fittings containing no more than 0.25% lead by weight for domestic water distribution for drinking or cooking.
- D. Pipe, fittings, and specialties shall be manufactured in the United States or be certified to meet ASTM and ANSI standards.

**1.5 SPARE PARTS**

- A. Maintenance Stock: Furnish one valve key for each key-operated wall hydrant, hose bibb, fixture supply, or faucet installed.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Automatic Flow Control Valves:
    - a. Calefi
    - b. Flow Design, Inc., Autoflow Div.
    - c. Victaulic Company
  2. Hose Bibbs with Vacuum Breaker:
    - a. Chicago Faucet Co.
    - b. Eljer, A Household International Company
    - c. T & S Brass & Bronze Works, Inc.
  3. Hose Bibbs:
    - a. Lee Brass Co.
    - b. Mansfield Plumbing Products
    - c. Mifab Manufacturing, Inc.
    - d. Nibco, Inc.
    - e. Prier, Inc.
    - f. Watts Regulator Co.
    - g. Woodford Mfg. Co.
  4. Wall/Yard Hydrants:
    - a. Josam Co.
    - b. Mifab Manufacturing, Inc.
    - c. Smith (Jay R.) Mfg. Co.
    - d. Prier, Inc.
    - e. Tyler Pipe/Wade Div.; Subs. of Tyler Corp.
    - f. Watts Drainage
    - g. Woodford Mfg. Co.
    - h. Zurn Industries Inc., Hydromechanics Div.
  5. Backflow Preventers:
    - a. Cla-Val Co.
    - b. Conbraco Industries, Inc.
    - c. Febco
    - d. Hersey Products, Inc.
    - e. Mifab Manufacturing, Inc./Beeco
    - f. Watts Regulator Co.
    - g. Zurn Industries Inc. Wilkins Regulator Div.
  6. Pilot Operated Pressure-Reducing Valves:
    - a. Cla-Val Co.
    - b. Conbraco Industries, Inc.
    - c. Mifab Manufacturing, Inc./Beeco
    - d. OCV
    - e. Watts Regulator Co.
    - f. Zurn Industries Inc. Wilkins Regulator Div.
  7. Pilot Operated Flood Control Valves:
    - a. Cla-Val Co.
    - b. Conbraco Industries, Inc.
    - c. Mifab Manufacturing, Inc./Beeco

- d. OCV
- e. Watts Regulator Co.
- f. Zurn Industries Inc. Wilkins Regulator Div.
- 8. Water Meters:
  - a. Badger Meter, Inc.
  - b. Hays Div., Romac Industries
  - c. Hersey Products, Inc.
  - d. Neptune Water Meter Co.; Subs. Neptune Intl. Corp.
  - e. Rockwell Intl.; Measurement & Flow Control Div.
- 9. Relief Valves:
  - a. Cash (A. W.) Valve Mfg. Corp.
  - b. Conbraco Industries, Inc.
  - c. Watts Regulator Co.
  - d. Zurn Industries, Inc. Wilkins Regulator Div.
- 10. Piston Type Water Hammer Arresters:
  - a. Amtrol, Inc.
  - b. Josam Co.
  - c. Precision Plumbing Products, Inc.
  - d. PROFLO
  - e. Sioux Chief Manufacturing Co.
  - f. Tyler Pipe/Wade Div.; Subs. of Tyler Corp.
  - g. Watts Regulator Co.
  - h. Zurn Industries, Inc. Wilkins Regulator Div.
- 11. Point of Use Thermostatic Mixing Valves
  - a. Acorn Engineering Co.
  - b. Cash Acme
  - c. Leonard Valve Co.
  - d. Powers Process Controls
- 12. Emergency Mixing Valves
  - a. Acorn Engineering Co.
  - b. Bradley
  - c. Haws Corp.
  - d. Lawler Manufacturing Co., Inc.
  - e. Leonard Valve Co.
  - f. Stingray Systems
- 13. Trap Primers and Distribution Units
  - a. Mifab Manufacturing, Inc.
  - b. Precision Plumbing Products, Inc.
  - c. PROFLO
  - d. Sioux Chief
- 14. Plumbing Pipe Support Brackets
  - a. Holdrite
  - b. PROFLO
  - c. Sioux Chief
- 15. Tube Suspension Clamps
  - a. PROFLO
  - b. Sioux Chief or approved Equivalent
- 16. Sanitary Roof Hydrants
  - a. Hoeptner Perfected Products
  - b. Jay R. Smith Mtg Co.
  - c. Prier, Inc.
  - d. Mapa
  - e. Woodford Mfg. Co.

**2.2 PIPE AND TUBE MATERIALS GENERAL**

- A. Pipe and Tube: Refer to Part 3, Articles "Above Ground Water Distribution Pipe and Fittings" or "Below Ground Water Distribution Pipe and Fittings", for identification of systems where the materials listed below are used.
- B. Copper Tube: ASTM B88, Type L Water Tube, drawn temper.
- C. Copper Tube: ASTM B88, Type K Water Tube, annealed temper.
- D. Ductile-Iron Pipe: AWWA C151 or AWWA C115 ductile-iron pipe, with AWWA C104 cement-mortar lining.

**2.3 FITTINGS**

- A. Wrought Copper Solder-Joint Fittings: ANSI B16.22, streamlined pattern.
- B. Ductile or Gray-Iron Flanged Fittings: AWWA C110 Class 125 with AWWA C116 epoxy coating inside and outside.
- C. Ductile-Iron Gasketed Fittings: AWWA C153, 150 psi rating, with AWWA C104 cement mortar lining and AWWA C111 rubber gaskets.
- D. Brass Fittings: Chrome plated ANSI B16, Class 125 with threaded connections.
- E. PVC to Ductile Iron Adapter Flanges: EBBA Iron, Inc. Series 2000PV or approved equivalent.

**2.4 JOINING MATERIALS**

- A. Solder Filler Metal: ASTM B32 Alloy Sb-5, 95-5 Tin-Antimony.
- B. Brazing Filler Metals: AWS A5.8, Bag-7 Silver.
- C. Gasket Material: Thickness, material, and type suitable for fluid to be handled and design temperatures and pressures.

**2.5 GENERAL-DUTY VALVES**

- A. General-duty valves (i.e., gate, globe, check, ball, and butterfly valves) are specified in Division 22 Section "General Duty Valves for Plumbing Piping." Special duty valves are specified below by their generic name; refer to Part 3, Article "Valve Applications" for specific uses and applications for each valve specified.

**2.6 SPECIAL DUTY VALVES**

- A. Automatic Flow Control Valves: 400 PSI WOG, flow regulator, with series 300 stainless steel body, series 300 stainless steel automatic pre-set flow balancing cartridge, union connection body, and threaded-end connections.

**2.7 PIPING SPECIALTIES**

- A. Hose Connections: Hose connections shall have garden hose thread outlets conforming to ASME B1.20.7.
- B. Hose Bibbs: Bronze body, renewable composition disc, tee handle, 1/2- or 3/4-inch solder inlet, hose outlet.
- C. Hose Bibbs: Bronze body with chrome- or nickel-plated finish, with renewable composition disc, wheel handle, 1/2- or 3/4-inch solder inlet, hose outlet.

- D. Hose Bibbs: Bronze body with chrome- or nickel-plated finish, with renewable composition disc, integral vacuum breaker, wheel handle, 1/2- or 3/4-inch solder inlet, hose outlet.
- E. Recessed Nonfreeze Wall Hydrants: Cast-bronze box, with chrome-plated face, tee handle key, vacuum breaker, hinged locking cover, 3/4-inch inlet, and hose outlet. Bronze casing shall be length to suit wall thickness.
- F. Roof Hydrants: As specified on the drawings.
- G. Backflow Preventers: Comply with requirements of ASSE Standard 1013 and as specified on the drawings.
- H. Pressure Reducing Valves: Comply with requirements of ASSE Standard 1003 and as specified on the drawings.
- I. Flood Control Valves: As specified on the drawings.
- J. Water Meters: Water meters to be supplied from city.
- K. Relief Valves: Sizes for relief valves shall be in accordance with ASME Boiler and Pressure Vessel Codes for indicated capacity of the appliance for which installed.
  - 1. Combined Pressure-Temperature Relief Valves: Bronze body, test lever, thermostat, complying with ANSI Z21.22 listing requirements for temperature discharge capacity. Temperature relief valves shall be factory set at 210 deg F, and pressure relief at 150 psi.
- L. Piston Type Water Hammer Arresters: Piston type, with casing of type "L" copper tube and spun copper ends, nylon piston with two EPDM "O"rings pressure lubricated with FDA approved silicone, pressure rated for 250 psi, tested and certified in accordance with PDI Standard WH-201.
- M. Point of Use Thermostatic Mixing Valves:
  - 1. Lead free bronze or brass body meeting ASTM B584 with non-corrosive parts, tamper resistant temperature adjustment, checks, stops, other components as scheduled and meeting ASSE 1070. Valve shall be designed to fail to the cold side of the system. Maximum pressure drop shall not be exceeded for the scheduled flow rate.
- N. Emergency Mixing Valves:
  - 1. Bronze body construction meeting ASTM B584, non-corrosive parts, tamper resistant temperature adjustment, union inlets. Valve shall be designed to fail to the cold side of the system with full cold water flow. Maximum pressure drop shall not be exceeded for the scheduled flow rate.
- O. Trap Primers: Brass construction, line pressure operation, capacity to prime number of traps as indicated with distribution units complying with requirements of ASSE Standard 1018.
- P. Pipe Support Brackets:
  - 1. Sheet Stud Bracket: 20 gauge copper with nominal copper tube holes of 1/2" on 2" centers and holes of 3/4" or 1" on 4" centers.
  - 2. Pipe Mounted Bracket: 20 gauge copper or plastic bracket with clamps for securing copper water tube and stainless steel hose clamp for securing bracket to vertical waste and vent pipe in wall.
  - 3. Carrier Bracket: 20 gauge copper bracket with 1" hole for supporting rough-in for flush valve copper tube and bolt slot for attaching to chair carrier.
- Q. Tube Suspension Clamps
  - 1. Combination plastic supports and insulators for installing copper tube in stud walls with integral bracket for securing to stud with screws.

**PART 3 - EXECUTION****1.1 INSTALLATION GENERAL**

- A. Install piping, valves and specialties in accordance with manufacturer's installation instructions.

**3.2 PREPARATION FOUNDATION FOR BELOW GROUND WATER DISTRIBUTION PIPE AND FITTINGS**

- A. Copper Tube: Provide 6" thick sand pipe bed underneath and around sides of pipe, up to middle half of the pipe. Support pipe in trench with sand bags level and true at fittings to prevent sand, gravel or debris from interfering with the brazing process. After pressure testing is complete, install bedding at fittings and install subbase. Refer to Section "General Plumbing Requirements" for bedding and subbase materials, excavation, trenching, backfill and compaction requirements.
- B. Ductile Iron Pipe: Shape bottom of trench to fit bottom of pipe for 90-degrees (bottom 1/4 of the circumference). Fill unevenness with tamped sand bedding. At each pipe joint dig bell holes to relieve the bell of the pipe of all loads, and to ensure continuous bearing of the pipe barrel on the foundation. For piping with rock trench bottoms, provide sand pipe bed 6" underneath and around sides of pipe up to middle half of the pipe, including fittings. After pressure testing is complete, provide first layer of pea gravel backfill 6" above pipe, tamp backfill with mechanical tamper and install bedding at fittings and install subbase. Refer to Section "General Plumbing Requirements" for bedding and subbase materials, excavation, trenching, backfill and compaction requirements.

**3.3 ABOVE GROUND WATER DISTRIBUTION PIPE AND FITTINGS**

- A. Install Type L, drawn copper tube with wrought copper fittings and solder joints for pipe sizes 8 inches and smaller, within the building.
- B. Install ductile or gray-iron epoxy coated fittings for 3" and larger at water service entrance riser and only upstream of the backflow preventer.

**3.4 BELOW GROUND WATER DISTRIBUTION PIPE AND FITTINGS**

- A. Install Type K, soft annealed copper tube and brazed joints for pipe sizes 2 inches and smaller, with minimum number of joints, inside and outside building.
- B. Install cement-lined ductile-iron pipe with rubber gasketed joints, inside and outside under the building, for pipe 3 inches and larger.

**3.5 PIPING INSTALLATION**

- A. General Locations and Arrangements: Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of the piping systems. Location and arrangement of piping layout take into consideration pipe sizing and friction loss, expansion, pump sizing, and other design considerations. So far as practical, install piping as indicated.
- B. Use fittings for all changes in direction and branch connections.
- C. Install piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated.
- D. Install piping free of sags or bends and with ample space between piping to permit proper insulation applications.
- E. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated to be exposed to view.

- F. Install horizontal piping as high as possible allowing for proper slope and coordination with other components. Install vertical piping tight to columns or walls. Provide space to permit insulation applications, with 1-inch clearance outside the insulation. Allow sufficient space above removable ceiling panels to allow for panel removal.
- G. Locate groups of pipes parallel to each other, spaced to permit applying full insulation and servicing of valves.
- H. Install drains at low points in mains, risers, and branch lines consisting of a tee fitting, 3/4-inch ball valve, and short 3/4-inch threaded nipple and cap.
- I. Fire Barrier Penetrations: Where pipes pass through fire-rated walls, partitions, ceilings, and floors, maintain the fire-rated integrity. Refer to Division 22 Section "Common Work Results for Plumbing" for special sealers and materials.
- J. Exterior Wall Penetrations: Seal pipe penetrations through exterior wall constructions with sleeves packing, and sealant. Refer to Division 22 Section "Basic Piping Materials and Methods" for additional information.
- K. Underground Exterior Wall Penetrations: Seal pipe penetrations through underground exterior walls with sleeves and mechanical sleeve seals. Refer to Division 22 Section "Basic Piping Materials and Methods" for additional information.
- L. Elevated Floor Penetrations of Waterproof Membrane, Interior Penetrations of Non-Fire Rated Walls and Concrete Slab on Grade Penetrations: Provide sleeves and seal pipes that pass through waterproof floors, non-fire rated walls, partitions and ceilings or concrete slab on grade. Refer to Division 22 Section "Basic Piping Materials and Methods" for special sealers and materials.
- M. Install piping level with no pitch.

### 3.6 HANGERS AND SUPPORTS

- A. General: Hanger, support, insulation protection shield and anchor components and installation procedures conforming to MSS SP-58 and SP-69 are specified in Division 22 Section "Hangers and Supports for Plumbing Piping". Conform to the table below for maximum spacing of supports.
- B. Pipe Attachments: Install the following:
  - 1. Adjustable steel clevis hangers, MSS SP-69 Type 1, for individual horizontal runs.
  - 2. Riser clamps, MSS SP-69 Type 8, for individual vertical runs. Provide copper coated riser clamps when in contact with copper tube.
  - 3. Insulation protection shields and high density insulation at each hanger for insulated pipe as specified in Division 22 Sections "Supports and Anchors" and "Plumbing Insulation".
  - 4. Copper coated extension split ring pipe clamp, MSS SP-69 Type 12, for individual vertical exposed runs of copper tube 2" and smaller on walls and for securing 1-1/4" to 2" copper tube inside walls and chases for battery fixtures. Secure clamp to the copper tube.
    - a. Seal each joint with insulation and split ring pipe to maintain the insulation barrier. Refer to Section "Plumbing Insulation" for requirement for maintenance of the vapor barrier and vapor barrier seal method.
  - 5. Extension split ring pipe clamp, MSS SP-69 Type 12, for individual vertical exposed runs of stainless steel tube 2" and smaller on walls or for securing tube inside walls for connection to faucets.
  - 6. Support copper tube in chases and walls at plumbing fixtures with plastic or copper brackets secured to structure and U-bolts sized to bare on the pipe.
  - 7. Engineered strut support system may be provided, at the contractor's option, in lieu of individual hangers for horizontal pipes as specified in Division 22 "Hangers and Supports for Plumbing Piping". Provide two piece straps for uninsulated pipe secured to the bare pipe and provide plastic galvanic isolators for bare copper tube. Provide two piece straps

- and 360° insulation protection shields sized for the insulation thickness used for the pipe for all insulated pipes.
8. Provide 316 stainless steel rods, nuts, washers, beam clamps, channels, insulation protection shields, adjustable band hangers, MSS SP-69 Type 7, or clevis hangers, MSS SP-69 Type 1, for piping located in Hydrotherapy and Pool Equipment Rooms.
  9. Pipe clamps for sway bracing: B-Line Fig 4B or approved equal.
  10. Secure copper tube rough-in for individual fixtures with sheet stud brackets attached to the wall studs or pipe mounting brackets attached to the fixture waste & vent pipe at each plumbing fixture.
  11. Secure 1" and smaller copper water tubing in stud walls at stud penetrations with tube suspension clamps.
    - a. Cut hole through non-supporting studs with a minimum 1/8" clearance around each uninsulated copper tube or insulated copper tube.
    - b. Seal each joint of insulation and tube suspension clamp to maintain the insulation barrier. Refer to Division 22 "Plumbing Insulation" for requirement for maintenance of the vapor barrier similar to insulation butted against insulation inserts and vapor barrier seal method.
  12. Secure copper tubes for flush valve wall mounted water closets to the chair carrier with carrier brackets.
  13. Provide roll hangers for individual horizontal runs 100 feet or longer.
- C. Install hangers with maximum horizontal spacing and minimum rod diameters, to comply with MSS-58, locally enforced codes, this specification, and authorities having jurisdiction requirements, whichever are most stringent. Install hangers for horizontal piping with the following maximum spacing and minimum rod diameters:

<u>Nom. Pipe Size - In.</u>	<u>Steel Pipe Max. Span - Ft.</u>	<u>Copper Tube Max. Span - Ft.</u>	<u>Min. Rod Dia. - In.</u>
Up to 1-1/4	12	6	3/8
1-1/2 to 2	12	10	3/8
2-1/2 to 4	12	10	3/8
5	12	10	1/2
6	12	10	1/2
8	12	10	1/2
10 to 12	12	10	5/8
14	12	N/A	3/4
16	12	N/A	7/8

1. Support vertical steel pipe at each floor and in intervals not to exceed 15 feet.
  2. Support vertical copper tube at each floor and in intervals not to exceed 10 feet.
- D. Support water piping within 12" of each elbow or tee and for water piping 2-1/2" and larger at each valve or strainer.
- E. Support water piping above the floor with pipe supports attached to the floor with anchor bolts where indicated on the drawings. Conform to the table above for maximum spacing of supports.
- F. Provide vibration isolation for piping connected to rotating equipment. Vibration isolators are specified in Division 22 specification Section "Vibration Isolation for Plumbing Piping and Equipment".
- G. PIPE AND TUBE JOINT CONSTRUCTION
- H. Soldered Joints: Comply with the procedures contained in the AWS "Soldering Manual."
- I. Brazed Joints: Comply with the procedures contained in the AWS "Brazing Manual."
1. CAUTION: Remove stems, seats, and packing of valves and accessible internal parts of piping specialties before soldering and brazing.

2. Fill the tubing and fittings during brazing with an inert gas (nitrogen or carbon dioxide) to prevent formation of scale.
  3. Heat joints to proper and uniform temperature.
- J. Threaded Joints: Conform to ASME B1.20.1, tapered pipe threads for field-cut threads. Join pipe fittings and valves as follows:
1. Note the internal length of threads in fittings or valve ends, and proximity of internal seat or wall, to determine how far pipe should be threaded into joint.
  2. Align threads at point of assembly.
  3. Apply appropriate tape or thread compound to the external pipe threads (except where dry seal threading is specified).
  4. Assemble joint wrench tight. Wrench on valve shall be on the valve end into which the pipe is being threaded.
    - a. Damaged Threads: Do not use pipe with corroded or damaged threads. If a weld opens during cutting or threading operations, that portion of pipe shall not be used.
- K. Flanged Joints: Align flange surfaces parallel. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible. Use suitable lubricants on bolt threads. Tighten bolts gradually and uniformly with a torque wrench.
- L. Joints Containing Dissimilar Metals: Provide dielectric unions for 2" and smaller and dielectric flanges for piping 2-1/2" and larger. Provide dielectric waterway fittings for 2" and smaller in concealed locations. Dielectric unions, waterway fittings and flanges are specified in Section "Basic Piping Materials and Methods".
- M. Joints at Valve Assemblies or Connections to Equipment: Provide unions downstream of shutoff valves at valve assemblies or equipment connections. Unions are not required at flanged connections. Unions are specified in Division 22 section "Basic Piping Materials and Methods".

### 3.7 SERVICE ENTRANCE

- A. Extend water distribution piping to connect to water service piping, of size and in location indicated for service entrance to building. Water service piping is specified in a separate section of Division 2.
- B. Underground exterior water distribution piping to be a depth as required by local conditions, in accordance with authority having jurisdiction's requirements and at depth no less than 18" below grade.
- C. Install sleeve and mechanical sleeve seal at penetrations through foundation wall for watertight installation.
- D. Install sleeve and caulk at penetrations through building floor for watertight installation.
- E. Install shutoff valve at service entrance inside building; complete with strainer, pressure gauge, and test tee with valve.
- F. Ductile-Iron Pipe: Install in accordance with AWWA C-600. Pipe below ground inside building and to a point 5 feet outside of building shall have restrained joints.
- G. Copper Pipe: Install Type K, soft annealed copper tube and brazed joints, with minimum number of joints, to a point 5 feet outside of building. Install changes of direction larger than the manufacturer recommended minimum bend radius to prevent kinks in the line.
- H. Install pilot operated flood control valve upstream of backflow preventer. Coordinate interlock of flood control valve water shutoff alarm with building management system. Alarm wiring and alarm interlock with the building management system are specified in Division 23 Section "Direct-Digital Control for HVAC".

**3.8 INSTALLATION OF WATER METER**

- A. Install water meter in accordance with utility company's installation instructions and requirements.
  - 1. Provide three valve water meter by pass, sized per the authority having jurisdiction's requirements.
- B. Size meter and arrange piping and specialties to comply with utility company's requirements.
- C. Set meter on concrete pad as indicated. Refer to Division 3 for concrete, formwork, and reinforcing requirements.

**3.9 ROUGH-IN FOR WATER METER**

- A. Install rough-in piping and specialties for water meter installation in accordance with utility company's instructions and requirements.

**3.10 VALVE APPLICATIONS**

- A. General-Duty Valve Applications: The Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
  - 1. Shut-off duty: Use gate, ball, and butterfly valves.

**3.11 INSTALLATION OF VALVES**

- A. Sectional Valves: Install sectional valves on each branch and riser, close to main, where branch or riser serves 2 or more plumbing fixtures or equipment connections, and elsewhere as indicated. For sectional valves 2 inches and smaller, use gate or ball valves; for sectional valves 2-1/2 inches and larger, use ball, gate or butterfly valves.
- B. Shutoff Valves: Install shutoff valves on inlet of each plumbing equipment item, on each supply to each plumbing fixture, and elsewhere as indicated. For shutoff valves 2 inches and smaller, use gate or ball valves; for shutoff valves 2-1/2 inches and larger, use ball, gate or butterfly valves.
- C. Drain Valves: Install drain valves on each plumbing equipment item, located to drain equipment completely for service or repair. Install drain valves at the base of each riser, at low points of horizontal runs, and elsewhere as required to drain distribution piping system completely. For drain valves 2 inches and smaller, use gate or ball valves; for drain valves 2-1/2 inches and larger, use ball, gate or butterfly valves.
- D. Check Valves: Install swing check valves on discharge side of each pump and elsewhere as indicated.
- E. Hose Bibbs: Install on exposed piping where indicated with vacuum breaker.
- F. Wall Hydrants: Install where indicated with vacuum breaker.
- G. Emergency Mixing Valves: Install where indicated on the plans with hot and cold water branch lines connecting to the mains without any shutoff valves. No other fixtures shall connect to the branch lines feeding the emergency mixing valve. Install ball valves with locking handles at the emergency mixing valve as indicated on the plans.
- H. Point-of-Use Thermostatic Mixing Valve: Install valve complying with ASSE 1070 on all public lavatories and handwashing sink locations. Install valve to be accessible by maintenance staff. Set temperature limit to 110F for dual temperature faucet or 100F for single temperature faucet."

**3.12 INSTALLATION OF FLOW CONTROL VALVES**

- A. Install flow control valves or automatic flow control valves in each hot water recirculating loop, and elsewhere as indicated. Install a shutoff valve and strainer upstream and a union, check valve and shutoff valve downstream of each flow control or automatic flow control valve.
- B. Set flow control valve flow rate as follows:
  - 1. Preliminary Procedures For Hot Water Return System Balancing:
    - a. Before operating the system perform these steps:
      - 1) Open valves at recirculation pump and flow control valves to full open position.
      - 2) Remove and clean all strainers.
      - 3) Check recirculation pump rotation.
      - 4) Set water heater temperature as indicated on the drawings.
  - 2. Procedures For Hot Water Return System Balancing
    - a. Refer to the drawings for required flow rate for each flow control valve.
    - b. Provide required instrumentation to obtain proper measurements. Instruments shall be properly maintained and protected against damage.
    - c. Apply instrument as recommended by the manufacturer.
    - d. Take readings with the eye at the level of the indicated value to prevent parallax.
    - e. Mark flow control valve setting with memory stop. Mark with paint or other suitable, permanent identification materials.
    - f. Retest, adjust, and balance systems subsequent to significant system modifications, and resubmit test results.
- C. Reports: Prepare hot water return system balancing reports signed and submit to the Architect upon completion of the project. Include the following information:
  - a. Valve tag number and description of location
  - b. Valve body size
  - c. Differential pressure reading from instrument in psi
  - d. Actual flow rate derived from the manufacturer's charts and tables for the valve size and measured differential pressure.

**3.13 TRAP PRIMERS**

- A. Install trap primers where indicated and where required by local authorities having jurisdiction.
- B. Connect trap primer supply line to the top of domestic cold water line no larger than 1-1/2" in diameter.
- C. Provide trap primer distribution units for trap primers serving more than one trap.
- D. Install trap primer distribution level to insure even water distribution unit to each circuit.
- E. Where applicable, adjust the trap primer for proper flow.
- F. Install trap primers a minimum of 12 inches above finished floor for every 20 feet of horizontal outlet piping to floor drains served.
- G. Install trap primers in an accessible location.
- H. Refer to Division 22 Section "Sanitary Drainage and Vent Piping and Specialties" for trap primer outlet pipe requirements.

**3.14 INSTALLATION OF PIPING SPECIALTIES**

- A. Install backflow preventers at each connection to mechanical equipment and systems and in compliance with the plumbing code and authority having jurisdiction. Locate in same room as

equipment being connected. Install air gap fitting and pipe relief outlet drain without valves to nearest floor drain.

- B. Install pressure reducing valves with inlet and outlet shutoff valves and balance cock bypass. Install pressure gauge on valve outlet.

### 3.15 EQUIPMENT CONNECTIONS

- A. Piping Runouts to Fixtures: Provide hot and cold water piping runouts to fixtures of sizes indicated, but in no case smaller than required by plumbing code.
- B. Mechanical Equipment Connections: Connect hot and cold water piping system to mechanical equipment as indicated. Provide shutoff valve and union for each connection; provide drain valve on drain connection. For connections 2-1/2 inches and larger, use flanges instead of unions.
- C. Coordinate interlock of flood control valve "shutdown" alarm with the building automation system. Alarm wiring and alarm interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".
- D. Coordinate interlock of deduct meter transducer with water purveyor per their standards. Set up a deduct account for each deduct meter with water purveyor.

### 3.16 FIELD QUALITY CONTROL

- A. Inspections: Inspect water distribution piping as follows:
  - 1. Do not enclose, cover, or put into operation water distribution piping system until it has been inspected and approved by the authority having jurisdiction.
  - 2. During the progress of the installation, notify the plumbing official having jurisdiction at least 24 hours prior to the time such inspection must be made. Perform tests specified below in the presence of the plumbing official.
    - a. Rough-in Inspection: Arrange for inspection of the piping system before concealed or closed in after system is roughed in and prior to setting fixtures.
    - b. Final Inspection: Arrange for a final inspection by the plumbing official to observe the tests specified below and to ensure compliance with the requirements of the plumbing code.
    - c. Reinspections: Whenever the plumbing official finds that the piping system will not pass the test or inspection, make the required corrections and arrange for reinspection by the plumbing official.
    - d. Reports: Prepare inspection reports signed by the plumbing official and turn over to the Architect upon completion of the project.
- B. Factory Start-up for Master Thermostatic Mixing Valves: Provide the services of a factory-authorized service representative to test and inspect unit installation, provide start-up service, and demonstrate operation of equipment to the Owner's maintenance personnel for a minimum time of 1 hour.
  - 1. Reports: Prepare inspection reports and required corrective action signed by the factory-authorized service representative and turn over to the Architect upon completion of the project.
- C. Piping System Test: Test water distribution systems in accordance with the procedures of the authority having jurisdiction, or in the absence of a published procedure, as follows:
  - 1. Test for leaks and defects all new water distribution piping systems and parts of existing systems that have been altered, extended or repaired. If testing is performed in segments, submit a separate report for each test, complete with a diagram of the portion of the system tested.

2. Leave uncovered and unconcealed all new, altered, extended, or replaced water distribution piping until it has been tested and approved. Expose all such work for testing that has been covered or concealed before it has been tested and approved.
  3. Cap and subject the piping system to a static water pressure of 50 psig above the operating pressure without exceeding the pressure rating of the piping system materials. Isolate the test source and allow to stand for 4 hours. Leaks and loss in test pressure constitute defects that must be repaired.
  4. Repair all leaks and defects with new materials and retest system or portion thereof until satisfactory results are obtained.
  5. Reports: Prepare inspection reports and required corrective action signed by the plumbing official and turn over to the Architect upon completion of the project.
- D. Super Flush Test:
1. Purpose:
    - a. This test is designed to closely simulate the usage of the domestic water system at a high usage event such as halftime. The test shall verify adequate residual water pressure is present and is sized for such an event. Great care shall be taken not to "over simulate" the halftime event by flushing fixtures at a more rapid rate than what can realistically occur.
  2. Procedure:
    - a. Fixtures to be tested: Water closets and urinals in the public restrooms on the Event, Main Concourse, Suite levels.
    - b. Duration: 10 minutes.
    - c. Flushing frequency:
      - 1) Water Closets: Flush every water closet in a restroom every 90 seconds.
      - 2) Urinals: Flush every urinal in a restroom every 30 seconds.
      - 3) At a minimum, provide (1) person per each (3) water closets or urinals to perform the test.
      - 4) At the start of the test, flush no more than two water closets and two urinals simultaneously.
  3. Timing: Notify Architect a minimum of one week in advance of the test.
  4. Report: Provide pressure gauge at most remote/highest elevation toilet room hose bibbs at each water pressure zone (boosted and non-boosted). Provide video of hose bibb pressure gauges and booster pump control panel to indicate peak flow rate, booster pump discharge and suction pressures and number of pumps running. Contractors option, record booster pump suction pressure, flow rate and discharge header pressure digitally thru booster pump computer interface.

### 3.17 AD USTING AND CLEANING

- A. Clean and disinfect water distribution piping as follows:
1. Purge all new water distribution piping systems and parts of existing systems that have been altered, extended, or repaired prior to use.
  2. Use the purging and disinfecting procedure proscribed by the authority having jurisdiction or, in case a method is not proscribed by that authority, the procedure described in either AWWA C651, or AWWA C652, or as described below:
    - a. Flush the piping system with clean, potable water until dirty water does not appear at the points of outlet.
    - b. Fill the system or part thereof with a water/chlorine solution containing at least 50 parts per million of chlorine. Isolate (valve off) the system or part thereof and allow to stand for 24 hours.
    - c. Drain the system or part thereof of the previous solution and refill with a water/chlorine solution containing at least 200 parts per million of chlorine and isolate and allow to stand for 3 hours.

- d. Following the allowed standing time, flush the system with clean, potable water until chlorine residual is lowered to incoming city water level.
  - e. Submit water samples in sterile bottles to the authority having jurisdiction. Repeat the procedure if the biological examination made by the authority shows evidence of contamination.
3. Reports: Prepare disinfection reports signed by the authority having jurisdiction and turn over to the Architect upon completion of the project.

### **3.18 COMMISSIONING**

- A. Fill the system. Check compression tanks to determine that they are not air bound and that the system is completely full of water.
- B. Before operating the system, perform these steps:
  1. Close drain valve, hydrants, and hose bibbs.
  2. Open valves to full open position.
  3. Remove and clean strainers.
  4. Check pumps for proper direction of rotation. Correct improper wiring.
  5. Lubricate pump motors and bearings.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 11 11 - MECHANICALLY JOINED PLUMBING PIPING SYSTEMS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section only applies to Mechanically Joined Plumbing Piping Systems for joining piping for Plumbing applications as defined in Division Section 22 "Water Distribution Piping and Specialties". Section includes:
  - 1. Copper grooved piping system
  - 2. Copper press piping systems
- B. The Division 22 contractor may provide mechanically joined, couplings, fittings, valves and related components as an option in lieu of, in whole or in part, copper sweat, brazing, threaded or flanged piping methods.
- C. Mechanically joined couplings, fittings, valves and related components specified in this section shall not be provided for natural gas piping in lieu of welded, threaded or flanged piping methods.

**1.2 ADMINISTRATIVE REQUIREMENTS**

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.
- B. Sequencing: Ensure that utility connections are achieved in an orderly and expeditious manner.

**1.3 DEFINITIONS**

- A. Lead Free: Refers to the wetted surface of pipe, fittings and fixtures in potable water systems that have a weighted average lead content  $\leq 0.25\%$  per Safe Drinking Water Act as amended January 4th, 2011 Section 1417.

**1.4 SUBMITTALS**

- A. Submit in accordance with conditions of Contract and Division 01 submittal procedures.
- B. Product Data: Submit data for each type of coupling, fitting and special-duty valve indicated. Include flow and pressure drop curves based on manufacturer's testing.
- C. Shop Drawings: Detail fabrication of pipe anchors, hangers, special pipe support assemblies, alignment guides, expansion joints and loops, and their attachment to the building structure.
  - 1. Indicate grooved-joint couplings and fittings on drawings and product submittals, and specifically identify with the applicable style or series designation.
  - 2. If an assembly of flexible couplings are used for seismic vibration, thermal expansion, or noise and vibration reduction, submit shop drawings indicating location of assembly, including anchors and guides. Include movement analysis of the assembly, and performance data of the assembly.
- D. Maintenance Data: Include for each piping specialty and valve in Maintenance Manual specified in Division 01 and Division 22 Section "General Plumbing Requirements."
- E. Field Test Reports: Written reports of tests specified in Part 3 of this Section. Include the following:
  - 1. Test procedures used.
  - 2. Test results that comply with requirements.
  - 3. Failed test results and corrective action taken to achieve requirements.

- F. Submit a schedule of dissimilar metal joints and adaptor flanges and flange kits. Include joint type material, connection method and proposed flange kits to isolate dissimilar metals. Include minimum and maximum torque requirements for flange connections to valves. Dielectric flange kits are specified in Division 22 section “Basic Plumbing Piping Materials and Methods”.
- G. Submit certification that valves and fittings for domestic water distribution comply with NSF 61 Annex G and / or NSF 372.
- H. Submit certification that pipe, pipe fittings, pipe specialties, and valves and fittings are manufactured in plants located in the United States or certified that they comply with applicable ANSI, ASTM and MSS standards.
- I. Submit training certificate of completion for each worker to engineer of record within 30-days of mobilization. Include copy of each worker’s training certificate of completion with closeout documents.
- J. Piping Analysis:
  - 1. As a contractor’s option, Victaulic can provide piping system design services to accommodate movement at building expansion joints. The service includes required grooved piping components detailed in CAD on an overlay of the plumbing contract drawing(s), including anchor load calculations and placement of anchors. A calculation report showing thermal movement and seismic accommodation shall be provided.
    - a. A design stamped by a qualified professional engineer of the manufacturer licensed in the jurisdiction where the project is being constructed is required.

**1.5 QUALITY ASSURANCE**

- A. All mechanically joined piping components shall be of one manufacturer, be date and origin stamped for quality assurance and traceability.
- B. Mechanically joined piping component end product manufacturer shall be ISO certified.
- C. Grooving tools shall be of an approved manufacturer by the grooved fittings manufacturer. Verify tolerances of and maintain grooving tool components for duration of grooving processes. Replace grooving tool components that are found out of tolerance with new as required.
- D. Comply with NSF 61 Annex G and / or NSF 372 for wetted surfaces of valves and fittings containing no more than 0.25% lead by weight for domestic water distribution.
- E. Pipe, fittings, specialties, and valves shall be manufactured in plants located in the United States or certified to meet the specified ASTM, ANSI, and MSS standards.
- F. Installer Qualifications:
  - 1. Company specializing in performing work of the type specified in this Section, with minimum three years of documented experience.

**1.6** **OPERATING PROCEDURES** **per part iii “Training Procedures” below. Maintain a copy of each worker’s training**

**1.7 COORDINATION**

- A. Reference Division 22 Section “Water Distribution Piping and Specialties” for coordination.

**1.8 DELIVERY STORAGE AND HANDLING**

- A. Comply with Division 22 Section “Basic Plumbing Piping Materials and Methods.”

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Refer to manufacturer's current literature for comparable products and pressure ratings of couplings and standard fittings for various pipe sizes and pipe schedules. Products identified by model number are based on available size ranges from that manufacturer. Products offered by manufacturers with extended ranges are acceptable provided they meet the specified requirements.
- B. Copper Grooved Copper Tubing System
  - 1. ASC Engineered Solutions "Gruvlok".
  - 2. Shurjoint Piping Products.
  - 3. Victaulic Company of America.
- C. Press to Connect Copper Tubing System
  - 1. Apollo "Press"
  - 2. GRINNELL Mechanical Products "G-Press"
  - 3. Mueller Streamline PRS
  - 4. NIBCO Inc., Press System.
  - 5. Viega ProPress

**2.2 COPPER GROOVED TUBING SYSTEM**

- A. Pipe:
  - 1. 2 inch through 8 inch: CTS, ASTM B88 Type L, hard drawn.
  - 2. Ends: Roll grooved only in accordance to manufacturer's current listed standards. Flaring of tube ends to IPS dimensions or to accommodate alternate sized couplings is not allowed.
  - 3. Grooved mechanical piping shall conform to local code approval and/or as listed by ANSI-B31.9, ASME, UL/ULC, FM, IAPMO or ICC.
    - a. Components shall be capable of providing system rigidity to accommodate hanging and support in accordance with ANSI B31.9.
- B. General requirements for couplings, adapters, and standard fittings:
  - 1. Full-flow type, compatible with ASTM B75 or B88 CTS grooved joints.
  - 2. Flaring of tube ends to IPS dimensions or to accommodate alternate sized couplings is not allowed.
- C. Couplings:
  - 1. Meeting ASTM F1476 and constructed of two-piece housing attached with bolts and nuts with pressure responsive elastomeric gasket, with pressure rating of 300 PSI at 180F. Provide washers where required by the manufacturer.
  - 2. Material: Cast of ductile iron conforming to ASTM A536, Grade 65-45-12 or ASTM A395 Grade 65-45-15, coated with suitable enamel or epoxy.
  - 3. Rigid Type:
    - a. ASC Engineered Solutions Gruvlok Series # 6402.
    - b. Shurjoint Piping Products Styles #305, #306, and #307.
    - c. Victaulic Style # 607.
  - 4. Bolts, nuts, and washers:
    - a. Track-head bolts of heat treated carbon or manganese steel conforming to ASTM A183 or A449 with a minimum tensile strength of 110,000 psi.
    - b. Heavy-duty hexagonal nuts conforming to ASTM A563, Grade B.
    - c. Plated carbon steel flat washers conforming to ASTM F436.
    - d. Zinc-electroplated conforming to ASTM B633.
    - e. Type 304 or 316 stainless steel bolts and nuts conforming to ASTM A193, Grade B8/B8M, Class 2 or ASTM F593 and F594, Group 2, Condition CW.

- f. Type 304 or 316 stainless steel washers.
- D. Flange Adapters:
  - 1. For connection to ANSI class components according to ANSI B16.1 (steel) or ANSI B16.24 (copper).
  - 2. Material: Cast of ductile iron conforming to ASTM A536, Grade 65-45-12 or ASTM A395 Grade 65-45-15, coated with suitable enamel or epoxy.
  - 3. 2 inch-6 inch (ANSI class 125/150):
    - a. ASC Engineered Solutions Gruvlok Series # 6084.
    - b. Shurjoint Piping Products Styles # C341.
    - c. Victaulic Style # 641.
- E. Fittings:
  - 1. Materials:
    - a. Wrought copper conforming to ASTM B75 alloy C12200 or ASTM B152 alloy C1100.
    - b. Lead free bronze sand cast conforming to ASTM B584 alloy UNS C89836.
- F. Gaskets:
  - 1. EPDM Gaskets:
    - a. Grade "E", "EHP" or "EHT" EPDM compound (green or red/green color coded, respectively) conforming to ASTM D2000 designation 2CA615A25B24F17Z.
    - b. Temperature operating range: -30 degrees F to 230 degrees F.
    - c. Style suitable for the application.
  - 2. Fluoroelastomer Gaskets
    - a. Fluoroelastomer compound specifically formulated for compatibility with potable water systems resistant to chlorine and chloramine disinfectants (red and blue stripe color code).
    - b. Temperature operating range: 0 degrees F to 180 degrees F.
    - c. Style suitable for the application.
- G. Valves:
  - 1. Provide valves as specified in Division 22 section "General Duty Valves for Plumbing Piping."
- H. Adapters – Grooved X Plain Copper
  - 1. Wrought copper conforming to ASTM B75 alloy C12200 or ASTM B152 alloy C1100. CTS grooved end x plain end for press or sweat connection.
    - a. ASC Engineered Solutions Gruvlok Series #652
    - b. Shurjoint #C52

### 2.3 PRESS TO CONNECT COPPER TUBING SYSTEM

- A. Copper Tube:
  - 1. CTS □ inch through 2inch: ASTM B-88 Type L.
- B. General requirements for couplings, adapters, and standard fittings:
  - 1. Fittings shall meet ASTM F3226, ASME B16.51, ASME B31.9 and IAPMO PS-117 or ICC-ES IC 1002.
  - 2. Acceptable body materials:
    - a. Wrought copper conforming to ASTM B75 alloy C12200 or ASTM B152 alloy C11000.
    - b. Lead free cast brass conforming to ASTM B584 alloy C87600..
  - 3. Coupling and fitting housings with soldered ends shall conform to ASME B16.18 and B16.22.
  - 4. Coupling and fitting housings with flared ends shall conform to ASME B16.26.
  - 5. Coupling and fitting housings with threaded ends shall conform to ASME B1.20.1.
  - 6. Coupling and fitting housings for press ends shall have self-contained O-ring seals in the coupling/fitting ends.
  - 7. Rated for 200 psi CWP up to 250 degrees F maximum.

8. Press to connect fittings shall have leak feature integral to the fitting body to detect unpressed fittings during pressure testing.
- C. O-Ring Seals: EPDM compound conforming to ASME B16.51, style suitable for the application.
- D. Flange Adapters:
1. For connection to ANSI class components according to ANSI B16.1 (steel) or ANSI B16.24 (copper).
  2. 2-1/2 inch through 4 inch (ANSI class 125/150):
    - a. Steel flange with NSF 14 compliant fused epoxy coating, copper or brass press to connect joint with copper face ring and plastic or rubber dielectric isolating ring separating the flange from the press to connect joint.
  3. Rated for 200 psi CWP up to 250 degrees F maximum.
- E. Valves:
1. Provide 2 inch and smaller press to connect valves listed in this section or lead free cast bronze valves 2 inch and smaller listed in Division 22 section "Water Distribution Piping and Specialties" may be used with sweat connections or sweat X press adapters.
  2. Ball Valve:
    - a. Rated for 200 psi CWP up to 250 degrees F maximum, conforming to MSS SP-110.
    - b. Body and trim: Lead free cast bronze conforming to ASTM B584.
    - c. Ends: Female press to connect ends of copper material.
    - d. Ball: Full port, chrome-plated brass ball.
    - e. Stem: Blow-out proof, of material silicon bronze conforming to ASTM B371 or ASTM B99, or stainless steel.
    - f. Seat: PTFE or TFE, suitable for intended service.
    - g. Operator: Lever handle with non-thermal conductive material for insulated piping. Provide with 2 inch extended sleeve to allow valve operation without disturbing the insulation and with memory stop for throttling, metering or balancing service.
      - 1) Apollo # 77WLF
      - 2) NIBCO # PC-585-LF
      - 3) Milwaukee # UPBA-450-12
  3. Ball Valve:
    - a. Rated for 200 psi CWP up to 250 degrees F maximum, conforming to MSS SP-110.
    - b. Body and trim: Lead free cast bronze conforming to ASTM B62 or B584.
    - c. Ends: Female press to connect ends of copper material.
    - d. Ball: Full port, stainless steel ball.
    - e. Stem: Blow-out proof, of material silicon bronze conforming to ASTM B371 or ASTM B99, or stainless steel.
    - f. Seat: PTFE or TFE, suitable for intended service.
    - g. Operator: Lever handle with non-thermal conductive material for insulated piping. Provide with 2 inch extended sleeve to allow valve operation without disturbing the insulation and with memory stop for throttling, metering or balancing service.
    - h. 2 inch and smaller:
      - 1) Apollo # 77WLF-140
      - 2) NIBCO # PC-585-66-LF
      - 3) Milwaukee # UPBA-450S-12
      - 4) Viega # 2971.1 ZL
  4. Gate Valves
    - a. Rated for 200 psig CWP up to 250 degrees F maximum, conforming to MSS SP-80.
    - b. Body and trim: Lead free cast bronze body conforming to B584 with threaded bonnet and solid wedge.
    - c. Ends: Female press to connect ends of copper or brass material.
    - d. Stem: Silicon bronze conforming to ASTM B371 or ASTM B99, or stainless steel, rising type with brass packing gland and non-asbestos packing.
    - e. Operator: Malleable or ductile iron hand-wheel.
    - f. 2 inch and smaller:

- 1) Apollo # 101T-PRLF
  - 2) Hammond # UP645 P2
  - 3) Milwaukee UP105 P2
  - 4) NIBCO # PC-113-LF
5. Globe Valves
    - a. Rated for 200 psig CWP up to 250 degrees F maximum, conforming to MSS SP-80.
    - b. Body and trim: Lead free cast bronze conforming to B584 with threaded bonnet.
    - c. Disc: PTFE renewable seat and disc.
    - d. Ends: Female press to connect ends of copper or brass material.
    - e. Stem: Silicon bronze conforming to ASTM B 99, or stainless steel, rising type with brass packing gland and non-asbestos composition packing.
    - f. Operator: Malleable or ductile iron hand-wheel.
    - g. 2 inch and smaller:
      - 1) Apollo # 120T-PRLF
      - 2) Hammond # UP440 P2
      - 3) Milwaukee # UP502 P2
  6. Check Valves (Y pattern, swing type or in-line)
    - a. Rated for 200 psig CWP up to 250 degrees F maximum, conforming to MSS SP-80.
    - b. Body and trim: Cast bronze conforming to ASTM B62.
    - c. Disc: PTFE renewable seat and disc.
    - d. Ends: Female press to connect ends of copper or brass material.
    - e. 2 inch and smaller:
      - 1) Apollo # 163T-PRLF
      - 2) Hammond # UP904 P2
      - 3) NIBCO # PF-413-Y-LF
      - 4) Milwaukee # UP509 P2
  7. Check Valves (lift type, in-line)
    - a. Rated for 250 psig CWP up to 250 degrees F maximum, conforming to MSS SP-80.
    - b. Body: Cast bronze conforming to ASTM B584.
    - c. Spring: 316 stainless steel.
    - d. Ends: Female press to connect ends of copper or brass material.
    - e. 2 inch and smaller:
      - 1) Apollo # 61LF
      - 2) Milwaukee # UP548T P2
  8. Gate Valves -2-1/2 inch and Larger
    - a. MSS SP-70; Class 125, 200-psi CWP, iron body, bronze mounted, with body and bonnet conforming to ASTM A 126 Class B; with flanged ends, non-asbestos composition packing, and two-piece packing gland assembly. Provide with factory installed press to connect flange adapters, as described herein, with bolts, nuts and washers.
      - 1) NIBCO
- F. Strainers:
1. Provide 2 inch and smaller press to connect strainers listed in this section or lead free cast bronze strainers 2 inch and smaller listed in Division 22 section "Basic Piping Materials and Methods" may be used with sweat connections or sweat X press adapters.
  2. Strainers (Y pattern)
    - a. Rated for 250 psig CWP up to 250 degrees F maximum.
    - b. Body: Cast bronze conforming to ASTM B584.
    - c. Screen: Stainless steel mesh with 0.062" perforations.
    - d. Ends: Female press to connect ends of copper or brass material.
    - e. 2 inch and smaller:
      - 1) Apollo # 59LF

**PART 3 - EXECUTION****3.1 PIPING INSTALLATIONS**

- A. Install pipe, fittings, valves and specialties in accordance with manufacturer's installation instructions.
- B. Water distribution piping installations shall be installed subject to Division 22 Section "Water Distribution Systems and Specialties" in addition to those requirements specified in this Section.
- C. Locations and Arrangements: Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of piping systems. Locations and arrangements of piping take into consideration pipe sizing and friction loss, expansion, pump sizing, and other design considerations. So far as practical, install piping as indicated.

**3.2 PIPE APPLICATIONS ABOVE GRADE**

- A. Water piping in sizes 2-1/2 to 8 inches shall be Type "L" drawn copper tube with roll-grooved ends and copper tube dimensioned mechanical couplings and fittings or water piping sizes 2-1/2 inch to 4 inch shall be Type L drawn copper tube with plain ends and copper tube dimensioned press to connect fittings.
- B. Water piping in sizes 2 inches and smaller shall be Type "L" drawn copper tube with plain ends and copper tube dimensioned press to connect copper couplings and fittings.

**3.3 HANGERS AND SUPPORTS**

- A. Support of piping must account for expansion and contraction, vibration, and the dead load of the piping and its contents.
- B. General: Hanger supports, and anchors devices are specified in Division 22 Section "Hangers and Supports for Plumbing Piping." Reference Division 22 Section "Water Distribution Systems and Specialties" for pipe spacing limitations.

**3.4 PIPE JOINT CONSTRUCTION**

- A. Copper Grooved tubing System
  1. Pipe ends shall be clean and free from oils, indentations, projections and roll marks in the area from pipe end to groove for proper gasket sealing.
  2. Roll and cut groove ends in accordance to manufacturer's current listed standards. Use rolls sets designed and intended for use on the appropriate pipe material when grooving pipe.
  3. Flaring of CTS tube ends to IPS dimensions or to accommodate alternate sized couplings is not allowed.
  4. Verify the gasket style and elastomeric material (grade) is suitable for the intended service as specified and in combination with any system chemical additive.
  5. Reference latest published manufacturer's product data for additional pressure ratings and application information.
  6. Reference latest published manufacturer's field installation instructions or other included installation instruction prior to attempting assembly.
  7. Ream, deburr and clean tube ends and verify they are free from indentations, projections and roll marks in the area from tube end to groove for proper gasket sealing.
  8. All grooved components (couplings, fittings, valves, gaskets, bolts and nuts) shall be of one manufacturer. All grooving tools shall be of one manufacturer, though not necessarily the same as the grooved component manufacturer.
  9. Install gaskets with lubricant suitable for all piping services. Lubricant shall be by one manufacturer.

- B. Press to connect Copper Tubing System
1. Ream, deburr and clean tube ends and verify they are free from indentations, projections, burrs and foreign matter.
  2. Install permanent inspection mark on tube.
  3. Clean tube and fittings of all dirt and oil. Verify O-ring is in place, press connection components in place and free of oil, grease or dirt.
  4. Push copper tube into fittings with twisting action to all the way to the fitting stop or shoulder.
  5. Mark tube with permanent marker to indicate proper tube insertion depth.
  6. Verify press tool has correct size jaw set for tube size used.
  7. Complete one tool cycle with empty jaw to calibrate tool for each time new jaw is inserted into tool.
  8. Squeeze jaw arms to open tool jaws and place jaws around the contour of the fitting. Verify tool is perpendicular to the fitting and depress tool switch.
  9. Squeeze jaw open to remove the tool and observe witness mark.
  10. Verify crimped fitting connection for misalignment of the copper tube, misalignment of the tool or improper insertion of the tube. If any of these conditions are found cut out the joint and provide a new joint.
  11. Maintain minimum distance between joints per the manufacturer's published installation instructions.
  12. Perform pressure test for unpressed fitting detection per manufacturer's installation instruction prior to final pressure test.
- C. Dielectric Isolation Requirements for Copper Grooved Connections: Provide dielectric grooved waterway fittings or couplings at grooved galvanized steel, stainless steel or ductile iron to grooved copper joints. Dielectric waterway fittings are specified in Section "Basic Piping Materials and Methods".
- D. Dielectric Isolation Requirements for Press to Connect Adapter Flange Connections: Provide dielectric flanges or flange kits for the following joint types:
1. Adapter Flanges to Iron, Ductile Iron or Steel Body Valves and Fittings (Except Butterfly Valves with EPDM Sleeve/Seats): Provide full face gaskets between flanges and adapter flanges. At each bolt provide, steel washers, thermoplastic washers and bolt isolation sleeves or thermoplastic combination washers and bolt sleeves on valve and adapter flanges.
  2. Full face gaskets, thermoplastic washers and bolt isolation sleeves or thermoplastic combination washers and bolt sleeves are specified in Section "Basic Piping Materials and Methods".
- E. Flange Adapters:
1. Install flange adapter washers when flange adapters are used against the following surfaces:
    - a. Rubber.
    - b. Adapting to ANSI/AWWA cast flanges.
    - c. Rubber faced lug valves.
    - d. Serrated flanged surfaces.
  2. Do not install flange adapters for applications that incorporate tie rods for anchoring or on standard grooved-end fittings within 90 degrees of each other.

### 3.5 VALVE APPLICATIONS

- A. Reference Division 22 Section "Water Distribution Piping and Specialties" for valve applications.

### 3.6 EQUIPMENT CONNECTIONS

- A. Grooved flexible style couplings may be used at equipment connections where specified for vibration isolation control only.

- B. Press to connect joints shall not be provided for equipment connections. Provide flanges, unions, di-electric unions or waterway fittings. Flanges, unions, di-electric unions and waterway fittings are specified in Division 22 specification section "Basic Piping Materials and Methods"

### **3.7 STRAINERS**

- A. Provide strainers as specified in part 2 of this specification section or Division 22 specification section "Basic Piping Materials and Methods".
  1. Provide manufacturer strainer with press to connect ends for 2 inches and smaller.
  2. Provide copper press to connect X screwed NPT adapters for 2 inches and smaller.
  3. Provide press to connect adapter flanges for 2-1/2 inches to 4 inches.
  4. Provide copper grooved adapter flanges for 2-1/2 inches to 8 inches.

### **3.8 WATER DISTRIBUTION SPECIALTIES INSTALLATION**

- A. Reference Division 22 Section "Water Distribution Systems and Specialties" for water distribution specialties and installation requirements.

### **3.9 FIELD QUALITY CONTROL**

- A. The following procedures are paraphrased from the ASME B-31.9, code for pressure piping, building services piping.
- B. Installing contractor shall schedule certification training session with the mechanically joined piping component manufacturer, or manufacturer's representative, for all workers that will be installing or handling the mechanically joined piping systems. Training shall cover the proper use of mechanically joining tools and installation of mechanically joined piping products. Mechanically joined piping component manufacturer, or manufacturer's representative shall provide a certificate of completion for each attending worker.
- C. Provide testing procedures as defined in Division 22 Section "Water Distribution Systems and Specialties" and as specified in mechanically joined piping component manufacturer's installation instructions.
- D. Installing contractor shall visually inspect couplings and repair or replace any misaligned couplings and couplings with gaps prior to calling for inspection as defined in Division 22 Section "General Plumbing Requirements."
- E. Mechanically joined piping component manufacturer's representative shall make periodic visits to the jobsite during construction to ensure the installing contractor is following the latest published manufacturer's field installation instructions and best practice procedures provided during the training session.
- F. Workers performing mechanically joined joints shall initial each joint with a permanent ink marker, such as a "Sharpie". Initials shall be block letters with a minimum height of 1/4".

### **3.10 STARTUP**

- A. Refer to Division 22 Section "Water Distribution Piping and Specialties" for startup procedures.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 11 14 - STAINLESS STEEL WATER DISTRIBUTION PIPING AND SPECIALTIES****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes the piping material, components, documentation, examination, installation, and testing for piping system fluid services of domestic cold water, hot water, and hot water recirculation piping, fittings, and specialties within the building.

**1.2 ADMINISTRATIVE REQUIREMENTS**

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.
- B. Sequencing: Ensure that utility connections are achieved in an orderly and expeditious manner.

**1.3 SUBMITTALS**

- A. Submit in accordance with conditions of Contract and Division 01 submittal procedures.
- B. Product Data: Submit data for each type of coupling, fitting and special-duty valve indicated. Include flow and pressure drop curves based on manufacturer's testing.
- C. Shop Drawings: Detail fabrication of pipe anchors, hangers, special pipe support assemblies, alignment guides, expansion joints and loops, and their attachment to the building structure.
  - 1. Indicate grooved-joint couplings and fittings on drawings and product submittals, and specifically identify with the applicable style or series designation.
  - 2. If an assembly of flexible couplings are used for seismic vibration, thermal expansion, or noise and vibration reduction, submit shop drawings indicating location of assembly, including anchors and guides. Include movement analysis of the assembly, and performance data of the assembly.
- D. Maintenance Data: Include for each piping specialty and valve in Maintenance Manual specified in Division 01 and Division 22 Section "General Plumbing Requirements."
- E. Field Test Reports: Written reports of tests specified in Part 3 of this Section. Include the following:
  - 1. Test procedures used.
  - 2. Test results that comply with requirements.
  - 3. Failed test results and corrective action taken to achieve requirements.
- F. Submit a schedule of dissimilar metal joints and adaptor flanges and flange kits. Include joint type material, connection method and proposed flange kits to isolate dissimilar metals. Include minimum and maximum torque requirements for flange connections to valves. Dielectric flange kits are specified in Division 22 section "Basic Plumbing Piping Materials and Methods".
- G. Submit certification that pipe, pipe fittings, pipe specialties, and valves and fittings are manufactured in plants located in the United States or certified that they comply with applicable ANSI, ASTM and MSS standards.
- H. Submit training certificate of completion for each worker to engineer of record within 30-days of mobilization. Include copy of each worker's training certificate of completion with closeout documents.
- I. Piping Analysis:
  - 1. As a contractor's option, Victaulic can provide piping system design services to accommodate movement at building expansion joints. The service includes required

grooved piping components detailed in CAD on an overlay of the plumbing contract drawing(s), including anchor load calculations and placement of anchors. A calculation report showing thermal movement and seismic accommodation shall be provided.

- a. A design stamped by a qualified professional engineer of the manufacturer licensed in the jurisdiction where the project is being constructed is required.

J. Welding Procedure Specifications

1. Provide Welding Procedure Specifications (WPS) for welded pipe fabrication. A Welding Procedure Specification is a document that provides, in detail, required welding conditions for a specific application. The standard to which the product is being manufactured will normally identify which of the WPS variables are qualification variables. Qualification variables are items in the WPS that, if changed beyond specified limits, require requalification of the welding procedure. Common variables include, but are not limited to: Scope, Base Metal, Welding Process, Filler Metal, Type of Current and Range, Arc Voltage and Travel Speed, Joint Design, Tack Welding, Welding detail, Position of Welding, Preheat and Interpass Temperature, Peening, Heat Input, Second Side Preparation, and Postheat treatment.
  - a. Reference ASME BPVC QW-200.1, Section IX.
  - b. Reference ASME form QW-482 - Welding Procedure Specifications.
2. Submit Welding Procedure Specifications (WPS) to the Owner for approval at least one week prior to the start of fabrication.
3. Contractor shall prepare and qualify welding procedures in accordance with the requirements of Section IX of the ASME Boiler and Pressure Vessel Code. The Contractor shall submit an index of all weld procedure specifications required for the job accompanied by four copies of each procedure, including the Procedure Qualification Record (PQR).
4. Procedures shall contain the specific information required by Section IX of the ASME Code QW—200.1. It is suggested that the WPS form QW—482, as recommended by Section IX, be utilized.

K. Welder/Welding Operator Performance Qualification

1. Provide Welder/Welding Operator Performance Qualifications (W/WOPQ). Welder, Welding Operator and Tack welder qualification tests determine the ability of the persons tested to produce acceptable sound welds with the process, materials and procedure called for in the test. Qualification tests are not intended to be used as a guide for welding during actual construction, but rather to assess whether an individual has a required minimum level of skill to produce sound welds. When the individual has passed the performance test, paperwork will be issued deeming that they are certified to produce a sound weld using that procedure.
  - a. Reference ASME BPVC QW-301, Section IX.
  - b. Reference ASME forms QW-484, QW-484A, and QW-484B - Welder/Welding Operator Performance Qualifications.
  - c. Reference ASME B31.9 paragraph 927.
2. Procedures shall contain the specific information required by Section IX of the ASME Code QW—301. It is suggested that the W/WOPQ forms QW—484, 484A and 484b, as recommended by Section IX, be utilized.

L. Procedure Qualification Record for Welding

1. Provide Procedure Qualification Records (PQR) for welded pipe fabrication. The (PQR) is a record of the welding data used to weld a test coupon. It records the actual welding condition used to produce an acceptable test joint. The results of the qualification test are recorded. This is the phase where the WPS is used like a recipe to produce the test specimen. The Qualification tests commonly used are Visual Inspection (VT), Dye Penetrant (PT), Magnetic Particle (MT), Ultrasonic (UT), Radiographic (RT), tensile and Bend testing. The referencing code will determine the test needed to be performed.
  - a. Reference ASME BPVC QW-201.2, Section IX.
  - b. Reference ASME forms QW-483 – Procedure Qualification Records (for welding).

2. Procedures shall contain the specific information required by Section IX of the ASME Code QW—201.2. It is suggested that the PQR form QW—483, as recommended by Section IX, be utilized.

#### 1.4 QUALITY ASSURANCE

- A. All grooved components shall be of one manufacturer, be date and origin stamped for quality assurance and traceability and conform to local code approval.
- B. Grooved mechanical piping shall conform to local code approval and/or as listed by ANSI/ASME-B-31.9, ASME, UL/ULC, FM, IAPMO or ICC.
- C. Grooved product manufacturer shall be ISO certified.
- D. Grooved couplings shall meet the requirements of ASTM F-1476.
- E. All wetted surface copper alloy couplings, fittings and valves shall meet ANSI/NSF-61, section 8.
- F. Contractor shall submit a copy of their (Contractor's) Quality Control Procedure to the Architect for review.
- G. At a minimum the procedure shall cover the following topics:
  1. Construction documents shall be reviewed by Contractor's Quality Control for Code compliance and constructability. The Architect shall be notified of any discrepancies before any action is taken.
  2. Contractor fabrication drawings shall be reviewed by Contractor's Quality Control for Code compliance and accuracy.
  3. Contractor's Quality Control shall review Purchase Orders for proper material and components.
  4. Receipt of material shall be examined by Contractor's Quality Control.
  5. Pipe fabrication shall be examined by Contractor's Quality Control.
  6. Contractor's Quality Control shall examine spool shipments for proper loading technique.
  7. Contractor's Quality Control shall verify that installation complies with design.
  8. Contractor's Quality Control shall verify spot passivation of welds.
  9. Contractor's Quality Control shall verify cleaning and testing of installed pipe.
- H. Examinations shall be in accordance with ASME B31.9.
- I. Couplings, fittings and valves shall meet ANSI/NSF-61.
- J. Stainless steel couplings, fittings and valves shall meet ANSI/NSF-61 Annex G.
- K. Qualify welding processes, welders, and welding operators in accordance with ASME Boiler and Pressure Vessel Code (BPVC), Section IX, "Welding and Brazing Qualifications."
- L. Regulatory Requirements: Comply with the provisions of the following codes:
  1. ASME B31.9 "Building Services Piping" for fabrication, installation, and testing.
  2. ASME Boiler and Pressure Vessel Code, Section IX, "Welding and Brazing Qualifications" for Qualifications for Welding Processes, welders, and welding Operators.
- M. Pipe and fittings shall be manufactured in the United States or be certified to meet ANSI and ASTM standards.
- N. Workers performing spot passivation of welds shall have a minimum of one year experience or be under the direct supervision of experienced passivation workers.
- O. Installer Qualifications:
  1. Company specializing in performing work of the type specified in this Section, with minimum three years of documented experience.
  2. Obtain installation training from the mechanically joined piping manufacturer for all workers that will be installing or handling the mechanically joined piping components per Part III

“FIELD QUALITY CONTROL” below. Maintain a copy of each worker’s training certificate of completion on site for the duration of the project.

### 1.5 COORDINATION

- A. Reference Division 22 Section “Water Distribution Piping and Specialties” for coordination.

### 1.6 DELIVERY STORAGE AND HANDLING

- A. Comply with Division 22 Section “Basic Plumbing Piping Materials and Methods.”

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance, with requirements, provide products by one of the following:
  - 1. Stainless Steel Grooved Mechanical-Joint Fittings and Couplings:
    - a. ASC Engineered Solutions “Gruvlok”.
    - b. Shurjoint Piping Products.
    - c. Victaulic Company of America.

### 2.2 PIPE AND TUBE MATERIALS GENERAL

- A. Pipe and Tube: Refer to Part 3, Article "Pipe Applications", for identification of systems where the materials listed below are used.
- B. Stainless Steel Pipe: ASTM A312.
  - 1. Schedule 10S Type 304L where noted on the drawings for use with grooved mechanical couplings with rolled grooved ends and Type 304L components as appropriate to pipe material, wall thickness, pressures, size and method of joining. Pipe ends shall be grooved in accordance with standards conforming to ANSI/AWWA C-606.
  - 2. Pipe shall be factory passivated.

### 2.3 FITTINGS

- A. Stainless steel fittings shall be the same of the same alloy as the pipe described above.
- B. Refer to current manufacturer’s literature for pressure ratings of couplings and standard fittings for various pipe sizes and pipe schedules.
- C. Stainless Steel Fittings: Fittings shall be smooth turn full flow stainless steel fittings with grooves designed to accept grooved end couplings. Provide Schedule 10S fittings where noted on the drawings. Specific style numbers are listed in manufacturer’s current literature. Mitered fittings are not allowed, except for angles 7-1/2 degrees or less. Otherwise, when a directional change requires a non-standard, single-plane angle the required angle shall be achieved by trimming a standard 45° or 90° elbow. Fittings shall be factory passivated.
- D. Ductile Iron Couplings:
  - 1. Material: Cast of ductile iron conforming to ASTM A536, Grade 65-45-12 or ASTM A395 Grade 65-45-15, coated with suitable enamel or epoxy.
  - 2. Constructed of two-piece housing attached with bolts and nuts with pressure responsive elastomeric gasket. Provide washers where required by the manufacturer.
  - 3. Rigid Type:
    - a. ASC Engineered Solutions Gruvlok Series #7401.
    - b. Shurjoint Piping Products Style #Z07.
    - c. Victaulic Style # 107N.

4. Flexible Type:
    - a. ASC Engineered Solutions Gruvlok Series #7001
    - b. Shurjoint Piping Products Style #7707.
    - c. Victaulic Style # 475.
      - 1) 8-inch and smaller: Style 177N
      - 2) 10-inch and larger: Style 77
  5. Rigid CTS Adapter Type: IPS X CTS.
    - a. Shurjoint Piping Products Styles#C307
    - b. ASC Engineered Solutions Gruvlok Fig 617.
  6. Bolts, nuts, and washers:
    - a. Heavy-duty hexagonal nuts conforming to ASTM A563, Grade B.
    - b. Plated carbon steel flat washers conforming to ASTM F436.
    - c. Zinc-electroplated conforming to ASTM B633.
- A. Stainless Steel Couplings:
7. Material: Cast of 316L stainless steel conforming to ASTM A74, Grade CR-8M or ASTM A395 Grade 65-45-15, coated with suitable enamel or epoxy.
  8. Constructed of two-piece housing attached with bolts and nuts with pressure responsive elastomeric gasket. Provide washers where required by the manufacturer. Rigid Type:
    - a. ASC Engineered Solutions Gruvlok Series #472
    - b. Shurjoint Piping Products Style #SS-7
    - c. Victaulic Style # 89
  9. Flexible Type
    - a. ASC Engineered Solutions Gruvlok Series #405
    - b. Shurjoint Piping Products Style #SS-8X
    - c. Victaulic (1/2" to 6") Style # 77DX
    - d. Victaulic (8" to 18") Style # 77DX
  10. Bolts and nuts
    - a. Stainless steel neck bolts meeting ASTM F93 Group 2 (316 SS)
    - b. Stainless steel nuts meeting ASTM F594 Group 2 (316 SS)
- E. Stainless Steel Flanges: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connection and facing:
1. Material Group: 2.3.
  2. End Connections Type Flange: Butt Welding.
  3. Facings: Raised face.
- F. Stainless Steel Flange Adapter Nipples:
1. ANSI 150 flange with welded grooved nipple or grooved nipple and flange of one piece. Two piece "clamshell" flanges with O-ring is not acceptable.
    - a. ASC Engineered Solutions Fig 7084SS
    - b. Shurjoint Model SS-80
    - c. GRINNELL Mechanical Products Style Fig 441.
    - d. Victaulic Style 445R
- G. Stainless Steel Strainers:
1. Shurjoint Model SS-726.
- H. Dielectric Waterway Adapters: Bronze or nylon encapsulated ductile iron body with IPS grooved X CTS grooved ends.
1. ASC Engineered Solutions Gruvlok #7091
  2. Victaulic Style # 647GG.

## 2.4 JOINING MATERIALS

- A. Welding Materials: Comply, with Section II, Part C. ASME Boiler and Pressure Vessel Code for welding materials appropriate for the wall thickness and chemical analysis of the pipe being welded.

- B. Gasket Material: Thickness, material, and type suitable for fluid to be handled and design temperatures and pressures.
  - 1. Manufacturer's Flange: EPDM.
  - 2. ASME Flange: 1/8" Thick EPDM.

## 2.5 GENERAL-DUTY VALVES

- A. General-duty valves (i.e., gate, globe, check, ball, and butterfly valves) are specified in Division 22 Section "General Duty Valves for Plumbing Piping."

## PART 3 - EXECUTION

### 3.1 INSTALLATION GENERAL

- A. Install pipe, fittings, valves and specialties in accordance with manufacturer's installation instructions.

### 3.2 ABOVE GROUND WATER DISTRIBUTION PIPE AND FITTINGS

- A. Install for domestic hot, cold and soft cold water Schedule 10S Type 304L stainless steel pipe with roll grooved fittings and joints for pipe sizes 4 inches and larger.

### 3.3 PIPING INSTALLATION

- A. General Locations and Arrangements: Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of the piping systems. Location and arrangement of piping layout take into consideration pipe sizing and friction loss, expansion, pump sizing, and other design considerations. So far as practical, install piping as indicated.
- B. Use standard fittings for all changes in direction and branch connections. Trim fittings only where required. Segmentally welded fittings are not permitted.
- C. Install piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated.
- D. Install piping free of sags or bends and with ample space between piping to permit proper insulation applications.
- E. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated to be exposed to view.
- F. Install horizontal piping as high as possible allowing for proper slope and coordination with other components. Install vertical piping tight to columns or walls. Provide space to permit insulation applications, with 1-inch clearance outside the insulation. Allow sufficient space above removable ceiling panels to allow for panel removal.
- G. Locate groups of pipes parallel to each other, spaced to permit applying full insulation and servicing of valves.
- H. Install drains at low points in mains, risers, and branch lines consisting of a tee fitting, 3/4-inch ball valve, and short 3/4-inch threaded nipple and cap.
- I. Fire Barrier Penetrations: Where pipes pass through fire-rated walls, partitions, ceilings, and floors, maintain the fire-rated integrity. Refer to Division 22 Section "Common Work Results for Plumbing" for special sealers and materials
- J. Contact manufacturer's product representative during the bidding phase to facilitate constructability, training, and to track progress to ensure stock-on-hand at the time of purchase. The factory representative shall also serve as a technical resource during construction.

- K. Elevated Floor Penetrations of Waterproof Membrane, Interior Penetrations of Non-Fire Rated Walls and Concrete Slab on Grade Penetrations: Provide sleeves and seal pipes that pass through waterproof floors, non-fire rated walls, partitions and ceilings or concrete slab on grade. Refer to Division 22 Section "Basic Piping Materials and Methods" for special sealers and materials. Stainless Branch Connections: Provide fittings as scheduled below for main and branch connections:

Pipe Size	Branch Size								
	½" to 2"	2-1/2"	3"	4"	6"	8"	10"	12"	
2-1/2"	RR	RT	T						
3"	RR		RT	T					
4"	RR		RT	RT	T				
6"	W		W	RT	RT	T			
8"	W		W	W	RT	RT	T		
10"	W		W	W	W	RT	RT	T	
12"	W		W	W	W	RT	RT	RT	T

Legend: T Tee, RT Reducing Tee, RR Reducing Tee & Reducer, W Butt Weld Pipet, TP Threaded Pipet

- L. Stainless steel piping shall not come in contact with ferrous material during its handling, storage, staging, transporting, or fabrication.
- M. The fabrication of stainless steel shall be segregated from that of ferrous materials.
- N. Fabricating tools that come in contact with stainless steel shall be dedicated to stainless steel.

### 3.4 HANGERS AND SUPPORTS

- A. General: Hanger, support, insulation protection shield and anchor components and installation procedures conforming to MSS SP-58 and SP-69 are specified in Division 22 Section "Hangers and Supports for Plumbing Piping". Conform to the table below for maximum spacing of supports.
- B. Pipe Attachments: Install the following:
- Adjustable stainless steel clevis hangers, MSS SP-69 Type 1, for stainless steel pipe 2" and larger for individual horizontal runs where hanger is in direct contact with the stainless steel pipe.
  - Adjustable steel clevis hangers, MSS SP-69 Type 1, for stainless steel pipe 2" and larger for individual horizontal runs where hanger is not in direct contact with the stainless steel pipe.
  - Riser clamps, MSS SP-69 Type 8, for individual vertical runs. Provide stainless steel riser clamps when in contact with stainless steel pipe.
  - Insulation protection shields and high density insulation at each hanger for insulated pipe as specified in Division 22 Sections "Hangers and Supports for Plumbing Piping" and "Plumbing Insulation".
  - Extension split ring pipe clamp, MSS SP-69 Type 12, for individual vertical exposed runs of stainless steel pipe 2" on walls or for securing tube inside walls for connection to faucets.
  - Engineered strut support system may be provided, at the contractor's option, in lieu of individual hangers for horizontal pipes as specified in Division 22 "Hangers and Supports for Plumbing Piping". Provide stainless steel two piece straps for uninsulated pipe secured to the bare stainless steel pipe. Provide two piece straps and 360° insulation protection shields sized for the insulation thickness used for the pipe for all insulated pipes.
  - Provide roll hangers for individual horizontal runs 100 feet or longer.
  - Provide vibration isolation on piping as specified in Division 22 Section "Vibration Isolation for Plumbing Piping and Equipment."
- C. Install hangers for horizontal piping with the following maximum spacing and minimum rod sizes:

Nom. Pipe Size - In.	Steel Pipe Max. Span - Ft.	Min. Rod Dia. - In.
Up to 3/4	7	3/8
2-1/2	10	3/8
3	10	3/8
3-1/2	10	3/8
4	10	3/8
5	10	1/2
6	10	1/2
8	10	1/2

1. Support vertical steel pipe at each floor.

- D. Support water piping above the floor with pipe supports attached to the floor with anchor bolts where indicated on the drawings. Conform to the table above for maximum spacing of supports.

### 3.5 PIPE AND TUBE JOINT CONSTRUCTION

- A. Flanged Joints: Align flange surfaces parallel. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible. Use suitable lubricants on bolt threads. Tighten bolts gradually and uniformly with a torque wrench.

B. Stainless Steel Grooved Tubing System

1. Verify gasket style and elastomeric material (grade) is suitable for the intended service as specified and in combination with any system chemical additives.
2. Reference latest published manufacturer's product data for additional pressure ratings and application information.
3. Reference latest published manufacturer's field installation instructions or other included installation instruction prior to attempting assembly.
4. Ream, debur and clean tube ends and verify they are free from indentations, projections and roll marks in the area from tube end to groove for proper gasket sealing.
5. All grooved components (couplings, fittings, valves, gaskets, bolts and nuts) and all grooving tools shall be of one manufacturer.
6. Install gaskets with lubricant suitable for system piping services. Lubricant shall be by one manufacturer.
7. Provide ductile iron couplings on schedule [10][40] pipe sizes [X"] and smaller
8. Provide stainless steel couplings on schedule [10][40] pipe sizes [X"] and larger

C. Stainless Steel to Copper Systems:

1. Stainless steel 4 inch and smaller to copper 2 inches and smaller:
  - a. Stainless steel reducing tee with 2 inch grooved side outlet.
  - b. Stainless steel rigid coupling, dielectric waterway adapter and CTS rigid coupling. CTS rigid couplings and their installation requirements are specified in Division 22 Section "Mechanically Joined Plumbing Piping Systems".
  - c. Contractors Option (in lieu of above) - 2 inch rigid CTS adapter coupling, 2 inch grooved X copper plain adapter (size as required). 2 inch grooved X copper plain adapters and their installation requirements are specified in Division 22 Section "Mechanically Joined Plumbing Piping Systems".
2. Stainless steel 6 inch and larger to copper 2 inches and smaller:
  - a. Stainless steel tee and welded pipet with 2 inch welded outlet.
  - b. Stainless steel rigid coupling, dielectric waterway adapter and CTS rigid coupling. CTS rigid couplings and their installation requirements are specified in Division 22 Section "Mechanically Joined Plumbing Piping Systems".
  - c. Contractors Option (in lieu of above) - Stainless steel reducing tee with 2 inch grooved side outlet, 2 inch rigid CTS adapter coupling, 2 inch grooved X copper plain adapter (size as required). 2 inch grooved X copper plain adapters and their

installation requirements are specified in Division 22 Section "Mechanically Joined Plumbing Piping Systems".

3. Stainless steel 6 inch and larger to copper 2-1/2 inches to 4 inches:
    - a. Stainless steel tee or reducing tee with grooved side outlet:
    - b. Stainless steel rigid coupling, dielectric waterway adapter and CTS rigid coupling. CTS rigid couplings and their installation requirements are specified in Division 22 Section "Mechanically Joined Plumbing Piping Systems".
    - c. Contractors Option (in lieu of above):
      - 1) Rigid CTS adapter coupling, grooved X copper plain adapter (size as required). Grooved X copper plain adapters and their installation requirements are specified in Division 22 Section "Mechanically Joined Plumbing Piping Systems".
      - 2) Grooved X stainless steel flange adapter nipple (X size as required), bronze flange and dielectric flange kit. Bronze flanges and dielectric flange kits and their installation requirements are specified in Division 22 Section "Basic Piping Materials and Methods Requirements".
  4. Stainless steel to copper 6 inches to 8 inches:
    - a. Stainless steel tee or reducing tee with grooved side outlet.
    - b. Stainless steel rigid coupling.
    - c. Grooved X stainless steel flange adapter nipple (X size as required).
    - d. Bronze flange and dielectric flange kit. Bronze flanges and dielectric flange kits and their installation requirements are specified in Division 22 Section "Basic Piping Materials and Methods Requirements".
- D. Welded Joints:
1. Comply with the requirement in ASME Code B31.9-"Building Services Piping" Para. 927.
  2. Use 316L, or 317L consumable electrode material when welding 316L pipe.
  3. Other consumable electrode materials may be used if the materials and the process qualification methods used are specifically approved by owner.
  4. Joint preparation for welding may be performed by machining, grinding, thermal cutting or combinations thereof. Excessively deep or sharp irregularities in joint edges shall be removed by machining or by grinding. Joint edges shall be free of cracks and laminations prior to welding.
  5. Prior to welding all oil, grease, dirt, rust or loose scale shall be removed from the surfaces of the joint and the adjacent base metal within one inch from the edge of the joint.
  6. Root gap in excess of 3/16" is not permitted.
  7. Acceptable welding processes are GTAW and GMAW. Requests to use any other welding processes shall be submitted to the owner for review.
  8. End prep for buttwelds shall comply with ASME B16.25 – Buttweld Ends.
  9. During welding provide internal purge with Argon or other suitable purge gas.
  10. Discoloration of the internal surface of the pipe wall within the Heat Affected Zone (HAZ) of a weld shall not exceed example weld No. 3 as represented in Fig. 1 – Weld Color Chart from AWS D18.2.

Figure 1 – Weld Color Chart from AWS D18.2

Note: For Quality Assurance purposes contractor is to obtain an original color chart from AWS for examination comparison. Fig. 1 is an example and is not to be used as a QC comparison tool.

- E. Passivation of Welded Joints
1. Situate all cleaning equipment in a central location that is free of performance hindering congestion and unauthorized traffic.
  2. Provide protective covering for floors, pipe fittings and equipment.
  3. Rinse area to be cleaned with appropriate volume of deionized water sending all waste water to drain.
  4. Pour small amount of ore-mixed Ultradent Citric Acid 10% solution into small plastic container. Using the plastic container pour just the amount to cover the welds.
  5. Using a non-metallic brush apply a uniform layer of passivation gel to the spot to be cleaned. Continue to wash the affected area every 20 to 30 minutes until a minimum of 2 hours contact time is achieved.
  6. In between applications, scrub the affected area with soft bristle, non-metallic (including stainless steel) brush for up to five minutes.
  7. Mix a solution of deionized water with 15 to 20% food grade sodium bicarbonate. Ensure sodium bicarbonate is completely dissolved.
  8. Using a non-metallic brush, apply sodium bicarbonate solution to the area to be cleaned. Continue to wet the affected area until all noticeable foaming reaction ceases.
  9. Test pH of the surface. Continue to wash affected area until pH value between 6 to 8 is achieved.
  10. Rinse affected area with de-ionized water for a minimum duration of ten minutes sending all waste water to drain.
  11. Contractor's quality control shall review each weld passivation and prepare report with list of completed passivation for each weld. Include date, location and size of weld passivated.

### 3.6 VALVE APPLICATIONS

- A. General-Duty Valve Applications: The Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
1. Shut-off duty: Use ball and butterfly valves.
  2. Throttling duty: Use ball and butterfly valves.

### 3.7 INSTALLATION OF VALVES

- A. Sectional Valves: Install sectional valves on each branch and riser, close to main, where branch or riser serves 2 or more plumbing fixtures or equipment connections, and elsewhere as indicated. For sectional valves 2 inches and smaller, use gate or ball valves; for sectional valves 2-1/2 inches and larger, use butterfly valves.

- B. Shutoff Valves: Install shutoff valves on inlet of each plumbing equipment item, on each supply to each plumbing fixture, and elsewhere as indicated. For shutoff valves 2 inches and smaller, use ball valves; for shutoff valves 2-1/2 inches and larger, use butterfly valves.
- C. Drain Valves: Install drain valves on each plumbing equipment item, located to drain equipment completely for service or repair. Install drain valves at the base of each riser, at low points of horizontal runs, and elsewhere as required to drain distribution piping system completely. For drain valves 2 inches and smaller, use ball valves; for drain valves 2-1/2 inches and larger, use butterfly valves.
- D. Check Valves: Install swing check valves on discharge side of each pump and elsewhere as indicated.

### 3.8 STRAINERS

- A. Provide stainless steel strainers in stainless steel piping systems for 3 inch to 8 inch.
- B. Provide strainers as specified in Division 22 specification section "Basic Piping M and M Requirements".
  - 1. Provide stainless steel adapter flanges for 2-1/2 inches and larger.

### 3.9 WATER DISTRIBUTION SPECIALTIES INSTALLATION

- A. Reference Division 22 Section "Water Distribution Systems and Specialties" for water distribution specialties and installation requirements.

### 3.10 FIELD QUALITY CONTROL

- A. The following procedures are paraphrased from the ASME B-31.9, code for pressure piping, building services piping.
- B. Installing contractor shall schedule certification training session with the mechanically joined piping component manufacturer, or manufacturer's representative, for all workers that will be installing or handling the mechanically joined piping systems. Training shall cover the proper use of mechanically joining tools and installation of mechanically joined piping products.. Mechanically joined piping component manufacturer, or manufacturer's representative shall provide a certificate of completion for each attending worker.
- C. Mechanically joined piping component manufacturer's representative shall make periodic visits to the jobsite during construction to ensure the installing contractor is following the latest published manufacturer's field installation instructions and best practice procedures provided during the training session.
- D. Workers performing mechanically joined joints shall initial each joint with a permanent ink marker, such as a "Sharpie". Initials shall be block letters with a minimum height of 1/4".
- E. Inspections: Inspect water distribution piping as follows:
  - 1. Do not enclose, cover, or put into operation water distribution piping system until it has been inspected, leak tested, and approved by the authority having jurisdiction.
  - 2. During the progress of the installation, notify the plumbing official having jurisdiction at least 24 hours prior to the time such inspection must be made. Perform tests specified below in the presence of the plumbing official.
    - a. Rough-in Inspection: Arrange for inspection of the piping system before piping is concealed or closed in after system is roughed in and prior to setting fixtures.
    - b. Final Inspection: Arrange for a final inspection by the plumbing official to observe the tests specified below and to ensure compliance with the requirements of the plumbing code.

- c. Reinspections: Whenever the plumbing official finds that the piping system will not pass the test or inspection, make the required corrections and arrange for reinspection by the plumbing official.
  - d. Reports: Prepare inspection reports signed by the plumbing official and turn over to the Architect upon completion of the project.
- F. Piping System Leak Test: After installation and prior to the disinfecting treatment of the domestic water piping system, perform an "initial service" leak test in accordance with ASME B31.9.
- 1. Test for leaks and defects in all new water distribution piping systems and parts of existing systems that have been altered, extended or repaired. If testing is performed in segments, submit a separate report for each test, complete with a diagram of the portion of the system tested.
  - 2. If leak testing is done in segments highlight and mark the boundaries of each piping test circuit on a P&ID, system isometric, or other suitable type drawing. Each test circuit shall have its own identifier. This identifier shall be used to identify the piping involved in each test.
  - 3. Each test shall be documented on a test form indicating, at the minimum, the date, type of test, start time, finish time, test pressure, test temperature, contractor representative and owner witness signatures.
  - 4. Leave uncovered and unconcealed all new, altered, extended, or replaced water distribution piping until it has been tested and approved. Expose all such work for testing that has been covered or concealed before it has been tested and approved.
  - 5. Cap and subject the piping system to a static water pressure of 50 psig above the operating pressure without exceeding the pressure rating of the piping system materials. Isolate the test source and allow to stand for 0.5 hours. Leaks and loss in test pressure constitute defects that must be repaired and retested.
  - 6. Repair all leaks and defects with new materials and retest system or portion thereof until satisfactory results are obtained.
  - 7. Reports: Prepare inspection reports and required corrective action signed by the plumbing official and turn over to the Architect upon completion of the project.

### **3.11 CLEANING AND DISINFECTING**

- A. Clean and disinfect water distribution piping system as follows:
- 1. Prior to flushing or purging the system with domestic water remove all strainer elements.
  - 2. Purge all new water distribution piping systems and parts of existing systems that have been altered, extended, or repaired prior to use.
  - 3. Flush the system with clean, potable water until chlorine residual is equal to incoming city water level.
    - a. Submit water samples in sterile bottles to the authority having jurisdiction. Repeat the procedure if the biological examination made by the authority shows evidence of contamination.
  - 4. Reports: Prepare disinfection reports signed by the authority having jurisdiction and turn over to the Architect upon completion of the project.

### **3.12 FLUSHING**

- A. The piping systems shall not be let to stand without use for no more than three days. Flush the system with twice the volume of the system to prevent stagnation.

### **3.13 COMMISSIONING**

- A. If the system remains in operation after flushing, leak test, and disinfecting process ensure that:
- 1. All air has been purged from the system.
  - 2. All gages and instruments are working properly.
  - 3. All pumps and equipment are working properly.

- B. If the piping system has been drained after the “initial service” leak test and disinfecting process, perform these steps prior to start-up of the system:
  - 1. Close drain valves, hydrants, and hose bibbs.
  - 2. Open in-line valves to full open position.
  - 3. Remove and clean strainers.
- C. Gradually fill the system again. Check compression tanks to determine that they are not air bound and that the system is completely full of water.
- D. Before operating the system, perform these steps:
  - 1. Close drain valve, hydrants, and hose bibbs.
  - 2. Open valves to full open position.
  - 3. Remove and clean strainers.

### **3.14 STARTUP**

- A. Refer to Division 22 Section “Water Distribution Piping and Specialties” for startup procedures.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 11 23 - DOMESTIC WATER PUMPS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes the following types of plumbing pumps:
  - 1. Inline circulator pumps
  - 2. Packaged domestic booster pumps
- B. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 3 Section "Concrete Work" for specifications on concrete and reinforcing materials and concrete placing requirements for equipment pads.
  - 2. Division 22 Section "Coordination" for basic requirements for electrical components that are an integral part of packaged system components.
  - 3. Division 22 Section, "Basic Piping Materials and Methods" for rubber flexible connectors.
  - 4. Division 22 Section "Vibration Isolation for Plumbing Piping and Equipment" for inertia pads, isolation pads, spring supports, and spring hangers.
  - 1. Division 23 Section "Direct-Digital Control for HVAC" for interlock of alarms with building automation system and alarm wiring.
  - 5. Division 26 Section "Common Work Results for Electrical" required electrical devices.
  - 6. Division 26 Sections "Enclosed Switches and Circuit Breakers" for field-installed disconnects.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.
  - 1. Product data including standard performance curves, weights (shipping, installed, and operating), furnished specialties, and accessories, plus installation and start-up instructions.
  - 2. Shop drawings showing layout and connections for plumbing pumps. Include setting drawings with templates, and directions for installation of foundation bolts, anchor bolts, and other anchorages.
  - 3. Wiring diagrams detailing wiring for power, signal, and control systems; differentiating between manufacturer-installed wiring and field-installed wiring.
  - 4. Maintenance data for plumbing pumps, for inclusion in Operating and Maintenance Manuals specified in Division 1 and Division 22 Section "General Plumbing Requirements."
  - 5. Submit certification that pumps, valves, fittings and specialties comply with NSF 61 Annex G.
- B. Submit certificate to the Architect stating completion of factory start up and of proper booster pump installation per "startup" in Part III below:

**1.3 QUALITY ASSURANCE**

- A. Hydraulic Institute Compliance: Design, manufacture, and install plumbing pumps in accordance with "Hydraulic Institute Standards."
- B. National Electrical Code Compliance: Components shall comply with NFPA 70 "National Electrical Code."
- C. UL Compliance: Plumbing pumps shall be listed and labeled by UL and comply UL Standard 778 "Motor Operated Water Pumps."

- D. UL Compliance: Control panels shall be listed and labeled by UL and comply with Standard 508A "Control Panels".
- E. NEMA Compliance: Electric motors and components shall be listed and labeled NEMA.
- F. Single-Source Responsibility: Obtain plumbing pumps of the same type from a single manufacturer.
- G. Design Criteria: The Drawings indicate sizes, profiles, connections, and dimensional requirements of plumbing pumps and are based on the specific manufacturer types and models indicated. Pumps having equal performance characteristics by other manufacturers may be considered, provided that deviations in dimensions and profiles do not change the design concept or intended performance as judged by the Architect. The burden of proof for equality of plumbing pumps is on the proposer.
- H. Comply with NSF 61 Annex G (pending) for wetted surfaces of valves, fittings and specialties containing no more than 0.25% lead by weight compliance for valves for domestic water service.
- I. Valves, pumps and fittings shall be manufactured in plants located in the United States or certified that they comply with applicable ANSI, ASTM and MSS standards.

#### 1.4 SPARE PARTS

- A. Furnish spare parts described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Mechanical Seals: One mechanical seal for each pump.

#### 1.5 WARRANTY

- A. Warranty on Pumps: Provide written warranty, signed by manufacturer, agreeing to replace/repair, within warranty period, pumps with inadequate or defective materials and workmanship, including leakage, breakage, improper assembly, or failure to perform as required; provided manufacturer's instructions for handling, installing, protecting, and maintaining units have been adhered to during warranty period. Replacement includes both parts and labor for removal and reinstallation.
  - 1. Warranty Period: One year from date of substantial completion.

### PART 2 - PRODUCTS AND MATERIALS

#### 2.1 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide one of the following:
  - 1. Inline Circulator Pumps:
    - a. Armstrong Pumps, Inc.
    - b. Bell & Gossett, ITT.
    - c. Grundfos Pumps, Corp.
    - d. Taco, Inc.
  - 2. Packaged Domestic Booster Pumps – Variable Speed Multistage
    - a. Armstrong
    - b. Bell & Gossett, ITT
    - c. Grundfos Pumps, Corp.
    - d. QuantumFlo, Inc.
  - 3. Aquastats:
    - a. Dayton
    - b. Honeywell
    - c. Penn
    - d. White-Rodgers

4. Time Switches
  - a. Intermatic.com
  - b. NSI Industries "TORK Series"

## 2.2 PUMPS GENERAL

- A. Pumps and circulators: factory assembled and factory tested.
- B. Preparation for shipping: After assembly and testing, clean flanges and exposed machined metal surfaces and treat with an anticorrosion compound. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.
- C. Motors: Conform to NEMA standards; single, multiple, or variable speed with type of enclosure and electrical characteristics as indicated; have built-in thermal-overload protection and grease-lubricated ball bearings. Select motors that are nonoverloading within the full range of the pump performance curve.
- D. Apply factory finish paint to assembled, tested units prior to shipping.

## 2.3 INLINE CIRCULATOR PUMPS

- A. General Description: Circulators shall be horizontal inline, centrifugal, separately coupled, single-stage, all-bronze, radially split case design, with mechanical seals, permanently lubricated ball bearings and rated for 125 psig working pressure and 225 deg F continuous water temperature.
- B. Casings: Cast lead free bronze, with threaded companion flanges for piping connections smaller than 2-1/2 inches, and threaded gauge tappings at inlet and outlet connections.
- C. Impeller: Statically and dynamically balanced, closed, overhung, single suction, fabricated from cast lead free bronze conforming to ASTM B 584, and keyed to shaft.
- D. Pump Shaft and Sleeve: Steel shaft with oil-lubricated copper sleeve.
- E. Mechanical Seals: Carbon steel rotating ring, stainless-steel spring, ceramic seat, and flexible bellows and gasket.
- F. Pump Bearings: Oil-lubricated, bronze journal and thrust bearings.
- G. Motor Bearings: Oil-lubricated sleeve bearings.
- H. Shaft Couplings: Flexible; capable of absorbing torsional vibration and shaft misalignment.
- I. Motors: Resiliently mounted to the pump casing.

## 2.4 PACKAGED DOMESTIC BOOSTER PUMPS – VARIABLE SPEED MULTISTAGE

- A. Packaged, constant pressure type with triplex vertical multiple stage centrifugal pumps, control panel, motors, variable frequency drives, gauges, ball type isolation valves, dielectric isolators, accumulator tank, thermal bleed aquastat and solenoid valve and accessories. The packaged system, including all items listed below, shall be factory assembled on a fabricated steel base plate with structural steel framework. The completed package shall be factory tested, adjusted and certified for the specified flow conditions, and shipped as an integral unit ready for plumbing and electrical connections.
- B. Pumps: Provide multiple stage vertical multiple stage centrifugal type with close-coupled motors, cast iron suction / discharge chamber, motor stool and pump shaft couplings, mechanical seals, 304 stainless steel and impellers, chambers, straps, suction interconnector and neck rings, 431 stainless steel pump shaft and 316 stainless steel bearings, neck rings retainers, split cones, split cone nuts, wear and lock rings.
- C. Motors: Provide variable speed, totally enclosed fan cooled type, operate at 3500 rpm and shall not overload at any point of the pump curve.

- D. Piping: Suction and discharge headers shall be 316 stainless steel with ANSI class 150 pressure rating and flanges welded to the headers. Peak velocity in headers shall not exceed 8 feet per second. Furnish with the following valves:
- a. Butterfly Valves, 2-1/2-Inch and Larger: MSS SP-67; 200-psi CWP; lug-type body constructed of cast-iron conforming to ASTM A 126, Class B or ductile iron conforming to ASTM A 536. Provide valves with field replaceable EPDM sleeve/seat, aluminum-bronze CF8M (316) stainless steel disc, 416 stainless steel stem, and EPDM O-ring stem seals. Provide lever operators, (10 position minimum), with lock and stops with locks for sizes 2-1/2 through 6 inches and gear operators with position indicator for sizes 8 inch and larger. Drill and tap valves on dead-end service or requiring additional body strength. Valves must be rated for dead end service at 150 psi with no downstream flange required.
  - b. Cast Iron Body Ball Valves, 2-1/2" and larger: 200 CWP, maximum operating temperature of 140F; two piece cast iron body meeting ASTM A126 Class B with flanged ends, 304 stainless steel full port ball and shaft, ductile iron handle, PTFE gasket, stem seal and seat.
  - c. Wafer Check Valves: Class 150, stainless steel body; with replaceable stainless steel seat, and non-slam design lapped and balanced twin stainless steel flappers and stainless steel trim and torsion spring. Provide valves designed to open and close at approximately one foot differential pressure.
- E. Accumulator Tank: Provide tank size as scheduled on the drawings with a minimum pressure rating of 125psig; FDA approved elastomer bladder, tank bottom connection and air charge valve. Tank shall be complete with check valves, isolation valves and pressure reducing valve for remote installation.
- F. Controls and Instruments: Control panel shall be mounted on the pump package and shall include a NEMA 12 enclosure, through door disconnect, disconnect for each pump, overload relays and indicator lights, 120V control circuit transformer with primary and secondary fuse protection, low suction pressure limit switch, suction and discharge header pressure sensors, programmable logic controller and variable speed drives. Touchscreen operator interface for monitoring and adjustment of the programmable controller variables with virtual on-off-automatic selector switch for each pump, low suction pressure shutdown alarm, high system pressure shutdown alarm, high flow rate shutdown alarm, VFD failure alarm contact, pump running indicators and hour meter for each pump. Control panel shall be configured for termination of 1 incoming power feeder. Control panel shall have a unit short circuit current rating equal to or greater than the available short circuit current as indicated on the electrical drawings.
1. Programmable Logic Controller (PLC): Designed specifically for the control of pumps with variable speed drives capable of receiving two analog pressure inputs, analog flow input, automatic pump alternating and On-line field modified data entries for staging pumps, with software memory stored in non-volatile EPROM memory, furnish with user interface keypad with LED display.
  2. Alarm Interface: Provide dry contact internal to the control panel for the following alarm conditions:
    - a. Low suction pressure shutdown alarm
    - b. High system pressure shutdown alarm
    - c. High flow rate shutdown alarm
    - d. VFD failure alarm
  3. Data Interface: Provide BACnet card following alarm and data conditions:
    - a. Low suction pressure shutdown alarm
    - b. High system pressure shutdown alarm
    - c. High flow rate shutdown alarm
    - d. VFD failure alarm
    - e. Instantaneous system flow rate
    - f. Suction header pressure
    - g. Discharge header pressure

4. Variable Frequency Drive: The variable speed drives (VFD) shall be adjustable frequency type which employs a pulse width modulated inverter. The drive shall include built in diagnostics. Diagnostics shall be annunciated through the alpha numeric keypad. The drive shall be listed UL, ETL and/or CSA. To insure safety of the equipment, the VFD shall include these protective features and options:
  - a. NEMA 1 enclosure.
  - b. Static instantaneous over-current and over-voltage trip.
  - c. Static over-speed (over-frequency) protection.
  - d. Line or fuse loss and under-voltage protection.
  - e. Power unit over-temperature protection.
  - f. Motor inverse time overload protection.
  - g. Input fused disconnect or circuit breaker.
  - h. Total voltage harmonic distortion from the VFD shall be less than 5% to meet IEEE requirements.
  - i. Speed meter.
  - j. Automatic restart after power failure or minor drive fault. The drive shall attempt a minimum of two restarts before a complete drive shut-down.
  - k. Power on light.
  - l. Manual speed potentiometer or control capability through the keypad.
  - m. Hand/Off/Automatic Switch or Manual/Automatic Switch with start/stop pushbutton.
  - n. Test switch
  - o. VFD fault light and reset with alarm relay.
  - p. Output to the PLC and integral LED display
  - q. The VFD shall be microprocessor based and utilize digital input for all parameter adjustments. The VFD shall include a digital display for monitoring system parameters and for first fault indication, and digital input programming capability on the main logic board.
  - r. The VFD shall operate on a frequency range of 1 to 66 Hz with resolution of 0.1% of base speed with analog input or 0.025% with digital input and have accuracy within 0.05% of set point. VFD shall operate in environment of 0 to 40 degrees C, 3,300 feet altitude and 95% non-condensing humidity without derating.
  - s. All control circuit voltages shall be physically and electrically isolated from power circuit voltages.
  - t. All VFD's shall be tested/run in the equivalent of NEMA 1 enclosure and burned in at rated ambient (40° C) with a fully loaded motor.
  - u. Configured for mounting on top of motor or outside of control panel.
5. Pressure Sensors: NEMA 4 water tight enclosure with pressure rating of 2,000psi, stainless steel wetted parts, 0.25" male NPT connection, calibration from 0 to 150 psi with 4-20mA DC signal at 24 VDC. Refer to the floor plans for location of remote pressure sensor.
6. Sequence of Operation: The domestic water booster pump shall be in automatic mode per the design conditions shown on the booster pump schedule. The pump shall modulate its speed to maintain the discharge head pressure setpoint, as determined by the internal control algorithm, simulating the performance of a system utilizing a remote differential pressure sensor. The pumps shall run in a lead/lag operation based on user defined run-time setpoint. When the flow capacity of the lead pump is exceeded, the lag pump shall start after an adjustable time delay. If the capacity of the lead pump and lag pump is exceeded, the second lag pump (and the N 1 sequencing shall continue based on the number of pumps in the system) shall start.
  - a. When a single pump operates at minimum flow rate, the pump speed shall be reduced to the minimum discharge header pressure as scheduled. When required flow increases, the pump speed shall increase linearly to the discharge pressure as scheduled at full flow, simulating the performance of a system utilizing a remote differential pressure sensor.

- b. When the lead pump is stopped because of required zero flow, the pump speed shall increase linearly to the discharge pressure as scheduled to charge the tank, then stop.
- 7. Safeties:
  - a. Low Suction Pressure
    - 1) When the suction pressure drops below the low suction pressure alarm point as determined by the integral suction pressure sensor, the pumps shall be disabled and an audible alarm shall be sent to the BMS or local building alarm system.
  - b. High Discharge Pressure
    - 1) When the discharge pressure rises above the high discharge pressure alarm point as determined by the integral discharge pressure sensor, the pumps shall be disabled and an audible alarm shall be sent to the BMS or local building alarm system
  - c. High Flow Shutdown
    - 1) When the discharge flow, as calculated by the control system, rises above the high flow alarm point, the pumps shall be disabled and an audible alarm shall be sent to the BMS or local building alarm system.
  - d. VFD Alarm
    - 1) When a VFD goes into alarm condition, as calculated by the internal VFD control system, an audible alarm shall be sent to the BMS or local building alarm system.
- 8. Control Wire: Domestic booster pump manufacturer shall furnish the appropriate type and amount of wire for interlock of the remote sensors with the domestic booster pump control panel.

## 2.5 AQUASTATS

- A. Remote sensing bulb type, non-modulating, single pole double pole throw with surface mount sensing bulb and mounting bracket, adjustable direct reading scale for set point with adjustable differential.

## 2.6 TIME SWITCHES

- A. As described on the drawings

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Install pumps in accordance with manufacturer's installation instructions.
- B. General: Comply with the manufacturer's written installation and alignment instructions.
- C. Install pumps in locations and arrange to provide access for periodic maintenance, including removal of motors, impellers, couplings, and accessories.
- D. Support pumps and piping separately so that the weight of the piping system does not rest on the pump.
- E. Suspend inline pumps with all thread hanger rod and vibration isolation hangers of sufficient size to support the weight of the pump independent from the piping system.

**3.2 EXAMINATION**

- A. Examine areas, equipment foundations, and conditions with Installer present, for compliance with requirements for installation and other conditions affecting performance of plumbing pumps. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Examine rough-in for plumbing piping systems to verify actual locations of piping connections prior to installation.

**3.3 CONCRETE EQUIPMENT BASES**

- A. Refer to Division 22 Section "Basic Mechanical Materials and Methods" for concrete equipment bases.
  - 1. Form concrete equipment bases by using framing lumber with form release compounds. Chamfer top edge and corners of pad.
  - 2. Install reinforcing bars, tied to frame, and place anchor bolts and sleeves using manufacturer's installation template.
  - 3. Place concrete and allow to cure before installation of pumps.

**3.4 ALIGNMENT**

- A. Align pump and motor shafts and piping connections after setting on foundations, after grout has been set and foundations bolts have been tightened, and after piping connections have been made.
  - 1. Adjust alignment of pump and motor shafts for angular and parallel alignment by one of the two methods specified in the Hydraulic Institute "Centrifugal Pumps - Instructions for Installation, Operation and Maintenance."
- B. After alignment is correct, tighten the foundation bolts evenly but not too firmly. Fill the base plate completely with nonshrink, nonmetallic grout, with metal blocks and shims or wedges in place. After grout has cured, fully tighten foundation bolts.
  - 1. Alignment tolerances shall meet manufacturers recommendations.

**3.5 CONNECTIONS**

- A. General: Install valves that are same size as the piping connecting the pump.
- B. Install suction and discharge pipe sizes equal to or greater than the diameter of the pump nozzles.
- C. Install a nonslam check valve and shutoff valve on the discharge side of pumps.
- D. Install a gate valve and strainer on the suction side of inline pumps.
- E. Install pressure gauges on the suction and discharge of each pump at the integral pressure gauge tapings provided.
- F. Install pressure gauge connector plugs in suction and discharge piping around pump. Pressure gauge connector plugs are specified in Division 22 Section "Meters and Gauges for Plumbing Piping."
- G. Install surface mounted aquastat on bare metal pipe, fastened securely to pipe upstream of circulator pump when indicated on the drawings.
- H. Interlock aquastat and or timer in series with hot water recirculation pump motor. Electrical wiring and connections are specified in Division 26 section "Common Work Results for Electrical".
- I. Electrical wiring and connections are specified in Division 26 section "Common Work Results for Electrical".

- J. Install domestic booster pump remote sensors as recommended by the manufacturer. Coordinate interlock of the sensors and domestic booster pump. Install control wire furnished with the domestic booster pump for interlock with the sensors. Electrical wiring and connections are specified in Division 26 section "Common Work Results for Electrical".
- K. Install flexible connectors at the header inlet and outlet of domestic booster pump, refer to Division 22 Section "Basic piping Materials and Methods".
- L. Provide equipment pad and vibration isolators, refer to Division 22 Section "Vibration Isolation for Plumbing Piping and Equipment".
  - 1. Extend equipment pads to 2" beyond elbows, shutoff valves and flexible connectors. Anchor elbows and shutoff valves to equipment pad.
  - 2. Extend equipment pad to 2" beyond base elbows. Anchor elbows to equipment pad. Install flexible connectors and shutoff valves in the vertical. Anchor shutoff valves to the structure.
- M. Provide concrete inertia base and vibration isolators, refer to Division 22 Section "Vibration Isolation for Plumbing Piping and Equipment".
  - 1. Provide an equipment pad, separate from the inertia pad, to 2" beyond elbows. Anchor elbows to equipment pad. Install flexible connectors and shutoff valves in the vertical. Anchor shutoff valve to the structure.
- N. Coordinate interlock of high flow rate, low suction pressure, high discharge pressure level and VFD failure alarms with the building automation system. Alarm wiring and alarm interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".
- O. Coordinate interlock of booster pump with building automation system via BACnet protocol for high flow rate, low suction pressure, high discharge pressure level and VFD failure alarms, Instantaneous system flow rate, Suction header pressure, and Discharge header pressure data. Wiring and interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".

### 3.6 FIELD QUALITY CONTROL

- A. Check suction lines connections for tightness to avoid drawing air into the pump.

### 3.7 STARTUP

- A. Final Checks Before Start-Up: Perform the following preventative maintenance operations and checks before start-up:
  - 1. Lubricate oil-lubricated bearings.
  - 2. Remove grease-lubricated bearing covers and flush the bearings with kerosene and thoroughly clean. Fill with new lubricant in accordance with the manufacturer's recommendations.
  - 3. Disconnect coupling and check motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
  - 4. Check that pump is free to rotate by hand. For pumps handling hot liquids, pump shall be free to rotate with the pump hot and cold. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.
- B. Starting procedure for pumps with shutoff power not exceeding the safe motor power:
  - 1. Prime the pump, opening the suction valve, closing the drains, and prepare the pump for operation.
  - 2. Open the valve in the cooling water supply to the bearings where applicable.
  - 3. Open the sealing liquid supply valve if the pump is so fitted.
  - 4. Open the warm-up valve of a pump handling hot liquids if the pump is not normally kept at operating temperature.
  - 5. Open the recirculating line valve if the pump should not be operated against dead shutoff.

6. Start motor.
  7. Open the discharge valve slowly.
  8. Observe the leakage from the stuffing boxes and adjust the sealing liquid valve for proper flow to ensure the lubrication of the packing. Do not tighten the gland immediately, but let the packing run in before reducing the leakage through the stuffing boxes.
  9. Check the general mechanical operation of the pump and motor.
  10. Close the recirculating line valve once there is sufficient flow through the pump to prevent overheating.
- C. If the pump is to be started against a closed check valve with the discharge gate valve open, the steps are the same except that the discharge gate valve is opened some time before the motor is started.
- D. Start Up Services for Booster Pump:
1. Startup Services: Domestic booster pump manufacturer representative shall provide factory start-up and check out of the booster pump. Domestic booster pump manufacturer shall provide the Owner a minimum of 1 hour of training in the operation of the booster pump.
  2. Certification: Domestic booster pump manufacturer representative shall prepare a certificate stating completion of factory start up and of proper booster pump installation signed by the manufacturer representative.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 13 00 - SANITARY DRAINAGE AND VENT PIPING AND SPECIALTIES****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes building sanitary drainage and vent piping systems, including drains and drainage specialties.
- B. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 22 Section "General Plumbing Requirements," for trenching and backfilling materials and methods for underground piping installations.
  - 2. Division 33 Section "Sanitary Sewage Systems," for sanitary drainage piping beginning from 5'-0" outside the building.
  - 3. Division 7 Section "Joint Sealers," for materials and methods for sealing pipe penetrations through basement and foundation walls, and fire and smoke barriers.
  - 4. Division 11 Section "Kitchen and Food Service Equipment," for drains and trim furnished with the food service and kitchen equipment.
  - 5. Division 12 Section "Laboratory Casework and Fixtures," for laboratory drains and trim furnished with the casework.
  - 6. Division 22 Section "Plumbing Identification," for labeling and identification of drainage and vent piping.
  - 7. Division 22 Section "Common Work Results for Plumbing," for materials and methods for fire barrier penetrations, wall and floor penetrations and equipment pads
  - 8. Division 22 Section "Basic Piping Material and Methods," for materials and methods for mechanical sleeve seals.
  - 9. Division 22 Section "Hangers and Supports for Plumbing Piping," for materials and methods for hanging and supporting drainage and vent piping.
  - 10. Division 22 Section "Plumbing Insulation," for materials and methods for insulating drainage piping.
  - 11. Division 22 Section "Water Distribution Piping and Specialties," for material and methods for trap primers and trap primer inlet piping.
  - 12. Division 22 Section "Condensate Pumps for HVAC Equipment," for material and methods for condensate pumps.

**1.2 DEFINITIONS**

- A. Sanitary Building Drain: That part of the lowest piping of a drainage system which receives the discharge from soil, waste, and other drainage pipes inside the walls of the building and conveys it to the building sewer.
- B. Sanitary Building Sewer: That part of the drainage system which extends from the end of the building drain and conveys its discharge to a public sewer, private sewer, individual sewage disposal system, or other point of disposal.
- C. Drainage System: Includes all the piping within a public or private premises which conveys sewage or other liquid wastes to a point of disposal. It does not include the mains of public sewer systems or a private or public sewage treatment or disposal plant.
- D. Vent System: A pipe or pipes installed to provide a flow of air to or from a drainage system, or to provide a circulation of air within such system to protect trap seals from siphonage and back pressure.

**1.3 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specifications Sections.
- B. Product data for the following products:
  - 1. Drainage piping
  - 2. Drainage piping specialties
  - 3. Floor drains
  - 4. Trench drains
  - 5. Interceptors
  - 6. No-hub fitting restraints
- C. Test reports specified in Part 3 of this Section.

**1.4 QUALITY ASSURANCE**

- A. Comply with the installation requirements for CPVC pipe and CPVC CTS tube per the Lubrizol "FlowGuard Gold and CORZAN Design and Installation Manual" and the installed manufacturer's installation manual.
- B. Regulatory Requirements: Comply with the provisions of the following codes:
  - 1. 2015 International Plumbing Code

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Drainage Piping Specialties, including backwater valves, expansion joints, cleanouts, floor drains, cast-iron trench drains and vandal-proof vent caps:
    - a. Jay R. Smith Mfg. Co.
    - b. Josam Mfg. Co.
    - c. Mifab Manufacturing Co.
    - d. Sioux Chief Manufacturing Co. Inc.
    - e. Tyler Pipe/Wade Div.; Subs. of Tyler Corp.
    - f. Watts Industries, Inc.
    - g. Zurn Industries, Inc.; Hydromechanics Div.
  - 2. Non-Metallic Trench Drains:
    - a. ABT, Inc., Polydrain
    - b. Dura Trench
    - c. Jay R. Smith Mfg. Co.
    - d. MEA-JOSAM
    - e. Mifab Manufacturing Co.
    - f. NDS
    - g. Sioux Chief Manufacturing Co. Inc.
    - h. Watts Industries, Inc.
    - i. Zurn Industries, Inc.
  - 3. Plastic Hydromechanical Grease Interceptors:
    - a. CANPLAS
    - b. Green Turtle, Inc.
    - c. Mifab Manufacturing, Inc.
    - d. Schier Products
  - 4. Heavy Duty Hubless Couplings
    - a. Anaco Husky HD-2000
    - b. Clamp-All 80in. lb.

- c. Ideal Tridon "HD"
- d. Mifab Manufacturing, Inc. #MI-XHUB-series
- e. Mission Rubber Company, "Heavy Weight"
- f. ProFlo "HD"
5. Cast Iron Soil Pipe and Fittings
  - a. AB & I Foundry
  - b. Charlotte Pipe and Foundry Company
  - c. Tyler Pipe / Soil Pipe Division
6. Shielded Transition Couplings
  - a. FERNCO, "Proflex 3000 Series"
  - b. Mifab Manufacturing, Inc. #MI-HUB-ARC-series
  - c. Mission Rubber Company, "Band Seal Specialty Couplings"
7. Underground Shielded Adapter Couplings
  - a. FERNCO, "1056 Series with SR73 Shear Ring"
  - b. Mifab Manufacturing, Inc. #MI-HUB-ARC-CL-series
  - c. Mission Rubber Company, "MR56 Series"
8. Trap Seals
  - a. Green Drain, Inc.
  - b. Jay R. Smith Mfg. Co.
  - c. Mifab Manufacturing, Inc.
  - d. Proset Systems "Trap Guard"
  - e. Rector Seal, Inc.
  - f. Zurn Industries, Inc.; Hydromechanics Div.
9. Hubless Couplings:
  - a. Anaco
  - b. Ideal Tridon
  - c. Mifab Manufacturing, Inc. #MI-HUB- series
  - d. Mission Rubber Company
  - e. ProFlo "PFNH"
  - f. Tyler Pipe / Soil Pipe Division
10. Plastic Gravity Interceptors
  - a. Green Turtle, Inc.
  - b. Mifab Manufacturing, Inc.
  - c. Schier Products
  - d. Thermaco, Inc.
  - e. Xerxes Corp.
11. No-Hub Fitting Restraints
  - a. Holdrite
12. Backwater Valves
  - a. Cleancheck
  - b. Mainline Backflow Products
  - c. Mifab Manufacturing Co.
  - d. Sioux Chief
  - e. Spears
13. Shower Linear Trench Drains
  - a. Infinity Drain
  - b. Jay R. Smith Mfg. Co.
  - c. Schluter systems
  - d. Zurn industries

## 2.2 ABOVE GROUND DRAINAGE AND VENT PIPE AND FITTINGS

- A. Refer to Part 3, Article "Pipe Applications - Above Ground, Within Building" for identification of systems where the materials listed below are used.

- B. Cast-Iron Soil Pipe: CISPI 301 and ASTM A888, no-hub pipe and fittings and bearing the trademark of CISPI and NSF.
  - 1. Couplings and compression gaskets, NSF certified: ASTM C564 and CISPI 310.
  - 2. Heavy duty couplings and compression gaskets: ASTM C1540 and meeting FM 1680.
- C. PVC DWV Pipe and Fittings: Schedule 40 pipe meeting ASTM D1785 and ASTM D2665 with "solid wall" PVC meeting ASTM D1784 with cell class 12454-B.
  - 1. Fittings: DWV pattern meeting ASTM D2665 with solvent cement socket joints.
  - 2. Solvent: ASTM D2564.
- D. Steel Pipe: ASTM A53, Type E or S, schedule 40, Grade B, galvanized, threaded ends.
  - 1. Galvanized Malleable Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern, for threaded joints. Threads shall conform to ASME B1.20.1.
- E. Shielded Transition Couplings: ASTM C1460 with neoprene adapter gasket with stainless steel Shield and hose clamps.

### **2.3 UNDERGROUND BUILDING DRAIN AND VENT PIPE AND FITTINGS**

- A. Refer to Part 3, Article "Pipe Applications - Below Ground, Within Building" for identification of systems where the materials listed below are used.
- B. Cast-Iron Soil Pipe: ASTM A74, Service weight, hub-and-spigot soil pipe and fittings. Pipe and fittings shall have a heavy coating of coal tar varnish or asphaltum on both inside and outside surfaces and bearing the trademark of CISPI and NSF.
  - 1. Neoprene Compression Gaskets: ASTM C564.
- C. PVC DWV Pipe and Fittings: Schedule 40 pipe meeting ASTM D1785 and ASTM D2665 with "solid wall" PVC meeting ASTM D1784 with cell class 12454-B.
  - 1. Fittings: DWV pattern meeting ASTM D2665 with solvent cement socket joints.
  - 2. Solvent: ASTM D2564.
- D. PVC Pressure Pipe and Fittings: Schedule 40 pipe meeting ASTM D1785 with "solid wall" PVC meeting ASTM D1784 with cell class 12454.
  - 1. Solvent: ASTM D2564.
  - 2. Fittings: Schedule 40 meeting ASTM D2466 with solvent cement socket joints.
- E. Underground Shielded Adapter Couplings: ASTM C1173 with neoprene adapter gasket with stainless steel shield and stainless steel hose clamps.

### **2.4 DRAINAGE PIPING SPECIALTIES**

- A. Backwater Valves: Valve assembly shall be bronze fitted cast-iron, with bolted cover. Flapper shall provide a maximum 1/4 inch clearance between flapper and seat for air circulation. Valve ends shall suit piping material.
- B. Cleanout Plugs: As specified on the drawings.
- C. Floor Cleanouts: As specified on the drawings.
- D. Wall Cleanouts: As specified on the drawings.
- E. Floor Drains: As specified on the drawings.
- F. Cast-iron Trench Drains: As specified on the drawings.
- G. Trap seals: Provide trap seals meeting either description below:
  - 1. Smooth, soft, flexible, elastomeric PVC material with a flapper closure. The flow of wastewater allows flapper to open and adequately discharge to floor drain through its opening. The flapper closes and returns to original position after wastewater discharge is complete.

**2.5 NO-HUB FITTING RESTRAINTS**

- A. Pre-engineered kits of galvanized steel pipe straps with stainless steel band clamps and tee bolts, meeting requirements of the CISPI Installation Handbook.

**2.6 TRENCH DRAINS**

- A. Trench drain type designations and sizes are indicated on the Drawings.
- B. Non-Metallic Trench Drains: Polyester resin and quartz aggregate, precast, interlocking design, with bottom radius and 0.6 percent slope.
  - 1. Precast Material: Load pressure of 14,500 psi, bending pressure of 2,900 psi, frost-proof, salt-proof, inert under dilute acid and alkali conditions, and less than 1.0 percent water absorption rate.
  - 2. Grates: Cast iron or steel as indicated, for heavy-duty truck traffic, with openings designed to prevent entry of bicycle or wheelchair tires.

**2.7 SHOWER LINEAR TRENCH DRAINS**

- A. Shower linear trench drain type designations and sizes are indicated on the drawings.

**2.8 INTERCEPTORS**

- A. Interceptor type designations, flow rates, and capacities are indicated on the drawings.
- B. Hydromechanical Grease Interceptor: As scheduled on the drawings.
- C. Lint Interceptor: As scheduled on the drawings.

**PART 3 - EXECUTION****3.1 INSTALLATION GENERAL**

- A. Install pipe and specialties in accordance with manufacturer's installation instructions.

**3.2 PREPARATION FOUNDATION FOR UNDERGROUND SANITARY BUILDING DRAINS**

- A. Pipe Beds:
  - 1. PVC Pipe: Support pipe in trench with sand bags level and true to prevent sand, gravel or debris from interfering with the solvent cement process. After pressure testing is complete, gradually install bedding to maintain continuous pipe slope and prevent pipe deflection and then install subbase. Refer to Section "General Plumbing Requirements" for bedding and subbase materials, excavation, trenching, backfill and compaction requirements and refer to ASTM D2321 "Underground Installation of Thermoplastic Pipe for Sewers and Gravity-flow Applications" for additional requirements.
  - 2. Cast Iron Soil Pipe: Shape bottom of trench to fit bottom of pipe for 90-degrees (bottom 1/4 of the circumference). Fill unevenness with tamped sand bedding. At each pipe joint dig bell holes to relieve the bell of the pipe of all loads, and to ensure continuous bearing of the pipe barrel on the foundation and maintain continuous pipe slope. For piping with rock trench bottoms, provide sand pipe bed 6" underneath and around sides of pipe, including fittings. After pressure testing is complete, install subbase. Refer to Section "General Plumbing Requirements" for bedding and subbase materials, excavation, trenching, backfill and compaction requirements.

**3.3 PIPE APPLICATIONS - ABOVE GROUND WITHIN BUILDING**

- A. Install hubless, cast-iron soil pipe and fittings for 15" and smaller soil, waste, and vent pipe.
- B. Install Type DWV copper tube with cast copper alloy solder joint drainage fittings (DWV) fittings, copper sweat X screwed with solder joints, for waste connections from urinals, lavatories, sinks, water coolers, and kitchen equipment to cast iron drainage piping.
- C. Install Type M copper tube with wrought copper fittings with solder joints, 1" and smaller, with 3/4" minimum size and install Type DWV copper tube with cast copper alloy solder joint drainage fittings (DWV) fittings for 1-1/4" and larger for waste connections from kitchen equipment and terminate over floor receptors with air gap.
- D. Condensate drain piping and pumped condensate drain piping inside the building: Provide 3/4" minimum size or as indicated on the drawings. Slope gravity drainage condensate piping from mechanical equipment at 1/8" per foot minimum slope. Discharge to floor receptor with air gap.
  - 1. Install Type M copper tube with wrought copper fittings with solder joints, 1" and smaller and install Type DWV copper tube with cast copper alloy solder joint drainage fittings (DWV) fittings for 1-1/4" and larger. Provide galvanic isolators as specified in Division 22 "Basic Piping Materials and Methods".
- E. Condensate drain piping outside the building: Provide 3/4" minimum size or as indicated on the drawings. Slope condensate piping at 1/8" per foot minimum slope to discharge point. Discharge to roof receptors or roof drains with air gap.
  - 1. Install Type M copper tube with wrought copper fittings with solder joints, 1" and smaller, and install Type DWV copper tube with cast copper alloy solder joint drainage fittings (DWV) fittings for 1-1/4" and larger. Provide galvanic isolators as specified in Division 22 "Basic Piping Material and Methods".
  - 2. Install PVC pressure pipe and fittings for 1" and smaller and install "solid wall" PVC Type DWV pipe and fittings for 1-1/4" and larger.
- F. Install galvanized schedule 40 steel pipe and malleable iron fittings for sump pump discharge pipe.
- G. Install type "L" copper tube with wrought copper fittings with solder joints for sump pump discharge pipe.
- H. Install 1/2" type L copper tube for trap primer outlet piping.

**3.4 PIPE APPLICATIONS - BELOW GROUND WITHIN BUILDING**

- A. Install hub-and-spigot, service weight, cast-iron, soil pipe and fittings with gasketed joints for 15 inch and smaller for soil, waste, and vent pipe.
- B. As a contractor's option with Owner approval, Install PVC Type DWV Plastic pipe and fittings for drainage and vent pipe for 24" and smaller. Install fabricated fittings for 16 inch and larger.
- C. Install PVC pressure pipe and fittings for sump pump discharge.
- D. Install type "K" soft copper tube with wrought copper fittings with solder joints for sump pump discharge pipe, 2" and smaller.
- E. Install 1/2" type K soft copper tube for trap primer outlet piping.

**3.5 PIPE AND TUBE JOINT CONSTRUCTION**

- A. Copper Tubing: Solder joints in accordance with the procedures specified in AWS "Soldering Manual."
- B. Cast-Iron Soil Pipe: Make hubless joints in accordance with the Cast-Iron Soil Pipe & Fittings Handbook, Chapter IV. Install Couplings as followings:

1. Install hubless couplings complying with CISPI 310 on soil and waste piping 3" and smaller and all vent piping.
  2. Install heavy duty hubless couplings on soil or waste stacks, soil and waste piping connections to soil or waste stacks and all soil and waste piping 4" and larger.
  3. Install No-Hub fitting restraints on joints 5" and larger at:
    - a. Changes of direction from vertical to horizontal
    - b. 4" branch connections, including tees, wyes and wye combination fittings to soil and waste piping 5" and larger
    - c. Horizontal changes of direction 22-1/2 degrees and greater
    - d. Changes in diameter of two pipe sizes or greater.
- C. PVC DWV Pipe: Joining and installation of PVC drainage pipe and fittings shall conform to ASTM D2665.
- D. ABS to PVC Transition Joints: When joining ABS to PVC components (such as an ABS building drain to PVC sewer pipe) make joints using solvent cements conforming to ASTM D3138.
- E. Cast Iron to PVC Above Grade: Join cast iron to PVC with shielded transition couplings.
- F. Cast Iron to PVC Below Grade: Join cast iron to PVC with underground shielded adapter couplings.

### 3.6 INSTALLATION

- A. General Locations and Arrangements: Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of the piping systems. Location and arrangement of piping layout take into consideration pipe sizing, slope, expansion, and other design considerations. So far as practical, install piping as indicated.
- B. Use fittings for all changes in direction and all branch connections.
- C. Install piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated.
- D. Install piping free of sags or bends and with ample space between piping to permit proper insulation applications.
- E. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated to be exposed to view.
- F. Install horizontal piping as high as possible allowing for proper slope and coordination with other components. Install vertical piping tight to columns or walls. Provide space to permit insulation applications, with 1-inch clearance outside the insulation. Allow sufficient space above removable ceiling panels to allow for panel removal.
- G. Paint exposed copper drain lines serving kitchen equipment with a minimum of two coats of chromium-based paint.
- H. Exterior Wall Penetrations: Seal pipe penetrations through exterior walls using sleeves and sealer. Refer to Division 22 Section " Basic Piping Material and Methods" for special sealers and materials.
- I. Underground Exterior Wall Penetrations: Seal pipe penetrations through underground exterior walls using sleeves and mechanical sleeve sealers. Refer to Division 22 Section "Basic Piping Material and Methods" for additional information.
- J. Fire Barrier Penetrations: Where pipes pass through fire rated walls, partitions, ceilings and floors, maintain the fire rated integrity. Refer to Division 22 Section " Basic Piping Material and Methods" for special sealers and materials.

- K. Foundation Penetrations: Where pipes pass through foundation walls above strip footings or under strip footings, protect pipes from building load with cast iron soil pipe sleeves two pipe sizes larger than the pipe. Sleeves installed under the strip footing shall be encased in concrete.
- L. Elevated Floor Penetrations of Waterproof Membrane, Interior Penetrations of Non-Fire Rated Walls and Concrete Slab on Grade Penetrations: Provide sleeves and seal pipes that pass through waterproof floors, non-fire rated walls, partitions and ceilings or concrete slab on grade. Refer to Division 22 Section "Common Work Results for Plumbing" for special sealers and materials.
- M. Make changes in direction for drainage and vent piping using appropriate 45 degree wyes, combination wye and eighth bend, or long sweep, quarter, sixth, eighth, or sixteenth bends. Sanitary tees or quarter bends may be used on vertical stacks of drainage lines where the change in direction of flow is from horizontal to vertical, except use long-turn pattern combination wye and eighth bends where two fixtures are installed back to back and have a common drain. Straight tees, elbows, and crosses may be used on vent lines. Double wyes or double wye combinations shall not be used in the horizontal. No change in direction of flow greater than 90 degrees shall be made. Where different sizes of drainage pipes and fittings are connected, use proper sized standard increasers and reducers. Reduction of the size of drainage piping in the direction of flow is prohibited.
- N. Install underground building drains to conform with the plumbing code, and in accordance with the Cast Iron Soil Pipe Institute Engineering Manual. Lay underground building drains beginning at low point of systems, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install required gaskets in accordance with manufacturer's recommendations for use of lubricants, cements, and other special installation requirements. Maintain swab or drag in line and pull past each joint as it is completed.
- O. Install drainage piping pitched down at a minimum slope of 1/4 inch per foot (2 percent) for piping 3 inch and smaller, and 1/8 inch per foot (1 percent) for piping 4 inch and larger. Install vent piping pitched to drain back by gravity to the sanitary drainage piping system.
- P. Install condensate drains pitched down at a minimum slope of 1 to 10 for piping 3 inches and smaller.
- Q. Extend building drain to connect to service piping, of size and in location indicated for service entrance to building. Sewer service piping is specified in a separate section of Division 2.
- R. Install 1 inch thick extruded polystyrene over underground building drain piping not under building. Width of insulation shall extend minimum of 12" beyond each side of pipe. Install directly over, and center on pipe center line.

### 3.7 HANGERS AND SUPPORTS

- A. General: Hanger, support, insulation protection shields, and anchor components and installation procedures conforming to MSS SP-58 and SP-69 are specified in Division 22 Section "Hangers and Supports for Plumbing Piping". Conform to the table below for maximum spacing of supports.
- B. Install the following pipe attachments:
  - 1. Adjustable clevis hangers, MSS SP-69 Type 1, for individual horizontal runs.
  - 2. Riser clamps, MSS SP-69 Type 8, for individual vertical runs.
  - 3. Provide 316 stainless steel rods, nuts, washers, beam clamps, channels, insulation protection shields, adjustable band hangers, MSS SP-69 Type 7, or clevis hangers, MSS SP-69 Type 1, for piping located in Hydrotherapy and Pool Equipment Rooms.
  - 4. Insulation protection shields and high density insulation at each hanger for insulated pipe as specified in Division 22 Sections "Hangers and Supports for Plumbing Piping" and "Plumbing Insulation".
    - a. Install high density insulation on insulated pipe.
  - 5. Provide vinyl coated hangers and riser clamps for use with PVC pipe and CPVC CTS tube.

1. Provide roll hangers for individual horizontal runs 100 feet or longer.
2. Provide ceiling flanges attached to the floor, all thread rod and split ring pipe clamps for indirect drains and condensate drains supported from the floor 2" and smaller.

C. Install hangers with maximum horizontal spacing and minimum rod diameters, to comply with MSS-58, locally enforced codes, this specification, and authorities having jurisdiction requirements, whichever are most stringent. Install hangers for horizontal piping with the following maximum spacing and minimum rod diameters:

Nom. Pipe	Steel Pipe		Copper Tube	Min. Rod	Dia. - In.
	Size - In.	Max. Span - Ft.	Max. Span - Ft.	Max. Span - Ft.	
Up to 1-1/4	12	6		3/8	
	1-1/2 to 2	12		10	3/8
	2-1/2 to 4	12		10	3/8
	5	12		10	1/2
	6	12		10	1/2
	8	12		10	1/2
	10 to 12	12		10	5/8
	14 to 15	12		N/A	3/4

1. Support all sizes of horizontal cast iron piping every five feet, except up to ten feet where ten foot sections are installed. Support all sizes of hubless horizontal cast iron piping every other joint, unless over four feet, then support each joint. Provide support adjacent to joint, not to exceed 18". Provide support at each horizontal branch.
2. Support all sizes of vertical cast iron piping every ten feet.
3. Support all sizes of horizontal of PVC piping every four feet.
4. Support all sizes of vertical of PVC piping every floor, but not to exceed ten feet. For sizes 2 inches and smaller, provide guide midway between required vertical supports.
5. Support piping within 12" of each elbow or tee.
6. Support each P-trap.

D. Support condensate piping located on roof with pre-engineered roof supports, pre-engineered roof supports are specified in Division 22 Section "Hangers and Supports for Plumbing Piping". Conform to the table above for maximum spacing of supports. Adjust pipe support to maintain minimum pipe slope.

E. Sway bracing:

1. Provide rigid sway bracing for pipe 4" and larger at changes of direction greater than 45 degrees.

F. Bracing for above floor base of stacks 4" and larger and higher than three stories:

1. Secure horizontal base of stack to structure with riser clamp within at the fitting changing direction of flow from vertical to horizontal. Provide rods of size equal to cast iron pipe size scheduled above in pipe hanger schedule.

### 3.8 INSTALLATION OF PIPING SPECIALTIES

- A. Install backwater valves in sanitary building drain piping as indicated, and as required by the plumbing code. For interior installation, provide cleanout cover flush to floor centered over backwater valve cover and of adequate size to remove valve cover for service.
- B. Provide PVC DWV expansion joints every 30' on straight vertical PVC waste or sanitary stacks receiving hot water waste. Install expansion joint at middle travel for equal expansion and contraction travel. Provide riser clamps within 18" of each end of expansion joint. Install expansion joint per manufacturer's installation instructions.

- C. Above Ground Cleanouts: Install in above ground piping and building drain piping as indicated, and:
1. as required by plumbing code;
  2. at each change in direction of piping greater than 45 degrees;
  3. at minimum intervals of 50' for piping 4" and smaller and 100' for larger piping;
  4. at base of each vertical soil and waste stack.
- D. Cleanout Covers: Install floor and wall cleanout covers for concealed piping, types as indicated.
- E. Floor Cleanouts: Install in below floor building drain piping as indicated, and:
1. as required by plumbing code;
  2. at each change in direction of piping greater than 45 degrees;
  3. Install in below floor building drain piping at minimum intervals of 50' for piping 4" and smaller and 75' for larger piping;
  4. Install floor cleanouts in waterproof floors with waterproof membrane securely flashed with cleanout body flashing clamp so that no leakage occurs between cleanout body and adjoining flooring. Maintain integrity of waterproof membranes, where penetrated.
- F. Exterior Cleanouts: Install exterior cleanouts embedded in a 18" x 18" x 8" block of concrete, flush with finished grade.

### 3.9 INSTALLATION OF FLOOR DRAINS FLOOR SINKS

- A. Install floor drains, floor sinks, and shower linear trench drains in locations indicated.
- B. Install floor drains, trench drains and shower linear trench drains at low points of surface areas to be drained, or as indicated. Set tops of drains flush with finished floor. Set floor sinks and floor troughs flush with the level finish floor.
- C. Refer to architectural documents for floor slope requirements and set floor drain elevation to match. Where architectural documents do not indicate the requirements, set the floor drain elevation depressed below the finished slab elevation as listed below to provide proper slope to drain:

<u>DEPRESSION IN INCHES</u>	<u>RADIUS OF AREA DRAINED - FEET</u>
1/2	5
3/4	10
1	15
1-1/4	20
1-1/2	25

- D. Provide P-traps for drains connected to the sanitary sewer.
- E. Install floor drains, floor sinks, and shower linear trench drains, in waterproof floors with waterproof membrane securely flashed with drain flashing clamp so that no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes, where penetrated.
- F. Position drains so that they are level, accessible and easy to maintain.

### 3.10 INSTALLATION OF TRAP PRIMERS

- A. Install trap primer outlet piping with 1/32" per foot slope towards drain trap where possible.
- B. Connect trap primer outlet piping only to factory installed taps on the drain body or P-trap assembly or provide an auxiliary inlet fitting with factory installed trap primer tap.
- C. Install trap primer outlet piping in elevated slabs or slabs on grade below concrete reinforcing bars. Wrap with 1/2" thick flexible unicellular insulation, attach to the reinforcing bars with plastic

ties and spacers every five feet to eliminate galvanic corrosion. Refer to Division 22 Section "Plumbing Insulation" for flexible unicellular insulation.

- D. Where proper trap primer outlet piping slope can be maintained and the trap primer outlet line would not be subject to freezing, trap primer outlet lines may be installed as follows:
  - 1. Install below elevated floor slabs.
  - 2. Install in the sub grade of slab on grade.
- E. Install sleeves and caulk at penetrations through building floor for watertight installation. In an elevated floor slab installation, bracket the piping to bottom of floor once the slab is poured.
- F. Refer to Division 22 Section "Water Distribution Piping and Specialties" for trap primer and trap primer inlet pipe requirements.

### **3.11 INSTALLATION TRAP SEALS**

- A. Install trap seals in accordance with manufacturer's written instructions and in locations indicated.
- B. Make watertight seal using an adhesive type caulk along bottom of trap seal, if required by the manufacturer.
- C. Employ a test plug for testing and remove before normal floor drain use. Clean inside of drain tailpiece and install trap seal after testing.
- D. Do not touch elastomeric plug or allow contact with primer or solvent cement.

### **3.12 CONNECTIONS**

- A. Piping Runouts to Fixtures: Provide drainage and vent piping runouts to plumbing fixtures and drains, with approved trap, of sizes indicated; but in no case smaller than required by the plumbing code.
- B. Locate piping runouts as close as possible to bottom of floor slab supporting fixtures or drains.

### **3.13 FIELD QUALITY CONTROL**

- A. Inspections
  - 1. Do not enclose, cover, or put into operation drainage and vent piping system until it has been inspected and approved by the authority having jurisdiction.
  - 2. During the progress of the installation, notify the plumbing official having jurisdiction, at least 24 hours prior to the time such inspection must be made. Perform tests specified below in the presence of the plumbing official.
    - a. Rough-in Inspection: Arrange for inspection of the piping system before concealed or closed-in after system is roughed-in, and prior to setting fixtures.
    - b. Final Inspection: Arrange for a final inspection by the plumbing official to observe the tests specified below and to insure compliance with the requirements of the plumbing code.
    - c. Reinspections: Whenever the piping system fails to pass the test or inspection, make the required corrections, and arrange for reinspection by the plumbing official.
    - d. Reports: Prepare inspection reports, signed by the plumbing official.
- B. Piping System Test: Test drainage and vent system in accordance with the procedures of the authority having jurisdiction, or in the absence of a published procedure, as follows:
  - 1. Test for leaks and defects all new drainage and vent piping systems and parts of existing systems, which have been altered, extended or repaired. If testing is performed in segments, submit a separate report for each test, complete with a diagram of the portion of the system tested.

2. Leave uncovered and unconcealed all new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose all such work for testing, that has been covered or concealed before it has been tested and approved.
  3. Rough Plumbing Test Procedure: Except for outside leaders and perforated or open jointed drain tile, test the piping of plumbing drainage and venting systems upon completion of the rough piping installation. Tightly close all openings in the piping system, and fill with water to the point of overflow, but not less than 10 feet head of water. Water level shall not drop during the period from 15 minutes before the inspection starts, through completion of the inspection. Inspect all joints for leaks.
  4. Final Plumbing Test Procedure: After the plumbing fixtures have been set and their traps filled with water, their connections shall be tested and proved gas and water-tight. Tightly close all openings, initially except vents thru the roof, in the system and fill the system with smoke from one or more smoke machines designed for smoke testing of plumbing systems. When smoke appears at a vent thru the roof, seal the vent thru roof with a test plug. Pressurize the system with 1" water column of smoke for 15 minutes. Use a "U" tube or manometer inserted in the trap of a water closet to measure this pressure. Visually verify all joints for leaks.
  5. Repair all leaks and defects using new materials and retest system or portion thereof until satisfactory results are obtained.
  6. Reports: Prepare inspection reports and required corrective action signed by the plumbing official and turn over to the Architect upon completion of the project.
- C. Super Flush Test:
1. Purpose: This test is designed to closely simulate the usage of the sanitary drainage system at a high usage event such as halftime. The test shall verify that the sanitary system is sized for such an event. Great care shall be taken not to "over simulate" the halftime event by flushing fixtures at a more rapid rate than what can realistically occur.
  2. Procedure:
    - a. Station personnel at each sanitary building drain exit at nearest floor drain, hub drain, floor sink or mop sink. Observe that no overflow occurs during the Super Flush Test of the Water Distribution System. Refer to Division 22 Section "Water Distribution Piping and Specialties" for additional Super Flush Test requirements.
  3. Repair all leaks and defects using new materials and retest system or portion thereof until satisfactory results are obtained. If overflow occurs, verify obstructions are not present downstream of overflow location with a sewer camera. Remove obstructions with power snake. Notify Architect if overflow observed with no obstructions found.
  4. Reports: Prepare observation report of a successful super flush test and turn over to the Architect upon completion of the project.

### **3.14 AD USTING AND CLEANING**

- A. Clean interior of piping system. Remove dirt and debris as work progresses.
- B. Clean drain strainers, domes, and traps. Remove dirt and debris.

### **3.15 PROTECTION**

- A. Protect drains during remainder of construction period, to avoid clogging with dirt and debris, and to prevent damage from traffic and construction work.
- B. Place plugs in ends of uncompleted piping at end of day or whenever work stops.
- C. Exposed PVC Piping: Protect plumbing vents exposed to sunlight with 2 coats of a water based latex paint.

END OF SECTION

**SECTION 22 13 28 - CONDENSATE PUMPS FOR HVAC EQUIPMENT****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes the following types of plumbing pumps:
  - 1. Condensate pumps for HVAC equipment
- B. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 22 Section "Coordination" for basic requirements for electrical components that are an integral part of packaged system components.
  - 2. Division 22 Section "Sanitary Drainage and Vent Piping and Specialties" for condensate pipe material and installation requirements.
  - 3. Division 23 Section "Direct-Digital Control for HVAC" for interlock with HVAC equipment and interlock of alarms with building automation system and alarm wiring.
  - 4. Division 26 Section "Common Work Results for Electrical" for required electrical devices.
  - 5. Division 26 Sections "Enclosed Switches and Circuit Breakers" for field-installed disconnects.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.
  - 1. Product data including standard performance curves, weights (shipping, installed, and operating), furnished specialties, and accessories, plus installation and start-up instructions.
  - 2. Wiring diagrams detailing wiring for power, signal, and control systems; differentiating between manufacturer-installed wiring and field-installed wiring.
  - 3. Maintenance data for condensate pumps, for inclusion in Operating and Maintenance Manuals specified in Division 1 and Division 22 Section "General Plumbing Requirements."

**1.3 QUALITY ASSURANCE**

- A. Hydraulic Institute Compliance: Design, manufacture, and install condensate pumps in accordance with "Hydraulic Institute Standards."
- B. National Electrical Code Compliance: Components shall comply with NFPA 70 "National Electrical Code."
- C. UL Compliance: Plenum rated condensate pumps shall be listed and labeled by UL and comply with Standard 2043 "Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air Handling Spaces".
- D. NEMA Compliance: Electric motors and components shall be listed and labeled NEMA.
- E. Single-Source Responsibility: Obtain plumbing pumps of the same type from a single manufacturer.
- F. Design Criteria: The Drawings indicate capacity, connections, and power requirements of condensate pumps and are based on the specific manufacturer types and models indicated. Pumps having equal performance characteristics by other manufacturers may be considered, provided that deviations in dimensions and profiles do not change the design concept or intended performance as judged by the Architect. The burden of proof for equality of plumbing pumps is on the proposer.

**1.4 WARRANTY**

- A. Warranty on Pumps: Provide written warranty, signed by manufacturer, agreeing to replace/repair, within warranty period, pumps with inadequate or defective materials and workmanship, including leakage, breakage, improper assembly, or failure to perform as required; provided manufacturer's instructions for handling, installing, protecting, and maintaining units have been adhered to during warranty period. Replacement includes both parts and labor for removal and reinstallation.
  - 1. Warranty Period: One year from date of substantial completion.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Products: Subject to compliance with requirements, provide one of the following:
  - 1. Plenum Rated HVAC Condensate Pump:
    - a. Little Giant with no substitutions

**2.2 PUMPS GENERAL**

- A. Condensate Pumps: Factory assembled and factory tested.
- B. Preparation for shipping: Provide suitable packaging to protect pump from damage during shipping.

**2.3 CONDENSATE PUMPS FOR HVAC EQUIPMENT**

- A. General Description: Pumps shall be direct connected, single stage type with body and reservoir of a material suitable for plenum or non-plenum installation as scheduled on plans, normally open safety overflow switch with two dry contacts, integral check valve and power cord with ground.
- B. Non-plenum rated: Reservoir and body shall be either ABS or PE plastic.
- C. Plenum rated: Reservoir and body shall be all polypropylene and meet UL 2043.

**PART 3 - EXECUTION****3.1 INSTALLATION**

- A. Install in accordance with manufacturer's installation instructions.
- B. Install pumps in locations and arrange to provide access for periodic maintenance.
- C. Support pumps and piping separately so that the weight of the piping system does not rest on the pump.

**3.2 EXAMINATION**

- A. Examine areas, equipment foundations, and conditions with Installer present, for compliance with requirements for installation and other conditions affecting performance of plumbing pumps. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Examine rough-in for plumbing piping systems to verify actual locations of piping connections prior to installation.

**3.3 CONNECTIONS**

- A. Piping between the HVAC unit and the pump shall be the greater of the discharge port size on the HVAC equipment or 3/4" pipe size or as shown on plans, whichever is larger. Discharge piping from the condensate pump shall be equal to or greater than the diameter of the pump nozzle, minimum 3/4", or as shown plans, whichever is larger. Condensate pump discharge pipe material is specified in Division 22 Section "Sanitary Drainage and Vent Piping and Specialties".
- B. Electrical wiring and connections are specified in Division 26 section "Common Work Results for Electrical".
- C. Coordinate interlock of condensate pump safety overflow switch with unit served to disable unit if safety overflow switch closes as noted on plans and schedules. HVAC interlock wiring and alarm interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".
- D. Coordinate interlock of condensate pump failure alarm with Building Automation System. HVAC interlock wiring and alarm interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".

**3.4 STARTUP**

- A. Final Checks Before Start-Up: Perform the following preventative maintenance operations and checks before start-up:
  - 1. Ensure pump is connected to the condensate discharge system.
  - 2. Verify all power wiring is in place and power is provided to pump.
- B. Testing procedure for condensate pumps:
  - 1. Pour water into the pump reservoir until the water sensing switch is activated.
  - 2. Verify water is pumped out of the reservoir and that there are no leaks in the condensate piping or at the connection point to the pump.
  - 3. Verify integral check valve is operating properly, replace with new if found to be defective.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 14 00 - STORM DRAINAGE PIPING AND SPECIALTIES****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes building storm drainage piping systems, including drains and drainage specialties.
- B. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 22 Section "General Plumbing Requirements," for trenching and backfilling materials and methods for underground piping installations.
  - 2. Division 33 Section "Storm Systems," for storm drainage piping beginning from 5'-0" outside the building.
  - 3. Division 33 Section "Foundation Drainage," for foundation drainage piping.
  - 4. Division 7 Section "Joint Sealers," for materials and methods for sealing pipe penetrations through basement and foundation walls, and fire and smoke barriers.
  - 5. Division 22 Section "Identification for Plumbing Piping and Equipment," for labeling and identification of drainage piping.
  - 6. Division 22 Section "Common Work Results for Plumbing," for materials and methods for fire barrier penetrations, wall and floor penetrations and equipment pads
  - 7. Division 22 Section "Basic Piping Material and Methods," for materials and methods for mechanical sleeve seals.
  - 8. Division 22 Section "Hangers and Supports for Plumbing Piping," for materials and methods for hanging and supporting drainage piping.
  - 9. Division 22 Section "Plumbing Insulation," for materials and methods for insulating drainage piping.

**1.2 DEFINITIONS**

- A. Storm Building Drain: That part of the lowest piping of a drainage system which receives the discharge from storm drainage pipes inside the walls of the building and conveys it to the building sewer.
- B. Storm Building Sewer: That part of the drainage system which extends from the end of the building drain and conveys its discharge to a public sewer or private sewer or other point of disposal.
- C. Drainage System: Includes all the piping within a public or private premises which conveys storm water or other liquid wastes to a point of disposal. It does not include the mains of public sewer systems or a private or public sewage treatment or disposal plant.

**1.3 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specifications Sections.
- B. Product data for the following products:
  - 1. Drainage piping
  - 2. Drainage piping specialties
  - 3. Area drains
  - 4. Trench drains
  - 5. Roof drains
  - 6. Hubless fitting restraints
- C. Test reports specified in Part 3 of this Section.

**1.4 QUALITY ASSURANCE**

- A. Regulatory Requirements: Comply with the provisions of the following codes:
  - 1. 2015 International Plumbing Code
- B. Comply with the installation requirements for PVC gasketed sewer pipe per the Uni-Bell PVC Pipe Association "Installation Guide for Solid Wall PVC Sewer Pipe". Comply with the installation requirements for gasketed fittings per the Uni-Bell PVC Pipe Association "Installation Guide for PVC Fittings and Laterals for Solid Wall PVC Sewer Pipe".
- C. Obtain installation training from the PVC gasketed sewer pipe manufacturer for all workers that will be installing or handling the PVC gasketed sewer pipe piping systems. Submit certification letter along with each workers certificate of completion to engineer of record within 30-days of mobilization. Include copy of certification letter with closeout documents.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Drainage Piping Specialties, including backwater valves, expansion joints, cleanouts, area/roof drains, cast-iron trench drains and downspout nozzles:
    - a. Josam Mfg. Co.
    - b. Sioux Chief Manufacturing Co. Inc.
    - c. Smith (Jay R) Mfg. Co.
    - d. Tyler Pipe/Wade Div.; Subs. of Tyler Corp.
    - e. Watts Industries, Inc.
    - f. Zurn Industries, Inc.; Hydromechanics Div.
    - g. Mifab Manufacturing, Inc.
  - 2. Heavy Duty Hubless Couplings
    - a. Anaco Husky HD-2000
    - b. Clamp-All 80in. lb.
    - c. Ideal Tridon "HD"
    - d. Mifab Manufacturing, Inc. #MI-XHUB-series
    - e. Mission Rubber Company "Heavyweight"
    - f. ProFlo "HD"
  - 3. Downspout Boots 4" and smaller
    - a. Josam Mfg. Co.
    - b. Smith (Jay R) Mfg. Co.
    - c. Tyler Pipe/Wade Div.; Subs. of Tyler Corp.
    - d. Watts Industries, Inc.
    - e. Zurn Industries, Inc.; Hydromechanics Div.
    - f. Mifab Manufacturing, Inc. Neenah Foundry Company
  - 4. Downspout Boots 5" and larger
    - a. Barrycraft
    - b. R. J. Hoe
    - c. Piedmont Pipe Manufacturing
  - 5. Cast Iron Soil Pipe and Fittings
    - a. AB & I Foundry
    - b. Charlotte Pipe and Foundry Company
    - c. Tyler Pipe / Soil Pipe Division
  - 6. Shielded Transition Couplings
    - a. FERNCO, "Proflex 3000 Series"
    - b. Mifab Manufacturing, Inc. #MI-HUB-ARC-series
    - c. Mission Rubber Company, "Band Seal Specialty Couplings"
  - 7. Underground Shielded Adapter Couplings

- a. FERNCO, "1056 Series with SR73 Shear Ring"
- b. Mifab Manufacturing, Inc. #MI-HUB-ARC-CL-series
- c. Mission Rubber Company, "MR56 Series"
- 8. PVC DWV Fittings 16" and Larger
  - a. Plastic Trends, Inc.
- 9. Hubless Fitting Restraints
  - a. Holdrite
- 10. PVC DWV Expansion Joints
  - a. Charlotte Pipe and Foundry Company #133
  - b. Spears Manufacturing Company #S119
- 11. Backwater Valves
  - a. Cleancheck
  - b. Mainline Backflow Products
  - c. Sioux Chief
  - d. Spears
  - e. Mifab Manufacturing, Inc.

## 2.2 ABOVE GROUND DRAINAGE PIPE AND FITTINGS

- A. Refer to Part 3, Article "Pipe Applications - Above Ground, Within Building" for identification of systems where the materials listed below are used.
- B. Cast-Iron Soil Pipe: CISPI 301 and ASTM A888, hubless pipe and fittings, and bearing the trademark of CISPI and NSF.
  - 1. Heavy duty couplings and compression gaskets: ASTM C564, ASTM C1540 and meeting FM 1680.
- C. Shielded Transition Couplings: ASTM C1460 with neoprene adapter gasket with stainless steel Shield and hose clamps.

## 2.3 UNDERGROUND BUILDING DRAIN PIPE AND FITTINGS

- A. Refer to Part 3, Article "Pipe Applications - Below Ground, Within Building" for identification of systems where the materials listed below are used.
- B. Cast-Iron Soil Pipe: ASTM A74, Service weight, hub-and-spigot soil pipe and fittings, and bearing the trademark of CISPI and NSF. Pipe and fittings shall have a heavy coating of coal tar varnish or asphaltum on both inside and outside surfaces.
  - 1. Neoprene Compression Gaskets: ASTM C564.
- C. PVC DWV Pipe and Fittings: Schedule 40 pipe meeting ASTM D1785 and ASTM D2665 with "solid wall" PVC meeting ASTM D1784 with cell class 12454-B.
  - 1. Fittings: DWV pattern meeting ASTM D2665 with solvent cement socket joints.
  - 2. Solvent: ASTM D2564.
- D. PVC Pressure Pipe and Fittings: Schedule 40 pipe meeting ASTM D1785 with "solid wall" PVC meeting ASTM D1784 with cell class 12454.
  - 1. Fittings: Schedule 40 meeting ASTM D2466 with solvent cement socket joints.
  - 2. Solvent: ASTM D2564.
- E. Underground Shielded Adapter Couplings: ASTM C1173 with neoprene adapter gasket with stainless steel shield and stainless steel hose clamps.

## 2.4 DRAINAGE PIPING SPECIALTIES

- A. Backwater Valves: Valve assembly shall be bronze fitted cast-iron, with bolted cover. Flapper shall provide a maximum 1/4 inch clearance between flapper and seat for air circulation. Valve ends shall suit piping material.

- B. Cleanout Plugs: As specified on the drawings.
- C. Floor Cleanouts: As specified on the drawings.
- D. Wall Cleanouts: As specified on the drawings.
- E. Area drains: As specified on the drawings.
- F. Roof Drains: As specified on the drawings.
- G. PVC DWV Expansion Joints: Schedule 40 PVC DWV meeting ASTM D2665 with socket connections and telescoping expansion joint with EPDM O-ring seal.

## **2.5 TRENCH DRAINS**

- A. Trench drain type designations and sizes are indicated on the Drawings.

## **2.6 HUBLESS FITTING RESTRAINTS**

- A. Pre-engineered kits of galvanized steel pipe straps with stainless steel band clamps and tee bolts, meeting requirements of the CISPI Installation Handbook.

## **PART 3 - EXECUTION**

### **3.1 INSTALLATION GENERAL**

- A. Install pipe and specialties in accordance with manufacturer's installation instructions.

### **3.2 PREPARATION FOUNDATION FOR UNDERGROUND BUILDING DRAINS**

- A. Pipe Beds:
  - 1. PVC Pipe: Support pipe in trench with sand bags level and true to prevent sand, gravel or debris from interfering with the solvent cement process. After pressure testing is complete, gradually install bedding to maintain continuous pipe slope and prevent pipe deflection and then install subbase. Refer to Section "General Plumbing Requirements" for bedding and subbase materials, excavation, trenching, backfill and compaction requirements and refer to ASTM D2321 "Underground Installation of Thermoplastic Pipe for Sewers and Gravity-flow Applications" for additional requirements.
  - 2. Cast Iron Soil Pipe: Shape bottom of trench to fit bottom of pipe for 90-degrees (bottom 1/4 of the circumference). Fill unevenness with tamped sand bedding. At each pipe joint dig bell holes to relieve the bell of the pipe of all loads, and to ensure continuous bearing of the pipe barrel on the foundation and maintain continuous pipe slope. For piping with rock trench bottoms, provide sand pipe bed 6" underneath and around sides of pipe, including fittings. After pressure testing is complete, install subbase. Refer to Section "General Plumbing Requirements" for bedding and subbase materials, excavation, trenching, backfill and compaction requirements.

### **3.3 PIPE APPLICATIONS - ABOVE GROUND WITHIN BUILDING**

- A. Install hubless, cast-iron soil pipe and fittings 15" and smaller for storm pipe.
- B. Install Type DWV copper tube with cast bronze Type DWV fittings 15" and smaller for storm pipe where indicated on the drawings.
- C. Install PVC pressure pipe and fittings for sump pump discharge, except no plastic pipe shall be installed in return air plenums.

- D. As a contractor's option with Owner approval, Install PVC Type DWV Plastic pipe and fittings for 24 inch and smaller storm pipe. Install fabricated fittings for 16 inch and larger.
- E. Install galvanized schedule 40 steel pipe and malleable iron fittings for sump pump discharge pipe.

### 3.4 PIPE APPLICATIONS - BELOW GROUND WITHIN BUILDING

- A. Install hub-and-spigot, service weight, cast-iron, soil pipe and fittings with gasketed joints for 15 inch and smaller storm pipe.
- B. [As a contractor's option with Owner approval, i] Install PVC Type DWV Plastic pipe and fittings for 24 inch and smaller storm pipe. Install fabricated fittings for 16 inch and larger.
- C. Install PVC gasketed sewer pipe and gasketed fittings for 27" and larger storm pipe.
- D. Install PVC pressure pipe and fittings for sump pump discharge.

### 3.5 PIPE AND TUBE JOINT CONSTRUCTION

- A. Copper Tubing: Solder joints in accordance with the procedures specified in AWS "Soldering Manual."
- B. Cast-Iron Soil Pipe: Make hubless joints in accordance with the Cast-Iron Soil Pipe & Fittings Handbook, Chapter IV. Install Couplings as followings:
  - 1. Install heavy duty hubless couplings on storm drainage piping, including connections to roof drains.
  - 2. Install Hubless fitting restraints on joints 5" and larger at:
    - a. Changes of direction from vertical to horizontal
    - b. 4" branch connections, including tees, wyes and wye combination fittings to storm drainage piping 5" and larger
    - c. Horizontal changes of direction 22-1/2 degrees and greater
- C. PVC DWV Pipe: Joining and installation of PVC drainage pipe and fittings shall conform to ASTM D2665.
- D. ABS to PVC Transition Joints: When joining ABS to PVC components (such as an ABS building drain to PVC sewer pipe) make joints using solvent cements conforming to ASTM D3138.
- E. Cast Iron to PVC Above Grade: Join cast iron to PVC with shielded transition couplings.
- F. Cast Iron to PVC Below Grade: Join cast iron to PVC with underground shielded adapter couplings.
- G. Gasketed Fittings: Install fittings per the Uni-Bell PVC Pipe Association "Installation Guide for PVC Fittings and Laterals for Solid Wall PVC Sewer Pipe".

### 3.6 INSTALLATION

- A. General Locations and Arrangements: Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of the piping systems. Location and arrangement of piping layout take into consideration pipe sizing, slope, expansion, and other design considerations. So far as practical, install piping as indicated.
- B. Use fittings for all changes in direction and all branch connections.
- C. Install piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated.
- D. Install piping free of sags or bends and with ample space between piping to permit proper insulation applications.

- E. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated to be exposed to view.
- F. Install horizontal piping as high as possible allowing for proper slope and coordination with other components. Install vertical piping tight to columns or walls. Provide space to permit insulation applications, with 1-inch clearance outside the insulation. Allow sufficient space above removable ceiling panels to allow for panel removal.
- G. Exterior Wall Penetrations: Seal pipe penetrations through exterior walls using sleeves and sealer. Refer to Division 22 Section "Basic Piping Materials and Methods" for special sealers and materials.
- H. Underground Exterior Wall Penetrations: Seal pipe penetrations through underground exterior walls using sleeves and mechanical sleeve sealers. Refer to Division 22 Section "Basic Piping Material and Methods" for additional information.
- I. Fire Barrier Penetrations: Where pipes pass through fire rated walls, partitions, ceilings and floors, maintain the fire rated integrity. Refer to Division 22 Section "Common Work Results for Plumbing" for special sealers and materials.
- J. Elevated Floor Penetrations of Waterproof Membrane, Interior Penetrations of Non-Fire Rated Walls and Concrete Slab on Grade Penetrations: Provide sleeves and seal pipes that pass through waterproof floors, non-fire rated walls, partitions and ceilings or concrete slab on grade. Refer to Division 22 Section "Common Work Results for Plumbing" for special sealers and materials.
- K. Foundation Penetrations: Where pipes pass through foundation walls above strip footings or under strip footings, protect pipes from building load with cast iron soil pipe sleeves two pipe sizes larger than the pipe. Sleeves installed under the strip footing shall be encased in concrete.
- L. Make changes in direction for drainage piping using appropriate 45 degree wyes, combination wye and eighth bend, or long sweep, quarter, sixth, eighth, or sixteenth bends. Sanitary tees or quarter bends may be used on vertical stacks of drainage lines where the change in direction of flow is from horizontal to vertical, except use long-turn pattern combination wye and eighth bends where two fixtures are installed back to back and have a common drain. No change in direction of flow greater than 90 degrees shall be made. Where different sizes of drainage pipes and fittings are connected, use proper sized standard increasers and reducers. Reduction of the size of drainage piping in the direction of flow is prohibited.
- M. Install underground building drains to conform with the plumbing code, and in accordance with the Cast Iron Soil Pipe Institute Engineering Manual. Lay underground building drains beginning at low point of systems, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install required gaskets in accordance with manufacturer's recommendations for use of lubricants, cements, and other special installation requirements. Maintain swab or drag in line and pull past each joint as it is completed.
- N. Install drainage piping pitched down at a minimum slope of 1/4 inch per foot (2 percent) for piping 3 inch and smaller, and 1/8 inch per foot (1 percent) for piping 4 inch and larger.
- O. Extend building drain to connect to service piping, of size and in location indicated for service entrance to building. Storm service piping is specified in a separate section of Division 2.

### 3.7 HANGERS AND SUPPORTS

- A. General: Hanger, support, insulation protection shields, and anchor components and installation procedures conforming to MSS SP-58 and SP-69 are specified in Division 22 Section "Hangers and Supports for Plumbing Piping". Conform to the table below for maximum spacing of supports.
- B. Install the following pipe attachments:
  - 1. Adjustable clevis hangers, MSS SP-69 Type 1, for individual horizontal runs.
  - 2. Riser clamps, MSS SP-69 Type 8, for individual vertical runs.

3. Provide 316 stainless steel rods, nuts, washers, beam clamps, channels, insulation protection shields, adjustable band hangers, MSS SP-69 Type 7, or clevis hangers, MSS SP-69 Type 1, for piping located in Hydrotherapy and Pool Equipment Rooms.
  4. Insulation protection shields and high density insulation at each hanger for insulated pipe as specified in Division 22 Sections "Hangers and Supports for Plumbing Piping" and "Plumbing Insulation".
    - a. Install high density insulation on insulated pipe.
  5. Provide vinyl coated hangers and riser clamps for use with PVC pipe.
  6. Provide roll hangers for individual horizontal runs 100 feet or longer.
- C. Install hangers with maximum horizontal spacing and minimum rod diameters, to comply with MSS-58, locally enforced codes, this specification, and authorities having jurisdiction requirements, whichever are most stringent. Install hangers for horizontal piping with the following maximum spacing and minimum rod diameters:

Nom. Pipe Size	Steel Pipe Max. Span	Copper Tube Max. Span.	Min. Rod Dia. - Inches
<u>In Inches</u>	<u>In Feet</u>	<u>In Feet</u>	
Up to 1-1/4	12	6	3/8
1-1/2 to 2	12	10	3/8
2-1/2 to 3	12	10	3/8
4	12	10	3/8
5	12	10	1/2
6	12	10	1/2
8	12	10	1/2
10 to 12	12	10	5/8
14	12	N/A	3/4
16	12	N/A	7/8

1. Support all sizes of hubless horizontal cast iron piping every five feet, except up to ten feet where ten foot sections are installed. Support all sizes of hubless horizontal cast iron piping every other joint, unless over four feet, then support each joint. Provide support adjacent to joint, not to exceed 18". Provide sway brace on horizontal piping at not more than 40' intervals to prevent horizontal movement. Provide support at each horizontal branch.
  2. Support all sizes of vertical cast iron piping every ten feet.
  3. Support all sizes of horizontal of PVC piping every four feet.
  4. Support all sizes of vertical of PVC piping every floor, but not to exceed ten feet. For sizes 2 inches and smaller, provide guide midway between required vertical supports.
  5. Support piping within 12" of each elbow or tee.
- D. Sway bracing:
1. Provide rigid sway bracing for pipe 4" and larger at changes of direction greater than 45 degrees.

### 3.8 INSTALLATION OF PIPING SPECIALTIES

- A. Install backwater valves in storm building drain piping as indicated, and as required by the plumbing code. For interior installation, provide cleanout cover flush to floor centered over backwater valve cover and of adequate size to remove valve cover for service.
- B. Provide PVC DWV expansion joints every 30' on straight vertical PVC waste or sanitary stacks receiving hot water waste. Install expansion joint at middle travel for equal expansion and contraction travel. Provide riser clamps within 18" of each end of expansion joint. Install expansion joint per manufacturer's installation instructions.
- C. Install expansion joints on stacks or horizontal piping as indicated, and as required by the plumbing code.

- D. Above Ground Cleanouts: Install in above ground piping and building drain piping as indicated, and:
1. as required by plumbing code;
  2. at each change in direction of piping greater than 45 degrees;
  3. at minimum intervals of 50' for piping 4" and smaller and 100' for larger piping;
  4. at base of each vertical soil, waste, or storm water stack.
- E. Cleanout Covers: Install floor and wall cleanout covers for concealed piping, types as indicated.
- F. Floor Cleanouts: Install in below floor building drain piping as indicated and:
1. as required by plumbing code;
  2. at each change in direction of piping greater than 45 degrees;
  3. Install in below floor building drain piping at minimum intervals of 50' for piping 4" and smaller and 75' for larger piping;
  4. Install floor cleanouts in waterproof floors with waterproof membrane securely flashed with cleanout body flashing clamp so that no leakage occurs between cleanout body and adjoining flooring. Maintain integrity of waterproof membranes, where penetrated.
- G. Exterior Cleanouts: Install exterior cleanouts embedded in a 18" x 18" x 8" block of concrete, flush with finished grade.

### 3.9 INSTALLATION OF AREA DRAINS

- A. Install area drains in locations indicated.
- B. Install area drains at low points of surface areas to be drained, or as indicated. Set tops of drains flush with finished floor.
- C. Refer to architectural documents for floor slope requirements and set area drain elevation to match. Where architectural documents do not indicate the requirements, set the area drain elevation depressed below the finished slab elevation as listed below to provide proper slope to drain:

<u>DEPRESSION IN INCHES</u>	<u>RADIUS OF AREA DRAINED - FEET</u>
1/2	5
3/4	10
1	15
1-1/4	20
1-1/2	25

- D. Provide P-traps for drains connected to combined sanitary and storm sewer.
- E. Install area drains in waterproof floors with waterproof membrane securely flashed with drain flashing clamp so that no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes, where penetrated.
- F. Position drains so that they are level, accessible and easy to maintain.

### 3.10 INSTALLATION OF ROOF DRAINS

- A. Install roof drains at low points of roof areas with the roof membrane securely flashed with drain flashing clamp so that no leakage occurs between drain and roof membrane.
- B. Install drain flashing collar or flange so that no leakage occurs between roof drain and adjoining roofing. Maintain integrity of waterproof membranes, where penetrated.
- C. Position roof drains so that they are accessible and easy to maintain.

**3.11 FIELD QUALITY CONTROL**

- A. Inspections
  - 1. Do not enclose, cover, or put into operation the storm drainage piping system until it has been inspected and approved by the authority having jurisdiction.
  - 2. During the progress of the installation, notify the plumbing official having jurisdiction, at least 24 hours prior to the time such inspection must be made. Perform tests specified below in the presence of the plumbing official.
    - a. Rough-in Inspection: Arrange for inspection of the storm drainage piping system before concealed or closed-in after system is roughed-in.
    - b. Final Inspection: Arrange for a final inspection by the plumbing official to observe the tests specified below and to ensure compliance with the requirements of the plumbing code.
    - c. Reinspections: Whenever the piping system fails to pass the test or inspection, make the required corrections, and arrange for reinspection by the plumbing official.
    - d. Reports: Prepare inspection reports, signed by the plumbing official.
- B. Piping System Test: Test storm drainage system in accordance with the procedures of the authority having jurisdiction, or in the absence of a published procedure, as follows:
  - 1. Test for leaks and defects all new storm drainage piping systems and parts of existing systems, which have been altered, extended or repaired. If testing is performed in segments, submit a separate report for each test, complete with a diagram of the portion of the system tested.
  - 2. Leave uncovered and unconcealed all new, altered, extended, or replaced storm drainage piping until it has been tested and approved. Expose all such work for testing, that has been covered or concealed before it has been tested and approved.
  - 3. Rough Plumbing Test Procedure: Except for outside leaders and perforated or open jointed drain tile, test the piping of storm drainage piping systems upon completion of the rough piping installation. Tightly close all openings in the piping system, and fill with water to the point of overflow, but not less than 10 feet head of water. Water level shall not drop during the period from 15 minutes before the inspection starts, through completion of the inspection. Inspect all joints for leaks.
  - 4. Repair all leaks and defects using new materials and retest system or portion thereof until satisfactory results are obtained.
  - 5. Reports: Prepare inspection reports and required corrective action signed by the plumbing official and turn over to the Architect upon completion of the project.

**3.12 ADJUSTING AND CLEANING**

- A. Clean interior of piping system. Remove dirt and debris as work progresses.
- B. Clean drain strainers and domes. Remove dirt and debris.

**3.13 PROTECTION**

- A. Protect drains during remainder of construction period, to avoid clogging with dirt and debris, and to prevent damage from traffic and construction work.
- B. Place plugs in ends of uncompleted piping at end of day or whenever work stops.
- C. Exposed PVC Piping: Protect storm drainage piping exposed to sunlight with 2 coats of a water based latex paint.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 14 89 - SUMP PUMPS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes the following types of plumbing pumps:
  - 1. Sump pumps
- B. Related Sections: The following sections contain requirements that relate to this Section:
  - 1. Division 3 Section "Concrete Work" for specifications on concrete and reinforcing materials and concrete placing requirements for sump basins and covers.
  - 2. Division 22 Section "Basic Piping Material and Methods," for materials and methods for mechanical sleeve seals.
  - 3. Division 22 Section "Coordination" for basic requirements for electrical components that are an integral part of packaged system components.
  - 4. Division 22 Section "Storm Drainage Piping and Specialties" for sump pump discharge pipe material and installation requirements.
  - 5. Division 23 Section "Direct-Digital Control for HVAC" for interlock of alarms with building automation system and alarm wiring.
  - 6. Division 26 Section "Common Work Results for Electrical" required electrical devices.
  - 7. Division 26 Sections "Enclosed Switches and Circuit Breakers" for field-installed disconnects.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.
  - 1. Product data including standard performance curves, weights (shipping, installed, and operating), furnished specialties, and accessories, plus installation and start-up instructions.
  - 2. Shop drawings showing layout and connections for plumbing pumps. Include setting drawings with templates, and directions for installation of foundation bolts, anchor bolts, and other anchorages.
  - 3. Wiring diagrams detailing wiring for power, signal, and control systems; differentiating between manufacturer-installed wiring and field-installed wiring.
  - 4. Maintenance data for plumbing pumps, for inclusion in Operating and Maintenance Manuals specified in Division 1 and Division 22 Section "General Plumbing Requirements."
  - 5. Shop drawings showing basins with depth, inlet, outlet and vent locations, pit covers, float switches, non-clog check valves and shutoff valves.

**1.3 QUALITY ASSURANCE**

- A. Hydraulic Institute Compliance: Design, manufacture, and install plumbing pumps in accordance with "Hydraulic Institute Standards."
- B. National Electrical Code Compliance: Components shall comply with NFPA 70 "National Electrical Code."
- C. UL Compliance: Control panels shall be listed and labeled by UL and comply with Standard 508A "Control Panels".
- D. NEMA Compliance: Electric motors and components shall be listed and labeled NEMA.

- E. SSPMA Compliance: Test and rate sump pumps in accordance with the Sump and Sewage Pump Manufacturers Association (SSPMA) Standards.
- F. Single-Source Responsibility: Obtain plumbing pumps of the same type from a single manufacturer.
- G. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS) Compliance: Comply with the MSS Standard Practices below:
  - 1. MSS SP 72 "Ball Valves with Flanged or Butt Welding Ends"
  - 2. MSS SP 110 "Ball Valves, Threaded, Socket Welding, Solder Joint, Grooved and Flared Ends"
- H. Valves shall be manufactured in plants located in the United States or certified that they comply with applicable ANSI, ASTM and MSS standards.
- I. Design Criteria: The Drawings indicate sizes, profiles, connections, and dimensional requirements of plumbing pumps and are based on the specific manufacturer types and models indicated. Pumps having equal performance characteristics by other manufacturers may be considered, provided that deviations in dimensions and profiles do not change the design concept or intended performance as judged by the Architect. The burden of proof for equality of plumbing pumps is on the proposer.

#### 1.4 WARRANTY

- A. Warranty on Pumps: Provide written warranty, signed by manufacturer, agreeing to replace/repair, within warranty period, pumps with inadequate or defective materials and workmanship, including leakage, breakage, improper assembly, or failure to perform as required; provided manufacturer's instructions for handling, installing, protecting, and maintaining units have been adhered to during warranty period. Replacement includes both parts and labor for removal and reinstallation.
  - 1. Warranty Period: One year from date of substantial completion.

### PART 2 - PRODUCTS AND MATERIALS

#### 2.1 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide one of the following:
  - 1. Elevator Pit Sump Pumps:
    - a. ABS Pump, Inc.,
    - b. FLYGT
    - c. Weil Pump Company
  - 2. Submersible Sump Pump High Level Alarms:
    - a. Weil Pump Company
    - b. Zoeller Pump Company
    - c. SJE Rhombus
  - 3. Full Port Bronze Ball Valves – 2" and smaller:
 

<u>MANUFACTURER</u>	<u>THREADED ENDS</u>	<u>SOLDER ENDS</u>
Apollo	77C-100	77C-200
Hammond	8301A	8311A
Milwaukee	BA-400	BA-450
Nibco	T-585-70	S-585-70
  - 4. Full Port Cast Iron Ball Valves – 2-1/2" and larger:
    - a. Apollo (Conbraco) "6P"
    - b. Watts "G4000M1"
  - 5. Non-Clog "Flapper Type" Check Valves:

- a. Liberty Pumps "Series CVXXXC"
- b. Little Giant Pump Company "Series CV-SE"
- c. Zoeller Pump Company "Series 30"
- 6. Cast Iron "Sinking Ball Type" Non-Clog Check Valves - 2" and smaller:
  - a. Flomatic "208"
  - b. FLYGT "2002"
  - c. GW Industries, Inc. "240T"
- 7. Cast Iron "Sinking Ball Type" Non-Clog Check Valves – 2-1/2" and larger:
  - a. Flomatic "508"
  - b. FLYGT "5087"
  - c. GW Industries, Inc. "240D"
- 8. Sump Basins
  - a. AK Industries
  - b. Fiberbasin, Inc.
  - c. Topp
- 9. Basin Covers:
  - a. Bilco
  - b. U.S.F. Fabrication
- 10. Control Panels
  - a. Cougar Sales
  - b. Sulzer
  - c. FLYGT
  - c. Weil Pump Company

## 2.2 PUMPS GENERAL

- A. Pumps: factory assembled and factory tested.
- B. Preparation for shipping: After assembly and testing, clean flanges and exposed machined metal surfaces and treat with an anticorrosion compound. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.
- C. Motors: Conform to NEMA standards; single, multiple, or variable speed with type of enclosure and electrical characteristics as indicated; have built-in thermal-overload protection and grease-lubricated ball bearings. Select motors that are non-overloading within the full range of the pump performance curve.
- D. Apply factory finish paint to assembled, tested units prior to shipping.

## 2.3 ELEVATOR PIT SUMP PUMPS – □ HP AND SMALLER

- A. General Description: Pumps shall be simplex centrifugal, direct connected, floor mounted, single stage type with cast iron body, stainless steel shaft, cast iron impeller, mechanical seal, permanently lubricated upper and lower ball bearings complete with integral inlet strainer, mechanical float switch, and power cord with ground.
- B. Casing: Cast iron with integral cast-iron inlet strainer and legs to elevate the pump to permit flow into the impeller. Vertical discharge with screwed female connection.
- C. Impeller: Statically and dynamically balanced, open or semiopen, overhung, single suction, fabricated from cast iron, keyed to shaft and secured by a locking capscrew.
- D. Pump and Motor Shaft: Stainless steel, with factory-sealed, upper and lower grease-lubricated ball bearings.
- E. Seals: Carbon steel rotating ring, stainless-steel spring, ceramic seat, and Buna-N bellows and gasket.

- F. Motor: NEMA 6 with class F insulation, hermetically sealed, 1750 RPM, capacitor start, air filled with built-in overload protection, with 3-conductor, waterproof cable and grounding plug.
- G. Controls: NEMA 1, tethered float switch for "on-off" control with "piggy back" power cord connection for sump pump power cord.

## 2.4 SUMP PUMPS

- A. General Description: Pumps shall be duplex centrifugal, direct connected, floor mounted, single stage type with cast iron body, stainless steel shaft, cast iron impeller, mechanical seal, permanently lubricated upper and lower ball bearings complete, control panel, mechanical float switch, and power cords with grounds.
- B. Casing: Cast iron with integral cast-iron legs to elevate the pump to permit flow into the impeller. Pump casing, volute and impeller shall pass a 2" diameter sphere. . Vertical discharge with screwed female connection.
- C. Rail Retrieval System: Provide with cast iron floor elbow, gasket, anchor bolts, yoke, pipe guides, stainless steel rope, and upper guide bracket.
- D. Impeller: Statically and dynamically balanced, open or semiopen, overhung, single suction, fabricated from cast iron, keyed to shaft and secured by a locking capscrew.
- E. Pump and Motor Shaft: Stainless steel, with factory-sealed, upper and lower grease-lubricated ball bearings.
- F. Seals: Single mechanical seal with carbon steel rotating ring, stainless-steel spring, ceramic seat, and Buna-N bellows and gasket.
- G. Seals: Tandem mechanical seals mounted in cast iron body seal chamber with upper seal of carbon rotating ring, stainless-steel spring, ceramic seat, and Buna-N bellows and gasket and lower seal of silicon carbide rotating ring, stainless-steel spring, silicon carbide seat, and Buna-N bellows and gasket.
- H. Motor: Hermetically sealed, with built-in overload protection, air filled, 1750 RPM, NEMA class B insulation capable of a maximum continuous operating temperature of 120F, 3-conductor and waterproof cable.
- I. Basin: Fiberglass reinforced plastic, PVC plastic is not acceptable, with a minimum wall thickness of 3/16", 2" wide retainer ring at the basin bottom and every four feet and factory pipe penetration connection kits. Refer to the drawings for basin dimensions.
- J. Basin: Cast in place concrete or pre-cast concrete, refer to structural drawings.
- K. Cover: Epoxy coated steel or aluminum gasketed round cover with holes for discharge piping, vent and conduits. Access cover shall be completely flush for all for discharge piping, vent and conduits entering or exiting the sump pit under the slab as indicated on the drawings.
- L. Controls: NEMA 4X fiberglass dead front door enclosure, complete with lockable combination circuit breaker magnetic motor starter and 3 leg overload protection with reset for each motor, internal test-off-automatic pump run switches, 120V control circuit transformer fused on primary and secondary, non-resettable pump run time hour meter for each pump, terminal board for connection of pumps and level sensors and automatic alternator for alternating lead-lag pump selection and to provide for both pumps to operate simultaneously under high level condition. Provide with power "on" indicator light, pump "on" light for each pump, overload relays and indicator lights, high level alarm relay, light and horn, moisture sensor alarm light for each pump, auxiliary alarm contacts for each alarm condition. Circuit breakers shall have minimum AIC rating as indicated on the Electrical Drawings. Control panel shall have a unit short circuit current rating equal to or greater than the available short circuit current as indicated on the electrical drawings.

Control panel shall be configured for terminating one incoming power feeder. Control panel shall be configured for terminating two incoming power feeders.

M.

N. VFD Controls: NEMA 4 enclosure with dead front door with lockable through door disconnect, programmable logic controller (PLC), lockable combination circuit breaker magnetic motor starter and 3 leg overload protection with reset for each motor, internal test-off-automatic pump run switches, 120V control circuit transformer fused on primary and secondary, terminal board for connection of pumps and level sensors and lightening arrestor. Provide with power "on" indicator light, overload relays, high level alarm relay, light and horn, second pump running alarm relay, failsafe relay, PLC Failure alarm relay, moisture sensor alarm for each pump, temperature limiter circuit alarm for each pump, auxiliary alarm contacts for each alarm condition. Provide with level transmitter with base and (3) redundant float switches. Circuit breakers shall have minimum AIC rating as indicated on the Electrical Drawings. Control panel shall have a unit short circuit current rating equal to or greater than the available short circuit current as indicated on the electrical drawings. Control panel shall be configured for terminating one incoming power feeder. Refer to control drawings for interlock of alarm contacts with the building automation system.

1. Touchscreen operator interface for monitoring and adjustment of the programmable controller variables with virtual on-off-automatic selector switch for each pump, high level alarm, pump running indicators, thermal overload indicator for each pump, moisture indicator for each pump and virtual hour meter for each pump. Second pump running alarm. PLC shall alternate lead-lag pump selection and to provide for two pumps to operate simultaneously under high level condition with third pump as standby. PLC shall alternate standby pump as "first "on" pump" after end of each pumping cycle.
2. Programmable Logic Controller (PLC): Designed specifically for the control of pumps with variable speed drives capable of receiving two analog pressure inputs, analog flow input, automatic pump alternating and On-line field modified data entries for staging pumps, with software memory stored in non-volatile EPROM memory, furnish with user interface keypad with LED display.
3. Variable Speed Drive: The variable speed drives (VFD) shall be adjustable frequency which employ a pulse width modulated inverter. The drive shall include built in diagnostics. Diagnostics shall be annunciated through the alpha numeric keypad. The drive shall be listed UL, ETL and/or CSA. To ensure safety of the equipment, the VFD shall include these protective features and options:
  - a. NEMA 1 enclosure.
  - b. Static instantaneous over-current and over-voltage trip.
  - c. Static over-speed (over-frequency) protection.
  - d. Line or fuse loss and under-voltage protection.
  - e. Power unit over-temperature protection.
  - f. Motor inverse time overload protection.
  - g. Input fused disconnect or circuit breaker.
  - h. Total voltage harmonic distortion from the VFD shall be less than 5% to meet IEEE requirements.
  - i. Speed meter.
  - j. Automatic restart after power failure or minor drive fault. The drive shall attempt a minimum of two restarts before a complete drive shut-down.
  - k. Power on light.
  - l. Manual speed potentiometer or control capability through the keypad.
  - m. Hand/Off/Automatic Switch or Manual/Automatic Switch with start/stop pushbutton.
  - n. Test switch
  - o. VFD fault light and reset.
  - p. Output to the PLC and integral LED display
  - q. The VFD shall be microprocessor based and utilize digital input for all parameter adjustments. The VFD shall include a digital display for monitoring system parameters

- and for first fault indication, and digital input programming capability on the main logic board.
- r. The VFD shall operate on a frequency range of 1 to 66 Hz with resolution of 0.1% of base speed with analog input or 0.025% with digital input and have accuracy within 0.05% of set point. VFD shall operate in environment of 0 to 40 degrees C, 3,300 feet altitude and 95% non-condensing humidity without derating.
  - s. All control circuit voltages shall be physically and electrically isolated from power circuit voltages.
4. All VFD's shall be tested/run in the equivalent of NEMA 1 enclosure and burned in at rated ambient (40° C) with a fully loaded motor.
  5. Sequence of operation:
    - a. Minimum run speed is 48Hz or 1400 rpm
    - b. The sewage ejector shall be in automatic mode.
    - c. When the water level rises from the level of pumps "off" to the level of first pump "on", the PLC shall start the lead pump. The PLC shall modulate the pump speed to maintain the water level in the pit at the level of first pump "on".
    - d. If water level rises to the water level of second pump "on", the PLC shall start the lag pump with a minimum run speed of 1400 rpm and the first pump will run with a minimum run speed of 1400 rpm. The PLC shall modulate the pumps speed to maintain the water at the level of second pump "on". When water level drops to the level of first pump "on", the PLC shall stop the lead pump.
    - e. When the PLC runs the pump at 48Hz or 1400 rpm and the water level drops to the level of pump "off", the PLC shall stop the pump. The lag pump shall start for the next control sequence. If a pump runs continuously for 24 hours, the PLC shall stop the lead pump and start the lag pump.
  6. Safeties:
    - a. High Level Alarm
      - 1) When the water level rises to the level of "high level alarm" an audible alarm shall sound and an alarm signal shall be sent to the BMS or local building alarm system.
    - b. Second Pump Running Alarm
      - 1) When the water level rises to the level of second pump "on", an alarm signal shall be sent to the BMS or local building alarm system.
    - c. Moisture Sensor Alarm
      - 1) When the moisture sensor in each pump senses moisture, an alarm "light" shall appear in the touch screen and an alarm signal shall be sent to the BMS or local building alarm system.
    - d. High Temperature Sensor Alarm
      - 1) When the temperature sensor in each pump senses moisture, an alarm "light" shall appear in the touch screen and an alarm signal shall be sent to the BMS or local building alarm system.
    - e. Level Transmitter Failure and Alarm
      - 1) If the level transmitter fails to send control signal to the PLC, the PLC shall shift control of the pumps via the failsafe relay to use the float switches to control the pumps at full speed. When water level rises to the water level of first pump "on", lead pump shall start. When water level drops to the level of pumps "off" the lead pump shall stop. The lag pump shall start for the next control sequence
      - 2) When the level transmitter fails to send control signal to the PLC, an alarm "light" shall appear in the touch screen and an alarm signal shall be sent to the BMS or local building alarm system.
    - f. PLC Failure and Alarm
      - 1) If the PLC has loss of power or logic failure, the failsafe relay shall use the float switches to control the pumps at full speed. When water level rises to the water level of first pump "on", lead pump shall start. When water level

drops to the level of pumps "off" the lead pump shall stop. The lag pump shall start for the next control sequence

- 2) The failsafe relay shall send a "PLC Failure Alarm" alarm signal to the BMS or local building alarm system.
- O. Level Controls: Pole mounted tethered float switches with chord grips, pole mounting plate and cover. Float switches shall be 120V 3 amp single pole normally open that closes on the rise for pump "off", first pump "on" second pump "on" and high level alarm.
  - P. Junction Box: NEMA 6P enclose of fiberglass reinforced polyester with fully gasketed cover, terminal strip and inlets and outlets for four control and two power connections.
  - Q. Disconnect: Disconnect is provided under Division 26 Section "Enclosed Switches and Circuit Breakers".

## 2.5 SUMP PUMP HIGH LEVEL ALARMS

- A. Alarm: Remote type 120V single phase with NEMA 4X enclosure, terminal block, 5 amp isolated alarm contact, alarm horn, alarm light, test-automatic-silence switch and mechanical float switch.

## 2.6 OIL SENSING SUMP PUMP ALARMS

- A. Alarm Panel: Remote type 120V NEMA 3R panel, oil and water sensor, power cord, receptacle for pump power cord, 85 bd alarm horn, oil present alarm light, water present alarm light, silence switch, test switch and alarm contacts for each alarm condition.

## 2.7 BALL VALVES

- A. Ball Valves, 2 Inch and Smaller: Meeting MSS SP 110, Class 150, 600-psi CWP; two-piece construction; with ASTM B 584 cast bronze, full port, blowout-proof stem and chrome-plated brass ball, with replaceable "Teflon" or "TFE" seats and seals, solder or threaded ends and vinyl-covered steel handle.
- B. Cast Iron Body Ball Valves, 2-1/2" and larger: Meeting MSS SP 72, 200-psi CWP, maximum operating temperature of 140F; two piece cast iron body meeting ASTM A126 Class B with flanged ends, 304 stainless steel full port ball and shaft, ductile iron handle, PTFE gasket, stem seal and seat.

## 2.8 CHECK VALVES

- A. Non Clog "Flapper Type" Check Valves, 2 Inch and Smaller: Flapper type with PVC body compression end fittings with Buna-N "O" ring and Buna-N flapper with PVC shields.
- B. Non Clog "Sinking Ball Type" Check Valves: Sinking ball type with cast iron body, steel ball with hollow core and Buna-N coating. Valve body shall be configured for unobstructed flow. Valves 2" and smaller with screwed ends and valves 2-1/2" and larger with flanged ends.

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Install in accordance with manufacturer's installation instructions.
- B. General: Comply with the manufacturer's written installation and alignment instructions.
- C. Install pumps in locations and arrange to provide access for periodic maintenance, including removal of motors, impellers, couplings, and accessories.

- D. Support pumps and piping separately so that the weight of the piping system does not rest on the pump.
- E. Basins: Install sump pump basins in indicated locations and connect to drainage lines. Brace interior of basin in accordance with manufacturer's instructions to prevent distortion or collapse during concrete placement. Refer to Division 3 for concrete work. Set cover over basin and fasten to top flange of basin. Install so cover is flush with finished floor.

### 3.2 EXAMINATION

- A. Examine areas, equipment foundations, and conditions with Installer present, for compliance with requirements for installation and other conditions affecting performance of plumbing pumps. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Examine rough-in for plumbing piping systems to verify actual locations of piping connections prior to installation.

### 3.3 CONNECTIONS

- A. General: Install valves that are same size as the piping connecting the pump.
- B. Install discharge pipe sizes equal to or greater than the diameter of the pump nozzles. Sump pump discharge pipe material is specified in Division 22 Section "Storm Drainage Piping and Specialties".
- C. Install a non-clog check valve in an accessible location or where indicated on the drawings. Install a full port ball valve on the discharge side of sump pumps downstream of the check valve.
- D. Electrical wiring and connections are specified in Division 26 section "Common Work Results for Electrical".
- E. Install inlets or outlets to fiberglass sump basins in the field at the required elevation. Cut inlet or outlet per the basin manufacturer's instructions, as installation requires with factory penetration kits at each penetration. See drawings for inlet and outlet elevations.
- F. Install sump basin inlets or outlets in the field at the required elevation. Seal penetrations with mechanical link seals. Mechanical link seals are specified in Division 22 Section "Basic Piping Material and Methods." See drawings for inlet and outlet elevations.
- G. Coordinate interlock of elevator pit high level alarm with building automation system. Alarm wiring and alarm interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".
- H. Coordinate interlock of sump pump high level, two moisture sensor, two high temperature shutdown, and two overload alarms with building automation system. Alarm wiring and alarm interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".
- I. Coordinate interlock of sump pump high level, two moisture sensor, two high temperature shutdown, two overload alarms, second pump running alarm, PLC failure alarm and level transmitter failure alarm with building automation system. Alarm wiring and alarm interlock with the building automation system are specified in Division 23 Section "Direct-Digital Control for HVAC".

### 3.4 FIELD QUALITY CONTROL

- A. Pressure Testing: Perform a pressure test on the discharge assembly. The test pressure shall be twice that of the shut off head of the pump.

- B. Valve Testing: After piping systems have been tested and put into service, but before final adjusting and balancing, inspect valves for leaks. Adjust or replace packing to stop leaks; replace valves if leak persists.

### 3.5 STARTUP

- A. Final Checks Before Start-Up: Perform the following preventative maintenance operations and checks before start-up:
  - 1. Lubricate oil-lubricated bearings.
  - 2. Remove grease-lubricated bearing covers and flush the bearings with kerosene and thoroughly clean. Fill with new lubricant in accordance with the manufacturer's recommendations.
  - 3. Disconnect coupling and check motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
  - 4. Check that pump is free to rotate by hand. For pumps handling hot liquids, pump shall be free to rotate with the pump hot and cold. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.
- B. Starting procedure for pumps with shutoff power not exceeding the safe motor power:
  - 1. Prime the pump, opening the suction valve, closing the drains, and prepare the pump for operation.
  - 2. Start motor.
  - 3. Open the discharge valve slowly.
  - 4. Observe the leakage from the stuffing boxes and adjust the sealing liquid valve for proper flow to ensure the lubrication of the packing. Do not tighten the gland immediately, but let the packing run in before reducing the leakage through the stuffing boxes.
  - 5. Check the general mechanical operation of the pump and motor.
- C. If the pump is to be started against a closed check valve with the discharge shut-off valve open, the steps are the same except that the discharge shut-off valve is opened some time before the motor is started.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 22 34 00 - FUEL FIRED DOMESTIC WATER HEATERS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes commercial gas fired water heaters.
- B. Related Sections: The following Sections contain requirements that relate to this Section:
  - 1. Division 3 Section "Concrete Work" for specifications on concrete and reinforcing materials and concrete placing requirements for equipment pads.
  - 2. Division 22 Section "Common Work Results for Plumbing" for concrete equipment pads.
  - 3. Division 22 Section "Basic Piping Materials and Methods" for flexible metal braid connectors, pipe joining materials, specialties, unions, dielectric unions, dielectric flanges, dielectric flange kits and basic installation requirements.
  - 4. Division 22 Section "Meters and Gauges for Plumbing Piping." for thermometers and their installation requirements.
  - 5. Division 22 Section "Natural Gas Piping" for natural gas equipment connections.
  - 6. Division 23 Section "Breechings, Chimneys, and Stacks" for gas-fired water heater vents.
  - 7. Division 26 Section "Common Work Results for Electrical" for required electrical devices.
  - 8. Division 26 Sections "Enclosed Switches and Circuit Breakers" for field-installed disconnects.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.
  - 1. Product data including rated capacities of selected models, weights (shipping, installed, and operating), furnished specialties, and accessories, and indicating dimensions, required clearances, and methods of assembly of components, and piping and wiring connections.
  - 2. Wiring diagrams from manufacturers detailing electrical requirements for electrical power supply wiring to water heaters. Include ladder-type wiring diagrams for interlock and control wiring required for final installation of water heaters and controls. Differentiate between portions of wiring that are factory installed and portions that are to be field installed.
  - 3. Certificates of shop inspection and data report as required by provisions of the ASME Boiler and Pressure Vessel Code.
  - 4. Maintenance data for inclusion in Operating and Maintenance Manual specified in Division 1 and Division 22 Section "General Plumbing Requirements."

**1.3 QUALITY ASSURANCE**

- A. UL Standards: Provide water heaters complying with the following:
  - 1. UL 732, "Oil Fired Water Heaters."
  - 2. UL 778, "Motor Operated Water Pumps."
- B. NSF Standards: Provide water heaters complying with NSF No. 5, "Standard for Hot Water Generating Equipment for Food Service Establishments using Spray Type Dishwashing Machines," and bearing NSF label.
- C. Electrical Component Standard: Provide components complying with NFPA 70 "National Electrical Code."
- D. Listing and Labeling: Provide water heaters that are listed and labeled.
  - 1. The terms "listed" and "labeled" shall be as defined in the National Electrical Code, Article 100.

2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.
- E. AGA Standards: Provide water heaters that bear the label of the American Gas Association.
- F. ASME Code Compliance: Provide water heaters and safety relief valves that comply with ASME Boiler and Pressure Vessel Code and that bear the appropriate code symbols.
- G. State Boiler Code Compliance: Provide rated water heaters, safety relief valve, gas train and accessories that comply with the state boiler code in effect.
- H. ASHRAE Standards: Provide water heaters with performance efficiencies not less than prescribed in ASHRAE 90.1b, "Energy Conservation in New Building Design."
- I. Design Concept: The drawings indicate types and capacities of water heaters and are based on specific descriptions and manufacturers indicated. Water heaters having equal performance characteristics by other manufacturers may be considered provided that deviations in capacities, dimensions, operation, or other characteristics are minor and do not change the design concept or intended performance as judged by the Architect. Burden of proof for equality of water heaters is on the proposer.

#### 1.4 WARRANTY

- A. Special Project Warranty: Submit a written warranty, executed by manufacturer, agreeing to repair or replace water heater units that fail in materials or workmanship within the specified warranty period. Failures include, but are not limited to, controls, tanks, coils, heat exchangers, and burners. This warranty shall be in addition to, and not a limitation of, other rights the Owner may have against the Contractor under the Contract Documents.
  1. Commercial, Gas Fired, Storage Water Heaters:
    - a. Storage Tank: Three years.
    - b. Controls and Other Components: One year.
  2. Commercial, Finned-Tube, Gas Fired Water Heaters:
    - a. Heat Exchanger: Five years.
    - b. Controls and Other Components: One year.
    - c. Separate Hot-Water Storage Tanks: Five years.

### PART 2 - PRODUCTS AND MATERIALS

#### 2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Commercial Atmospheric Gas-Fired Water Heaters:
    - a.
    - b. A.O. Smith Water Products Co. Div.; A.O. Smith Corp.
  2. Gas-Fired High Efficiency Water Heaters With Fan Assisted Combustion And All Stainless Steel Heat Exchanger
    - a. LAARS - "Neotherm"
    - b. Lochinvar Water Heater Corp. - "Armor"
    - c. Raypak "XFyre"
    - d. RB & I - "Fusion"
  3. Thermal Expansion Tanks
    - a. Armstrong Pumps, Inc.
    - b. Amtrol, Inc.
    - c. Bell & Gosset, ITT
    - d. Elbi
    - e. TACO, Inc.

- a. Watts
- b. Wessels Tank Co.
4. Vacuum Relief Valves
  - a. Apollo #37
  - b. Cash ACME #VR-801
  - c. Watts #N36
  - d. Wilkins #VR-10

## 2.2 ATMOSPHERIC GAS-FIRED WATER HEATERS

- A. Description: Automatic, commercial, gas-fired; with vertical, ASME labeled, 150-psig-rated tank, gas burner, integral controls, draft diverter, drain valve, gas regulator, and relief valve.
  1. Fuel: Natural gas.
  2. Fuel: Liquefied petroleum (LP) gas.
- B. Insulation: Fiberglass, surrounding tank.
- C. Jacket: Steel, with baked-on enamel finish.
- D. Tank: Glass-lined steel, with anode rods and drain valve.
- E. Safety Controls: Automatic gas shutoff device to shut off entire gas supply in event of excessive temperature in tank.
- F. Controls: Adjustable surface mounted thermostat, intermittent electronic ignition and flue damper control.
- G. Temperature and Pressure Relief Valve: Lead free brass body meeting ANSI Z21.22.

## 2.3 GAS-FIRED HIGH EFFICIENCY WATER HEATERS WITH FAN ASSISTED COMBUSTION AND ALL STAINLESS STEEL HEAT EXCHANGER

- A. Description: Automatic, commercial, gas-fired, ASME labeled, 160-psig rated, finned-tube heat exchanger for condensing flue gases; with integral controls, sealed combustion chamber, modulating gas burner with fan assisted combustion and 5:1 turndown, gas train including gas regulator, ASME labeled storage tank, factory vertical, horizontal combustion air cap and exhaust flue cap and circulating pump. Low NO<sub>x</sub> burner meeting SCAQMD Rule 1146.2.
  1. Heat Exchanger: ASME Boiler Pressure Vessel Code Section 4 160-psig of all stainless steel construction
- B. Water Heater Insulation: Manufacturer's standard insulation.
- C. Storage Tank: ASME Boiler Pressure Vessel Code Section 8 150-psig rated, glass-lined steel, with anode rods and temperature and pressure relief valve.
- D. Storage Tank Insulation: Fiberglass surrounding tank.
- E. Water Heater and Storage Tank Jackets: Steel, with baked-on enamel finish.
- F. Circulating Pump: All bronze, inline, centrifugal, single-stage, radially split case design, with mechanical seals, and rated for 125 psig working pressure and 225 deg F continuous water temperature.
- G. Controls: Adjustable storage tank temperature control fitting with immersion thermostat and Intermittent electronic ignition.
- H. Safety Controls: Automatic gas shutoff device to shut off entire gas supply in event of excessive temperature, low water cutout, low gas pressure, low air pressure and flow switch to verify circulating pump operation.
- I. Safety Controls: Automatic gas shutoff device to shut off entire gas supply in event of excessive temperature, low water cutout and flow switch interlocked with circulating pump and burner.

- J. Temperature and Pressure Relief Valve: Lead free brass body meeting ANSI Z21.22.
- K. Condensate Neutralization Kits: PVC body with socket weld inlets and outlets, minimum ¾". Capacity to match heater input.

## 2.4 THERMAL EXPANSION TANKS

- A. ASME Thermal Expansion Tanks: Provide size and number as indicated; construct of welded carbon steel ASME labeled for 150 psig working pressure, 200 deg F maximum operating temperature. Separate air charge from system water to maintain design expansion capacity, by means of a FDA approved butyl rubber diaphragm securely sealed into tank. Provide taps for pressure gauge and air charging fitting, and drain fitting. Support vertical tanks with steel legs or base. Tank, with taps and supports, shall be constructed, tested, and labeled in accordance with ASME Pressure Vessel Code, Section VIII, Division 1.

## 2.5 VACUUM RELIEF VALVES

- A. Lead free brass body meeting ANSI Z21.22 with silicon disc. Valve shall open at 0.5 inches HG vacuum and be rated for 200 psig working pressure and 250 F operating temperature.

## PART 3 - EXECUTION

### 3.1 WATER HEATER INSTALLATION

- A. Install in accordance with manufacturer's installation instructions.
- B. General: Install water heaters on concrete equipment bases. Set and connect units in accordance with manufacturer's installation-instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances. Orient so controls and devices needing servicing are accessible.
- C. Install thermometers on water heater outlet piping. Thermometers are specified in Division 22 Section "Meters and Gauges for Plumbing Piping."
- D. NFPA Compliance: Install gas-fired water heaters in compliance with NFPA 54, "National Fuel Gas Code."
- E. NFPA Compliance: Install oil-fired water heaters in compliance with NFPA 31, "Installation of Oil Burning Equipment."
- F. Install temperature and pressure relief valve furnished with water heater. The temperature shall be normally set to relieve at 210F and the pressure relief shall be equal to the tank pressure rating. Install line size relief valve discharge line to discharge to an approved receptor with air gap.
- G. Vacuum Relief Valve: Install in cold water supply to each water heater downstream of the shutoff and check valves.
- H.
- I. Install condensate neutralization kit furnished with water heater condensate drain downstream of trap at condensate connection. Fill kit with water heater manufacturer recommended neutralization media.

### 3.2 CONCRETE EQUIPMENT BASES

- A. Construct concrete equipment bases in accordance with Section "Basic Mechanical Materials and Methods" for setting of equipment.

### 3.3 EXPANSION TANK INSTALLATION

- A. Install in-line expansion tanks in the vertical or horizontal position (where allowed by manufacturer). Where tanks are installed in horizontal position, provide supports per manufacturer requirements.
- B. Install stand mounted expansion tanks on concrete equipment bases.
- C. Charge expansion tank bladder with air to a pressure equal to the domestic water static pressure.

### 3.4 CONNECTIONS

- A. Piping installation requirements are specified in other Sections of Division 22. The Drawings indicate general arrangement of piping, fittings, and specialties. The following are specific connection requirements:
  - 1. Install piping adjacent to equipment arranged to allow servicing and maintenance.
  - 2. Connect hot and cold water piping to units with shutoff valves and unions. Connect hot water circulating piping to unit with shutoff valve, check valve, and union. Extend relief valve discharge to closest floor drain.
    - a. Where water heater piping connections are dissimilar metals, install dielectric waterway fittings or dielectric unions for joints 2" and smaller and dielectric flanges for joints 2-1/2" and larger. Dielectric waterway fittings, unions and flanges are specified in Division 22 Section "Basic Piping Materials and Methods."
    - b. Install vacuum relief valve in cold water inlet piping.
  - 3. Connect gas supply piping to burner with drip leg, tee, gas cock, and union; minimum size same as inlet connection. Arrange piping to allow unit servicing. Gas piping is specified in Division 22 Section "Natural Gas Piping".
    - a. Install vent piping from gas train pressure regulators and valves to outside the building. Terminate vent piping with brass screened vent cap fitting. Do not combine vents except with approval of local authority.
    - b. Install gas pressure regulators where indicated.
  - 4. Install drain as indirect waste to spill into open drain or over floor drain.
    - a. Install drain valve at low point in water piping, for water heaters not having tank drain.
  - 5. Connect oil piping to oil burner with shutoff valve and union in supply, and check valve and union in return. Arrange piping to allow unit servicing.
  - 6. Install heat traps at inlet and outlet of each water heater storage tank. Heat trap shall be made of elbows and piping. Heat trap shall turn down to 12" below the outlet or inlet, run 12" horizontal and turn up to the cold water to the heater or hot water from the heater. Where multiple tanks are connected with a manifold, a single heat trap may be provided at the connection of the cold water supply to the cold water manifold together.
- B. Electrical Connections:
  - 1. Power wiring is specified in Division 26 Section "Common Work Results for Electrical"
  - 2. Field-installed disconnects are specified in Division 26 Sections "Enclosed Switches and Circuit Breakers".
  - 3. Grounding: Connect unit components to ground in accordance with the National Electrical Code.
  - 4. Vents are specified in Division 23 Section "Breechings, Chimneys, and Stacks."
- C. Vent Connections for Sealed Combustion Tank Type Gas Fire Water Heaters:
  - 1. Vents are specified in Division 23 Section "Breechings, Chimneys, and Stacks."
  - 2. Furnish intake and exhaust vent terminal furnished by heater manufacturer for installation by mechanical.
  - 3. Provide 3/4" PVC indirect drain from manufacturer exhaust fitting indirect drain connection furnished with water heater. Provide 3/4" PVC P-trap with minimum 1" trap seal and route indirect drain to nearest floor drain, discharge to floor drain with air gap.
  - 4. Install condensate neutralization kit furnished with water heater on floor adjacent to water heater in an accessible location.

**3.5 FIELD QUALITY CONTROL**

- A. General: Provide the services of a factory-authorized service representative to test and inspect unit installation, provide start-up service, and demonstrate operation of equipment as specified below.
  - 1. Test and adjust operating and safety controls. Replace damaged and malfunctioning controls and equipment.

**3.6 STARTUP**

- A. Perform the following before start-up final checks:
  - 1. Fill water heaters with water.
  - 2. Piping systems test complete.
  - 3. Check for piping connections leaks.
  - 4. Check for adequate combustion air.
  - 5. Check for clear vent.
  - 6. Test operation of safety controls and devices.
- B. Perform the following start-up procedures:
  - 1. Energize circuits.
  - 2. Adjust operating controls.
  - 3. Adjust hot water outlet temperature setting.

**3.7 TRAINING**

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**SECTION 22 40 00 - PLUMBING FIXTURES****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes plumbing fixtures and trim, fittings, and accessories, appliances, appurtenances, equipment, and supports associated with plumbing fixtures.
- B. Related Sections: The following Sections contain requirements that relate to this Section:
  - 1. Division 7 Section "Joint Sealers," for materials and methods for sealing between plumbing fixtures and interior walls.
  - 2. Division 10 Section "Service Wall Systems" for wall modules with built-in plumbing fixtures.
  - 3. Division 22 Section "General Duty Valves for Plumbing Piping" for valves used as supply stops.
- C. Products furnished but not installed under this Section include:
  - 1. Plumbing fittings (including faucets) and piping indicated, for fixtures, appliances, appurtenances, and equipment provided by Owner.
  - 2. Plumbing fittings (including faucets) and piping indicated, for fixtures, appliances, appurtenances, and equipment specified in other Sections.
- D. Products installed but not furnished under this Section include:
  - 1. Owner furnished fixtures, as indicated.
  - 2. Accessories, appliances, appurtenances, and equipment specified in other Sections, requiring plumbing services or fixture-related devices, as indicated.

**1.2 DEFINITIONS**

- A. Accessible: Describes a plumbing fixture, building, facility, or portion thereof that can be approached, entered, and used by physically handicapped people.
- B. Accessory: Device that adds effectiveness, convenience, or improved appearance to a fixture but is not essential to its operation.
- C. Appliance: Device or machine designed and intended to perform a specific function.
- D. Appurtenance: Device or assembly designed to perform some useful function when attached to or used with a fixture.
- E. Equipment: Device used with plumbing fixtures or plumbing systems to perform a certain function for plumbing fixtures but that is not part of the fixture.
- F. Fitting: Fitting installed on or attached to a fixture to control the flow of water into or out of the fixture.
- G. Fixture: Installed receptor connected to the water distribution system, that receives and makes available potable water and discharges the used liquid or liquid-borne wastes directly or indirectly into the drainage system. The term "Fixture" means the actual receptor, except when used in a general application where terms "Fixture" and "Plumbing Fixture" include associated trim, fittings, accessories, appliances, appurtenances, support, and equipment.
- H. Roughing-In: Installation of piping and support for the fixture prior to the actual installation of the fixture.
- I. Support: Device normally concealed in building construction, for supporting and securing plumbing fixtures to walls and structural members. Supports for urinals, lavatories, and sinks are made in types suitable for fixture construction and the mounting required. Categories of supports are:

1. Carrier: Floor-mounted support for wall-mounted water closet, and support fixed to wall construction for wall-hung fixture.
  2. Chair Carrier: Support for wall-hung fixture, having steel pipe uprights that transfer weight to the floor.
  3. Chair Carrier, Heavy Duty: Support for wall-hung fixture, having rectangular steel uprights that transfer weight to the floor.
  4. Reinforcement: Wood blocking or steel plate built into wall construction, for securing fixture to wall.
- J. Trim: Hardware and miscellaneous parts, specific to a fixture and normally supplied with it required to complete fixture assembly and installation.
- K. Lead Free: Refers to the wetted surface of pipe, fittings and fixtures in potable water systems that have a weighted average lead content  $\leq 0.25\%$  per Safe Drinking Water Act as amended January 4th 2011 Section 1417.

### 1.3 SUBMITTALS

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.
1. Product data for each type of plumbing fixture specified, including fixture and trim, fittings, accessories, appliances, appurtenances, equipment, supports, construction details, dimensions of components, and finishes.
  2. Wiring diagrams for field-installed wiring of electrically operated units.
  3. Maintenance data for inclusion in Operating and Maintenance Manual specified in Division 1 and Division 22 Section "General Plumbing Requirements."
- B. Submit third party certification that faucets and trim for domestic water distribution for drinking or cooking comply with NSF 61 Annex G and / or NSF 372. The following faucets and trim need not comply:
1. Electronic faucets
  2. Service sink faucets
  3. Flush valves
  4. Shower valves and heads

### 1.4 QUALITY ASSURANCE

- A. Regulatory Requirements: Comply with requirements of ICC Standard A117.1, "Accessible and Usable Buildings and Facilities," and "2010 ADA Standards for Accessible Design" with respect to plumbing fixtures for individuals with disabilities.
- B. Listing and Labeling: Provide electrically operated fixtures specified in this Section that are listed and labeled.
1. The terms "listed" and "labeled" shall be as defined in the National Electrical Code, Article 100.
  2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.
- C. Comply with NSF 61 Annex G and / or NSF 372 for wetted surfaces of faucets and trim containing no more than 0.25% lead by weight for domestic water distribution for drinking or cooking.
- D. Design Concept: The drawings indicate types of plumbing fixtures and are based on the specific descriptions, manufacturers, models, and numbers indicated. Plumbing fixtures having equal performance characteristics by other manufacturers may be considered provided that deviations in dimensions, operation, color or finish, or other characteristics are minor and do not change the design concept or intended performance as judged by the Architect. Burden of proof for equality of plumbing fixtures is on the proposer.

**1.5 SPARE PARTS**

- A. Deliver spare parts to Owner. Furnish spare parts described below matching products installed, packaged with protective covering for storage, and identified with labels clearly describing contents.
- B. Faucet Washers and O-rings: Furnish quantity of identical units not less than 10 percent of amount of each installed.
- C. Faucet Cartridges and O-rings: Furnish quantity of identical units not less than 5 percent of amount of each installed.
- D. Flushometer Repair Kits: Furnish quantity of identical units not less than 10 percent of amount of each flushometer installed.
- E. Provide individual metal boxes or a hinged-top wood or metal box having separate compartments for each type and size of above extra materials.
- F. Toilet Seats: Furnish quantity of identical units not less than 5 percent of amount of each type toilet seat installed.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products in each category, by one of the following listed for that category:
  - 1. Water Closets:
    - a. American Standard, Inc.
    - b. Gerber Plumbing Fixture Corp.
    - c. Kohler Co.
    - d. Sloan Valve Co.
    - e. TOTO KIKI USA, Inc.
    - f. Zurn Plumbing Products Group
  - 2. Urinals:
    - a. American Standard, Inc.
    - b. Gerber Plumbing Fixture Corp.
    - c. Kohler Co.
    - d. Sloan Valve Co.
    - e. TOTO KIKI USA, Inc.
    - f. Zurn Plumbing Products Group
  - 3. Lavatories:
    - a. American Standard, Inc.
    - b. Gerber Plumbing Fixture Corp.
    - c. Kohler Co.
    - d. Sloan Valve Co.
    - e. TOTO KIKI USA, Inc.
    - f. Zurn Plumbing Products Group
  - 4. Sinks:
    - a. Elkay Manufacturing Co.
    - b. Franke
    - c. Just Manufacturing Co.
    - d. Kohler Co.
    - e. Moen Group; Stanadyne Corp.
  - 5. Service Sinks:
    - a. American Standard, Inc.
    - b. Kohler Co.
  - 6. Mop Basins:

- a. Acorn Engineering Co.
- b. Fiat Products.
- c. Stern-Williams Co., Inc.
7. Drinking Fountains:
  - a. American Standard, Inc.
  - b. Acorn / Aqua
  - c. Elkay Manufacturing Co.
  - d. Halsey Taylor; A Household International Co.
  - e. Haws Drinking Faucet Co.
  - f. Kohler Co.
8. Water Coolers:
  - a. Acorn / Aqua
  - b. Elkay Manufacturing Co.
  - c. Filtrine Manufacturing Co.
  - d. Halsey Taylor; A Household International Co.
  - e. Haws Drinking Faucet Co.
9. Emergency Equipment:
  - a. Acorn Engineering Co.
  - b. Bradley Corp.
  - c. Chicago Faucet Co.
  - d. ENCON Safety Products
  - e. Guardian Equipment.
  - f. Haws Drinking Faucet Co.
  - g. Speakman Co.
  - h. Stingray Systems
  - i. Water Saver Faucet Co.
10. Toilet Seats:
  - a. Bemis Mfg. Co.
  - b. Beneke Div.; Sanderson Plumbing Products, Inc.
  - c. Church Seat Co.
  - d. Kohler Co.
  - e. Olsonite Corp.
  - f. Sperzel Industries, Inc.
11. Flushometers – Diaphragm Type:
  - a. Sloan Valve Co.
  - b. Zurn Industries, Inc.; Flush Valve Operations.
12. Commercial/Industrial Cast-Brass Faucets:
  - a. Chicago Faucet Co.
  - b. Delta-Commercial
  - c. Speakman Co.
  - d. T & S Brass and Bronze Works, Inc.
  - e. Zurn Industries, LTD. "Aqua Spec"
13. Commercial/Residential Cast-Brass and Cast-Brass Underbody Faucets:
  - a. American Standard, Inc.
  - b. Delta Faucet Co.; Div. of Masco Corp.
  - c. Grohe America, Inc.
  - d. Kohler Co.
  - e. Symmons Industries, Inc.
14. Commercial Pressure Balance Shower Valves:
  - a. Speakman Co.
  - b. Symmons Industries, Inc.
15. Sensor-Operated Faucets and Devices:
  - a. Sloan Valve Co.
  - b. Zurn Industries, LTD. "Aqua Spec"
16. Stop Valves & Supplies:
  - a. Brass Craft Subsidiary; Masco Co.

- b. Chicago Faucet Co.
- c. Engineered Brass Company
- d. Kohler Co.
- e. McGuire Manufacturing Co., Inc.
- f. PROFLO
- g. Royal Brass Mfg. Co.
- h. T & S Brass and Bronze Works, Inc.
- i. Watts Brass and Tubular
- j. Zurn Industries
- 17. P-traps, Drains & Miscellaneous Fittings:
  - a. Brass Craft Subsidiary; Masco Co.
  - b. Dearborn Brass
  - c. Engineered Brass Company
  - d. Franke
  - e. McGuire Manufacturing Co., Inc.
  - f. PROFLO
  - g. Watts Brass and Tubular
  - h. Zurn Industries
- 18. Supports:
  - a. Josam Co.
  - b. Smith (Jay R.) Mfg. Co.
  - c. Wade Div.; Tyler Pipe.
  - d. Watts Drainage Products
  - e. Zurn Industries, Inc.; Hydromechanics Div.
  - f. Mifab Manufacturing, Inc.
- 19. Insulation Kits
  - a. Brocar
  - b. McGuire
  - c. Plumberex
  - d. PROFLO
  - e. Trap-Wrap
  - f. Truebro, Inc.

## 2.2 PLUMBING FIXTURES GENERAL

- A. Provide plumbing fixtures and trim, fittings, other components, and supports as specified on the drawings and below:

## 2.3 FAUCETS

- A. Faucets General: As described on the drawings.
  - 1. Electronic faucets shall be of the same manufacturer as the water closet and urinal flush valves.

## 2.4 STOP VALVES & SUPPLIES

- A. Supplies General: As described on the drawings.
  - 1. Exposed piping and parts shall be polished chrome plated.

## 2.5 P-TRAPS DRAINS AND MISCELLANEOUS FITTINGS

- A. Fittings General: As described on the drawings, except as listed below.
  - 1. Exposed piping and fittings shall be polished chrome plated.
  - 2. Fittings installed concealed inside a plumbing fixture or within wall construction may be without chrome plate finish.

3. Fitting and faucet bodies for domestic water distribution shall be of lead free brass or lead free cast bronze.
- B. Sink Continuous Wastes: Polished chrome-plated, tubular brass, 1-1/2 inches, 17 gauge, with brass nuts on slip inlets, and of configurations indicated.
- C. Scullery sink Continuous Wastes: Polished chrome-plated, tubular brass, 2 inches, 17 gauge, with brass nuts on slip inlets, and of configurations indicated.
- D. Escutcheons: Wall flange with set screw.
- E. Escutcheons: Polished chrome-plated, sheet steel wall flange with friction clips.
- F. Deep Pattern Escutcheons: Wall flange with set screw or sheet steel wall flange with friction clips, of depth adequate to conceal protruding roughing-in fittings.

## 2.6 FLUSHOMETERS

- A. Provide flushometers compatible with fixtures, with features and of consumption indicated As described on the drawings.
  1. Exposed metal parts shall be polished chrome plated.
  2. Flush valves installed within wall construction may be without chrome plate finish.

## 2.7 TOILET SEATS

- A. General: As described on the drawings.

## 2.8 PLUMBING FIXTURE SUPPORTS

- A. Supports: ASME A112.6.1M, categories and types as required for wall-hanging fixtures specified, and wall reinforcement.
- B. Support categories are:
  1. Carriers: Supports for wall-hanging water closets and fixtures supported from wall construction. Water closet carriers shall have an additional faceplate and coupling when used for wide pipe spaces. Provide tiling frame or setting gauge with carriers for wall-hanging water closets.
  2. Chair Carriers: Supports with steel pipe uprights for wall-hanging fixtures. Urinal chair carriers shall have bearing plates.
  3. Chair Carriers, Heavy Duty: Supports with rectangular steel uprights for wall-hanging fixtures.
- C. Support Types: Provide support of category specified, of type having features required to match fixture.
- D. Provide supports specified as part of fixture description, in lieu of category and type requirements above.

## 2.9 INSULATION KITS

- A. Insulation kits for lavatory and sink waste and supplies of vinyl plastic with reusable fasteners and openings for access to supply stop handles.

## PART 3 - EXECUTION

### 3.1 INSTALLATION GENERAL

- A. Install fixtures, trim and supports in accordance with manufacturer's installation instructions.

**3.2 APPLICATION**

- A. Install plumbing fixtures and specified components, in accordance with designations and locations indicated on Drawings.
- B. Install supports for plumbing fixtures in accordance with categories indicated, and of type required:
  - 1. Carriers for following fixtures:
    - a. Wall-hanging water closets.
    - b. Wall hanging lavatories
    - c. Wall hanging electric water coolers and drinking fountains.
    - d. Wall-hanging fixtures supported from wall construction.
  - 2. Chair carriers for the following fixtures:
    - a. Wall-hanging urinals.
    - b. Wall-hanging lavatories and sinks.
    - c. Wall-hanging drinking fountains and electric water coolers.
  - 3. Heavy-duty chair carriers for the following fixtures:
    - a. Accessible lavatories.
    - b. Fixtures where specified.
  - 4. Reinforcement for the following fixtures:
    - a. Floor-mounted lavatories required to be secured to wall.
    - b. Floor-mounted sinks required to be secured to wall.
    - c. Wall mounted and mop sink faucets.
    - d. Urinal flush valve solid pipe ring supports.

**3.3 INSTALLATION OF PLUMBING FIXTURES**

- A. Install plumbing fixtures level and plumb, in accordance with fixture manufacturers' written installation instructions, roughing-in drawings, and referenced standards.
- B. Install wall-hanging, back-outlet water closets with support manufacturer's tiling frame or setting gauge.
- C. Install wall-hanging, back-outlet urinals with gasket seals.
- D. Fasten wall-hanging plumbing fixtures securely to supports attached to building substrate when supports are specified, and to building wall construction where no support is indicated.
- E. Fasten floor-mounted fixtures and special fixtures having holes for securing fixture to wall construction, to reinforcement built into walls.
- F. Fasten wall-mounted fittings to reinforcement built into walls.
- G. Fasten counter-mounting-type plumbing fixtures to casework.
- H. Secure supplies behind wall or within wall pipe space, providing rigid installation.
- I. Set mop basins in leveling bed of cement grout.
- J. Install stop valve in an accessible location in each water supply to each fixture.
- K. Install trap on fixture outlet except for fixtures having integral trap.
- L. Install escutcheons at each wall, floor, and ceiling penetration in exposed finished locations and within cabinets and millwork. Use deep pattern escutcheons where required to conceal protruding pipe fittings.
- M. Seal fixtures to walls, floors, and counters using a sanitary-type, one-part, mildew-resistant, silicone sealant in accordance with sealing requirements specified in Division 7 Section "Joint Sealers." Match sealant color to fixture color.
- N. Install insulation kits on ADA compliant sink and lavatory waste, continuous wastes, hot and cold water supplies where indicated on the drawings and as required by the ADA.

**3.4 CONNECTIONS**

- A. Piping installation requirements are specified in other sections of Division 22. The Drawings indicate general arrangement of piping, fittings, and specialties. The following are specific connection requirements:
1. Install piping connections between plumbing fixtures and piping systems and plumbing equipment specified in other sections of Division 22.
  2. Install piping connections indicated between appliances and equipment specified in other sections, direct connected to plumbing piping systems.

**3.5 FIELD QUALITY CONTROL**

- A. Inspect each installed fixture for damage. Replace damaged fixtures and components.
- B. Test fixtures to demonstrate proper operation upon completion of installation and after units are water pressurized. Replace malfunctioning fixtures and components, then retest. Repeat procedure until all units operate properly.

**3.6 ADJUSTING AND CLEANING**

- A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.
- B. Operate and adjust disposers, hot water dispensers, and controls. Replace damaged and malfunctioning units and controls.
- C. Adjust water pressure at drinking fountains, electric water coolers, and faucets, shower valves, and flushometers having controls, to provide proper flow and stream.
- D. Replace washers of leaking and dripping faucets and stops.
- E. Clean fixtures, fittings, and spout and drain strainers with manufacturers' recommended cleaning methods and materials.
- F. Adjust faucet wrist blade handles perpendicular to the spout while in the closed position.
- G. Review the data in Operating and Maintenance Manuals. Refer to Division 1 Section "Project Closeout."
- H. Set each shower valve temperature limit stop to 110°F. Perform work after the shower head is installed and the domestic water heater is in operation. Allow the hot water to run for 5 minutes minimum or until temperature reaches equilibrium. Allow cold to run for 5 minutes minimum or until temperature reaches equilibrium. Provide the architect a report and schedule indicating the hot, cold and mixed maximum water temperature at each shower.

**3.7 FIXTURE SCHEDULE**

- A. Provide plumbing fixtures as specified on the drawings.
- B. Install rough-in for plumbing fixtures as scheduled on the drawings.

**3.8 MOUNTING HEIGHTS SCHEDULE**

- A. Refer to the architectural drawings for plumbing fixture mounting heights. Unless indicated otherwise, install plumbing fixtures with the mounting heights as listed below with final approval by the Architect:

FIXTURE	MOUNTING HEIGHT
Lavatory or Sink	

	Standard Height	31" floor to rim
	ADA Accessible	34" floor to rim
Urinal		
	Standard Height	24" floor to rim
	ADA Accessible	17" floor to rim
Water Closet		
	Standard	15" floor to rim
	ADA Accessible	17" to 19" floor to top of seat
Water Cooler or Drinking Fountain		
	Standard Height	41" floor to spout
	ADA Accessible	36" floor to spout
Shower Valves		
	Standard Height	48" men and 42" women floor to centerline
	ADA Accessible	38" minimum to 48" maximum floor to centerline
Shower heads		
	Standard Height	7'-6" men, 7'-0" women floor to centerline
Ice Maker Outlet Boxes		24" floor to center of box
Washing Machine Outlet Boxes		42" floor to rim
Janitor's Sink Faucet Fittings		42" floor to centerline
Hose Bibbs		36" AFF to centerline
Non Freeze Wall Hydrant		18" AFG to centerline
Interior Wall Hydrant		18" AFF to centerline

END OF SECTION

**SECTION 22 70 00 - NATURAL GAS SYSTEMS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes distribution piping systems for natural gas, liquid petroleum-gas and manufactured gas within the building and extending from the point of delivery to the connections with gas utilization devices. Piping materials and equipment specified in this Section include:
1. Pipes, fittings, and specialties.
  2. Special duty valves.
  3. Pressure regulators.
- B. This Section does not apply to liquid petroleum piping; industrial gas applications using such gases as acetylene and acetylenic compounds, hydrogen, ammonia, carbon monoxide, oxygen and nitrogen; gas piping, meters, gas pressure regulators and other appurtenances used by the serving gas supplier in distribution of gas.
- C. Related Sections: The following sections contain requirements that relate to this Section:
1. Division 22 Section "General plumbing Requirements," for trenching, excavation, backfill and compaction materials and methods for underground piping installations.
  2. Division 7 Section "Joint Sealers," for materials and methods for sealing pipe penetrations through basement and foundation walls.
  3. Division 9 Section "Painting," for materials and methods for painting pipe.
  4. Division 12 Section "Laboratory Casework and Fixtures," for laboratory trim installed in the casework.
  5. Division 22 Section "Common Work Results for Plumbing," for materials and methods for fire barrier penetrations and wall and floor penetrations.
  6. Division 22 Section "Basic Piping Material and Methods," for materials and methods for strainers, unions, dielectric flanges, and mechanical sleeve seals.
  7. Division 22 Section "Hangers and Supports for Plumbing Piping," for materials and methods for hanging and supporting gas distribution piping.
  8. Division 26 Section "Common Work Results for Electrical" required electrical devices.
- D. Gas pressures for systems specified in this Section are limited to 5 psig.
- E. Products furnished under this Section include gas meters and gas service piping, which will be provided by the utility company to the site. The following is the name and address of the utility company:
- Contact: Jim Bray  
Company: Spire Gas  
Address: 2828 Dauphin St. Mobile AL 36606  
Telephone number: (251) 591-0106

**1.2 DEFINITIONS**

- A. Pipe sizes used in this Specification are Nominal Pipe Size (NPS).
- B. Gas Distribution Piping: A pipe within the building which conveys gas from the point of delivery to the points of usage.
- C. Gas Service Piping: The pipe from the gas main or other source of supply including the meter, regulating valve, or service valve to the gas distribution system of the building served.
- D. Point of Delivery: The outlet of the service meter assembly, or the outlet of the service regulator (service shutoff valve when no meter is provided).

**1.3 SUBMITTALS**

- A. Product data for each gas piping specialty and special duty valves. Include rated capacities of selected models, furnished specialties and accessories, and installation instructions.
- B. Shop drawings detailing dimensions, required clearances, for connections to gas meter.
- C. Coordination drawings for gas distribution piping systems in accordance with Division 22 Section "General Plumbing Requirements."
- D. Maintenance data for gas specialties and special duty valves, for inclusion in operating and maintenance manual specified in Division 1 and Division 22 Section "General Plumbing Requirements."
- E. Welders' qualification certificates, certifying that welders comply with the quality requirements specified under "Quality Assurance" below.
- F. Test reports specified in Part 3 below.

**1.4 QUALITY ASSURANCE**

- A. Installer Qualifications: Installation and replacement of gas piping, gas utilization equipment or accessories, and repair and servicing of equipment shall be performed only by a qualified installer. The term qualified is defined as experienced in such work (experienced shall mean having a minimum of 5 previous projects similar in size and scope to this project), familiar with precautions required, and has complied with the requirements of the authority having jurisdiction. Upon request, submit evidence of such qualifications to the Architect.
- B. Qualifications for Welding Processes and Operators: Comply with the requirements of ASME Boiler and Pressure Vessel Code, "Welding and Brazing Qualification."
- C. Regulatory Requirements: Comply with the requirements of the following codes:
  - 1. NFPA 54 - National Fuel Gas Code, for gas piping materials and components, gas piping installation and inspections, testing, and purging of gas piping systems.
  - 2. 2021 International Fuel Gas Code
- D. Local Gas Utility Requirements: Comply with local gas utility installation rules and regulations.
- E. Pipe, pipe fittings and pipe specialties shall be manufactured in plants located in the United States or certified to meet the specified ASTM and ANSI standards.

**1.5 SPARE PARTS**

- A. Valve Wrenches: Furnish to Owner, with receipt, 2 valve wrenches for each type of gas valve installed, requiring same.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Manufacturer: Subject to compliance with requirements, provide gas piping system products from one of the following:
  - 1. Gas Ball Valves – 2" and Smaller:
    - a. Apollo Valves # 77F-1XX-01
    - b. Hammond Valve # 8901
    - c. Milwaukee Valve # BA-475B
    - d. Nibco Inc. # T-FP 600A
    - e. Watts # FBV-3C
  - 2. Gas Ball Valves – 2-1/2" to 4":
    - a. Apollo Valve # 77F-1XX-01

- b. Hammond Valve # 8901
- c. Milwaukee Valve # BA-475B
- d. Nibco Inc. # T-FP 600A
- 3. Gas Cocks – 2" and Smaller:
  - a. Homestead # 601
  - b. Milliken #200M
  - c. RM Energy Systems # D125
- 4. Gas Cocks – 2-1/2" and Larger:
  - a. Homestead # 602
  - b. Milliken #200MF
  - c. RM Energy Systems "Hercules" # D126
- 5. CSA Listed Gas Pressure Regulators
  - a. Karl Dungs, Inc.
  - b. Maxitrol
  - c. Pietro-Fiorentini
- 6. Polyethylene Pipe and Pipe Fittings:
  - a. Cresline Plastic Pipe Co. PE 2708
  - b. Charter Plastics PE 2708
  - c. Chevron Phillips DriscoPlex Series 6500
- 7. Polyethylene to Steel Pipe Transition Fittings:
  - a. Perfection Corporation
  - b. R.W. Lyall
  - c. Central Plastics
- 8. Insect Screens
  - a. Northtown Pipe Protection Products "BUGSCRN Series"
- 9. Gas Relief Vents
  - a. Richards "GV Series"

## 2.2 PIPE AND TUBING MATERIALS

- A. General: Refer to Part 3, Article "PIPE APPLICATIONS" for identification of systems where the specified pipe and fitting materials listed below are used.
- B. Steel Pipe: ASTM A 53, Grade B, Schedule 40, (Type E electric-resistance welded or Type S seamless, black steel pipe, beveled ends).
- C. Plastic Pipe: Medium Density, SDR-11 iron pipe size polyethylene pipe, meeting ASTM D 2513, with heat fusion connections. Pipe shall meet Plastic Pipe Institute Material Designation of PE 2708.

## 2.3 FITTINGS

- A. Malleable-Iron Threaded Fittings: ANSI B16.3, Class 150, standard pattern, for threaded joints. Threads shall conform to ANSI B1.20.1.
- B. Steel Fittings: ASTM A 234, seamless or welded, for welded joints.
  - 1. 1-1/4" and smaller shall be socket type
  - 2. 1-1/2" and larger shall be butt weld type.
- C. Forged Steel Flanges and Flanged Fittings: ASME B16.5, Class 150, butt weld ends, standard pattern with bolts, nuts and gaskets of material group 1.1.
- D. Plastic Fittings: Medium density polyethylene socket fusion fittings, meeting ASTM D 2515 compatible with the piping system.
- E. Transition Fittings – Steel to Polyethylene: Factory assembled and pressure tested one piece design, with steel half of Schedule 40 steel pipe with beveled edge for welding and polyethylene half shall be of ample length for making welds. Steel pipe shall have epoxy protective coating.

- F. Insect screens: Black steel body with 20 mesh stainless steel screen and MNPT end.
- G. Gas Relief Vents: Galvanized steel body with 90 degree inlet to screened outlet, 20 mesh stainless steel screen and FNPT end.

## 2.4 JOINTING MATERIALS

- A. Joint Compound: Suitable for the gas being handled.
- B. Gasket Material: Thickness, material, and type suitable for gas to be handled, and for design temperatures and pressures.

## 2.5 PIPING SPECIALTIES

- A. Protective Coating: When piping will be in contact with material or atmosphere exerting a corrosive action, pipe and fittings shall be factory-coated with polyethylene tape, having the following properties:
  - 1. overall thickness; 20 mils;
  - 2. synthetic adhesive;
  - 3. water vapor transmission rate, gallons per 100 square inch: 0.10 or less.
  - 4. water absorption, percent: 0.02 or less.
- B. Prime pipe and fittings with a compatible primer prior to application of tape.
- C. Strike Plates: 16 gauge carbon steel, tested and listed by CSA International.
- D. In wall Strike Protection Hose: UL listed spiral wound interlocking galvanized steel reduced wall flexible conduit.
- E. Nonmetallic Watertight Conduit: Schedule 80 rigid PVC, UL 651, with fittings to match to conduit type and material.
- F. Multiple Port Manifolds: ANSI LC1b, plastic coated malleable iron, of the same manufacturer of the corrugated stainless steel tubing, tested and listed by CSA International.

## 2.6 VALVES

- A. Gas Ball Valves – 2" and Smaller: Full port brass body with brass ball, PTFE seats, threaded ends 150psi steam, 600 WOG, UL listed for natural gas service.
- B. Gas Ball Valves – 2-1/2" to 4": Standard port brass body with brass ball, PTFE seats, threaded ends 150psi steam, 400 WOG, UL listed for natural gas service.
- C. Gas Cocks 2 Inch and Smaller: 175 psi, lubricated plug type, ASTM A126 Grade B semi-steel body, brass or semi-steel plug with full area rectangular port, straightaway pattern, square head, threaded ends.
- D. Gas Cocks 2-1/2 Inch and Larger: 175 psi, lubricated plug type, ASTM A126 Grade B semi-steel body and plug with full area rectangular port, straightaway pattern, single gland, wrench operated, flanged ends.
- E. Solenoid Valves: As specified on the drawings.
- F. Gas Line Pressure Regulators: Single stage, steel jacketed, corrosion-resistant gas pressure regulators; with atmospheric vent, elevation compensator; internal relief vent, vent limiter for indoor installation, with threaded ends for 2 inch and smaller, flanged ends for 2-1/2 inch and larger; for inlet and outlet gas pressures, specific gravity, and volume flow as indicated on the drawings.
  - 1. CSA listed for 2 PSI gas systems

**PART 3 - EXECUTION****3.1 INSTALLATION**

- A. Install pipe, fittings, valves and specialties in accordance with manufacturer's installation instructions.

**3.2 PREPARATION**

- A. Precautions: Before turning off the gas to the premises, or section of piping, turn off all equipment valves. Perform a leakage test as specified in "FIELD QUALITY CONTROL" below, to determine that all equipment is turned off in the piping section to be affected.
- B. Conform with the requirements in NFPA 54, for the prevention of accidental ignition.

**3.3 PREPARATION FOUNDATION FOR UNDERGROUND GAS SERVICE PIPING**

- A. Pipe Beds for PE Pipe and PVC Pipe Conduit: Support pipe in trench with sand bags level and true to prevent sand, gravel or debris from interfering with the solvent cement or fusion process. After pressure testing is complete, gradually install bedding to maintain continuous pipe slope and prevent pipe deflection and then install subbase. Refer to Division 22 Section "General Plumbing Requirements" for bedding and subbase materials, excavation, trenching, backfill and compaction requirements and refer to ASTM D2321 "Underground Installation of Thermoplastic Pipe for Sewers and Gravity-flow Applications" for additional requirements.

**3.4 PIPE APPLICATIONS**

- A. Install steel pipe with threaded joints and fittings for 2 inch and smaller, and with welded joints for 2-1/2 inch and larger.
- B. Install PE plastic pipe with fusion bond plastic fittings below grade outside the building slab.

**3.5 PIPING INSTALLATION**

- A. General: Conform to the requirements of NFPA 54 - National Fuel Gas Code.
- B. Locations and Arrangements: Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of piping systems. Design locations and arrangements of piping take into consideration pipe sizing, flow direction, slope of pipe, expansion, and other design considerations. So far as practical, install piping as indicated.
- C. Concealed Locations: As specified below:
  - 1. Inaccessible Above-Ceiling Locations: Install concealed gas piping in inaccessible above-ceiling spaces without valves or unions.
  - 2. Accessible Above-Ceiling Locations: Gas piping may be installed in accessible above-ceiling spaces (subject to the approval of the authority having jurisdiction), whether or not such spaces are used as a plenum. Valves and unions shall not be located in such spaces used as a plenum.
  - 3. In Floors: Install concealed gas piping in concrete floor slabs in an air-tight conduit constructed of Schedule 40 PVC with socket weld joints two pipe sizes larger than the gas pipe served. Extend conduit a minimum of 12" above finish floor and cap air tight at both ends. Vent conduit to the outside with a minimum 2" pipe and terminate with a screened vent cap.
  - 4. Piping In Partitions: Install concealed gas piping in hollow partitions with welded joint (subject to the approval of the authority having jurisdiction) and protect gas piping against

- physical damage. Install gas piping passing through partitions with no joints or unions inside the partition.
5. Concrete or Masonry Walls: Do not install gas piping in masonry or concrete walls.
  6. Prohibited Locations: Do not install gas piping in or through a circulating air duct, clothes chute, chimney or gas vent, ventilating duct, dumbwaiter or elevator shaft. This does not apply to accessible above-ceiling space specified above.
- D. Fire Barrier Penetrations: Where pipes pass through fire-rated walls, partitions, ceilings, and floors, maintain the fire-rated integrity. Refer to Division 22 Section "Common Work Results for Plumbing" for special sealers and materials.
  - E. Elevated Floor Penetrations of Waterproof Membrane, Interior Penetrations of No-Fire Rated Walls and Concrete Slab on Grade Penetrations: Provide sleeves and seal pipes that pass through waterproof floors, non-fire rated walls, partitions and ceilings or concrete slab on grade. Refer to Division 22 Section "Basic Piping Materials and Methods" for special sealers and materials.
  - F. Exterior Wall Penetrations: Seal pipe penetrations through exterior wall constructions with sleeves, packing, and sealant. Refer to Division 22 Section "Common Work Results for Plumbing" for additional information.
  - G. Dirt legs and Sediment Traps: Install a dirt leg at points where condensate and impurities may collect, at the outlet of the gas meter, as close to the inlet of each gas appliance or equipment as possible, and in a location readily accessible to permit cleaning and emptying.
    1. Construct dirt legs and sediment traps using a tee fitting with the bottom outlet plugged or capped. Provide a 3" length of pipe and screwed cap for the dirt leg. Use line size pipe for dirt leg, refer to the drawings for sizes. Enter the tee with flow from the top and exit the tee from the side outlet. Install the dirt leg a minimum of 3-1/2" above the roof or floor readily accessible to permit cleaning and emptying.
    2. Install line size gas cock, union and dirt leg at each equipment connection; refer to the drawings for sizes. Provide reducers at the equipment connection as required. Unions are specified in Division 22 section "Basic Piping Materials and Methods".
  - H. Use fittings for all changes in direction and all branch connections.
  - I. Install exposed piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated.
  - J. Install piping free of sags or bends and with ample space between piping to permit proper insulation applications.
  - K. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated to be exposed to view.
  - L. Install horizontal piping as high as possible allowing for specified slope and coordination with other components. Install vertical piping tight to columns or walls. Allow sufficient space above removable ceiling panels to allow for panel removal.
  - M. Locate groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.
  - N. Install gas piping at a uniform grade of 1/4 inch in 15 feet, upward to risers, and from the risers to the meter, or service regulator when meter is not provided, or the equipment.
  - O. Make reductions in pipe sizes using eccentric reducer fittings installed with the level side down.
  - P. Connect branch outlet pipes from the top or sides of horizontal lines, not from the bottom.
  - Q. Install unions in pipes 2 inch and smaller, adjacent to each valve, and elsewhere as indicated. Unions are not required on flanged devices. Unions are specified in Section "Basic Piping Materials and Methods".

- R. Joints Containing Dissimilar Metals: Provide dielectric unions for 2" and smaller and dielectric flanges for piping 2-1/2" and larger. Dielectric unions and flanges are specified in Section "Basic Piping Materials and Methods".
- S. Install flanges on valves, apparatus, and equipment having 2-1/2 inch and larger connections.
- T. Install strainers on the supply side of each control valve, pressure reducing valve, pressure regulating valve, solenoid valve, and elsewhere as indicated.
- U. Anchor piping to ensure proper direction of expansion and contraction. Install expansion loops and joints as indicated on the Drawings and specified in Division 22 Section "Expansion Fittings and Loops for Plumbing Piping."
- V. Paint Exposed Outdoor Gas Piping: Cleaning and painting of exposed outdoor gas piping is specified in Division 9 Section "Painting".
  - 1. Final color per the architect.

### 3.6 HANGERS AND SUPPORTS

- A. General: Hanger, support, and anchor components and installation procedures conforming to MSS SP-58 and SP-69 are specified in Division 22 Section "Hangers and Supports for Plumbing Piping". Conform to the table below for maximum spacing of supports.
- B. Pipe Attachments: Install the following:
  - 1. Adjustable clevis hangers, MSS SP-69 Type 1, for steel pipe 2-1/2" and larger for individual horizontal runs.
  - 2. Riser clamps, MSS SP-69 Type 8, for individual vertical runs.
  - 3. Extension split ring pipe clamp, MSS SP-69 Type 12, for individual exposed runs on walls.
  - 4. Engineered strut support system may be provided, at the contractor's option, in lieu of individual hangers for horizontal pipes as specified in Division 22 "Hangers and Supports for Plumbing Piping". Provide two piece straps for uninsulated pipe secured to the bare pipe and provide plastic galvanic isolators for bare copper tube.
  - 5. Provide roll hangers for individual horizontal runs 100 feet or longer.
  - 6. Provide roll hangers for individual horizontal runs 20 feet or longer for exposed piping installed on roofs.
  - 7. Provide 316 stainless steel rods, nuts, washers, beam clamps, channels, adjustable band hangers, MSS SP-69 Type 7, or clevis hangers, MSS SP-69 Type 1, for piping located in Hydrotherapy and Pool Equipment Rooms. Install hangers with maximum horizontal spacing and minimum rod diameters, to comply with MSS-58 and SP-69, locally enforced codes, this specification, and authorities having jurisdiction requirements, whichever are most stringent. Install hangers for horizontal piping with the following maximum spacing and minimum rod diameters:

<u>Nom. Pipe Size in Inches</u>	<u>Max Span In Feet</u>	<u>Min. Rod Dia. - Inches</u>
1/2	6	3/8
3/4 to 1	8	3/8
1-1/4 to 2	10	3/8
2-1/2 to 3	10	3/8
4	10	3/8
6	10	1/2
8	10	3/4

- C. Support vertical piping at every floor.
- D. Support gas piping within 12" of each elbow or tee and for gas piping 2-1/2" and larger at each valve or pressure regulator.

- E. Support gas piping located on roof with pre-engineered roof supports, pre-engineered roof supports are specified in Division 22 Section "Hangers and Supports for Plumbing Piping". Conform to the table above for maximum spacing of supports. Support pipe at a minimum 7" above the roof.
- F. Provide vibration isolation for piping connected to rotating equipment. Vibration isolators are specified in Division 22 specification Section "Vibration Isolation for Plumbing Piping and Equipment".

### 3.7 PIPE JOINT CONSTRUCTION

- A. Welded Joints: Comply with the requirements in ASME Boiler and Pressure Vessel Code, Section IX.
- B. Threaded Joints: Conform to ANSI B1.20.1, tapered pipe threads for field cut threads. Join pipe, fittings, and valves as follows:
  - 1. Note the internal length of threads in fittings or valve ends, and proximity of internal seat or wall, to determine how far pipe should be threaded into joint. Refer to NFPA 54, for guide for number and length of threads for field threading steel pipe.
  - 2. Align threads at point of assembly.
  - 3. Apply thread compound for use with gas systems to the external pipe threads. Pipe thread tape is not accepted.
  - 4. Assemble joint to appropriate thread depth. When using a wrench on valves place the wrench on the valve end into which the pipe is being threaded.
  - 5. Damaged Threads: Do not use pipe with threads which are corroded, or damaged. If a weld opens during cutting or threading operations, that portion of pipe shall not be used.
- C. Flanged Joints: Align flanges surfaces parallel. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible. Use suitable lubricants on bolt threads. Tighten bolts gradually and uniformly to appropriate torque specified by the bolt manufacturer.
- D. Fusion Welded: Joints shall be made by a qualified and approved operator in accordance with Title 49, CFR, Part 192.283 and be made in accordance with pipe manufacturer's recommendations.
- E. Semi-rigid Corrugated Stainless Steel Tubing: Joints shall be made by a qualified and approved operator in accordance with pipe manufacturer's recommendations.

### 3.8 VALVE APPLICATIONS

- A. General: The Drawings indicate valve types, locations, and arrangements.
- B. Shut-off duty: Use gas cocks specified in Part 2 above.

### 3.9 VALVE INSTALLATIONS

- A. Install valves in accessible locations, protected from physical damage. Tag valves with a metal tag attached with a metal chain indicating the piping systems supplied.
- B. Install the emergency natural gas shutoff valve furnished with exhaust hood fire extinguishing system in an accessible location.
- C. Install line size gas cock at the outlet of the gas meter set or gas riser and install a line size union downstream of the gas cock outside of the building.
- D. Installation of Gas Pressure Regulators:

1. Install a gas cock 10 pipe diameters upstream of each gas pressure regulator. Where two gas pressure regulators are installed in series in a single gas line, a manual valve is not required at the second regulator.
2. Install line pressure regulators a minimum of 10 pipe diameters upstream of each atmospheric or power burner equipment connection.
3. Install line pressure regulators a minimum of 10'-0" upstream of each condensing boiler or water heater connection.
4. Install gas pressure regulator relief devices so they can be readily operated to determine if the valve is free; so they can be tested to determine the pressure at which they will operate; and examined for leakage when in the closed position.
5. Install gas pressure regulators with listed vent limiters indoors where allowed by the AHJ. Install with regulator dome vertically upright and level.
6. Install gas pressure regulators located outside the building with the relief port facing down to prevent the entry of moisture with the relief port a minimum of 18" above the roof or finish grade. Remove vent limiter and provide with line size (same size as gas vent relief port) insect screen or gas relief vent and 1" long schedule 40 black steel nipple.
  - a. Where manufacturer does not allow the gas pressure regulator to be installed upside down, install gas pressure regulator with regulator dome in the horizontal or vertically upright with factory breather plug.
7. Gas Pressure Regulator Relief Vents: Provide for gas pressure regulators that require them or for vent less regulators where the AHJ requires them. Install steel pipe with threaded joints and fittings for 2 inch and smaller, and with welded joints for 2-1/2 inch and larger. Route vent to the outdoors thru building side wall and turn down or thru the roof and turn down minimum 18" above the roof or grade. Provide with line size (same size as gas relief) insect screen or gas relief vent. Provide vent sizes per the following developed length and include 3 feet of length for each elbow:
  - a. 10 feet developed length size vent one pipe size larger than relief vent outlet size
  - b. 20 feet developed length size vent two pipe size larger than relief vent outlet size
  - c. 30 feet developed length size vent three pipe size larger than relief vent outlet size
  - d. 40 feet developed length size vent four pipe size larger than relief vent outlet size

### **3.10 TERMINAL EQUIPMENT CONNECTIONS**

- A. Install line size gas cock upstream and within 6 feet of gas appliance. Install a line size union or flanged connection downstream from the gas cock to permit removal of controls. Install reducer at the gas appliance connection, if required.
- B. Install stainless steel flexible gas pipe connector, of size and length as required to complete equipment hook-up of foodservice equipment. Verify appropriate length of flexible gas pipe connector for movement of the foodservice equipment for cleaning.

### **3.11 ELECTRICAL BONDING AND GROUNDING**

- A. Install above ground portions of gas piping systems, upstream from equipment shutoff valves electrically continuous and bonded to a grounding electrode in accordance with NFPA 70 - "National Electrical Code."
- B. Do not use gas piping as a grounding electrode.
- C. Conform to NFPA 70 - "National Electrical Code," for electrical connections between wiring and electrically operated control devices.

### **3.12 FIELD QUALITY CONTROL**

- A. Piping Tests: Inspect, test, and purge natural gas systems in accordance with NFPA 54, and local utility requirements.

END OF DIVISION 23 TABLE OF CONTENTS

12/11/2024

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 00 10 - GENERAL MECHANICAL REQUIREMENTS****PART 1 - GENERAL REQUIREMENTS****1.1 DESCRIPTION OF WORK**

- A. This Division requires the furnishing and installing of complete functioning systems, and each element thereof, as specified or indicated on the Drawings and Specifications or reasonably inferred; including every article, device or accessory (whether or not specifically called for by item) reasonably necessary to facilitate each system's functioning as indicated by the design and the equipment specified. Elements of the work include materials, labor, supervision, supplies, equipment, transportation, and utilities.
- B. Division 23 of the Specifications and Drawings numbered with prefixes M, MP or ME, or MEP generally describe these systems, but the scope of the Mechanical work includes all such work indicated in the Contract Documents: Instructions to Bidders; Proposal Form; General Conditions; Supplementary General Conditions; Architectural, Structural, Mechanical, Plumbing and Electrical Drawings and Specifications; and Addenda.
- C. The Drawings have been prepared diagrammatically intended to convey the scope of work, indicating the intended general arrangement of the equipment, fixtures, ductwork, piping, etc. without showing all the exact details as to elevations, offsets, control lines, and other installation requirements. The Contractor shall use the Drawings as a guide when laying out the work and shall verify that materials and equipment will fit into the designated spaces, and which, when installed per manufacturers requirements, will ensure a complete, coordinated, satisfactory and properly operating system.

**1.2 QUALITY ASSURANCE**

- A. All work under this Division shall be executed in a thorough professional manner by competent and experienced workmen licensed to perform the Work specified.
- B. All work shall be installed in strict conformance with manufacturers' requirements, recommendations, and installation instructions. Equipment and materials shall be installed in a neat and professional manner and shall be aligned, leveled, and adjusted for satisfactory operation.
- C. Material and equipment shall be new, shall be of the best quality and design, shall be current model of the manufacturer, shall be free from defects and imperfections and shall have markings or a nameplate identifying the manufacturer and providing sufficient reference to establish quality, size and capacity. Material and equipment of the same type shall be made by the same manufacturer whenever practicable.
- D. Unless specified otherwise, manufactured items shall have been installed and used, without modification, renovation, or repair for not less than one year prior to date of bidding for this project.

**1.3 CODES REFERENCES AND STANDARDS**

- A. Execute Work in accordance with the National Fire Protection Association and all Local, State, and National codes, ordinances and regulations in force governing the particular class of Work involved. Obtain timely inspections by the constituted authorities, and upon final completion of the Work obtain and deliver to the Owner executed final certificates of acceptance from the Authority Having Jurisdiction.
- B. Any conflict between these Specifications and accompanying Drawings and the applicable Local, State and Federal codes, ordinances and regulations shall be reported to the Architect in sufficient

time, prior to the opening of Bids, to prepare the Supplementary Drawings and Specification Addenda required to resolve the conflict.

- C. The governing codes are minimum requirements. Where these Drawings and Specifications exceed the code requirements, these Drawings and Specification shall prevail.
- D. All material, manufacturing methods, handling, dimensions, method or installation and test procedure shall conform to but not be limited to the following industry standards and codes:

BOCA	Building Officials Code Administration
UPC	Uniform Plumbing Code
IBC	International Building Code
IMC	International Mechanical Code
IPC	International Plumbing Code
IECC	International Energy Conservation Code
IFC	International Fire Code
IFGC	International Fuel Gas Code
ADA	American Disabilities Act
ADC	Air Diffusion Council

- E. Contractor shall comply with rules and regulations of public utilities and municipal departments affected by connections of services.
- F. All mechanical work shall be performed in compliance with applicable safety regulations, including OSHA regulations. Safety lights, guards, shoring and warning signs required for the performance of the mechanical work shall be provided by the Contractor.

#### 1.4 DEFINITIONS

- A. General:
  1. Furnish: The term "furnish" is used to mean "supply and deliver to the project site, ready for unloading, unpacking, assembly, installation and similar operations."
  2. Install: The term "install" is used to describe operations at the project site including the actual "unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations."

3. Provide: The term "provide" means "to furnish and install, complete and ready for the intended use. When 'furnish', 'install', 'perform', or 'provide' is not used in connection with services, materials, or equipment in a context clearly requiring an obligation of Contractor, "provide" is implied.
  4. Furnished by Owner or Furnished by Others: The item will be furnished by the Owner or Others. It is to be installed and connected under the requirements of this Division, complete and ready for operation, including items incidental to the Work, including services necessary for proper installation and operation. The installation shall be included under the guarantee required by this Division.
  5. Engineer: Where referenced in this Division, "Engineer" is the Engineer of Record and the Design Professional for the Work under this Division, and is a Consultant to, and an authorized representative of, the Architect, as defined in the General and/or Supplementary Conditions. When used in this Division, it means increased involvement by, and obligations to, the Engineer, in addition to involvement by, and obligations to, the "Architect".
  6. AHJ: The local code and/or inspection agency (Authority) Having Jurisdiction over the Work.
  7. NRTL: Nationally Recognized Testing Laboratory, as defined and listed by OSHA in 29 CFR 1910.7 (e.g., UL, ETL, CSA, etc.), and acceptable to the Authority having Jurisdiction (AHJ) over this project. Nationally Recognized Testing Laboratories and standards listed are used only to represent the characteristics required and are not intended to restrict the use of other listed Manufacturers and models that meet the specified criteria.
  8. Substitution: Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents and proposed by Contractor. Substitutions include Value Engineering proposals.
    - a. Substitutions for Cause: Changes proposed by Contractor that are required due to changed Project conditions, such as unavailability of product, regulatory changes, or unavailability of required warranty terms.
    - b. Substitutions for Convenience: Changes proposed by Contractor or Owner that are not required in order to meet other Project requirements but may offer advantage to Contractor or Owner.
  9. Value Engineering: A systematic method to improve the "value" of goods and services by using an examination of function. Value, as defined, is the ratio of function to cost. Value can therefore be increased by either improving the function or reducing the cost. The goal of VE is to achieve the desired function at the lowest overall cost consistent with required performance.
- B. The terms "approved equal", "equivalent", or "equal" are used synonymously and shall mean "accepted by or acceptable to the Engineer as equivalent to the item or manufacturer specified". The term "approved" shall mean labeled, listed, or both, by an NRTL, and acceptable to the AHJ over this project.
- C. The following definitions apply to excavation operations:
1. Additional Excavation: Where excavation has reached required subgrade elevations, if unsuitable bearing materials are encountered, continue excavation until suitable bearing materials are reached. The Contract Sum may be adjusted by an appropriate Contract Modification.
  2. Bedding: Bedding as used in this section refers to the compacted sand or pea gravel installed in the bottom of a trench to immediately support and cover a pipe or duct.
  3. Subbase: as used in this Section refers to the compacted soil layer used in pavement systems between the subgrade and the pavement base course material.
  4. Subgrade: as used in this Section refers to the compacted soil immediately below the slab or pavement system.
  5. Unauthorized excavation consists of removal of materials beyond indicated subgrade elevations or dimensions without specific direction from the Architect.

**1.5 COORDINATION**

- A. The Contractor shall visit the site and ascertain the conditions to be encountered while installing the Work under this Division, verify all dimensions and locations before purchasing equipment or commencing work, and make due provision for same in the bid. Failure to comply with this requirement shall not be considered justification for omission, alteration, incorrect or faulty installation of Work under this Division or for additional compensation for Work covered by this Division.
- B. The Contractor shall refer to Drawings of the other disciplines and to relevant equipment drawings and shop drawings to determine the extent of clear spaces. The Contractor shall make offsets required to clear equipment, beams and other structural members; and to facilitate concealing piping and ductwork in the manner anticipated in the design.
- C. The Contractor shall confirm and coordinate the final location and routing of all mechanical, electrical, plumbing, fire protection, control and audio-visual systems with all architectural features, structural components, and other trades. The contractor shall locate equipment, components, ductwork, piping, conduit, and related accessories to maintain the desired ceiling heights as indicated on the architectural drawings. The contractor shall inform the architect of any areas where conflicts may prevent the indicated ceiling height from being maintained. The contractor shall not proceed with any installation in such areas until the architect has given written approval to proceed or has provided modified contract drawings or written instructions to resolve the apparent conflict.
- D. The Contractor shall provide materials with trim which will fit properly the types of ceiling, wall, or floor finishes actually installed.
- E. The Contractor shall maintain a foreman on the jobsite at all times to coordinate the work with other contractors and subcontractors so that various components of the mechanical systems will be installed at the proper time, will fit the available space, and will allow proper service access to the equipment. Carry on the Work in such a manner that the Work of the other contractors and trades will not be handicapped, hindered, or delayed at any time.
- F. Work of this Division shall progress according to the "Construction Schedule" as established by the Prime Contractor and their subcontractors and as approved by the Architect. Cooperate in establishing these schedules and perform the Work under this Division, in a timely manner in conformance with the construction schedule so as to ensure successful achievement of schedule dates.

**1.6 COORDINATION DRAWINGS**

- A. Coordination Drawings, General: Prepare coordination drawings according to the requirements of individual Sections. Additionally, prepare coordination drawings as required scope of installation is not completely shown on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one trade.
  - 1. Information shall be project specific and drawn accurately to a scale large enough to resolve conflicts. Do not base coordination drawings on standard dimensional data.
  - 2. Prepare floorplans, sections, elevations, and details as needed to adequately describe relationship of various systems and components.
  - 3. Clearly indicate functional and spatial relationships of components of all systems specified in the Contract Documents, including but not limited to: architectural, structural, civil, mechanical, electrical, fire protection, and specialty systems.
  - 4. Indicate space requirements for routine maintenance and for anticipated replacement of components during the life of the installation.
  - 5. Show location and size of access doors required for access to concealed equipment, fittings, controls, terminations, and cabling.

6. Indicate required installation sequence to minimize conflicts between entities.
  7. Indicate dimensions shown on the Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternate sketches to Contract Administrator indicating proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.
  8. The details of the coordination are the responsibility of the Contractor and, where indicated on the Drawings, minor adjustments in raceway routing, device placement, device type, or equipment arrangement are not to be considered changes to the Contract.
- B. Equipment Room Coordination Drawings: In accordance with the submittal procedures outlined within these Specifications, provide dimensioned layouts of electrical equipment locations within electrical rooms/closets, mechanical rooms, generator rooms, and fire pump rooms with equipment drawn to scale and identified therein.
1. Clearly identify all required working clearances and access provisions required for installation and maintenance.
  2. Equipment layouts should be arranged accounting for considerations for required door openings and the clearances required by the equipment manufacturer.
  3. Indicate path to allow for the future removal of each large piece of equipment (up to and including generators and unit sub-station transformers) without removal of non-related equipment or architectural elements.
  4. Include work provided by others routed through the equipment rooms.
- C. Coordination Digital Data Files: Prepare coordination digital data files according to the following requirements:
1. File Preparation Format: Same digital data software program, version, and operating system as original Drawings.
  2. BIM File Incorporation: Develop and incorporate coordination drawing files into Building Information Model established for Project.
    - a. Perform three-dimensional component conflict analysis as part of preparation of coordination drawings. Resolve component conflicts prior to submittal. Indicate where conflict resolution requires modification of design requirements by Contract Administrator.
  3. Where the Engineer's digital data files are provided to the Contractor for use in preparing coordination digital data files, the Engineer makes no representations as to the accuracy or completeness of digital data files as they relate to the Drawings or Specifications.
  4. Submit coordination drawings in accordance with the submittal procedures outlined within these Specifications.

## 1.7 MEASUREMENTS AND LAYOUTS

- A. The drawings are schematic in nature, but show the various components of the systems approximately to scale and attempt to indicate how they are to be integrated with other parts of the building. Figured dimensions shall be taken in preference to scale dimensions. Determine exact locations by job measurements, by checking the requirements of other trades, and by reviewing the Contract Documents. The Contractor will be held responsible for errors which could have been avoided by proper checking and inspection.

## 1.8 SUBMITTALS

- A. Refer to Division 01 and General Conditions for submittal requirements in addition to requirements specified herein.
- B. Refer to Division 01 for acceptance of electronic submittals. If not specified by Division 01, provide electronic submittals. If Division 01 requires paper submittals, provide the quantity of submittals required, but no fewer than seven (7) sets.

- C. For electronic submittals, Contractor shall submit the documents in accordance with this Section and the procedures specified in Division 01. Contractor shall notify the Contract Administrator and Engineer that the submittals have been posted. If electronic submittal procedures are not defined in Division 01, Contractor shall include the website, username and password information needed to access the submittals. For submittals sent by e-mail, Contractor shall copy the Contract Administrator's and Engineer's designated representatives. Contractor shall allow for the Engineer Review Time as specified. Contractor shall submit only the documents required to purchase the materials and/or equipment in the submittal.
- D. Engineer Review Time: Transmit submittals as early as required to support the project schedule. Allow two weeks for Engineer review time or time specified in the Engineer's Agreement with the Client, plus to/from mailing time via the Contract Administrator, plus a duplication of this time for resubmittal if required. Transmit submittals as soon as possible after Notice to Proceed and before Mechanical construction starts.
- E. Submittals and shop drawings shall not contain the firm name, logo, seal, or signature of the Engineer. They shall not be copies of the work product of the Engineer. If the Contractor desires to use elements of such product, the license agreement for transfer of information obtained from the Engineer must be used.
- F. Assemble and submit for review manufacturer product literature for material and equipment to be furnished and/or installed under this Division. Literature shall include shop drawings, manufacturer product data, performance sheets, samples, and other submittals required by this Division as noted in each individual Section. General product catalog data not specifically noted to be part of the specified product will be rejected and returned without review.
- G. Separate submittals according to individual specification sections. Only resubmit those sections requested for resubmittal.
- H. Provide submittals in sufficient detail so as to demonstrate compliance with these Contract Documents and the design concept. Highlight, mark, list or indicate the materials, performance criteria and accessories that are being proposed. Illegible submittals will be rejected and returned without review.
- I. Refer to individual Sections for additional submittal requirements.
- J. Before transmitting submittals and material lists, verify that the equipment submitted is mutually compatible with and suitable for the intended use. Verify that the equipment will fit the available space and maintain manufacturer recommended service clearances. If the size of equipment furnished makes necessary any change in location, or configuration, submit a shop drawing showing the proposed layout.
- K. Submittals shall contain the following information:
  - 1. The project name.
  - 2. The applicable specification section and paragraph.
  - 3. Equipment identification acronym as used on the drawings.
  - 4. The submittal date.
  - 5. The Contractor's stamp, which shall certify that the stamped drawings have been checked by the Contractor, comply with the Drawings and Specifications, and have been coordinated with other trades.
  - 6. Submittals not so identified will be returned to the Contractor without action.
- L. The checking and subsequent acceptance by the Engineer and/or Contract Administrator of submittals shall not relieve responsibility from the Contractor for (1) deviations from Drawings and Specifications; (2) errors in dimensions, details, sizes of equipment, or quantities; (3) omissions of components or fittings; and (4) not coordinating items with actual building conditions and adjacent work. Contractor shall request and secure written acceptance from the Engineer and Contract Administrator prior to implementing any deviation.
- M. Provide welders' qualification certificates.

- N. BIM Incorporation: Develop and incorporate Shop Drawing files into BIM established for Project.

### 1.9 ELECTRONIC DRAWING FILES

- A. In preparation of shop drawings or record drawings, Contractor may, at their option, obtain electronic drawing files in AutoCAD or DXF format from the Engineer for a shipping and handling fee of 200 for a drawing set up to 12 sheets and 15 per sheet for each additional sheet. Contact the Architect for Architect's written authorization. Contractor shall request and complete the Electronic File Release Agreement form from the Engineer. Send the form along with a check made payable to Henderson Engineers, Inc. Contractor shall indicate the desired shipping method and drawing format on the attached form. In addition to payment, Architect's written authorization and Engineer's release agreement form must be received before electronic drawing files will be sent.

### 1.10 SUBSTITUTIONS

- A. Refer to Division 01 and General Conditions for Substitutions in addition to requirements specified herein.
- B. Materials, products, equipment, and systems described in the Bidding Documents establish a standard of required function, dimension, appearance and quality to be met by the proposed substitution.
- C. The base bid shall include only the products from manufacturers specifically named in the drawings and specifications.
- D. Request for Substitution:
1. Complete and send the Substitution Request Form attached at the end of this section for each material, product, equipment, or system that is proposed to be substituted.
  2. The burden of proof of the merit of the proposed substitution is upon the proposer.
  3. Unless stated otherwise in writing to the Engineer by the Contractor, Contractor warrants to the Engineer, Architect, and Owner the following:
    - a. Proposed substitution has been fully investigated and determined to meet or exceed the specified Work in all respects.
    - b. Proposed substitution is consistent with the Contract Documents and will produce indicated results, including functional clearances, maintenance service, and sourcing of replacement parts.
    - c. Proposed substitution has received necessary approvals of authorities having jurisdiction.
    - d. Same warranty will be furnished for proposed substitution as for specified Work.
    - e. If accepted substitution fails to perform as required, Contractor shall replace substitute material or system with that originally specified and bear costs incurred thereby.
    - f. Coordination, installation and changes in the Work as necessary for accepted substitution will be complete in all respects.
- E. Substitution Consideration:
1. No substitutions will be considered unless the Substitution Request Form is completed and attached with the appropriate substitution documentation.
  2. No substitutions will be considered prior to receipt of Bids unless written request for approval to bid has been received by the Engineer at least ten (10) calendar days prior to the date for receipt of Bids.
  3. If the proposed substitution is approved prior to receipt of Bids, such approval will be stated in an Addendum. Bidders shall not rely upon approvals made in any other manner. Verbal approval will not be given.
  4. No substitutions will be considered after the Contract is awarded unless specifically provided in the Contract Documents.

**1.11 OPERATION AND MAINTENANCE MANUALS**

- A. Refer to Division 01 and General Conditions for Operation and Maintenance Manuals in addition to requirements specified herein.
- B. Submit manuals prior to requesting the final punch list and before all requests for Substantial Completion.
- C. Instruct the Owner's permanent personnel in the proper operation of, startup and shutdown procedures and maintenance of the equipment and components of the systems installed under this Division.
- D. Prior to Substantial Completion of the project, furnish to the Architect, for Engineer's review, and for the Owner's use, four (4) copies of Operation and Maintenance Manuals in labeled, hard-back three-ring binders, with cover, binding label, tabbed dividers and plastic insert folders for Record Drawings. Include local contacts, complete with address and telephone number, for equipment, apparatus, and system components furnished and installed under this Division of the specifications.
- E. Each manual shall contain data listed in each individual Section.
- F. Refer to Division 01 for acceptance of electronic manuals for this project. For electronic manuals, Contractor shall submit the documents in accordance with this Section and the procedures specified in Division 01. Contractor shall notify the Architect and Engineer that the manuals have been posted. If electronic manual procedures are not defined in Division 01, Contractor shall include the website, user name and password information needed to access the manuals. For manuals sent by e-mail, Contractor shall copy the Architect and Engineer's designated representative.

**1.12 SPARE PARTS**

- A. Provide to the Owner the spare parts specified in the individual sections in Division 23 of this specification.

**1.13 RECORD DRAWINGS**

- A. Refer to Division 01 and General Conditions for Record Drawings in addition to requirements specified herein.
- B. A set of work prints of the Contract Documents shall be kept on the jobsite during construction for the purpose of noting changes. During the course of construction, the Contractor shall indicate on these Documents changes made from the original Contract Documents. Particular attention shall be paid to those items which need to be located for servicing. Underground utilities shall be located by dimension from column lines.
- C. At the completion of the project, the Contractor shall obtain, at their expense, reproducible copies of the final drawings and incorporate changes noted on the jobsite work prints onto these drawings. These changes shall be done by a skilled drafter. Each sheet shall be marked "Record Drawing", along with the date. These drawings shall be delivered to the Architect/Engineer.

**1.14 TRAINING**

- A. Provide training as indicated in each specific section. Schedule training with the Owner at least 7 days in advance. Video record the training sessions in format as agreed to with the Owner. Provide three copies of each session to the Owner and obtain written receipt from the Owner.

**1.15 PAINTING**

- A. Exposed ductwork and ferrous surfaces, including pipe, pipe hangers, equipment stands and supports and exposed insulated piping shall be painted by the Contractor using materials and methods as specified under Division 09 of the Specifications; colors shall be as selected by the Architect.
- B. Factory finishes, shop priming and special finishes are specified in the individual equipment specification sections.
- C. Where factory finishes are provided and no additional field painting is specified, marred or damaged surfaces shall be touched up or refinished so as to leave a smooth, uniform finish.

**1.16 DELIVERY STORAGE AND HANDLING**

- A. Refer to Division 01 and General Conditions for Delivery, Storage and Handling in addition to requirements specified herein.
- B. Equipment and material shall be delivered to the job site in their original containers with labels intact, fully identified with manufacturer's name, model, model number, type, size, capacity and Underwriter's Laboratories, Inc. labels and other pertinent information necessary to identify the item.
- C. Deliver, receive, handle and store equipment and materials at the job site in the designated area and in such a manner as to prevent equipment and materials from damage and loss. Store equipment and materials delivered to the site on pallets and cover with waterproof, tear resistant tarp or plastic or as required to keep equipment and materials dry. Follow manufacturer's recommendations, and at all times, take every precaution to properly protect equipment and material from damage, to include the erection of temporary shelters to adequately protect equipment and material stored at the Site. Equipment and/or material which become rusted or damaged shall be replaced or restored by the Contractor to a condition acceptable to the Architect.
- D. The Contractor shall be responsible for the safe storage of their own tools, material and equipment.

**1.17 GUARANTEES AND WARRANTIES**

- A. Refer to Division 01 and General Conditions for Guarantees and Warranties in addition to requirements specified herein.
- B. Each system and element thereof shall be warranted against defects due to faulty workmanship, design or material for a period of 12 months from date of Substantial Completion, unless specific items are noted to carry a longer warranty in the Construction Documents or manufacturer's standard warranty. The Contractor shall remedy defects occurring within a period of one year from the date of Substantial Completion or as stated in the General Conditions.
- C. The following additional items shall be guaranteed:
  - 1. Piping shall be free from obstructions, holes or breaks of any nature.
  - 2. Insulation shall be effective.
  - 3. Proper circulation of fluid in each piping system.
- D. The above guarantees shall include both labor and material; and repairs or replacements shall be made without additional cost to the Owner.
- E. The remedial work shall be performed promptly, upon written notice from the Architect or Owner.
- F. At the time of Substantial Completion, deliver to the Owner warranties with terms extending beyond the one year guarantee period, each warranty instrument being addressed to the Owner and stating the commencement date and term.

**1.18 TEMPORARY FACILITIES**

- A. Refer to Division 01 and General Conditions for Temporary Facilities requirements in addition to requirements specified herein.
- B. Temporary Utilities: The types of services required include, but are not limited to, water, sewerage, surface drainage and gas. When connecting to existing franchised utilities for required services, comply with service companies' recommendations on materials and methods, or engage service companies to install services. Locate and relocate services (as necessary) to minimize interference with construction operations.
  - 1. Provide the necessary backflow prevention devices where connecting to the potable water system. Protect water service from freezing by draining system or by providing adequate heat. Where non-potable water is used, mark each outlet with health hazard warning signs.
  - 2. Sewer Sediment: Maintain sewers and temporary connecting sewers in a clean, non-clogged condition during construction period.
- C. Construction Facilities: Provide facilities reasonably required to perform construction operations properly and adequately.
  - 1. Enclosures: When temporary enclosures are required to ensure adequate workmanship, weather protection and ambient conditions required for the work, provide fire-retardant treated lumber and plywood; provide tarpaulins with UL label and flame spread of 15 or less; provide translucent type (nylon reinforced polyethylene) where daylighting of enclosed space would be beneficial for workmanship, and reduce use of temporary lighting.
  - 2. Heating: Provide heat, as necessary, to protect work, materials and equipment from damage due to dampness and cold. In areas where building is occupied, maintain a temperature not less than 65 degrees Fahrenheit. Use steam, hot water, or gas from piped distribution system where available. Where steam, hot water or piped gas are not available, heat with self-contained LP gas or fuel oil heaters, bearing UL, FM or other approval labels appropriate for application. Vent fuel-burning heaters, and equip units with individual-space thermostatic controls. Use electric-resistance space heaters only where no other, more energy-efficient, type of heater is available and allowable.

**1.19 PROJECT CONDITIONS****PART 2 - PRODUCTS AND MATERIALS****2.1 SOIL MATERIALS**

- A. Bedding Material: Provide clean sand, pea gravel or flowable fill material (per the geotechnical or structural engineer's recommendations).
- B. Subbase Material: Where applicable, provide natural soils with 10% by volume of rocks less than 2" diameter or artificially graded crushed aggregate. Corrosive fill materials shall be not be utilized. When CL clay, rock, or gravel is used, it shall not be larger than 2 inches in any dimension and shall be free of debris, waste, frozen materials, vegetable and other deleterious matter.
- C. Drainage Fill: Provide washed, evenly graded mixture of 3/4" open graded aggregate stone or gravel, around drainage pipes to a level above pipe as detailed by Architect. Provide open graded aggregate, crushed stone, crushed or uncrushed gravel with 100 percent passing a 1-1/2-inch sieve, and not more than 5 percent passing a No. 4 sieve for drainage fill to subgrade or around equipment structures.
- D. Filter Fabric: Flat needle punched PP or polyester fibers or combination of both, with flow rate range from 110 to 330 gpm/sq. ft. when tested according to ASTM D 4491.

**PART 3 - EXECUTION****3.1 PERMITS**

- A. Secure and pay for permits required in connection with the installation of the Mechanical Work. Arrange with the various utility companies for the installation and connection of required utilities for this facility and pay charges associated therewith including connection charges and inspection fees, except where these services or fees are designated to be provided by others.

**3.2 EXISTING UTILITIES**

- A. Schedule and coordinate with the Utility Company, Owner and with the Engineer connection to, or relocation of, or discontinuation of normal utility services from existing utility lines. Premium time required for any such work shall be included in the bid.
- B. Existing utilities damaged due to the operations of utility work for this project shall be repaired to the satisfaction of the Owner or Utility Company without additional cost.
- C. Utilities shall not be left disconnected at the end of a work day or over a weekend unless authorized by representatives of the Owner or Engineer.
- D. Repairs and restoration of utilities shall be made before workmen leave the project at the end of the workday in which the interruption takes place.
- E. Contractor shall include in their bid the cost of furnishing temporary facilities to provide services during interruption of normal utility service.

**3.3 EXCAVATION AND BACKFILLING**

- A. Refer to Division 01, Division 02, and Division 31, Geotechnical Soils Report and General Conditions for Excavation and Backfilling in addition to the requirements specified herein.
- B. Perform excavation of every description, of whatever substance encountered and to the depth required in connection with the installation of the work under this Division. Excavation and Trenching shall be in conformance with applicable Division and section of the General Specifications.
- C. Roads, alleys, streets and sidewalks damaged during this work shall be restored to the satisfaction of Authorities Having Jurisdiction.
- D. Trenches close to walks or columns shall not be excavated without prior consultation with the Architect.
- E. Erect barricades around excavations and trenches for safety. Provide an adequate number of amber lights on or near the work and keep them burning from dusk to dawn. Contractor shall be held responsible for any damage that any parties may sustain due to neglecting the necessary precautions when performing the work.
- F. Slope sides of excavations and trenches to comply with Geotechnical Report, local, state and federal codes and ordinances. Shore and brace as required for stability of excavation.
- G. Shoring and Bracing: Establish requirements for trench shoring and bracing to comply with local, state and federal codes and authorities. Maintain shoring and bracing in excavations and trenches regardless of time period excavations and trenches will be open.
  - 1. Remove shoring and bracing when no longer required. Where sheeting is allowed to remain, cut top of sheeting at an elevation of 30 inches below finished grade elevation.
- H. Install sediment and erosion control measures in accordance with local codes and ordinances.
- I. Dewatering of Excavation and Trenches: Prevent surface water and subsurface or ground water from flowing into excavations and trenches.

1. Do not allow water to accumulate in excavation or trenches. Remove water to prevent softening of bearing materials. Provide and maintain dewatering system components necessary to convey water away from excavations and trenches.
  2. Establish and maintain temporary drainage ditches and other diversions outside excavation and trench limits to convey surface water to collecting or run-off areas.
  3. Do not use trench excavations as temporary drainage ditches. In no case shall sewers be used as drains for such water.
- J. Material Storage: Stockpile satisfactory excavated materials where directed, until required for backfill or fill. Place, grade, and shape stockpiles for proper drainage.
1. Locate and retain soil materials away from edge of excavations and trenches. Do not store within drip-line of trees indicated to remain.
  2. Remove and legally dispose of excess excavated materials and materials not acceptable for use as backfill or fill.
- K. Excavation for Underground Tanks, Basins, and Mechanical Structures: Conform to elevations and dimensions shown within a tolerance of plus or minus 0.10 foot; plus a sufficient distance to permit placing and removal of concrete formwork, installation of services, other construction, and for inspection.
1. Excavate, by hand, areas within drip-line of large trees. Protect the root system from damage and dry-out. Maintain moist conditions for root system and cover exposed roots with burlap. Paint root cuts of 1 inch in diameter and larger with emulsified asphalt tree paint.
  2. Take care not to disturb bottom of excavation. Excavate by hand to final grade just before concrete reinforcement is placed.
- L. Trenching: Excavate trenches as follows:
1. Excavate trenches to the uniform width, sufficiently wide to provide ample working room and a minimum of 6 to 9 inches clearance on both sides of pipe and equipment.
  2. Excavate trenches to depth indicated or required to establish indicated slope and invert elevations. Beyond building perimeter, excavate trenches to an elevation below frost line.
  3. Limit the length of open trench to that in which pipe can be installed, tested, and the trench backfilled within the same day.
  4. Where rock is encountered, carry excavation below required elevation and backfill with a layer of sand or pea gravel prior to installation of pipe. Provide a minimum of 6 inches of sand or pea gravel cushion between rock bearing surface and pipe.
  5. Excavate trenches for piping and equipment with bottoms of trench to accurate elevations for support of pipe and equipment bedding on undisturbed soil.
- M. Cold Weather Protection: Protect excavation and trench bottoms against freezing when atmospheric temperature is less than 35°F.
- N. Bedding:
1. Fill bottom of pipe trench and fill unevenness with compacted bedding material to ensure continuous bearing of the pipe barrel on the bearing surface. Additional bedding installation requirements are in the following piping specifications. Compact bedding as described below.
  2. Fill bottom of equipment trench and fill unevenness with compacted sand backfill to ensure continuous bearing of the equipment on the bearing surface. Compact bedding as described below.
- O. Backfilling and Filling: Place soil materials in layers to required subgrade elevations for each area classification listed below, using materials specified in Part 2 of this Section.
1. Under pipes, use bedding materials in layers to 6 inches above top of the pipe.
  2. Under walks and pavements, use a combination of subbase materials and excavated or borrowed materials.
  3. Under building slabs, use subbase materials.
  4. Under piping and equipment, use bedding and subbase materials over rock bearing surface and for correction of unauthorized excavation.

5. For piping less than 30 inches below surface of roadways, provide 4-inch-thick concrete protection slab. After installation and testing of pipes, provide a 4-inch thick concrete protection top slab prior to backfilling and placement of roadway subbase. Contractor shall coordinate with local AHJ as to requirements for colored concrete in this application.
  6. Other areas, use excavated or borrowed materials where applicable.
  7. Backfill excavations as promptly as work permits, but not until completion of the following:
    - a. Inspection, testing, approval, and locations of underground utilities have been recorded.
    - b. Removal of concrete formwork.
    - c. Removal of shoring and bracing, and backfilling of voids.
    - d. Removal of trash and debris.
  8. Where gravel fill (drainage fill) is used as building fill material in lieu of natural soils, provide filter fabric material to line the trench to support the bedding fill material and subgrade materials to ensure that backfill materials will not segregate within the trench nor create voids and sags within the pipe trench.
  9. Ductwork under slab shall be backfilled with a minimum of 4" bedding material on all sides for protection from soils (per Code). Subbase materials shall be utilized above the bedding material to the subgrade level.
    - a. If concrete encasement is required, a minimum of 4" thickness all sides shall be provided unless otherwise noted. Contractor shall provide hold down straps as per manufacturer's recommendations.
    - b. If a concrete ballast pad is required, size of ballast pad shall be as noted on the drawings or as per manufacturer's recommendations.
- P. Backfill excavations as promptly as work permits, but not until completion of the following:
1. Inspection, testing, approval, and locations of underground utilities have been recorded.
  2. Removal of concrete formwork.
  3. Removal of shoring and bracing, and backfilling of voids.
  4. Removal of trash and debris.
- Q. Subgrade Placement and Compaction: Place subgrade backfill materials in maximum layers of not more than 8 inches in loose depth for material compacted by heavy equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.
- R. Before compaction, moisten or aerate each layer as necessary to provide optimum moisture content. Compact each layer to required percentage of maximum dry density or relative dry density for each area classification specified below. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
- S. Place backfill and fill materials evenly adjacent to structures, piping, and equipment to required elevations. Prevent displacement of piping and equipment by carrying material uniformly around them to approximately same elevation in each lift.
- T. Placement and Compaction: Place bedding backfill materials in maximum layers of not more than 6 inches loose depth for material compacted by hand-operated tampers. Place subbase backfill materials in maximum layers of not more than 8 inches in loose depth for material compacted by heavy equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers. Control soil compaction during construction, providing minimum percentage of density specified for each area classification indicated below.
1. Use of pneumatic backhoe as compaction method is disallowed as an acceptable process for compaction of excavations or trenches.
  2. For vertical and/or diagonal pipe installations greater than 1/2" rise/lf, thoroughly support pipes from permanent concrete structures or undisturbed earth at no less than 10-foot intervals, while placing backfill materials, so that pipes are not deflected, crushed, broken, or otherwise damaged by the backfill placement or settlement.
  3. Before compaction, moisten or aerate each layer as necessary to provide optimum moisture content. Compact each layer to required percentage of maximum dry density or

- relative dry density for each area classification specified below. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
4. Place backfill and/or drainage fill materials evenly adjacent to structures, piping, and equipment to required elevations. Coordinate with Architect and/or Civil Engineer backfill requirements prior to installation. Prevent displacement of pipes and equipment by carrying material uniformly around them to approximately same elevation in each layer or lift.
  5. Compaction: control soil compaction during construction, providing minimum percentage of density specified for each area classification indicated below:
  6. Percentage of maximum density requirements: Compact soil to not less than the following percentages of maximum density for soils which exhibit a well-defined moisture-density relationship (cohesive soils), determined in accordance with ASTM D 1557 or ASTM D 698 and not less than the following percentages of relative density, determined in accordance with ASTM D 4253, for soils which will not exhibit a well-defined moisture-density relationship (cohesionless soils).
    - a. Areas under Structures, Building Slabs and Steps, Pavements: Compact top 12 inches of subgrade and each layer of backfill or fill material to 95 percent maximum density for cohesive material listed, or 95 percent relative density for cohesionless material.
    - b. Areas Under Walkways: Compact top 6 inches of subgrade and each layer of backfill or fill material to 95 percent maximum density for cohesive material, or 95 percent relative density for cohesionless material.
    - c. Other Areas: Compact top 6 inches of subgrade and each layer of subbase backfill or fill material to 90 percent maximum density for cohesive soils, and 90 percent relative density for cohesionless soils.
- U. Subsidence: Where subsidence occurs at mechanical installation excavations and trenches during the period 12 months after Substantial Completion, remove surface treatment (i.e., pavement, lawn, or other finish), add backfill material, compact to specified conditions, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent areas.

### **3.4 CUTTING AND PATCHING**

- A. Cut walls, floors, ceilings, and other portions of the facility as required to install work under this Division.
- B. Obtain permission from the Architect prior to cutting. Do not cut or disturb structural members without prior approval from the Architect and Structural Engineer.
- C. For post-tension slabs, x-ray slab and closely coordinate all core drill locations with Architect and Structural Engineer prior to performing any work. Obtain approval from Architect and Structural Engineer for all core drills and penetrations at least four days prior to performing work.
- D. Penetrations shall be made as small as possible while maintaining required clearances between the building element penetrated and the system component.
- E. Patch around openings to match adjacent construction, including fire ratings, if applicable.
- F. Repair and refinish areas disturbed by work to the condition of adjoining surfaces in a manner satisfactory to the Architect.

### **3.5 CLEANING**

- A. Dirt and refuse resulting from the performance of the work shall be removed from the premises as required to prevent accumulation. The Mechanical Contractor shall cooperate in maintaining reasonably clean premises at all times.
- B. Immediately prior to the final inspection, the Mechanical Contractor shall clean material and equipment installed under the Mechanical Contract. Dirt, dust, plaster, stains, and foreign matter

shall be removed from surfaces including components internal to equipment. Damaged finishes shall be touched-up and restored to their original condition.

### **3.6 SUBSTANTIAL COMPLETION REVIEW**

- A. Prior to requesting inspection for "CERTIFICATE OF SUBSTANTIAL COMPLETION", the Contractor shall complete the following items:
  - 1. Submit complete Operation and Maintenance Manuals.
  - 2. Submit complete Record Drawings.
  - 3. Perform special inspections as required in each individual Section.
  - 4. Start-up testing of systems.
  - 5. Removal of temporary facilities from the site.
  - 6. Comply with requirements for Substantial Completion in the "General Conditions".
- B. The Contractor shall request in writing a review for Substantial Completion. The Contractor shall give the Architect/Engineer at least seven (7) days notice prior to the review.
- C. The Contractor's written request shall state that the Contractor has complied with the requirements for Substantial Completion.
- D. Upon receipt of a request for review, the Architect/Engineer will either proceed with the review or advise the Contractor of unfulfilled requirements.
- E. If the Contractor requests a site visit for Substantial Completion review prior to completing the above mentioned items, the Contractor shall reimburse the Architect/Engineer for time and expenses incurred for the visit.
- F. Upon completion of the review, the Architect/Engineer will prepare a "final list" of outstanding items to be completed or corrected for final acceptance.
- G. Omissions on the "final list" shall not relieve the Contractor from the requirements of the Contract Documents.
- H. Prior to requesting a final review, the Contractor shall submit a copy of the final list of items to be completed or corrected. The Contractor shall state in writing that each item has been completed, resolved for acceptance or the reason it has not been completed.

**SUBSTITUTION REQUEST FORM**

To Project Engineer: \_\_\_\_\_ Request # (GC Determined): \_\_\_\_\_

Project Name: \_\_\_\_\_

Project No/Phase: \_\_\_\_\_ Date: \_\_\_\_\_

Specification Title: \_\_\_\_\_

Section Number: \_\_\_\_\_ Page: \_\_\_\_\_ Article/Paragraph: \_\_\_\_\_

Proposed Substitution: \_\_\_\_\_

Manufacturer: \_\_\_\_\_ Model No.: \_\_\_\_\_

Address: \_\_\_\_\_ Phone: \_\_\_\_\_

History:  New product  1-4 years old  5-10 years old  More than 10 years old

Differences between proposed substitution and specified Work: \_\_\_\_\_

Point-by-point comparative data attached – REQUIRED BY ENGINEER  
Comparative data may include but not be limited to performance, certifications, weight, size, durability, visual effect, sustainable design characteristics, warranties, and specific features and requirements. Include all information necessary for an evaluation.

Supporting Data Attached:  Drawings  Product Data  Samples  
 Tests  Reports  Other: \_\_\_\_\_

Reason for not providing specified item: \_\_\_\_\_

Similar Installation:  
Project: \_\_\_\_\_ Architect: \_\_\_\_\_

Address: \_\_\_\_\_ Owner: \_\_\_\_\_

\_\_\_\_\_ Date Installed: \_\_\_\_\_

Proposed substitution affects other parts of Work:  No  Yes; explain: \_\_\_\_\_

\_\_\_\_\_  
\_\_\_\_\_

**Substitution Certification Statement:**

Unless stated otherwise in writing to the Engineer by the Contractor, Contractor warrants to the Engineer, Architect, and Owner that the:

- ▲ A. Proposed substitution has been fully investigated and determined to meet or exceed the specified Work in all respects.
- B. Proposed substitution is consistent with the Contract Documents and will produce indicated results.
- C. Proposed substitution does not affect dimensions and functional clearances.
- D. Proposed substitution has received necessary approvals of authorities having jurisdiction.
- E. Same warranty will be furnished for proposed substitution as for specified Work.
- F. Same maintenance service and source of replacement parts, as applicable, is available.
- G. Proposed substitution will not adversely affect other trades or delay construction schedule.
- H. Coordination, installation, and changes in the Work as necessary for accepted substitution will be complete in all respects.

_____	_____	_____
Submitting Contractor	Date	Company

**Manufacturer's Certification of Equal Quality:**

I \_\_\_\_\_ represent the manufacturer of the Proposed Substitution item and hereby certify and warrant to Architect, Engineer, and Owner that the function and quality of the Proposed Substitution meets or exceeds the Specified Item.

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 00 15 - ELECTRICAL COORDINATION FOR MECHANICAL EQUIPMENT****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. This Section specifies the basic requirements for electrical components which are an integral part of packaged mechanical equipment. These components include, but are not limited to factory furnished motors, starters, and disconnect switches furnished as an integral part of packaged mechanical equipment.
- B. Specific electrical requirements (i.e. horsepower and electrical characteristics) for mechanical equipment are scheduled on the Drawings.
- C. System shall be complete and operational with power and control wiring provided to meet the design intent shown on the drawings and specified within the specification sections.

**1.2 SUBMITTALS**

- A. No separate submittal is required. Submit product data for motors, starters, and other electrical components with submittal data required for the equipment for which it serves, as required by the individual equipment specification Sections.

**1.3 QUALITY ASSURANCE**

- A. Electrical components and materials shall be UL labeled.
- B. All electrical equipment provided and the wiring and installation of electrical equipment shall be in accordance with the requirements of this Section and Division 26.

**PART 2 - PRODUCTS AND MATERIALS****2.1 GENERAL**

- A. The Contractors shall provide all motors, starters, disconnects, wire, conduit, etc. as specified in the Construction Documents. If, however, the Division 23 Contractor furnishes a piece of equipment requiring a different motor, starter, disconnect, wire size, etc. than what is shown and/or intended on the Construction Documents, this Contractor shall coordinate the requirements with any other Contractor and shall be responsible for any additional cost incurred by any other Contractor that is associated with installing the different equipment and related accessories for proper working condition.
- B. Refer to Division 26, "COMMON WORK RESULTS FOR ELECTRICAL" for specification of motor connections.
- C. Refer to Division 26, "ENCLOSED CONTROLLERS" for specification of motor starters.
- D. Refer to Division 26, "ENCLOSED SWITCHES AND CIRCUIT BREAKERS" for specification of disconnect switches and enclosed circuit breakers.

**PART 3 - EXECUTION****3.1 CONTRACTOR COORDINATION**

- A. Unless otherwise indicated, all motors, equipment, controls, etc. shall be furnished, set in place and wired in accordance with Table 1. Any items not listed but shown on the drawings shall be considered part of the Contract Documents and brought to the attention of the Architect.
- B. The General Contractor is the central authority governing the total responsibility of all trade contractors. Therefore, deviations and clarifications of this schedule are permitted provided the General Contractor assumes responsibility to coordinate the trade contractors different than as indicated herein. If deviations or clarifications to this schedule are implemented, submit a record copy to the Engineer.

**TABLE 1 ELECTRICAL REQUIREMENTS FOR MECHANICAL EQUIPMENT**

ITEM	FURN BY	SET BY	POWER WIRING	CONTROL WIRING
Equipment motors	DIV23m	DIV23m	DIV26	---
Motor control centers	DIV26	DIV26	DIV26	DIV23t
Factory furnished motor starters contactors and disconnects	DIV23m	DIV23m	DIV26	DIV23t
Overload heaters	DIV23m	DIV26	---	---
Loose motor starters, disconnect switches, thermal overloads and heaters.	DIV26	DIV26	DIV26	DIV23t

END OF SECTION

**SECTION 23 05 00 - COMMON WORK RESULTS FOR HVAC****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Access panels and doors in walls, ceilings, and floors for access to mechanical materials and equipment.
- B. Mechanical equipment nameplate data.
- C. Concrete for bases and housekeeping pads.
- D. Non-shrink grout for equipment installations.
- E. Sleeves for mechanical penetrations.
- F. Drip Pans with detection.
- G. Miscellaneous metals for support of mechanical materials and equipment.
- H. Wood grounds, nailers, blocking, fasteners, and anchorage for support of mechanical materials and equipment.
- I. Joint sealers for sealing around mechanical materials and equipment.
- J. Sealing penetrations through noise critical spaces.
- K. Firestopping

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Division 01 and Division 23 Section General Mechanical Requirements.
  - 1. Product data for the following products:
    - a. Access panels and doors.
    - b. Joint sealers.
    - c. Through and membrane-penetration firestopping systems.
    - d. Plenum insulation.
  - 2. Shop drawings detailing fabrication and installation for metal fabrications, and wood supports and anchorage for mechanical materials and equipment.
  - 3. Welder certificates, signed by Contractor, certifying that welders comply with requirements specified under "Quality Assurance" article of this Section.
  - 4. Schedules indicating proposed methods and sequence of operations for selective demolition prior to commencement of Work. Include coordination for shut-off of utility services and details for dust and noise control.
    - a. Coordinate sequencing with construction phasing and Owner occupancy specified in Division 01 Section "Summary of Work."
  - 5. Through and Membrane Penetration Firestopping Systems Product Schedule: Submit a schedule for each piping system penetration that includes UL listing, location, wall or floor rating and installation drawing for each penetration fire stop system.
    - a. Where Project conditions require modification to a qualified testing and inspecting agency's illustration for a particular penetration firestopping condition, submit illustration, with modifications marked, approved by penetration firestopping manufacturer's fire-protection engineer as an engineering judgment or equivalent fire-resistance-rated assembly.

**1.3 QUALITY ASSURANCE**

- A. Qualify welding processes and welding operators in accordance with AWS D1.1 "Structural Welding Code - Steel."
  - 1. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
- B. Fire-Resistance Ratings: Where a fire-resistance classification is indicated, provide access door assembly with panel door, frame, hinge, and latch from manufacturer listed in the UL "Building Materials Directory" for rating shown.
  - 1. Provide UL Label on each fire-rated access door.
- C. Through and Membrane Penetration Firestopping Systems Installer Qualifications: A firm experienced in installing penetration firestopping systems similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful performance. Qualifications include having the necessary experience, staff, and training to install manufacturer's products per specified requirements. Manufacturer's willingness to sell its penetration firestopping system products to Contractor or to Installer engaged by Contractor does not in itself confer qualification on buyer.

**1.4 NOISE CRITICAL SPACES**

- A. Many areas of the building, referred to as "noise-critical spaces", require special attention (special acoustical provisions and restrictions). The table below designates the noise-critical spaces; noise levels due to equipment, ductwork, grilles, registers, terminal devices, diffusers, etc., shall permit attaining sound pressure levels in all 8 octave bands in occupied spaces conforming to RC levels per ASHRAE handbook as indicated.

<u>Space</u>	<u>RC Levels</u>
Sound/Lighting Control Rooms	25
A/V Spaces	25
TV Production Studio	25
Teleconference Rooms	25
Meeting/Banquet Rooms	30
Conference Rooms	30

**PART 2 - PRODUCTS AND MATERIALS****2.1 ACCESS TO EQUIPMENT**

- A. Manufacturers:
  - 1. Bar-Co., Inc.
  - 2. Elmdor Stoneman.
  - 3. JL Industries
  - 4. Jay R. Smith Mfg. Co.
  - 5. Karp Associates, Inc.
  - 6. Milcor
  - 7. Nystrom Building Products
  - 8. Wade
  - 9. Zurn
- B. Access Doors:
  - 1. Steel Access Doors and Frames: Factory-fabricated and assembled units, complete with attachment devices and fasteners ready for installation. Joints and seams shall be continuously welded steel, with welds ground smooth and flush with adjacent surfaces.
  - 2. Frames: 16-gauge steel, with a 1-inch-wide exposed perimeter flange for units installed in unit masonry, pre-cast, or cast-in-place concrete, ceramic tile, or wood paneling.

- a. For installation in masonry, concrete, ceramic tile, or wood paneling: 1-inch-wide exposed perimeter flange and adjustable metal masonry anchors.
  - b. For installation in gypsum wallboard or plaster: perforated flanges with wallboard bead.
  - c. For installation in full-bed plaster applications: galvanized, expanded metal lath and exposed casing bead, welded to perimeter of frame.
3. Flush Panel Doors: 14-gauge sheet steel, with concealed spring hinges or concealed continuous piano hinge set to open 175 degrees; factory-applied prime paint.
    - a. Fire-Rated Units: Insulated flush panel doors, with continuous piano hinge and self-closing mechanism.
  4. Locking Devices: Flush, screwdriver-operated cam locks.

## 2.2 MECHANICAL EQUIPMENT NAMEPLATE DATA

- A. For each piece of power operated mechanical equipment, provide a permanent operational data nameplate indicating manufacturer, product name, model number, serial number, capacity, operating and power characteristics, labels of tested compliance's, and similar essential data. Locate nameplates in an accessible location.

## 2.3 CONCRETE EQUIPMENT BASES HOUSEKEEPING PADS

- A. Provide concrete equipment bases and housekeeping pads for various pieces of floor mounted mechanical equipment. Concrete equipment bases/housekeeping pads shall generally conform to the shape of the piece of equipment it serves with a minimum 4" margin around the equipment and supports.
- B. Form concrete equipment bases and housekeeping pads using framing lumber or steel channel with form release agent. Chamfer top edges and corners. Trowel tops and sides of each base/pad to a smooth finish, equal to that of the floors.
- C. Concrete equipment bases and housekeeping pads shall be made of a minimum 28 day, 4000 psi concrete conforming to American Concrete Institute Standard Building Code for Reinforced Concrete (ACI 318-99) and the latest applicable recommendations of the ACI standard practice manual. Concrete shall be composed of cement conforming to ASTM C 150 Type I, aggregate conforming to ASTM C33, and potable water. All exposed exterior concrete shall contain 5 to 7 percent air entrainment.
- D. Unless otherwise specified or shown on the structural drawings, reinforce equipment bases and housekeeping pads with No. 4 reinforcing bars conforming to ASTM A 615 or 6x6 – W2.9 x W2.9 welded wire mesh conforming to ASTM A185. Reinforcing bars shall be placed 24" on center with a minimum of two bars each direction.
- E. Provide galvanized anchor bolts for all equipment placed on concrete equipment bases and housekeeping pads or on concrete slabs. Anchor bolts size, number and placement shall be as recommended by the Manufacturer of the equipment.
- F. Concrete equipment bases and housekeeping pads shall have height as specified on the drawings or minimum height if not specified in accordance with the following table:

Equipment	Minimum Height
Other Equipment Not Listed	3-1/2"
Air Handling Units w/TSP less than or equal to 3.5", Boilers (See Note 1)	3-1/2"
Chillers, Condensate Pumps, Base Mounted Pumps up to 30 HP, Air Handling Units w/TSP greater than 3.5", All Vertical Inline Pumps, (See Note 1)	5-1/2"

## NOTES:

- Height of equipment bases applies to equipment installed on slab-on-grade. For equipment installed on floors above grade and/or roof, reference the drawings.
- Coordinate final pad heights for air handling units with required condensate trap depths. Increase pad heights as needed to allow for unit trap height and required slope to drain.

**2.4 GROUT**

- Provide nonshrink, nonmetallic grout conforming to ASTM C 1107, Grade B, in premixed and factory-packaged containers.
- Grout shall have post-hardening, volume-adjusting, dry, non-staining, non-corrosive, non-gaseous, hydraulic-cement characteristics and shall be as recommended by manufacturer for interior and exterior applications.
- Grout shall have 5,000 psi, 28-day compressive strength design mix.

**2.5 PENETRATIONS**

- Sleeves:
  - Steel Sleeves: Schedule 40 galvanized, welded steel pipe, ASTM A-53 grade A or 12 gauge (0.1084 inches) welded galvanized steel formed to a true circle concentric to the pipe.
  - Sheet-Metal Sleeves: 10 gauge (0.1382 inches), galvanized steel, round tube closed with welded longitudinal joint.
- Frames for rectangular openings attached to forms and of a maximum dimension established by the Architect. For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches, provide 18 gauge (0.052 inches) welded galvanized steel. For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches and 1 or more sides equal to, or greater than, 16 inches, provide 10 gauge (0.1382 inches) welded galvanized steel. Notify the General Contractor or Architect before installing any box openings not shown on the Architectural or Structural Drawings.

**2.6 DRIP PANS**

- Drip pans for pipes in protected areas shall be 20 gauge galvanized steel with 2" lapped and soldered joints. Drip pan shall have a depth of 2" and a width of 6" in addition to the diameter of the associated pipe. Provide 3/4" galvanized pipe with male NPT outlet at low point of drip pan. Connect 3/4" type "L" copper indirect drain line to drip pan outlet. Route and discharge to receptor with air gap outside of the protected area.
- Drip pan supports shall be 1/4" X 2" galvanized bar stock welded to the drip pan without holes. Provide 1/4" galvanized threaded rods through bar stock on each side of the drip pan and attached with 2 nuts per rod. Attach rods to structure with MSS SP-58 compliant components.
- Flood Detector: Flood detector switch utilizing hydrophilic pad and stainless steel sensor array to detect moisture. Switch shall be provided with integral feet to prevent pad from contacting the pan. Provide with solid state electronics and double throw relay to allow switch to shut down unit and provide an auxiliary alarm output.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Diversitech
  - b. RCT/Aquaguard
  - c. Approved equivalent

## 2.7 MISCELLANEOUS METALS

- A. Steel plates, shapes, bars, and bar grating: ASTM A 36.
- B. Cold-Formed Steel Tubing: ASTM A 500.
- C. Hot-Rolled Steel Tubing: ASTM A 501.
- D. Steel Pipe: ASTM A 53, Schedule 40, welded.
- E. Fasteners: Zinc-coated, type, grade, and class as required.

## 2.8 MISCELLANEOUS LUMBER

- A. Framing Materials: Standard Grade, light-framing-size lumber of any species. Number 3 Common or Standard Grade boards complying with WCLIB or AWPB rules, or Number 3 boards complying with SPIB rules. Lumber shall be preservative treated in accordance with AWPB LP-2, and kiln dried to a moisture content of not more than 19 percent.
- B. Construction Panels: Plywood panels; APA C-D PLUGGED INT, with exterior glue; thickness as indicated, or if not indicated, not less than 15/32 inches.

## 2.9 JOINT SEALERS

- A. General: Joint sealers, joint fillers, and other related materials compatible with each other and with joint substrates under conditions of service and application.
- B. Colors: As selected by the Architect from manufacturer's standard colors.
- C. Nonacid Curing Sealer: One-part, nonacid-curing, silicone sealant complying with ASTM C920, Type S, Grade NS, Class 25, for uses in non-traffic areas for masonry, glass, aluminum, and other substrates recommended by the sealant manufacturer.
  1. Manufacturers:
    - a. Dow Corning, Dowsil 790.
    - b. Dow Corning, Dowsil 795.
    - c. GE, Silglaze II SCS 2350.
    - d. GE, Silpruf SCS 2000.
    - e. Owens Corning, Energy Complete.
    - f. Pecora, 864 NST.
    - g. Tremco, Spectrem 1.
    - h. Tremco, Spectrem 2.
- D. High Humidity Sealer: One-part, mildew-resistant, silicone sealant complying with ASTM C920, Type S, Grade NS, Class 25, for uses in non-traffic areas for glass, aluminum, and nonporous joint substrates; formulated with fungicide; intended for sealing interior joints with nonporous substrates; and subject to in-service exposure to conditions of high humidity and temperature extremes.
  1. Manufacturers:
    - a. Dow Corning, Dowsil 786.
    - b. GE, Momentum SCS1700.
    - c. Pecora, 898 Silicone NST.

- E. Hybrid Joint Sealer: One-part, non-sag, paintable complying with ASTM C920, Type S, Grade NS, Class 50, recommended for exposed applications on interior and exterior locations involving joint movement of not more than plus or minus 50 percent.
  - 1. Manufacturers:
    - a. BASF, MasterSeal NP 100.
    - b. Pecora, DyanTrol I-XL.
    - c. Tremco, Dymonic FC.
- F. Acrylic Latex Joint Sealer: One-part, non-sag, mildew-resistant, paintable acrylic latex or siliconized acrylic latex, complying with ASTM C834, Type OP, Grade NF, recommended for exposed applications on interior and protected exterior locations involving joint movement of not more than plus or minus 5 percent.
  - 1. Manufacturers:
    - a. Pecora, AC-20
    - b. Sherwin Williams 950A
    - c. Tremco, Tremflex 834

## 2.10 ACOUSTICAL SEALANTS

- A. General: Penetrations by ducts, pipes and conduit through surfaces that are around and between noise critical spaces shall be sleeved, packed and sealed airtight with foam rod, non-hardening sealant and/or packing material as described herein.
- B. Foam Rod: Foam backer rod shall be closed cell polyethylene suitable for use as a backing for non-hardening sealant.
- C. Non-Hardening Sealant: Sealant for penetrations shall be non-hardening. Permanently flexible, approved firestop putty may be used in lieu of the sealant on foam rod in noise critical walls that are also fire rated.
- D. Packing Material: Mineral fiber; non-combustible; resistant to water, mildew and vermin. Expanding resilient foams manufactured for this purpose are an acceptable alternative only if the material density is at least 15 pcf (40 kg/m<sup>3</sup>).
- E. Acoustical Joint Sealant: Manufacturer's standard non-sag, paintable, non-staining latex sealant complying with ASTM C834. Product effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E90. Meeting ASTM E84 for a smoke flame spread index of less than 25 / 50.
- F. Manufacturers:
  - 1. Pecora, AC-20 FTR.
  - 2. Pecora, AIS-919.
  - 3. USG, SHEETROCK Acoustical Sealant.

## 2.11 FIRESTOPPING

- A. Sealants and accessories shall have fire-resistance ratings indicated, as established by testing identical assemblies in accordance with UL 2079 or ASTM E814, or other NRTL acceptable to AHJ.
- B. Manufacturers:
  - 1. 3M Corp., Fire Barrier Sealant.
  - 2. Hilti.
  - 3. Owens Corning, Firestopping Insulation.
  - 4. Pecora, AC-20 FTR.
  - 5. RectorSeal.
  - 6. Specified Technologies Inc., Firestop.
  - 7. USG SHEETROCK Firecode Compound.

8. Tremco, Tremstop Fyre-Sil.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION GENERAL**

- A. Install products in accordance with manufacturer's instructions.

#### **3.2 INSTALLATION OF ACCESS DOORS**

- A. Provide access doors for all concealed equipment and duct and piping accessories that require service where indicated or as required, except where above lay-in ceilings. Refer to Section "Identification for HVAC Piping and Equipment" for labeling of access doors.
- B. Access doors shall be adequately sized for the devices served with a minimum size of 18 inches x 18 inches, furnished by the respective Contractor or Subcontractor and installed by the General Contractor.
- C. Access doors must be of the proper construction for type of construction where installed.
- D. The exact location of all access doors shall be verified with the Architect prior to installation.
- E. Set frames accurately in position and securely attached to supports, with face panels plumb and level in relation to adjacent finish surfaces.
- F. Adjust hardware and panels after installation for proper operation.

#### **3.3 ERECTION OF METAL SUPPORTS AND ANCHORAGE**

- A. Cut, fit, and place miscellaneous metal fabrications accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.
- B. Field Welding: Comply with AWS "Structural Welding Code."

#### **3.4 ERECTION OF WOOD SUPPORTS AND ANCHORAGE**

- A. Cut, fit, and place wood grounds, nailers, blocking, and anchorage accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.
- B. Select fastener sizes that will not penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood members.
- C. Attach to substrates as required to support applied loads.

#### **3.5 PREPARATION FOR JOINT SEALERS**

- A. Surface Cleaning for Joint Sealers: Clean surfaces of joints immediately before applying joint sealers to comply with recommendations of joint sealer manufacturer.
- B. Apply joint sealer primer to substrates as recommended by joint sealer manufacturer. Protect adjacent areas from spillage and migration of primers, using masking tape. Remove tape immediately after tooling without disturbing joint seal.

#### **3.6 APPLICATION OF JOINT SEALERS**

- A. General: Comply with joint sealer manufacturers' printed application instructions applicable to products and applications indicated, except where more stringent requirements apply.
  1. Comply with recommendations of ASTM C 962 for use of elastomeric joint sealants.

2. Comply with recommendations of ASTM C 790 for use of acrylic-emulsion joint sealants.
- B. Tooling: Immediately after sealant application and prior to time shinning or curing begins, tool sealants to form smooth, uniform beads; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

### 3.7 PENETRATIONS

- A. New Construction:
1. Coordinate with Divisions 03 and 04 for installation of sleeves and sleeve seals integrally in cast-in-place, precast, and masonry walls and horizontal slabs where indicated on the Drawings or as required to support piping or ductwork penetrations.
- B. Provide sleeves and/or box frames for openings in all concrete and masonry construction and fire or smoke partitions, for all mechanical work that passes through such construction; Coordinate with other trades and Divisions to dimension and lay out all such openings.
- C. The General Contractor will provide only those openings specifically indicated on the Architectural or Structural Drawings as being provided under the General Contractor's work.
- D. The cutting of new or existing construction shall not be permitted except by written approval of the Architect.
- E. Floor sleeves shall be fitted with means for attachment to forms and shall be of length to extend at least two inches above the floor level.
- F. All sleeves shall be of ample size to allow for movement of conduit, duct or pipe and insulation through the sleeves without damage to the insulation.
- G. Cut sleeves to length for mounting flush with both surfaces of walls.
- H. Extend sleeves installed in floors 2 inches above finished floor level.
- I. Seal space outside of sleeves with grout for penetrations of concrete and masonry.
- J. Seal space outside of sleeves with approved joint compound for penetrations of gypsum board assemblies.
- K. All circular and oval openings sleeved through underground exterior walls shall be sealed with mechanical sleeve seals as specified in Division 23 Section "Basic Piping Materials and Methods". All rectangular openings through underground exterior walls shall be flanged and flashed with non-corrosive material on each side and the gap sealed with weatherproof sealant.

### 3.8 DRIP PANS

- A. Provide drip pans in locations indicated on drawings.
- B. Provide drip pans under piping or equipment that is installed in spaces that have sensitive electronics/electrical equipment such as electrical, IT/AV, telecom, data equipment, elevator machinery rooms, etc. Obtain approval from the Architect prior to installation.
- C. Provide drip pans for piping directly above a two hour rated ceiling of an elevator machine room.
- D. Provide drip pans, only with written approval obtained prior to installation, installed beneath piping above electrical rooms, telecom rooms, data rooms, servers or any other protected area not clearly indicated by drawings.
- E. Provide drip pan supports every 4'-0".
- F. Place flood detector in the lowest location in the drip pan. Interlock detector with the HVAC equipment per manufacturer's recommendations.

- G. Wire flood detector to remote alarm, Diversitech Universal Alarm or equivalent. Coordinate location of the remote alarm with building owner prior to installation.
- H. Coordinate interlock of "Water Present" alarm and "Cable Fault" alarm with building automation system. Refer to Division 23 Section "Direct Digital Controls for HVAC" for integration with building automation system and low voltage power wiring.

### 3.9 ACOUSTICAL PENETRATIONS

- A. General: There shall be no direct contact of Sheet Metal or piping with shaft walls, floor slabs and/or partitions. All openings around pipes and ducts in the structure surrounding the mechanical equipment and surrounding noise-critical spaces shall be sealed, packed with caulking for the full depth of the penetration, as described herein.. This includes all slab penetrations and penetrations of noise critical walls.
- B. Duct Penetrations: Where each duct passes through a wall, floor or ceiling of a noise critical space, there shall be a clear annular space of 1 inch between the duct and structure. After all of the ductwork is installed, the Contractor shall check the clearance, pack the voids full depth with packing material and caulk both ends with non-hardening sealant backed by foam rod or permanently flexible firestop material. Where there is not sufficient access space to pack around all sides of a duct (for example, at the underside of a slab), place a short stub duct in the wall, pack and caulk around it and then attach the inlet and outlet ducts to each end.
- C. HVAC Piping:
  - 1. Provide a steel sleeve cast or grouted into the structure. The internal diameter of the sleeve shall be 2 inches larger than the external diameter of the pipe passing through it. After all of the piping is installed in that area, verify the specified clearance and correct it, if necessary, to within 1/2 inch. Pack the void full depth with packing material sealed at both ends, 1 inch deep, with non-hardening sealant backed by foam rod.
  - 2. Provide factory fabricated split seal clamp around the pipe filled with closed-cell neoprene sponge insulation, thickness as required to match adjacent insulation, minimum 3/4 inch. Cast or grout the sleeve into the structure. Provide fiberglass insulation if the pipe is subject to temperatures greater than 225 degrees F. Provide Mason Industries Type SWS or approved equal.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 05 10 - BASIC PIPING MATERIALS AND METHODS****PART 1 - GENERAL REQUIREMENTS****1.1 SECTION INCLUDES**

- A. Joining materials.
- B. Escutcheons.
- C. Nipples.
- D. Unions.
- E. Dielectric unions.
- F. Dielectric waterway fittings.
- G. Dielectric flanges and flange kits.
- H. Mechanical sleeve seals.
- I. Pipe roof curbs.

**1.2 SUBMITTALS**

- A. Refer to Division 01 and Division 23 Section "General Mechanical Requirements" for administrative and procedural requirements for submittals.
- B. Product Data, including, rated capacities of selected models, weights (shipping, installed, and operating), furnished specialties and accessories, and installation instructions.
- C. Quality Assurance Submittals: Submit welders' certificates specified in Article "Quality Assurance" below.
- D. Piping Schedule: Submit a piping schedule that states the material being proposed for each piping system application in the project including manufacturer's catalog information, pipe materials, sizes, fittings, Type, Grade, Schedule, applicable ASTM standard, and connection method(s).
- E. Submit a schedule of dissimilar metal joints and dielectric flanges, flange kits, unions, or waterway fittings. Include proposed product, joint type materials, and connection method to isolate dissimilar metals. Refer to the individual Division 23 piping system specification sections for piping materials and fittings relative to that particular system and additional requirements.
- F. Submit certification that fittings and specialties are manufactured in plants located in the United States or certified that they comply with applicable ANSI and ASTM standards.
- G. Manufacturer's Installation Instructions: Indicate hanging and support methods and joining procedures.
- H. Maintenance Data: Include installation instructions, spare parts lists, exploded assembly views.
- I. Shop Drawings: Include detailed fabrication of pipe anchors, hangers, special pipe support assemblies, alignment guides, expansion joints and loops, and their attachment to the building structure.
- J. Coordination Drawings: Include piping layout, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
  - 1. Suspended ceiling components.
  - 2. Other building services.
  - 3. Structural members.

- K. As-built drawings for each piping system in electronic and PDF format.
- L. Refer to the individual piping system specification sections in Division 23 for additional requirements.

### 1.3 QUALITY ASSURANCE

- A. Welder's Qualifications: All welders shall be qualified in accordance with ASME Boiler and Pressure Vessel Code (BPVC), Section IX, "Welding, Brazing, and Fusing Qualifications."
- B. Comply with ASME B31.9 - Building Services Piping, most recent edition.
- C. Comply with American Welding Society (AWS), Welding Handbook, most recent edition.
- D. Soldering and Brazing procedures shall conform to ANSI B9.1 Safety Code for Mechanical Refrigeration.
- E. Pipe specialties and fittings shall be manufactured in plants located in the United States or certified to meet the specified ASTM, ASME, and ANSI standards.
- F. Refer to the individual piping system specification sections in Division 23 for additional requirements.

### 1.4 DELIVERY STORAGE AND HANDLING

- A. Provide temporary end caps and closures on piping and fittings. Maintain in place until installation.
- B. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the work, and isolating parts of completed system.
- C. Refer to the individual piping system specification sections in Division 23 for additional requirements.

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 PIPE AND FITTINGS

- A. Refer to the individual piping system specification sections in Division 23 for specifications on piping and fittings relative to that particular system.

### 2.2 JOINING MATERIALS

- A. Refer to individual Division 23 Piping Sections for special joining materials not listed below.
- B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.
- C. Welding Materials: Comply with AWS D10.12 and Section II, Part C, ASME BPVC for welding materials appropriate for the wall thickness and chemical analysis of the pipe being welded.
- D. Brazing Filler Metals: Comply with SFA-5.8, Section II, ASME BPVC for brazing filler metal materials appropriate for the materials being joined.
  - 1. AWS A5.8, Classification BAg-5:
    - a. Silver (Ag) 44.0 – 46.0 percent.
    - b. Zinc (Z) 23.0 – 27.0 percent.
    - c. Copper (Cu) 29.0 – 31.0 percent.
  - 2. AWS A5.8, Classification BCuP-5:
    - a. Phosphorus (P) 4.8 - 5.2 percent.
    - b. Silver (Ag) 14.5 - 15.5 percent.
    - c. Copper (Cu) remainder.

- E. Soldering Filler Metals: ASTM B32, 95-5 Tin-Antimony and water flushable flux in accordance with ASTM B813.
- F. Plastic Pipe Solvent Cement:
  - 1. PVC: ASTM D2564.
  - 2. CPVC: ASTM F493.
- G. Gaskets for Flanged Joints: ASME B16.21, full-faced for cast-iron flanges and raised-face for steel flanges. Select material, thickness, and type to suit the service of the piping system in which installed and which conform to their respective ASME Standard (A21.11, B16.20, or B16.21). Provide materials that will not be detrimentally affected by the chemical and thermal conditions of the fluid being carried.

### 2.3 ESCUTCHEONS

- A. Manufacturers:
  - 1. AWI Manufacturing.
  - 2. Keeney Manufacturing Company.
  - 3. Wal-Rich Corp.
  - 4. Jones Stephens Corp.
  - 5. Approved equal.
- B. Chrome-plated, stamped-steel, hinged, split-ring escutcheon, with set screw. Inside diameter shall closely fit pipe outside diameter, or outside of pipe insulation where pipe is insulated. Outside diameter shall completely cover the opening in floors, walls, or ceilings.

### 2.4 NIPPLES

- A. Steel: ASTM A733, made of ASTM A53, Schedule 40, black steel; Type S seamless for pipe sizes 2 inch and smaller, Type E electric-resistance welded for pipe sizes 2-1/2 inch and larger.

### 2.5 UNIONS

- A. Manufacturers:
  - 1. Anvil International.
  - 2. Hart Industries.
  - 3. Mueller Streamline Co.
  - 4. Victaulic Company of America.
  - 5. Watts Regulator Co.
  - 6. Approved equal.
- B. Hexagonal stock, with ball-and-socket joints, metal-to-metal bronze seating surfaces; female threaded ends.
  - 1. Malleable-iron: ASME B16.39, class as specified in section "Hydronic Piping" for the piping system used.
  - 2. Bronze: ASME B16.15, cast bronze body meeting ASTM B62, class as specified in section "Hydronic Piping" for the piping system used.
  - 3. Copper: ASME B16.22 wrought copper body.
    - a. For hydronic systems, provide class as specified in section "Hydronic Piping" for the piping system used.
    - b. For refrigerant systems, provide pressure rating as required for the refrigerant type used.

### 2.6 DIELECTRIC UNIONS

- A. Manufacturers:
  - 1. Hart Industries.

2. Victaulic Company of America.
  3. Watts Regulator Co.
  4. Approved equal.
- B. Factory-fabricated with cast bronze body meeting ASTM B584 and galvanized or black steel body with plastic dielectric gasket, class 125 for low pressure service and class 250 for high pressure service, and appropriate end connections for the pipe materials in which installed (screwed or soldered) to effectively isolate dissimilar metals, prevent galvanic action, and stop corrosion.

## 2.7 DIELECTRIC WATERWAY FITTINGS

- A. Manufacturers:
1. Grinnell Mechanical Products.
  2. Victaulic Company of America (Sweat and threaded connections only).
  3. Approved equal.
- A. Electroplated steel, brass, bronze, or nylon encapsulated nipple, with an inert and non-corrosive, thermoplastic lining, and appropriate end connections for the pipe materials in which installed (screwed, soldered, grooved, or flanged) to effectively isolate dissimilar metals, prevent galvanic action, and stop corrosion.

## 2.8 DIELECTRIC FLANGES AND FLANGE KITS

- A. Manufacturers:
1. Advance Products & Systems, Inc.
  2. Calpico, Inc.
  3. Pipeline Seal & Insulator, Inc.
  4. Tampa Rubber & Gasket Co. Inc.
  5. Watts Water Technologies.
  6. Approved equal.
- B. Full-faced gasket with same outside diameter and bolt hole arrangement as the flange. Conform to ANSI B16.5. Pressure rating of 200 psi for low pressure service and 400 psi for high pressure service at a continuous operating temperature of 180F.
- C. Steel washers, thermoplastic washers and bolt isolation sleeves or thermoplastic combination washers and bolt sleeves.
- D. Flanges: Cast bronze meeting ASTM B584, class 125 solder type or cast iron meeting ASTM A536, class 125 threaded type for low pressure service, bronze class 250 solder type or cast iron class 250 threaded type for high pressure service.

## 2.9 MECHANICAL SLEEVE SEALS

- A. Manufacturers:
1. Thunderline/Link Seal.
  2. Calpico, Inc.
  3. Metraflex Co.
  4. Approved equal.
- B. Sleeves: Refer to Division 23 Section "Common Work Results for HVAC" for sleeve materials.
- C. Modular mechanical type, consisting of interlocking synthetic rubber links shaped to continuously fill annular space between pipe and sleeve, connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation.

**2.10 PIPE ROOF CURBS**

- A. Manufacturers:
  - 1. AES Industries.
  - 2. Custom Curb, Inc.
  - 3. Pate Company.
  - 4. Thybar.
- B. Provide factory-fabricated, pipe roof curbs with the following features:
  - 1. Factory installed treated wood nailer.
  - 2. Welded, 18 gauge galvanized steel shell, base plate and flashing.
  - 3. 1-1/2 inch thick, 3 pound rigid insulation.
  - 4. Fully mitered 3-inch raised cant.
  - 5. Cover of weather-resistant, weather-proof material.
  - 6. Pipe collar of weather-resistant material with stainless steel pipe clamps.

**PART 3 - EXECUTION****3.1 PREPARATION**

- A. Ream ends of pipes and tubes, and remove burrs. Bevel plain ends of steel pipe.
- B. Remove scale, slag, dirt, and debris for both inside and outside of piping and fittings before assembly.

**3.2 INSTALLATION GENERAL**

- A. Install products in accordance with manufacturer's instructions.
- B. Drawings (plans, schematics, and diagrams) indicate the general location and arrangement of the piping systems. Location and arrangement of piping layout take into consideration pipe sizing and friction loss, expansion, pump sizing, and other design considerations. So far as practical, install piping as indicated. Refer to individual system specifications for requirements for coordination drawing submittals.
- C. Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated to be exposed to view. Install escutcheons at each wall, floor and ceiling penetration in exposed finished locations. Provide deep pattern escutcheons where required to conceal protruding pipe fittings.
- D. Install piping free of sags and bends and with ample space between piping to permit proper insulation applications.
- E. Install exposed piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated on the Drawings.
- F. Install horizontal piping as high as possible allowing for specified slope and coordination with other components. Install vertical piping tight to columns or walls. Provide space to permit insulation applications, with 1 inch clearance outside the insulation. Allow sufficient space above removable ceiling panels to allow for panel removal.
- G. Locate groups of pipes parallel to each other, spaced to permit applying full insulation and servicing of valves.
- H. Support piping from structure. Do not support piping from ceilings, equipment, ductwork, conduit and other non-structural elements.
- I. Install drains at low points in mains, risers, and branch lines consisting of a tee fitting, 3/4 inch ball valve, and short 3/4 inch threaded nipple and cap.
- J. Verify final equipment locations for roughing in.

- K. Use fittings for all changes in direction and all branch connections.
- L. Remake leaking joints using new materials.
- M. Install components with pressure rating equal to or greater than system operating pressure.
- N. Piping Protection:
  - 1. Protect piping during construction period, to avoid clogging with dirt and debris, and to prevent damage from traffic and construction work.
  - 2. Place plugs in ends of uncompleted piping at end of day or whenever work stops.

### 3.3 PENETRATIONS

- A. Mechanical penetrations occur when piping or ductwork penetrate concrete slabs, concrete or masonry walls, or fire / smoke rated floor and wall assemblies. Reference Division 23 Section "Common Work Results for HVAC" for additional penetration requirements.
- B. Above Grade Concrete or Masonry Penetrations:
  - 1. Provide sleeves for pipes passing through above grade concrete or masonry walls, concrete floor or roof slabs. Sleeves are not required for core drilled holes in existing masonry walls, concrete floors or roofs.
    - a. Provide Schedule 40 galvanized steel pipe for sleeves smaller than 6 inches in diameter.
    - b. Provide galvanized sheet metal for sleeves 6 inches in diameter and larger, thickness shall be 10 gauge (0.1382 inches).
    - c. Provide welded galvanized sheet metal for rectangular sleeves with the following minimum metal thickness:
      - 1) For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches, thickness shall be 18 gauge (0.052 inches).
      - 2) For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches and 1 or more sides equal to, or greater than, 16 inches, thickness shall be 10 gauge (0.1382 inches).
    - d. Schedule 40 PVC pipe sleeves are acceptable for use in areas without return air plenums.
  - 2. Extend pipe insulation for insulated pipe through floor, wall and roof penetrations, including fire rated walls and floors. The vapor barrier shall be maintained. Size sleeve for a minimum of 1 inch annular clear space between inside of sleeve and outside of insulation.
  - 3. Seal elevated floor, exterior wall and roof penetrations watertight and weathertight with non-shrink, non-hardening commercial sealant. Pack with mineral wool and seal both ends with minimum of 1/2 inch of sealant.
- C. Underground, Exterior-Wall Penetrations:
  - 1. Install cast-iron sleeves. Size sleeves to allow for 1-inch (or larger, if required by the mechanical sleeve manufacturer) annular clear space between pipe and sleeve. Provide mechanical sleeve seal.
  - 2. Use type and number of sealing elements recommended by manufacturer for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
  - 3. Inspect installed sleeve and sleeve-seal installations for damage and faulty work. Verify watertight integrity of sleeves and seals installed below grade to seal against hydrostatic pressure.
- D. Above Ground, Exterior Wall Penetrations:
  - 1. Seal annular space between sleeve and pipe or duct, using joint sealant appropriate for size, depth, and location of joint. Pack with mineral wool and seal both ends with minimum of 1/2 inch of waterproof sealant. Refer to Division 07 Section "Joint Sealants" for materials and installation.

2. Extend pipe insulation for insulated pipe through sleeve. The vapor barrier shall be maintained. Size sleeve for a minimum of 1 inch annular clear space between inside of sleeve and outside of insulation.
- E. Elevated Floor Penetrations of Waterproof Membrane:
1. Provide cast-iron sleeves, extend top of sleeve minimum 1 inch above finish floor. Size sleeve for minimum 1/2 inch annular space between pipe and sleeve.
  2. Extend pipe insulation for insulated pipe through sleeve. The vapor barrier shall be maintained. Size sleeve for a minimum of 1 inch annular clear space between inside of sleeve and outside of insulation.
  3. Pack with mineral wool and seal both ends with minimum of 1/2 inch of waterproof sealant. Refer to Division 07 Section "Joint Sealants" for materials and installation.
  4. Secure waterproof membrane flashing between clamping flange and clamping ring. Comply with requirements for flashing specified in Division 07 Section "Sheet Metal Flashing and Trim."
  5. Extend bottom of sleeve below floor slab as required and secure underdeck clamp to hold sleeve rigidly in place.
- F. Interior Foundation Penetrations:
1. Provide sleeves for horizontal pipe passing through or under foundation. Sleeves shall be cast iron soil pipe two nominal pipe sizes larger than the pipe served.
- G. Concrete Slab on Grade Penetrations:
1. Provide schedule 40 PVC pipe sleeves for vertical pressure pipe passing through concrete slab on grade. Sleeves shall be one nominal pipe size larger than the pipe served and two pipe sizes larger than pipe served for ductile iron pipes with restraining rods. Seal water-tight with silicone caulk.
  2. Provide 1/2 inch thick cellular foam insulation around perimeter of non-pressure pipe passing thru concrete slab on grade. Insulation shall extend to 2 inches above and below the concrete slab.
- H. Interior Penetrations of Non-Fire-Rated Walls:
1. Seal annular space between sleeve and pipe or duct, using joint sealant appropriate for size, depth, and location of joint. Pack with mineral wool and seal both ends with minimum of 1/2 inch of sealant. Refer to Division 07 Section "Joint Sealants" for materials and installation.
  2. Extend pipe insulation for insulated pipe through sleeve. The vapor barrier shall be maintained. Size sleeve for a minimum of 1 inch annular clear space between inside of sleeve and outside of insulation.
- I. Fire / Smoke Rated Floor and Wall Assemblies:
1. Seal around penetrations of fire rated assemblies to maintain fire resistance rating of fire-rated assemblies. Coordinate fire ratings and locations with the architectural drawings. Install sealants in compliance with the manufacturer's UL listing. Refer to Division 07 Section "Penetration Firestopping" for special sealers and materials.
- J. Acoustical Barrier Penetrations:
1. Where a pipe passes through a wall, ceiling or floor slab of a noise critical space, a steel sleeve shall be cast or grouted into the structure. Refer to Section "Common Work Results for HVAC" for noise critical spaces. The internal diameter of the sleeve shall be minimum of 2 inches larger than the external diameter of the pipe. After the piping is installed, the Contractor shall check the clearance and correct it to within 1/2-inch. Contractor shall pack the void full depth with glass/mineral fiber insulation and seal at both ends, 1-inch deep, with sealant backed by foam rod.
  2. Penetration of sound isolating ceilings by sprinkler pipes and heads shall be sleeved and sealed and shall have no rigid connections between them.

**3.4 PIPE JOINT CONSTRUCTION**

- B. Threaded Joints:
1. Provide tapered pipe threads for field cut threads. Cut threads full and clean using sharp dies.
  2. Ream threaded pipe ends to remove burrs and restore full inner diameter.
  3. Note the internal length of threads in fittings or valve ends and proximity of internal seat or wall to determine how far pipe should be threaded into joint.
  4. Align threads at point of assembly.
  5. Apply appropriate tape or thread compound to the male pipe threads except where dry seal threading is specified.
  6. Assemble joint wrench tight. Wrench on valve shall be on the valve end into which the pipe is being threaded. Tighten joint to leave not more than 3 threads exposed.
  7. Damaged Threads: Do not use pipe or pipe fittings with threads which are corroded or damaged.
- C. Flanged Joints:
1. Select appropriate gasket material, size, type, and thickness for service application.
  2. Install gasket concentrically positioned.
  3. Align flanges surfaces parallel.
  4. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible.
  5. Use suitable lubricants on bolt threads.
  6. Tighten bolts gradually and uniformly using torque wrench.
- D. Welded Joints:
1. Comply with the requirement in ASME Code B31.9, "Building Services Piping."
  2. Damaged Welds: Do not use pipe sections that have cracked or open welds.
- E. Brazed and Soldered Joints:
1. Soldered Joints: Comply with the procedures contained in the AWS "Soldering Manual."
  2. Brazed Joints: Comply with the procedures contained in the AWS "Brazing Manual."
  3. WARNING: Some filler metals contain compounds which produce highly toxic fumes when heated. Avoid breathing fumes. Provide adequate ventilation.
  4. CAUTION: Remove stems, seats, and packing of valves and accessible internal parts at piping specialties before brazing.
    1. Thoroughly clean tube surface and inside surface of the cup of the fittings, using very fine emery cloth, prior to making joint.
    2. Wipe tube and fittings clean and apply flux. Flux shall not be used as the sole means for cleaning tube and fitting surfaces.
    5. Copper-to-copper joints shall be made using BCuP-5 brazing filler metal without flux.
    6. Dissimilar metals such as copper and brass shall be jointed using an appropriate flux with either BCuP-5 or BAg-5 brazing filler metal. Apply flux sparingly to the clean tube only and in a manner to avoid leaving any excess inside the completed joint.
    7. Continuously purge the pipe and fittings during brazing with an inert gas (i.e., dry nitrogen or carbon dioxide) to prevent formation of scale. Maintain purge until the joint is cool to the touch.
    8. Heat joints using oxy-acetylene torch. Heat to proper and uniform temperature.
    9. Provide temporary cap or cover on completed joints with open ends to prevent entry of contaminating materials.
- F. Socket Joints:
1. Comply with ASTM F402 for safe-handling practice of cleaners, primers, and solvent cements.
  2. Prepare surfaces to be solvent cemented by wiping with a clean cloth moistened with acetone or methylethyl ketone.
  3. CPVC Joints: Solvent cement joints in accordance with ASTM D2846.
  4. PVC Joints: Solvent cement joints in accordance to ASTM D2672.

- B. Joints for other piping materials are specified within the respective piping system Sections.

### **3.5 UNIONS**

- A. Install unions on pipes 2 inch and smaller, adjacent to each valve, at final connections to each piece of equipment, and elsewhere as indicated. Unions are not required on flanged devices.

### **3.6 DIELECTRIC UNIONS**

- A. Install dielectric unions for piping 2 inch and smaller to connect piping materials of dissimilar metals in dry piping systems (gas, compressed air, vacuum) for the following conditions:
  - 1. Copper or brass connected to carbon steel, stainless steel, cast or ductile iron.
- B. Install dielectric unions for piping 2 inch and smaller to connect piping materials of dissimilar metals in wet piping systems (water, steam) for the following conditions:
  - 1. Copper or brass connected to carbon steel, stainless steel, cast or ductile iron.
  - 2. Install waterway fittings where installation is concealed. Do not install dielectric unions in concealed spaces.

### **3.7 DIELECTRIC WATERWAY FITTINGS**

- A. Install dielectric waterway fittings for piping 2 inch and smaller for copper or brass pipe connections to carbon steel equipment connections.

### **3.8 DIELECTRIC FLANGES AND FLANGE KITS**

- A. Install dielectric flanges for piping 2-1/2 inch and larger to connect piping materials of dissimilar metals in dry piping systems (gas, compressed air, vacuum) for the following conditions:
  - 1. Copper or brass connected to carbon steel, stainless steel, cast or ductile iron.
- B. Install dielectric flanges for piping 2-1/2 inch and larger to connect piping materials of dissimilar metals in wet piping systems (water, steam) for the following conditions:
  - 1. Copper or brass connected to carbon steel, stainless steel, cast or ductile iron.
  - 2. Install waterway fittings where installation is concealed. Do not install dielectric flanges in concealed spaces.
- C. Provide brass nipples between the equipment connection and dielectric flange for screwed connections. Provide an iron flange for the equipment side and a bronze flange for the copper or brass piping side of the joint.
- D. Provide a bronze flange for the copper or brass piping connection to a cast iron, ductile iron or steel flange.
- E. Provide full face gasket with pressure rating equal to system served.
- F. At each bolt provide steel washers, thermoplastic washers, and bolt isolation sleeves or thermoplastic combination washers and bolt sleeves.

### **3.9 PIPE FIELD QUALITY CONTROL**

- A. Testing: Refer to individual piping system specification sections.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 05 13 - COMMON MOTOR REQUIREMENT FOR HVAC EQUIPMENT****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. General construction and requirements.
- B. Applications.
- C. Single phase electric motors.
- D. Three phase electric motors.
- E. Electronically Commutated Motors (ECM).
- F. Capacitors.

**1.2 SUBMITTALS**

- A. Conform with the submittal procedures in Division 01.
- B. Product Data: Provide wiring diagrams with electrical characteristics and connection requirements. Provide nameplate data and ratings, mounting arrangements, size and location of winding termination lugs, overload relays, conduit entry, grounding lug, and coatings.
- C. Test Reports: Indicate test results verifying nominal efficiency and power factor for three phase motors larger than 1/2 horsepower.
- D. Manufacturer's Installation Instructions: Indicate setting, mechanical connections, lubrication, and wiring instructions.
- E. Operation Data: Include instructions for safe operating procedures.
- F. Maintenance Data: Include assembly drawings, bearing data including replacement sizes, and lubrication instructions.

**1.3 QUALITY ASSURANCE**

- A. Comply with NFPA 70 National Electrical Code.
- B. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.

**1.4 DELIVERY STORAGE AND HANDLING.**

- A. Protect motors stored on site from weather and moisture by maintaining factory covers and suitable weather-proof covering. For extended outdoor storage, remove motors from equipment and store separately.

**1.5 WARRANTY**

- A. Provide five year manufacturer warranty for motors larger than 20 horsepower.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Baldor Electric Company.
- B. General Electric.
- C. Gould.
- D. Marathon.
- E. Regal-Beloit Corporation (Century).
- F. Westinghouse

**2.2 GENERAL CONSTRUCTION AND REQUIREMENTS**

- A. Electrical Service: All motors shall be supplied in accordance with the following voltage and phase unless noted otherwise on the Drawings.
  - 1. Motors 1/2 HP and Smaller: 115 volts, single phase, 60 Hz.
  - 2. Motors 3/4 HP and Larger: Voltage as scheduled, three phase, 60 Hz.
- B. Construction:
  - 1. Open drip-proof except where noted otherwise.
  - 2. Design for continuous operation in 104 degrees F environment.
  - 3. Design for temperature rise in accordance with NEMA MG 1 limits for insulation class, service factor, and motor enclosure type.
  - 4. Motors with frame sizes 254T and larger: Energy Efficient Type.
- C. Explosion-Proof Motors: UL approved and labeled for hazard classification, with over temperature protection.
- D. Visible Nameplate: Indicating motor horsepower, voltage, phase, cycles, RPM, full load amps, locked rotor amps, frame size, manufacturer's name and model number, service factor, power factor, efficiency.
- E. Wiring Terminations:
  - 1. Provide terminal lugs to match branch circuit conductor quantities, sizes, and materials indicated. Enclose terminal lugs in terminal box sized to NFPA 70, threaded for conduit.
  - 2. For fractional horsepower motors where connection is made directly, provide flexible conduit connection in end frame. Maximum length of flexible conduit shall be five feet.

**2.3 APPLICATIONS**

- A. Exception: Motors less than 250 Watts, for intermittent service may be the equipment manufacturer's standard and need not comply with these specifications.
- B. Single phase motors for shaft mounted fans or blowers: Permanent split capacitor type.
- C. Single phase motors for fans, pumps, blowers and air compressors: Capacitor start type.
- D. Single phase motors for fans less than 1 hp and greater than 1/12 hp: Electronically commutated type.
- E. Motors located in exterior locations, air cooled condensers, humidifiers and explosion proof environments: Totally enclosed fan cooled type.
- F. Motors located outdoors in wet airstreams, including but not limited to cooling towers, evaporative condensers, and sprayed coils: Totally enclosed weatherproof epoxy-sealed type.

**2.4 SINGLE PHASE POWER - PERMANENT-SPLIT CAPACITOR MOTORS**

- A. Starting Torque: Exceeding one fourth of full load torque.
- B. Starting Current: Up to six times full load current.
- C. Multiple Speed: Through tapped windings.
- D. Open Drip-proof or Enclosed Air Over Enclosure: Class A (50 degrees C temperature rise) insulation, minimum 1.0 Service Factor, prelubricated sleeve or ball bearings, automatic reset overload protector.

**2.5 SINGLE PHASE POWER - CAPACITOR START MOTORS**

- A. Starting Torque: Three times full load torque.
- B. Starting Current: Less than five times full load current.
- C. Pull-up Torque: Up to 350 percent of full load torque.
- D. Breakdown Torque: Approximately 250 percent of full load torque.
- E. Motors: Capacitor in series with starting winding; provide capacitor-start/capacitor-run motors with two capacitors in parallel with run capacitor remaining in circuit at operating speeds.
- F. Drip-proof Enclosure: Class A (50 degrees C temperature rise) insulation, NEMA Service Factor, prelubricated ball bearings.
- G. Enclosed Motors: Class A (50 degrees C temperature rise) insulation, 1.0 Service Factor, prelubricated ball bearings.

**2.6 THREE PHASE POWER - SQUIRREL CAGE MOTORS**

- A. Starting Torque: Between 1 and 1-1/2 times full load torque.
- B. Starting Current: Six times full load current.
- C. Power Output, Locked Rotor Torque, Breakdown or Pull Out Torque: NEMA Design B characteristics.
- D. Design, Construction, Testing, and Performance: Conform to NEMA MG 1 for Design B motors.
- E. Insulation System: NEMA Class B or better.
- F. Drip-proof Enclosure: NEMA Service Factor.
- G. All motors controlled by variable frequency controllers shall have a 1.15 Service Factor.
- H. Testing Procedure: In accordance with IEEE 112. Load test motors to determine free from electrical or mechanical defects in compliance with performance data.
- I. Motor Frames: NEMA Standard T-Frames of steel, aluminum, or cast iron with end brackets of cast iron or aluminum with steel inserts.
- J. Thermistor System (Motor Frame Sizes 254T and Larger): Three PTC thermistors imbedded in motor windings and epoxy encapsulated solid state control relay for wiring into motor starter; refer to Division 26 - Motor Controlling Equipment.
- K. Bearings: Grease lubricated anti-friction ball bearings with housings equipped with plugged provision for relubrication, rated for minimum AFBMA 9, L-10 life of 20,000 hours. Calculate bearing load with NEMA minimum V-belt pulley with belt center line at end of NEMA standard shaft extension. Stamp bearing sizes on nameplate.
- L. Sound Power Levels: To NEMA MG 1.

- M. All totally enclosed motors shall be fan cooled type. Non-ventilated type motors are not acceptable.
- N. Motors controlled by variable frequency drives:
  - 1. Rated for voltage peaks and minimum rise times in accordance with NEMA MG1, Part 31.
  - 2. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width modulated inverters.
  - 3. Inverter-Duty Motors: Class B temperature rise; Class F insulation.
  - 4. Shaft Bearing Protection:
    - a. Provide shaft grounding system as listed below. Install system in accordance with manufacturer's recommendations.
      - 1) AEGIS SGR Bearing Protection Ring,
      - 2) Inpro/Seal Current Diverter Ring (CDR).
      - 3) Helwig Carbon Products BPK.
    - b. Provide magnetic core as listed below. Install system in accordance with manufacturer's recommendations.
      - 1) VLT MCC 105.
      - 2) CoolBLUE Inductive Absorbers.
  - 5. Motor Overload Relay: When a single drive is used to supply power to multiple motors, provide a solid state 3-phase adjustable overload relay between the drive and each motor.
    - a. Relay shall have manual reset.
    - b. Provide alarm contact with automatic reset overloads.
- O. Part Winding Start, Where Indicated: Use part of winding to reduce locked rotor starting current to approximately 60 percent of full winding locked rotor current while providing approximately 50 percent of full winding locked rotor torque.
- P. Weatherproof Epoxy Sealed Motors: Epoxy seal windings using vacuum and pressure with rotor and starter surfaces protected with epoxy enamel; bearings double shielded with waterproof non-washing grease.
- Q. Nominal Efficiency: Motors shall have minimum NEMA premium efficiency at full load and rated voltage when tested in accordance with IEEE 112.
- R. Nominal Power Factor: As scheduled at full load and rated voltage when tested in accordance with IEEE 112.

## **2.7 ELECTRONICALLY COMMUTATED MOTORS (ECM)**

- A. Minimum efficiency: 70 percent when rated in accordance with NEMA Standard MG 1 at full load rating conditions.
- B. Motor shall be permanently lubricated with heavy-duty ball bearings to match the equipment load and prewired to the specific voltage and phase.
- C. Internal motor circuitry shall convert AC power supplied to the equipment to DC power to operate the motor.
- D. Motor shall be speed controllable down to 20% of full speed (80% turndown). Speed shall be controlled by either a potentiometer dial mounted on the motor or by a 0-10 VDC signal.

## **2.8 CAPACITORS**

- A. Furnish capacitors for power factor correction as specified herein on motors furnished under Division 23 that are not connected to variable frequency drives. KVAR size shall be as required to correct motor power factor to 90 percent or better and shall be installed on all motors 1 horsepower and larger, that have an uncorrected power factor of less than 85 percent at rated load.

- B. Features:
  - 1. Individual unit cells.
  - 2. All welded steel housing.
  - 3. Each capacitor internally fused.
  - 4. Non-flammable synthetic liquid impregnated.
  - 5. Craft tissue insulation.
  - 6. Aluminum foil electrodes.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION**

- A. Install products in accordance with manufacturer's instructions.
- B. Install securely on firm foundation.
- C. Check line voltage and phase and ensure agreement with nameplate.
- D. Install motor overload relays in a common enclosure adjacent to the variable frequency drive

**3.2 NEMA OPEN MOTOR SERVICE FACTOR SCHEDULE**

HP	3600 RPM	1800 RPM	1200 RPM	900 RPM
1/6-1/3	1.35	1.35	1.35	1.35

END OF SECTION

**SECTION 23 05 14 - VARIABLE FREQUENCY DRIVES****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Variable speed drives shall be furnished for those units so indicated on the drawings. All variable speed drives provided under this section shall be by the same manufacturer.
- B. Type of variable speed drive specified in this Section include the following:
  - 1. Pulse Width Modulated

**1.2 CODES AND STANDARDS**

- A. The VFD shall meet the following standards.
  - 1. Institute of Electrical and Electronic Engineers (IEEE)
    - a. Standard 519-2022 IEEE Recommended Practice and Requirements for Harmonic Control in Electric Power Systems
  - 2. Nationally recognized testing lab such as UL or ETL
    - a. UL 508C (Variable frequency drive)
    - b. UL 508A (Bypass)
  - 3. NEMA – ICS 7.0, AC Adjustable Speed Drives

**1.3 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.
  - 1. Product Data: Submit manufacturer's technical product data for variable speed drive including dimensions, capacities, component performance data, ratings, features, motor electrical characteristics, over current protection rating, gages and finishes of material, and installation instructions.
  - 2. Shop Drawings: Submit assembly-type shop drawings including unit dimensions, required clearances, control description, construction details, and field connection details.
  - 3. Wiring Diagrams: Submit manufacturer's electrical requirements for power supply wiring to variable speed drives. Submit manufacturer's ladder-type wiring diagrams for interlock and control wiring. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
  - 4. Maintenance Data: Submit maintenance instructions, including instructions for adjustments, troubleshooting, operation, testing and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in maintenance manuals; in accordance with requirements of Division 1 and Division 23 Section "General Mechanical Requirements."
  - 5. Harmonic Analysis Report: Provide project-specific calculations and manufacturer's statement of compliance with IEEE 519.

**1.4 QUALITY ASSURANCE**

- A. Testing: The variable speed drive, all components and subassemblies shall be factory tested. The variable speed drive shall be tested and cycled under motor load.
- B. Reliability: A complete description of supplier's Quality Assurance and Testing program shall be provided.
  - 1. Component Testing: All power semiconductors and integrated circuits shall be 100% tested.

2. Computerized ATE Testing: Computerized Automated Testing Equipment (ATE) testing shall be used to evaluate functional performance of printed circuit boards. Printed circuit boards shall receive a thermal stress test where temperatures are cycled between 0°C and 65°C and receive electrical power-on and power-off cycle tests.
3. Burn In: All VFD's shall be tested/run in the equivalent of a NEMA 1 for interior or NEMA 3R for exterior enclosure and burned in at rated ambient (40°C) with a fully loaded motor.

## 1.5 WARRANTY

- A. Provide warranty including on site parts and labor for minimum 36 months from date of shipment.

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 GENERAL

- A. Provide factory assembled and factory tested variable speed drives as indicated, of sizes and capabilities as scheduled, and as specified herein.

### 2.2 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering variable speed drives which may be incorporated in the work are limited to the following:
  1. ABB.
  2. Danfoss.
  3. Delta Controls
  4. Eaton/Cutler-Hammer.
  5. Franklin Control Systems.
  6. Invertek.
  7. Square D, a division of Schneider Electric.
  8. Yaskawa Electric America.

### 2.3 VARIABLE FREQUENCY DRIVES

- A. The VFD shall provide the following design features as standard:
  1. Input Section: Full wave rectification shall be achieved with input diodes in a conventional bridge configuration and shall be used to supply voltage to the DC bus. Drive shall be provided with dual DC bus chokes or AC line reactors, as required, for a total input impedance of 5% or better.
  2. Output Section: The inverter shall use power transistors to provide three phase output power to the motor.
  3. Input Displacement Power Factor: The input displacement power factor shall be 0.97 or higher at all operating speeds and loads.
  4. Microprocessor Logic: The VFD shall be microprocessor based and utilize digital input for all parameter adjustments. Use of potentiometers for parameter adjustment is not acceptable.
  5. Auto Restart: The VFD shall automatically attempt to restart after a malfunction or an interruption of power. The number of attempted restarts shall be customer selectable (0 to 5). If the drive reaches the limit of restarts without successfully restarting and running for a customer selectable length of time (60 to 600 seconds), the restart circuit shall lockout and shall provide contact annunciation. Delay between attempts to restart shall be customer selectable from 3 to 300 seconds.
  6. Current Limit: A current limit circuit shall be provided to limit motor current to a preset adjustable maximum level by reducing the drive operating speed or acceleration rate when the limit is reached. Range of adjustment shall be from 50 to 110%.

7. Digital Output Displays and Input Parameter Programming: The VFD shall include a digital display and digital input programming capability on the main logic board. The display shall be programmable for indication of output speed in rpm, frequency, and percent of base speed, motor amps, output motor volts, and output load. The display shall also function as a first fault indicator.
  8. Critical Frequency Avoidance (Frequency Jump Points): The VFD shall provide selectable frequency jump points to be used to avoid critical resonance frequencies of the mechanical system.
  9. Input Signal Follower: The input signal follower circuit shall have selectable differential inputs and accept an electrical speed command from an external source rated at 4-20 mA or 0-10Vdc. The input follower circuit shall be capable of operating directly or inversely proportional to the listed speed commands.
  10. Motor Overload Protection: Electronic motor protection shall be provided which is capable of predicting motor winding temperature based on inputting specific parameters including motor design type (TEFC, ODP, or other) and speed range. The protection shall provide an orderly shutdown should the motor's thermal capabilities be exceeded. This protection also eliminates the requirement for motor overload relays on single motor applications when a bypass is not used.
  11. Open Collector Outputs: The VFD shall include three (3) open collector outputs to indicate drive run, drive fault, and drive ready.
  12. Output Signals: The VFD shall include analog output signals for output load, output speed, instantaneous kw and motor voltage. The signals shall be 4-20 ma or 0-10 Vdc @ 1 mA.
  13. Stop Mode Functions: The VFD stopping mode functions shall be selectable for coast-to-rest or stopping at programmed deceleration rate.
  14. V/Hz Profiles: The VFD shall provide selectable V/Hz profiles.
  15. Loss of Control Signal: The VFD shall revert to the last speed on loss of input control signal. Owner shall be able to field select a preset speed for the VFD to run when control signal is lost, if preferred. In either case, an open collector output shall be selected to indicate loss of control signal for remote indication purposes.
- B. The VFD supplier shall provide the same design/technology to cover the HP range for all VFD's.
- C. Output Ratings: The VFD shall operate within the following ratings:
1. Frequency range: 1-120 Hz
  2. Overload rating: 110% for one minute
- D. Motor Performance: The VFD shall provide 3% speed regulation.
- E. Input Power: The VFD shall operate within ( 5%/-10%) of the nominal rated voltage.
- F. Set-up Adjustments: Standard setup adjustments shall include:
1. Minimum speed: 0 to 100%
  2. Maximum speed: 0 to 100%
  3. Linear accel: 0.5 to 600 seconds
  4. Linear decel: 0.5 to 600 seconds
  5. Maximum output voltage: Adjustable
  6. V/Hz: Adjustable with selectable profiles
  7. Current limit: 50 to 110%
- G. Environmental Ratings: The VFD shall operate within the following parameters without the requirement for derating:
1. Operating temperature: 0°C to 40°C
  2. Altitude: Up to 1000m (3300 ft.)
  3. Humidity: 95% non-condensing
- H. Enclosure: Refer to VFD schedule or drawings for enclosure type. At minimum, the enclosure shall be suitable for environment installed. Finned heatsinks and/or cooling fans shall be provided as necessary for proper heat dissipation.

- I. Protective Features: The VFD shall be designed to meet the following specifications and operate within the following parameters:
1. AC Input Overcurrent Protection: The VFD's power circuit shall be isolated internally with respect to ground and provided with a 100,000 AIC interrupting rated input circuit breaker. As an alternate to the circuit breaker, fuses may be used to accomplish the 100,000 A interrupting rating.
  2. Logic Common: The power unit's logic common shall be at ground potential.
  3. Phase Loss Protection: Phase loss protection shall be provided to prevent single phasing.
  4. Power Loss Ride-Through: The VFD shall be capable of continued operation during an intermittent loss of power. Opening of the VFD's input and/or output line switches while operating shall not result in damage to the power circuit components.
  5. Short Circuit and Ground Fault Protection: The VFD shall have an instantaneous electronic trip circuit to protect the VFD from output line-to-line and line-to-ground short circuits. The VFD must be capable of withstanding short circuits at nominal rated voltage plus 10%(i.e., 480V rated drive 10% 528V short circuit voltage). The VFD shall be capable of providing 110% motor current intermittently. The VFD shall include an instantaneous overcurrent trip and shall not restart after electronic overcurrent trip until reset through the run/stop circuit, or unless the auto restart function has been enabled.
  6. Transient and Surge Voltage Protection: Transient and surge voltage protection shall be provided through the use of Metal Oxide Varistors (MOVs). The VFD shall withstand a 6000 volt, 80 joule surge voltage when tested in accordance with UL 1449 with the test circuit adjusted for a 2100 amp peak 8x20 us short circuit discharge current pulse.
  7. Rotating Motor Start: The VFD shall be able to start into a motor rotating in either direction and at any speed, and accelerate to set speed without any time delay, tripping or component loss.
  8. DV/DT Filters: Dv/dt filters shall be provided per the VFD schedule, or if recommended by the VFD manufacturer to ensure that the VFD is applied correctly and to maintain the manufacturer's full warranty.
- J. Maintainability
1. All control circuit voltages (12VAC, 24VDC, 160VDC and 120VAC) shall be physically and electrically isolated from power circuit voltages (200 to 600VAC, 600VDC) to ensure safety to maintenance personnel.
  2. The VFD shall be furnished with an alphanumeric diagnostic display with fault indications to include the following: bus overvoltage, bus undervoltage, overcurrent, overtemperature, ground fault, and timed overload.
  3. VFD shall be capable of starting and operating without a motor connected for ease of service.
  4. All setup and operating parameters shall be stored in nonvolatile memory. The static memory module shall be to be removed and installed in replacement logic boards with all setup and operating parameters intact requiring no adjustment of replacement boards.
- K. Communications
1. The VFD shall have an RS-485 port as standard. The standard protocols shall be BACnet, Modbus, Johnson Controls N2 bus, and Siemens Building Technologies FLN. Optional protocols for LonWorks, Profibus, Ethernet, and DeviceNet shall be available. Each individual drive shall have the protocol in the base VFD. The use of third party gateways and multiplexers is not acceptable. All protocols shall be "certified" by the governing authority. Use of non-certified protocols is not allowed.
  2. Serial communication capabilities shall include, but not be limited to; run-stop control, speed set adjustment, proportional/integral/derivative PID control adjustments, current limit, accel/decel time adjustments, and lock and unlock the keypad. The drive shall have the capability of allowing the building management system to monitor feedback such as process variable feedback, output speed / frequency, current (in amps), % torque, power (kW), kilowatt hours (resettable), operating hours (resettable), and drive temperature. The building management system shall also be capable of monitoring the VFD relay output status, digital input status, and all analog input and analog output values. All diagnostic

warning and fault information shall be transmitted over the serial communications bus. Remote VFD fault reset shall be possible. The following additional status indications and settings shall be transmitted over the serial communications bus – keypad “Hand” or “Auto” selected, bypass selected, the ability to change the PID setpoint, and the ability to force the unit to bypass (if bypass is specified). The building management system shall also be able to monitor if the motor is running in the VFD mode or bypass mode (if bypass is specified) over serial communications. A minimum of 15 field parameters shall be capable of being monitored.

3. The VFD shall allow the building management system to control the drive’s digital and analog outputs via the serial interface. This control shall be independent of any VFD function. For example, the analog outputs may be used for modulating chilled water valves or cooling tower bypass valves. The drive’s digital (relay) outputs may be used to actuate a damper, open a valve or control any other device that requires a maintained contact for operation. In addition, all of the drive’s digital and analog inputs shall be capable of being monitored by the building management system.
4. The VFD shall include an independent PID loop for customer use. The independent PID loop may be used for cooling tower bypass value control, chilled water value control, etc. Both the VFD control PID loop and the independent PID loop shall continue functioning even if the serial communications connection is lost. The VFD shall keep the last good set-point command and last good DO & AO commands in memory in the event the serial communications connection is lost.

L. Required Optional Features

1. Operator Panel: A door-mounted Softouch Operator Panel shall be included with the following features:
  - a. Shall digitally display motor speed, load, amps, and output volts. (and controller setpoint and system pressure when setpoint controller is included).
  - b. Shall have indication for drive run, drive ready, drive fault, plus operator function/status indication such as auto speed reference, and auto restart.
  - c. Shall provide selection for Hand/Off/Auto control. In Hand mode, the VFD shall be started and stopped from the operator’s panel. In the Auto mode, the VFD shall be started and stopped by remote contact closure. In the Off mode, the VFD shall be locked out.
  - d. Shall provide selection for Manual/Auto Speed Reference. In the Manual Reference mode, the VFD speed reference shall be set from the operator’s panel. In the Auto Reference mode, the VFD speed reference shall be set by the external source instrument signal. Selecting between Manual and Auto speed reference shall have no bearing on the Hand/Off/Auto start/stop selector, or vice versa.
  - e. Shall name all parameters in English, not codes or numbers.
  - f. Keypad shall include electronic lock-out feature to prevent unauthorized personnel from parameter access.
  - g. Shall store from three to six drive faults in a history batch file in the order they occur to simplify trouble-shooting. This file will automatically be updated should new faults occur.
2. Bypass Systems: Bypass control circuitry shall be mounted integrally to the VFD enclosure. The bypass shall utilize an input circuit breaker to feed both the VFD and the bypass starter. An input service switch shall be utilized to feed the VFD and isolate the VFD for trouble shooting. An output contactor which is electrically and mechanically interlocked with the bypass starter shall be utilized on the VFD to provide a positive disconnect between the VFD and the motor. Separate Hand/Off/Auto and Inverter/Bypass switches shall be included to allow manual or automatic transfer to across-the-line operation. If the VFD trips on a fault, power will automatically transfer across the line to run the motor at full speed. If the VFD auto restart function has been enabled, the drive will first attempt to restart itself after a fault. If it is unable to do so within the number of times programmed, power will then automatically transfer across the line. The bypass system shall NOT depend on the VFD to be installed for bypass operation. Bypass stand

alone operation shall be completely functional in both Hand and Automatic modes even if the VFD has been removed for repair/replacement. Bypass system serial communications shall remain functional with the VFD removed to provide HVAC system temperature control. Serial communications in the bypass system and its' programmable inputs and outputs shall be monitored and controlled via serial communications to provide HVAC system temperature control.

3. Input Overcurrent Protection Device: The operating mechanism shall be designed so that the door can be padlocked in the "OFF" position.
4. Elapsed Time Meter: Meter shall provide indication of how long the drive has been running.
5. Smoke Purge/Load Shed: VFDs for smoke control system fans shall provide smoke purge or load shedding when activated by a remote contact closure. This circuit shall override all other speed commands (local or remote) to operate the VFD at a preset, field adjustable speed.
6. Firestat/Freezestat: VFDs for air system fans requiring shutoff from safety devices per sequences of operation shall provide terminals for connecting normally closed remote safety devices. This emergency shutdown shall operate in any mode of operation.

### **PART 3 - EXECUTION**

#### **3.1 INSPECTION**

- A. Examine areas and conditions under which variable speed drive is to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to installer.

#### **3.2 INSTALLATION**

- A. General: Install systems and materials in accordance with manufacturer's instruction.
- B. Maintain minimum clearance of 12 inches on each side and 36 inches in front of the variable speed drive.
- C. Install variable speed drive in the vertical position.
- D. Provide separate conduits for input and output power cables.
- E. Provide separate conduits for control cables and the output cables to the motor.
- F. Install power and control cabling in separate conduits.
- G. Provide dedicated conduits for power cables to the motors.
- H. Load Side Disconnects: Provide a disconnect switch on the load side of the VFD near the motor for ease of service and safety. Disconnect switch shall be lockable in the open position when the VFD is not within sight of the motor. Operating the switch with the VFD running shall not cause any component failure. In dual motor applications, VFD shall be able to operate either motor with the other motor disconnected without requiring jumpers, parameter modifications, or other adjustments. As part of start-up, VFD supplier shall certify all load side disconnects can be opened or closed with drive running at full speed without damage to the drive.
  1. When a separate disconnect is provided at the motor, provide auxiliary contact in the disconnect switch that will shut down the variable speed drive when the disconnect switch is turned off.

#### **3.3 START UP**

- A. All units shall be started up at the jobsite by a factory trained and authorized representative.

**3.4 TRAINING**

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter written by the Contractor stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided. Copies of the startup report shall be attached to the certification letter.
- D. Schedule: Schedule training with Owner with at least 14 days' advance notice.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 05 16 - EXPANSION FITTINGS AND LOOPS FOR HVAC PIPING****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Expansion joints for grooved piping.
- B. Flexible expansion loops.
- C. Expansion loops.
- D. Alignment guides and anchors.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 01 Specification Sections.
- B. Product Data: Submit product data for each type of pipe expansion joints specified. Submit expansion compensation schedule showing manufacturer's figure number, size, location, connections, material, and displacement for each required expansion joint.
- C. Shop Drawings:
  - 1. Submit assembly-type shop drawings for each type of expansion compensation product, indicating dimensions, weights, required clearances, and methods of assembly of components. Detail fabrication of pipe anchors, hangers, special pipe support assemblies, and their attachment to the building structure. Submit calculations of pipe expansion forces at anchor points for structural engineer review.
  - 2. Submit shop drawings for field-fabricated expansion loops indicating location, dimensions, pipe sizes, calculations for compression or tension required, and location. Detail fabrication of pipe anchors, hangers, special pipe support assemblies, and their attachment to the building structure. Submit calculations of pipe expansion forces at anchor points for structural engineer review.
- D. Manufacturer's Instructions: Indicate manufacturer's installation instructions, special procedures, and external controls.
- E. Maintenance Data: Submit maintenance adjustment instructions for expansion fittings for inclusion in Operating and Maintenance Manuals specified in Division 1 and Division 23 Section "General Mechanical Requirements."

**1.3 QUALITY ASSURANCE**

- A. Regulatory Requirements: Comply with the provisions of the following codes:
  - 1. Comply with ASME B31.9 for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label.
  - 2. ASME BVPC.IX for qualifications for Welding Processes and Operators.
- B. Expansion joints shall be manufactured in plants located in the United States or certified to meet the specified ASTM and ANSI standards.

**PART 2 - PRODUCTS AND MATERIALS****2.1 PIPE EXPANSION JOINTS GENERAL**

- A. Pipe expansion joints shall provide 200 percent absorption capacity of piping expansion between anchors.

**2.2 EXPANSION JOINTS FOR GROOVED PIPING**

- A. Manufacturers:
  - 1. Grooved Piping Couplings and Nipples Expansion Joints:
    - a. Grinnell Corp.
    - b. Gustin - Bacon Div., Tyler Pipe
    - c. Stockham Valves & Fittings, Inc.
    - d. Victaulic Co. of America.
  - 2. Grooved Piping Slip-Type Expansion Joints:
    - a. Victaulic Co. of America
- B. Combination Couplings and Nipples: Cut grooved short ASTM A 53 steel pipe nipples and ductile iron or malleable iron couplings, with removable ties to hold joint compressed or expanded during piping fabrication.
- C. Slip-Type Expansion Joints: Ductile iron or malleable iron housing, ASTM A 53 steel pipe body, and polytetrafluoroethylene (PTFE) modified polyphenylene coated steel pipe slide.
- D. Select suitable gasket material for piping system.

**2.3 FLEXIBLE EXPANSION LOOPS**

- A. Manufacturers:
  - 1. Flex-Hose Co., Inc.
  - 2. Flexicraft Industries
  - 3. Keflex HVAC Products Div., Flex-Weld, Inc.
  - 4. Metraflex Co. Metraloop
  - 5. Twin City Hose.
- B. Provide prefabricated expansion compensator loops with inlet and outlet elbow fittings and two (2) sections of metal hose and braid joined by long-radius, 180-degree return bend or center section of metal hose and braid, suitable for working pressures and temperatures specified on the drawings. End connections shall match rest of piping system and as required for the size specified in Division 23 Section "Hydronic Piping".
  - 1. For steel piping, provide wetted components of stainless steel.
  - 2. For copper piping, provide wetted components of bronze.

**2.4 EXPANSION LOOPS**

- A. Provide pipe expansion loop constructed of main pipe material. Acceptable methods include use of elbows in a U or Z shape as defined by ASHRAE or ASME; or a detailed stress analysis may be utilized to define areas of expansion.

**2.5 ALIGNMENT GUIDES AND ANCHORS**

- A. Provide alignment guides and anchors as specified in specification Division 23 Section "Hangers & Supports for HVAC Piping & Equipment".

**PART 3 - EXECUTION****3.1 INSTALLATION GENERAL**

- A. Install products in accordance with manufacturer's instructions.
- B. Install expansion joints and expansion loops where indicated on the drawings and where required for adequate expansion of installed piping system.
- C. Anchor piping to ensure proper direction of expansion and contraction.

**3.2 EXPANSION JOINTS**

- A. Align joints to avoid end loading and torsional stress.

**3.3 EXPANSION COMPENSATION FOR RISERS AND TERMINALS**

- A. Install connection between piping mains and risers with at least 5 pipe fittings including tee in main. Install connections between piping risers and terminal heating and cooling units with at least 4 pipe fittings including tee in riser.

**3.4 FLEXIBLE EXPANSION LOOPS**

- A. Install loops at locations indicated on plans. Amount of expansion shall be as indicated on plans. Loop shall be installed horizontally for steam systems. If installed vertically in chilled or hot water systems, drains and manual air vents shall be installed as required in Division 23 Section "Hydronic Piping". Support loop as required by manufacturer and to prevent binding or sagging per Division 23 Section "Hangers & Supports for HVAC Piping and Equipment".

**3.5 EXPANSION LOOPS**

- A. Base expansion loop locations and dimensions on routing shown on plans. If routing is modified, coordinate locations with engineer.
- B. Fabricate expansion loops to dimensions indicated on plans.
- C. Provide air vents and drains for piping in vertical runs in accordance with Division 23 Section "Hydronic Piping". Provide hangers and supports in accordance with Division 23 Section "Hangers & Supports for HVAC Piping and Equipment". For expansion loops with horizontal and vertical components, design supports for the horizontal legs for full weight of the pipe with maximum load variation of 25%.
- D. Provide alignment guides at locations indicated on plans and as required for piping expansion. At a minimum, install alignment guides on both sides of expansion loop, spaced at twice the height of the U or Z loop (height defined as perpendicular distance of piping from primary pipe direction) or as required by the expansion joint manufacturer. Alignment shall be sufficient to allow for proper installation of expansion joints to prevent binding or torsional stress on joint.
- E. Provide anchors at locations indicated on plans and as required for piping expansion. At a minimum install anchors on both sides of straight pipe length incorporating expansion loop.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 05 19 - METERS AND GAUGES FOR HVAC PIPING****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Flow meters.
- B. BTU meters
- C. Pressure gauges and fittings.
- D. Thermometers and thermometer wells.
- E. Test plugs.

**1.2 SUBMITTALS**

- A. Submit in accordance with conditions of Contract and Division 01 submittal procedures.
- B. Product Data: Provide schedule that indicates the following for each manufactured component:
  - 1. Model or figure number.
  - 2. Use.
  - 3. Rating.
  - 4. Operating range.
  - 5. Total range.
  - 6. Calibrated performance curves, certified where indicated.
  - 7. Figure number.
  - 8. Location.
  - 9. Accessories.
- C. Product Certificates: Signed by manufacturer certifying accuracy under specified operating conditions and product compliance with specified requirements.
- D. Samples: Submit two of each type of instrument specified.
- E. Project Record Documents: Record actual locations of components and instrumentation.
- F. Operation and Maintenance Data: Furnish data for each manufactured component for inclusion in operating and maintenance manual.
- G. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
  - 1. Extra Pressure Gauges: One of each type and size.

**1.3 FIELD CONDITIONS**

- A. Do not install instrumentation when areas are under construction, except for required rough-in, taps, supports and test plugs.

**PART 2 - PRODUCTS****2.1 FLOW METERS**

- A. General:
  - 1. Select meter size using the design flow rate of the connected equipment or system.
  - 2. Permanently Mounted Meters: Include 6 inch dial or equivalent monitoring device, integral with meter construction or suitable for mounting on wall or bracket with fittings connecting to flow element.

3. Portable Meters: Include differential-pressure gauge and two 12 foot hoses in carrying case with handle.
  4. Scale unless otherwise indicated:
    - a. Water: GPM.
  5. Range: Inclusive of the design flow rate of the pipe in which the meter is installed.
  6. Construction:
    - a. Components shall be suitable for the operating temperatures and pressures.
    - b. Components shall be compatible for the fluid being measured.
    - c. Materials which will be wetted shall be made from non-corrosive materials and shall not contaminate fluid in contact.
  7. Connections:
    - a. In-line: Threaded or flanged, meeting the connection and pressure rating requirements of the adjoining piping system.
    - b. Clamp-on: Adjustable metallic mounting straps.
  8. Calibration: Individually calibrated and tagged accordingly against the manufacturer's primary standards which must be accurate to within 0.1 percent and NIST traceable.
  9. Output: 0-10 Vdc or 4 to 20 mA output linearly proportional to flow.
    - a. Transmitter Housing: Minimum NEMA 1.
- B. Electromagnetic Meter:
1. Manufacturers:
    - a. Badger Meter.
    - b. Emerson Electric, Rosemount.
    - c. Onicon Incorporated.
    - d. Spirax Sarco Flow Systems.
    - e. Veris.
  2. Sensing Method: Magnetic field generating device with electrodes to sense induced voltage within the fluid. The meter shall have no moving parts.
  3. Mounting: Insertion or inline.
  4. Volumetric Accuracy: Plus/minus 1.0 percent of reading over a 10:1 calibrated flow velocity range.
  5. Repeatability: Plus/minus 0.1 percent of reading within the calibrated flow range.
- C. Ultrasonic Meter:
1. Manufacturers:
    - a. Badger Meter.
    - b. Belimo.
    - c. Onicon Incorporated.
    - d. Sierra Instruments.
    - e. Spirax Sarco Flow Systems.
    - f. Veris.
  2. Sensing Method: Ultrasonic transducers utilizing direct beam path transit time to measure flow.
  3. Mounting: In-line or clamp-on.
  4. Volumetric Accuracy: Plus/minus 1.0 percent of reading over a 25:1 calibrated flow range.
  5. Repeatability: Plus/minus 0.25 percent of reading within the calibrated flow range.

## 2.2 BTU METERS

- A. Manufacturers:
1. Badger Meter.
  2. Onicon Incorporated.
  3. Veris.
- B. In-Line Meter:
1. Components: Pipe-mounted flow meter, integral solid-state control board, 2 temperature sensors pre-wired to the control board.

2. Flow Meter: Comply with specifications in paragraph section, "Flow Meters" above.
  3. Size: Up to and including 2 inches, sized for the design flow rate of the pipe in which it shall be installed.
  4. Construction: Brass body, polysulfone electronics enclosure, brass thermowell, threaded or sweat union fittings.
  5. Programming: Factory application specific programmed.
  6. Memory: Non-volatile memory shall retain totalized values in the event of power failure.
  7. Input: Nominal 24 Vdc.
  8. Output Signal:
    - a. 0 to 10 VDC or 4-20 mA analog signal, or serial connection compatible with building automation system network.
    - b. Available Control Points: As scheduled on the control drawings.
- C. Remote Meter:
1. Components: Pipe mounted flow meter, 2 temperature sensors, and remote mounted solid-state meter.
  2. Flow meter shall be as specified in paragraph section, "Flow Meters" above.
  3. Temperature Sensors: Comply with Section 230913.
  4. Remote Solid-State Meter:
    - a. Programming: Factory programmed, field programmable at front panel interface.
    - b. Memory: Non-volatile EEPROM memory shall retain all program parameters and totalized values in the event of power loss.
    - c. Display: Alphanumeric LCD displays total energy, energy rate, flow rate, supply temperature and return temperature..
  5. Enclosure:
    - a. NEMA 250, Type 12 or 13 for indoor applications.
    - b. NEMA 250, Type 4 or 4X for outdoor applications.
  6. Input: Nominal 24 VDC.
  7. Output Signal: Serial connection compatible with building automation system.
    - a. Available Control Points: As scheduled on the control drawings.

## 2.3 PRESSURE GAUGES

- A. Manufacturers:
1. Ametek, U.S. Gauge Div.
  2. Ashcroft Dresser Industries Instrument Div.
  3. Dwyer Instruments, Inc.
  4. H.O. Trerice Co.
  5. Marsh Instrument Co., Unit of General Signal.
  6. Marshalltown Instruments, Inc.
  7. Miljoco Corp.
  8. Weiss Instruments, Inc.
  9. Weksler Glass Thermometer Corp.
  10. WIKA Instruments Corp.
  11. Winters Instruments.
- B. Description: ASME B40.100, UL 393, rotary brass movement, white with black markings and black pointer.
- C. Case: Drawn steel, cast aluminum, or stainless steel with phosphor bronze bourdon tube and front or rear recalibration adjustment. Provide silicone fluid damping where required by Part 3.
- D. Size: 4-1/2 inch diameter.
- E. Lens: Clear glass.
- F. Stem: Brass for separable socket, length to suit installation.
- G. Scale: Progressive, satin-faced, non-reflective aluminum, permanently etched markings.

- H. Accuracy: Plus or minus 1 percent of range span.
- I. Liquid-Filled: Provide liquid filled gauges where specified in Part 3 of this section.

## 2.4 PRESSURE GAUGE TAPPINGS

- A. Manufacturers: Same as pressure gauge manufacturers.
- B. Gauge Cock: Tee or lever handle, brass, rated for system pressure.
- C. Needle Valve: Brass, 1/4 inch NPT, rated for system pressure.
- D. Pulsation Damper: Pressure snubber, brass with 1/4 inch threaded connections, corrosion-resistant porous metal disc. Disc material shall be suitable for fluid served and rated pressure.
- E. Syphon: Brass, 1/4-inch NPT angle or straight pattern.

## 2.5 STEM TYPE THERMOMETERS

- A. Manufacturers:
  - 1. Dwyer Instruments, Inc.
  - 2. H.O. Trerice Co.
  - 3. Marsh Instruments, Inc.
  - 4. Miljoco Corp.
  - 5. Weiss Instruments, Inc.
  - 6. Weksler Glass Thermometer Corp.
  - 7. Winters Instruments.
- B. Thermometers - Adjustable Angle:
  - 1. Description: Red- or blue-appearing non-toxic liquid in glass tube; ASTM E1.
  - 2. Adjustable Joint: Finish to match case with positive locking device; adjustable 360 degrees in horizontal plane, 180 degrees in vertical plane.
  - 3. Case: Cast aluminum with enamel finish.
  - 4. Size: 9 inch scale.
  - 5. Window: Clear Lexan.
  - 6. Stem: Brass, copper-plated steel, or aluminum for separable socket, length to suit installation.
  - 7. Scale: Progressive, satin-faced, non-reflective aluminum, with permanently etched markings.
  - 8. Accuracy: Plus or minus 1 percent of range span or plus or minus 1 scale division to maximum of 1.5 percent of range span.
  - 9. Calibration: Degrees F.

## 2.6 DIAL THERMOMETERS

- A. Thermometer – Direct Mount, Bimetal Actuated:
  - 1. Manufacturers:
    - a. Ashcroft Dresser Industries Instruments Div.
    - b. H.O. Trerice Co.
    - c. Marshalltown Instruments, Inc.
    - d. Miljoco Corp.
    - e. Tel-Tru Manufacturing Co., Inc.
    - f. Weiss Instruments, Inc.
    - g. Weksler Glass Thermometer Corp.
    - h. Winters Instruments.
  - 2. Description: Dial type, ASTM E1 bimetallic helix actuated with silicone fluid damping, white with black markings and black pointer.

3. Adjustable joint: Finish to match case with positive locking device; adjustable 360 degrees in horizontal plane, 180 degrees in vertical plane.
  4. Case: Stainless steel with front or rear recalibration.
  5. Size: 5 inch diameter dial.
  6. Lens: Clear glass, hermetically sealed.
  7. Stem: Stainless steel for separable socket. Length to suit installation.
  8. Scale: Progressive, satin-faced, non-reflective aluminum, permanently etched markings.
  9. Accuracy: Plus or minus 1.0 percent of range span or plus or minus 1 scale division to maximum of 1.5 percent of range span.
  10. Calibration: Degrees F.
- B. Thermometers – Direct Mount, Vapor Actuated:
2. Manufacturers:
    - a. Ashcroft Dresser Industries Instruments Div.
    - b. H.O. Trerice Co.
    - c. Miljoco Corp.
    - d. Weiss Instruments, Inc.
    - e. Weksler Glass Thermometer Corp.
    - f. Winters Instruments.
  2. Description: Dial type vapor or liquid actuated; ASTM E1; copper bulb, copper or phosphor bronze bourdon tube, white with black markings and black pointer.
  3. Adjustable joint: Finish to match case with positive locking device; adjustable 360 degrees in horizontal plane, 180 degrees in vertical plane.
  4. Case: Drawn steel, cast aluminum, or stainless steel.
  5. Size: 4-1/2 inch diameter dial.
  6. Lens: Clear glass.
  7. Stem: Brass, copper-plated steel, or aluminum for separable socket. Length to suit installation.
  8. Scale: Progressive, satin-faced, non-reflective aluminum, permanently etched markings.
  9. Accuracy: Plus or minus 1.0 percent of range span or plus or minus 1 scale division to maximum of 1.5 percent of range span.
  10. Calibration: Degrees F.
- C. Thermometers – Remote Reading:
3. Manufacturers:
    - a. Ashcroft Dresser Industries Instruments Div.
    - b. H.O. Trerice Co.
    - c. Miljoco Corp.
    - d. Tel-Tru Manufacturing Co., Inc.
    - e. Weiss Instruments, Inc.
    - f. Weksler Glass Thermometer Corp.
    - g. Winters Instruments.
  2. Description: Dial type vapor or liquid actuated; ASTM E1; white with black markings and black pointer.
  3. Case: Drawn steel, cast aluminum, or stainless steel.
  4. Size: 4-1/2 inch diameter dial.
  5. Lens: Clear glass.
  6. Bulb: Copper for separable socket for liquids, averaging element for air.
  7. Scale: Progressive, satin-faced, non-reflective aluminum, permanently etched markings.
  8. Capillary: Copper or bronze double-braided capillary for separable socket. Length to suit installation, minimum 5 feet.
  9. Accuracy: Plus or minus 1.0 percent of range span or plus or minus 1 scale division to maximum of 1.5 percent of range span.
  10. Calibration: Degrees F.

**2.7 THERMOMETER SUPPORTS**

- A. Thermowell Socket: ASTM A536 ductile iron, brass, or stainless steel, compatible with adjacent piping to eliminate dielectric corrosion, with separable socket for thermometer stems and 2 inch extension for insulated piping, pressure rated to match piping system design pressure, with cap and chain.
- B. Flange: 3 inch outside diameter reversible flange, designed to fasten to sheet metal air ducts, with brass perforated stem.

**2.8 TEST PLUGS**

- A. Manufacturers:
  - 1. Flow Design, Inc.
  - 2. MG Piping Products Co.
  - 3. Peterson Equipment Co., Inc.
  - 4. Sisco, A Spedco, Inc. Co.
  - 5. Watts Regulator.
- B. Test Plug: 1/2 inch nickel-plated brass fitting, rated for 500 psig, extension for insulation, and threaded cap with retention chain for receiving 1/8 inch outside diameter pressure or temperature probe.
- C. Core Material:
  - 1. Neoprene core for temperatures up to 200 degrees F.
  - 2. Nordel core for temperatures up to 350 degrees F.
  - 3. Viton core for temperatures up to 400 degrees F.
- D. Test Kit: Carrying case, internally padded and fitted containing one 2-1/2 inch diameter pressure gauge, one gauge adapter with 1/8 inch probes, two 1 inch bimetal dial thermometers.

**PART 3 - EXECUTION****3.1 INSTALLATION**

- A. Install in accordance with manufacturer's instructions.
- B. Install flow meters in a readily accessible location.
- C. Install flow meters with isolating valves on inlet and outlet.
- D. Install differential pressure-type flow elements with minimum straight lengths of pipe upstream and downstream from element in accordance with manufacturer's instructions.
- E. Install in-line BTU meters in piping where indicated in the hydronic supply line. Install thermal well in return line for remote sensor.
- F. Install remote mounted BTU meters on wall or bracket in an accessible location.
- G. Provide one pressure gauge per pump, installing taps before strainers and on suction and discharge of pump. Pipe to gauge.
- H. Install pressure gauges with pulsation dampers. Provide gauge cock to isolate each gauge. Provide siphon on gauges in steam systems. Extend nipples and siphons to allow clearance from insulation.
- I. Install thermometers in piping systems in sockets in short couplings. Enlarge pipes smaller than 2-1/2 inch for installation of thermometer sockets. Ensure sockets allow clearance from insulation.
- J. Install thermometers in air duct systems on flanges.

- K. Install thermometer sockets adjacent to controls system thermostat, transmitter, or sensor sockets. Where thermometers are provided on local panels, duct or pipe mounted thermometers are not required.
- L. Locate duct mounted thermometers minimum 10 feet downstream of mixing dampers, coils, or other devices causing air turbulence.
- M. Coil and conceal excess capillary on remote element instruments.
- N. Provide instruments with scale ranges selected according to service with largest appropriate scale.
- O. Install gauges and thermometers in locations where they are easily read from normal operating level. Install vertical to 45 degrees off vertical.
- P. Adjust gauges and thermometers to final angle, clean windows and lenses, and calibrate to zero.
- Q. Locate test plugs adjacent thermometers and thermometer sockets.

### 3.2 SCHEDULE

- A. Flow Meters: Reference plans for location.
- B. Pressure Gages, Location and Scale Range:
  - 1. Location: Install device at inlet and outlet of each of the following:
    - a. Headers to central equipment.
    - b. Heat exchangers.
    - c. Pumps. Provide silicone damping gauge.
    - d. Boilers.
    - e. Chillers.
    - f. After major coils. Reference details on plans.
    - g. Expansion tanks.
    - h. Pressure reducing valves.
  - 2. Scale Range:
    - a. Vacuum: 30 inches Hg to 15 psig.
    - b. All fluids: 2 times operating pressure.
- C. Pressure Gage Tappings, Location:
  - 1. Control valves 3/4 inch & larger – inlets and outlets.
  - 2. Major coils – inlets and outlets.
  - 3. Chiller – inlets and outlets.
  - 4. Boiler – inlets and outlets.
- D. Stem Type Thermometers, Location and Scale Range:
  - 1. Location: Install device at inlet and outlet of each of the following:
    - a. Headers to central equipment.
    - b. Boilers.
    - c. Chillers.
    - d. Hydronic zone supply and return.
    - e. After major coils. Reference details on plans.
  - 2. Scale Range:
    - a. Hot Water: 30 to 300 degrees F with 2-degree scale divisions
    - b. Condenser Water: 0 to 160 degrees F with 2-degree scale divisions.
    - c. Chilled Water: 0 to 100 degrees F with 2-degree scale divisions.
    - d. Steam and Condensate: 50 to 400 degrees F with 5-degree scale divisions.
- E. Thermometer Sockets, Location:
  - 1. Control valves 1 inch & larger - inlets and outlets.
  - 2. Reheat coils - inlets and outlets.
  - 3. Cabinet heaters - inlets and outlets.

4. Unit heaters - inlets and outlets.
- F. Dial Thermometers, Location and Scale Range:
1. Each supply air zone, minus 32 to 150 degrees F.
  2. Outside air, minus 32 to 150 degrees F.
  3. Return air, minus 32 to 150 degrees F.
  4. Mixed air, minus 32 to 150 degrees F.

END OF SECTION

**SECTION 23 05 23 - GENERAL DUTY VALVES FOR HVAC PIPING****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Applications.
  - 1. General duty valves common to most mechanical piping systems.
  - 2. Special purpose valves are specified in individual piping system specifications.
- B. General requirements.
- C. Globe valves.
- D. Ball valves.
- E. Butterfly valves.
- F. Check valves.
- G. Chainwheels.

**1.2 ABBREVIATIONS AND ACRONYMS**

- A. CWP: Cold working pressure.
- B. EPDM: Ethylene propylene diene monomer rubber.
- C. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber.
- D. NRS: Nonrising stem.
- E. OS&Y: Outside screw and yoke.
- F. PTFE: Polytetrafluoroethylene.
- G. RS: Rising stem.
- H. SWP: Steam working pressure.
- I. TFE: Tetrafluoroethylene.

**1.3 SUBMITTALS**

- A. Submit in accordance with conditions of Contract and Division 01 submittal procedures.
- B. Product Data: Provide data on valves including manufacturers catalog information. Submit performance ratings, pressure and temperature classifications, valve design, body material, seating materials, trim material, dimensions, clearances, rough-in details, weights, support requirements, and piping connections.
- C. Warranty: Submit manufacturer warranty and ensure that forms have been completed in Owner's name and registered with manufacturer.
- D. Operation and Maintenance Data: Include manufacturer's descriptive literature, operating instructions, maintenance and repair data, and parts listings.
- E. Maintenance Materials: Furnish Owner with one wrench for every five plug valves, in each size of square plug valve head.

**1.4 QUALITY ASSURANCE**

- A. Manufacturer:
  - 1. Obtain valves for each valve type from a single manufacturer.
  - 2. Company must specialize in manufacturing products specified in this section, with not less than three years of documented experience.
  - 3. Subject to compliance requirements, provide products from one of the manufacturers listed in Valve Schedule in Part 3.
- B. Valves shall be certified to meet the specified ASTM, ASME, ANSI, and MSS standards in Part 2 Products, and as follows:
  - 1. ASME B31.9 for building services piping.
  - 2. ASME B31.1 for power piping.
- C. Welding Materials and Procedures: Conform to ASME BPVC-IX.

**1.5 DELIVERY STORAGE AND HANDLING**

- A. Prepare valves for shipping as follows:
  - 1. Minimize exposure of operable surfaces by setting plug and ball valves to open position.
  - 2. Protect valve parts exposed to piped medium against rust and corrosion.
  - 3. Protect valve piping connections such as grooves, weld ends, threads, and flange faces.
  - 4. Adjust globe, gate, and angle valves to the closed position to avoid clattering.
  - 5. Secure check valves in either the closed position or open position.
  - 6. Adjust butterfly valves to closed or partially closed position.
- B. Use the following precautions during storage:
  - 1. Maintain valve end protection and protect flanges and specialties from dirt.
    - a. Provide temporary inlet and outlet caps.
    - b. Maintain caps in place until installation.
  - 2. Store valves in shipping containers and maintain in place until installation.
    - a. Store valves indoors in dry environment.
    - b. Store valves off the ground in watertight enclosures when indoor storage is not an option.
- C. Exercise the following precautions for handling:
  - 1. Avoid the use of operating handles or stems as rigging or lifting points.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Subject to compliance with requirements, provide products from one of the manufacturers listed in the Valve Schedule in Part 3.

**2.2 APPLICATIONS**

- A. Provide the following valves for the applications if not indicated on Drawings:
  - 1. Throttling (Hydronic): Butterfly, Ball, and Globe.
  - 2. Isolation (Hydronic): Butterfly and Ball.
  - 3. Dead-End: Butterfly and Ball.
- B. Substitutions of valves with higher CWP classes or SWP ratings for same valve types are permitted when specified CWP ratings or SWP classes are not available.
- C. Required Valve End Connections for Non-Wafer Types:
  - 1. Steel Pipe:
    - a. 2 NPS and Smaller: Threaded ends.

- b. 2-1/2 NPS and Larger: Grooved or flanged ends.
      - 2. Copper Tube:
        - a. 2 NPS and Smaller: Threaded or solder-joint valve ends.
          - 1) Exception: Solder ends not acceptable for hot water or steam pipe.
        - b. 2-1/2 NPS and Larger: Grooved or flanged ends.
      - 3. Steam and Steam Condensate Pipe: Solder and grooved ends not acceptable.
  - D. Chilled Water Valves:
    - 1. 2 NPS and Smaller:
      - a. Minimum Class: 125.
      - b. Body: Bronze.
      - c. Allowable Valve Types:
        - 1) Ball: Two piece. Forged brass body is acceptable to bronze body.
          - a) Brass components.
          - b) Stainless steel components.
        - 2) Lift check.
        - 3) Swing check.
        - 4) Wafer plate-type check.
        - 5) Globe.
    - 2. 2-1/2 NPS and Larger:
      - a. Minimum Class: 125.
      - b. Body: Cast iron, except as noted below.
      - c. Allowable Valve Types:
        - 1) Ball: 2-1/2 inch to 3 inch: Three piece, bronze, forged brass, carbon steel, or stainless steel body.
          - a) Brass components.
          - b) Stainless steel components.
        - 2) Butterfly: Ductile iron body.
        - 3) Lift check.
        - 4) Swing check.
        - 5) Wafer plate-type check.
        - 6) Globe.
- E. Condenser Water Valves:
  - 1. 2 NPS and Smaller:
    - a. Minimum Class: 125.
    - b. Body: Bronze.
    - c. Allowable Valve Types:
      - 1) Ball: Two piece. Forged brass body is acceptable to bronze body.
        - a) Brass components.
        - b) Stainless steel components.
      - 2) Lift check.
      - 3) Swing check.
      - 4) Wafer plate-type check.
      - 5) Globe.
  - 2. 2-1/2 NPS and Larger:
    - a. Minimum Class: 125.
    - b. Body: Cast iron, except as noted below.
    - c. Allowable Valve Types:
      - 1) Ball: 2-1/2 inch to 3 inch: Three piece, bronze, forged brass, carbon steel, or stainless steel body.
        - a) Brass components.
        - b) Stainless steel components.
      - 2) Butterfly: Ductile iron body. Furnish aluminum bronze or stainless steel disc in open loop systems.
      - 3) Lift check.
      - 4) Swing check.

- 5) Wafer plate-type check.
  - 6) Globe.
- F. Heating Hot Water Valves:
1. 2 NPS and Smaller:
    - a. Minimum Class: 125.
    - b. Body: Bronze.
    - c. Allowable Valve Types:
      - 1) Ball: Two piece. Forged brass body is acceptable to bronze body.
        - a) Brass components.
        - b) Stainless steel components.
      - 2) Lift check.
      - 3) Swing check.
      - 4) Wafer plate-type check.
      - 5) Globe.
  2. 2-1/2 NPS and Larger:
    - a. Minimum Class: 125.
    - b. Body: Cast iron, except as noted below.
    - c. Allowable Valve Types:
      - 1) Ball: 2-1/2 inch to 3 inch: Three piece, bronze, forged brass, carbon steel, or stainless steel body.
        - a) Brass components.
        - b) Stainless steel components.
      - 2) Butterfly: Ductile iron body.
      - 3) Lift check.
      - 4) Swing check.
      - 5) Wafer plate-type check.
      - 6) Globe.

### 2.3 GENERAL REQUIREMENTS

- A. Mechanically Joined General Duty Valves:
1. Contractor may provide mechanically joined general duty valves as an option in lieu of, in whole of, or in part of, the general duty valve fitting and joining methods for the specific systems indicated in Article "Applications." Reference Division 23 Section "Mechanically Joined Hydronic Piping Systems."
- B. Valve Pressure and Temperature Ratings: No less than rating indicated; as required for system pressures and temperatures.
- C. Valve Sizes: Match upstream piping unless otherwise indicated.
- D. Valve Stem Design:
1. Rising stem or rising outside screw and yoke stems.
  2. Non-rising stem valves may be used on water systems where headroom prevents full extension of rising stems.
- E. Valve Actuator Types:
1. Gear Actuator: Quarter-turn valves 8 NPS and larger.
  2. Handwheels: Valves other than quarter-turn types.
  3. Hand Lever: Quarter-turn valves 6 NPS and smaller, vinyl-covered.
  4. Chainwheel: Device for attachment to valve handwheel, stem, or other actuator, of size and with chain for mounting height, as indicated in the "Valve Installation" Article.
- F. Valves in Insulated Piping: Provide stem extensions so valve operator extends a minimum of 1/2 inches outside of the insulation and the following features:
1. Gate Valves: Rising stem.

2. Ball Valves: Extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation.
  3. Butterfly Valves: Extended neck.
  4. Memory Stops: Fully adjustable after insulation is installed.
- G. Valve-End Connections:
1. Threaded End Valves: ASME B1.20.1.
  2. Flanges: ASME B16.1 for cast iron.
  3. Pipe Flanges and Flanged Fittings 1/2 NPS through 24 NPS: ASME B16.5 for steel, ASME B16.24 for bronze.
  4. Solder Joint Connections: ANSI B16.18.
  5. Grooved End Connections: AWWA C606.
- H. General ASME Compliance:
1. Ferrous Valve Dimensions and Design Criteria: ASME B16.10 and ASME B16.34.
  2. Power Piping Valves: ASME B31.1.
  3. Building Services Piping Valves: ASME B31.9.
- I. Bronze Valves:
1. Fabricate from dezincification resistant material.
  2. Copper alloys containing more than 15 percent zinc are not permitted.
- J. Valve Bypass and Drain Connections: MSS SP-45.
- K. Source Limitations: Obtain each valve type from a single manufacturer.

## 2.4 BRONZE GLOBE VALVES

- A. Class 150, 300 psig CWP:
1. Comply with MSS SP-80, Type 2, nonmetallic disc to metal seat.
  2. Body: Bronze; ASTM B62, with integral seat and union bonnet.
  3. Ends: Threaded or solder joint.
  4. Stem and Disc: Bronze stem, PTFE disc.
  5. Packing: Asbestos free, brass gland.
  6. Operator: Malleable iron handwheel.

## 2.5 IRON GLOBE VALVES

- A. Class 125, 200 psig CWP and Class 250, 500 psig CWP:
1. Comply with MSS SP-85, Type 1.
  2. Body: Gray iron; ASTM A126, with bolted bonnet.
  3. Ends: Grooved or flanged.
  4. Trim: Bronze.
  5. Packing and Gasket: Asbestos free, two-piece backing gland assembly.
  6. Operator: Handwheel or chainwheel.

## 2.6 BRONZE BALL VALVES

- A. Two Piece, Class 150, bronze trim, for valves 2 inch and smaller:
1. Comply with MSS SP-110.
  2. CWP Rating: 600 psi.
  3. Body: Bronze, ASTM B584.
  4. Trim: Bronze.
  5. Ends: Threaded or solder joint.
  6. Seats and Seals: PTFE.
  7. Stem: Blowout-proof.
  8. Ball: Full port, chrome plated brass.

9. Operator: Vinyl-covered steel handle.
- B. Two Piece, Class 150, stainless steel trim, for valves 2 inch and smaller:
1. Comply with MSS SP-110.
  2. CWP Rating: 600 psi.
  3. Body: Bronze, ASTM B584.
  4. Trim: Stainless steel.
  5. Ends: Threaded or solder joint.
  6. Seats and Seals: PTFE.
  7. Stem: Blowout-proof, stainless steel..
  8. Ball: Full port, ASTM A276 Type 316 stainless steel.
  9. Operator: Vinyl-covered steel handle.
- C. Three Piece, Class 150, bronze trim, for valves 2-1/2 inch to 3 inch:
1. Comply with MSS SP-110.
  2. CWP Rating: 600 psig.
  3. Body: Bronze, ASTM B584.
  4. Trim: Bronze.
  5. Ends: Threaded or solder joint.
  6. Seats and Seals: PTFE.
  7. Stem: Blowout-proof.
  8. Ball: Full port, chrome plated brass.
  9. Operator: Vinyl-covered steel handle.
- D. Three Piece, Class 150, stainless steel trim, for valves 2-1/2 inch to 3 inch:
1. Comply with MSS SP-110.
  2. CWP Rating: 600 psi.
  3. Body: Bronze, ASTM B584.
  4. Trim: Stainless steel.
  5. Ends: Threaded or solder joint.
  6. Seats and Seals: PTFE.
  7. Stem: Blowout-proof, stainless steel..
  8. Ball: Full port, ASTM A276 Type 316 stainless steel.
  9. Operator: Vinyl-covered steel handle.

## 2.7 BRASS BALL VALVES

- A. Two Piece, Class 150, brass trim, for valves 2 inch and smaller:
1. Standard: MSS SP-110.
  2. CWP Rating: 600 psig.
  3. Body Design: Two piece.
  4. Body Material: Forged brass, ASTM B283 or DZR forged brass, ASTM B283 UNS No. C48640.
  5. Trim: Brass.
  6. Ends: Threaded or soldered.
  7. Seats: PTFE.
  8. Stem: Blowout-proof ,brass.
  9. Ball: Chrome plated brass.
  10. Port: Full.
- B. Two Piece, Class 150, stainless trim, for valves 2 inch and smaller:
1. Standard: MSS SP-110.
  2. CWP Rating: 600 psig.
  3. Body Design: Two piece.
  4. Body Material: Forged brass, ASTM B283 or DZR forged brass, ASTM B283 UNS No. C48640.
  5. Trim: Stainless steel.
  6. Ends: Threaded or soldered.

7. Seats: PTFE.
  8. Stem: Blowout-proof, stainless steel.
  9. Ball: ASTM A276 Type 316 stainless steel.
  10. Port: Full.
- C. Two Piece, Class 150, Brass Trim, for valves 2-1/2 inch to 3 inch:
1. Standard: MSS SP-110.
  2. CWP Rating: 600 psig.
  3. Body Design: Three piece.
  4. Body Material: Forged brass, ASTM B283 or DZR forged brass, ASTM B283 UNS No. C48640.
  5. Trim: Brass.
  6. Ends: Threaded or soldered ends.
  7. Seats: PTFE.
  8. Stem: Blowout-proof, brass.
  9. Ball: Chrome plated brass.
  10. Port: Full
- D. Two Piece, Class 150, Stainless Steel Trim, for valves 2-1/2 inch to 3 inch:
1. Standard: MSS SP-110.
  2. CWP Rating: 600 psig.
  3. Body Design: Three piece.
  4. Body Material: Forged brass, ASTM B283 or DZR forged brass, ASTM B283 UNS No. C48640.
  5. Trim: Stainless steel.
  6. Ends: Threaded or soldered ends.
  7. Seats: PTFE.
  8. Stem: Blowout-proof, stainless steel.
  9. Ball: ASTM A276 Type 316 stainless steel.
  10. Port: Full

## 2.8 IRON BUTTERFLY VALVES

- A. Lug type: Bi-directional dead-end service without downstream flange.
1. Comply with MSS SP-67, Type I.
  2. CWP Rating: 200 psig and 250 psig.
  3. Body Material: ASTM A536 ductile iron.
  4. Stem: One or two-piece stainless steel.
  5. Seat and Seal: EPDM.
  6. Disc: Aluminum-bronze, stainless steel, or one-piece Nylon-coated ductile iron.
  7. Operator:
    - a. Size 2-1/2 through 6 inches: Lever operator, 10 position minimum, with locks and stops.
    - b. Size 8 inch and larger: Gear type with position indicator.

## 2.9 BRONZE SWING CHECK VALVES

- A. Class 150:
1. Comply with MSS SP-80, Type 3.
  2. CWP Rating: 300 psig.
  3. Design: Horizontal swing, Y-pattern, capable of being refitted and ground while valve remains in the line.
  4. Body: Bronze, ASTM B62.
  5. Ends: Threaded.
  6. Disc: PTFE.
  7. Disc: Bronze.

**2.10 IRON FLANGED END SWING CHECK VALVES**

- A. Class 125, 200 psig CWP.
  - 1. Comply with MSS SP-71, Type I.
  - 2. Design: Horizontal swing, clear or full waterway, capable of being refitted and ground while valve remains in the line.
  - 3. Body: Cast iron with bolted bonnet in accordance with ASTM A126, Class B.
  - 4. Ends: Flanged.
  - 5. Trim: Bronze.
  - 6. Disc Holder: Bronze face ring and seat ring.
  - 7. Disc: Bronze or ductile iron.
  - 8. Gasket: Asbestos free.

**2.11 IRON WAFER PLATE-TYPE CHECK VALVES**

- A. Class 125 Dual-Plate (Twin Disc):
  - 1. Comply with API STD 594.
  - 2. 2-1/2 NPS to 12 NPS, CWP Rating: 200 psig.
  - 3. 14 NPS to 24 NPS, CWP Rating: 150 psig.
  - 4. Design: Wafer, non-slam, spring-loaded plates, designed to open and close at approximately 0.5 psi differential.
  - 5. Body: ASTM A126, cast iron.
  - 6. Ends: Flanged.
  - 7. Trim: Stainless steel.
  - 8. Disc: Replaceable bronze.
  - 9. Seat: EPDM, or NBR.

**2.12 CHAINWHEELS**

- A. Description: Valve actuation assembly with sprocket rim, brackets, and chain.
  - 1. Brackets: Type, number, size, and fasteners required to mount actuator on valve.
  - 2. Sprocket Rim with Chain Guides: Ductile iron include zinc coating.
  - 3. Chain: Hot-dip galvanized steel. Sized to fit sprocket rim.

**PART 3 - EXECUTION****3.1 EXAMINATION**

- A. Discard all packing materials and verify that valve interior, including threads and flanges are completely clean without signs of damage or degradation that could result in leakage.
- B. Verify valve parts to be fully operational in all positions from closed to fully open.
- C. Confirm gasket material to be suitable for the service, to be of correct size, and without defects that could compromise effectiveness.
- D. If valve is determined to be defective, replace with new valve.

**3.2 INSTALLATION**

- A. Install products in accordance with manufacturer's instructions.
- B. Locate valves for easy access. Provide access doors and fire rated access doors as required.
- C. Provide unions or flanges with valves to facilitate equipment removal and maintenance while maintaining system operation and full accessibility for servicing.

- D. Install shut-off duty valves at each branch connection to supply mains, at supply connection to each piece of equipment, and elsewhere as indicated.
- E. Install throttling duty valves at each branch connection to return mains, at return connections to each piece of equipment, elsewhere as indicated.
- F. Install three-valve bypass around each pressure reducing valve using throttling-type valves.
- G. Provide separate valve support as required and locate valve with stem at or above center of piping, maintaining unimpeded stem movement.
- H. Install valves in a position to allow full stem movement.
- I. Where valve support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to welds.
- J. Valves with soldered end connections:
  - 1. Use solder with a melting point as follows:
    - a. Below 840 degrees F for gate, globe, and check valves.
    - b. Below 421 degrees F for ball valves.
- K. Install check valves where necessary to maintain direction of flow as follows:
  - 1. Lift Check: Install horizontal style with stem plumb and vertical.
  - 2. Swing Check: Install horizontal maintaining hinge pin level.
  - 3. Orient plate-type into horizontal or vertical position, between flanges.
- L. Provide chainwheels on operators for valves 2-1/2 NPS and larger where located 72 inches or more above finished floor in mechanical rooms, terminating 60 NPS above finished floor.

### 3.3 FIELD QUALITY CONTROL

- A. Tests: After piping systems have been tested and put into service, but before final adjusting and balancing, inspect valves for leaks. Adjust or replace packing to stop leak; replace valves if leak persists.

### 3.4 ADJUSTING AND CLEANING

- A. Cleaning: Clean mill scale, grease, and protective coatings from exterior of valves and prepare valves to receive finish painting or insulation.
- B. Inspect valves for leaks after piping systems have been tested and put into service, but before final adjusting and balancing. Adjust or replace packing, as required, on valves with leaks. Replace valve if leak persists.

### 3.5 VALVE SCHEDULE

A. Bronze Globe Valves, Class 150:

MANUFACTURER	THREADED	THREADED	SOLDER
	NRS	RS	RS
Apollo	--	122T	--
Crane	--	7TF	1310
Hammond	--	IB413T	IB423
Jenkins	--	106BJ	--
Milwaukee	--	590T	1590T
Nibco	--	T-235-Y	S-235-Y
Powell	150	--	--
Stockham	--	B-22T	--

## B. Iron Globe Valves:

MANUFACTURER	CLASS 125	CLASS 125
	STRAIGHT BODY	ANGLE BODY
Apollo	711F	--
Bray	DG	--
Crane	351	353
Hammond	IR116	IB463

## J. Iron Wafer Plate-Type Check Valves:

<u>MANUFACTURER</u>	<u>CLASS 125</u>
Apollo	910WB
Center Line	800
Crane	DuoChek StyleG
Metraflex	CVOSSXXX
Nibco	W-920-W
Stockham	WG970

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 05 29 - HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Support and attachment components.
- B. Horizontal piping hangers and supports.
- C. Saddles and shields.
- D. Vertical piping clamps.
- E. Pipe alignment guides.
- F. Pipe anchors.
- G. Pre-engineered roof equipment supports.
- H. Anchors and fasteners.
- I. Miscellaneous materials.

**1.2 ADMINISTRATIVE REQUIREMENTS**

- A. Coordination:
  - 1. Coordinate sizes and arrangement of supports and bases with the actual equipment and components to be installed.
  - 2. Coordinate the work with other trades to provide additional framing and materials required for installation.
  - 3. Coordinate compatibility of support and attachment components with mounting surfaces at the installed locations.
  - 4. Coordinate the arrangement of supports with ductwork, piping, equipment and other potential conflicts installed under other sections or by others.
  - 5. Notify Architect of any conflicts with or deviations from Contract Documents. Obtain direction before proceeding with work.
- B. Sequencing:
  - 1. Do not install products on or provide attachment to concrete surfaces until concrete has fully cured.

**1.3 SUBMITTALS**

- A. Product Data: Provide manufacturer's standard catalog pages and data sheets for each type of hanger and support. Include a hanger and support schedule showing manufacturer's figure number, size, location, and features for each hanger and support. Submit style and type to Structural Engineer for approval prior to installation.
- B. Product Certificates: Signed by the manufacturer of hangers and supports certifying the products meet the specified requirements.
- C. Welder Certificates: Signed by Contractor certifying that welders comply with requirements specified under "Quality Assurance" Article.
- D. Maintenance Data: For inclusion in Operating and Maintenance manual specified in Division 01 and Division 23 Section "General Mechanical Requirements."

- E. Shop Drawings: Include details for fabricated hangers and supports where materials or methods other than those indicated are proposed for substitution. Include dimensions, weights, required clearances, and method of assembly.
  - 1. Application of protective inserts, saddles, and shields at pipe hangers for each type of insulation and hanger.
- F. Installer's Qualifications: Include evidence of compliance with specified requirements.
- G. Manufacturer's Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.
- H. Deferred Submittals: Submit signed and sealed drawings that indicate the design and installation requirements of pre-engineered roof supports can withstand the design criteria listed in this specification. Include installation requirements for anchoring to the roof structure. The Engineer is not responsible and will not provide the seal and signature. Deliver submittal to the local AHJ for approval prior to installation of the contractor provided, pre-engineered roof supports.

#### **1.4 QUALITY ASSURANCE**

- A. Comply with applicable building code.
- B. Maintain at the project site a copy of each referenced document that prescribes execution requirements.
- C. Installer Qualifications for Field-Welding:
  - 1. Qualify welding processes and welding operators in accordance with AWS D1.1 "Structural Welding Code - Steel."
  - 2. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
  - 3. Qualify welding processes and welding operators in accordance with ASME BPVC Section IX, "Welding and Brazing Qualifications."
- D. Flame/Smoke Ratings: Provide hangers and supports with flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by UL 723 or ASTM E84 (NFPA 255) method.
- E. Product Listing Organization Qualifications: An organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.
- F. Deferred Submittals: Signed and sealed by a professional engineer or National Institute for Certification in Engineering Technologies (NICET) stamp and signature. The professional engineer shall be licensed in the same state in which the project is located.

#### **1.5 DELIVERY STORAGE AND HANDLING**

- A. Receive, inspect, handle, and store products in accordance with manufacturer's instructions.

#### **1.6 DEFINITIONS**

- A. Terminology used in this Section is defined in MSS SP-90.

### **PART 2 - PRODUCTS AND MATERIALS**

#### **1.1 PERFORMANCE REQUIREMENTS**

- A. Structural Performance: Hangers and supports for HVAC piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.

1. Design supports for pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test fluid. Include the weight of the pipe, valves, insulation and piping accessories.
2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

## 1.2 SUPPORT AND ATTACHMENT COMPONENTS

### B. General Requirements:

1. Comply with MSS SP-58.
2. Provide all required hangers, supports, anchors, fasteners, fittings, accessories, and hardware as necessary for the complete installation of work.
3. Provide products listed, classified, and labeled as suitable for the purpose intended, where applicable.
4. Where support and attachment component types and sizes are not indicated, select in accordance with manufacturer's application criteria as required for the load to be supported. Include consideration for vibration, equipment operation, and shock loads where applicable.
5. Do not use wire, chain, perforated pipe strap, or wood for permanent supports unless specifically indicated or permitted.
6. Materials: Products and materials listed in this specification are based on indoor, dry locations. Use corrosion resistant materials suitable for the environment where installed.
  - a. Indoor Dry Locations: Provide painted carbon steel, galvanized steel or zinc-plated steel. Where supports will be field painted in exposed locations, provide carbon steel.
  - a. Indoor Damp or Wet Locations: Galvanized steel or type 304 stainless steel.
  - b. Natatorium or other treated pool environments: Type 316 stainless steel.
  - b. Outdoor Locations: Galvanized steel or Type 304 stainless steel.
  - c. Dielectrics Barriers: Provide dielectric barriers between metallic supports and metallic piping and associated items of dissimilar type. Acceptable barriers include rubber, or copper-plated coatings where attachments are in direct contact with copper.
  - d. Zinc-Plated Steel: Electroplated in accordance with ASTM B633.
  - e. Galvanized Steel: Hot-dip galvanized after fabrication in accordance with ASTM A123/A123M or ASTM A153/A153M.
  - f. Stainless Steel: Type 304 or 316 in accordance with ASTM A240.

### C. Metal Channel (Strut) Framing Systems:

1. Manufacturers:
  - a. Cooper B-Line.
  - b. Ferguson Enterprises/FNW.
  - c. PHD Manufacturing.
  - d. Thomas & Betts Corporation.
  - e. Unistrut, a brand of Atkore International Inc.
  - f. Source Limitations: Furnish channels (struts) and associated fittings, accessories, and hardware produced by a single manufacturer.
2. Factory-fabricated continuous-slot metal channel (strut) and associated fittings, accessories, and hardware required for field-assembly of supports.
3. Comply with MSS SP-58, Type 59, MSS SP-89, and MFMA-4. Welds shall comply with AWS D1.1.
4. Channel Material:
  - a. Indoor Dry Locations: Provide carbon steel, galvanized steel or zinc-plated steel. Where supports will be field painted in exposed locations, provide carbon steel .
  - b. Indoor Damp or Wet Locations: Galvanized steel or Type 304 stainless steel.
  - c. Outdoor Locations: Galvanized steel or Type 304 stainless steel.
  - d. Natatorium or other treated pool environments: Type 316 stainless steel.

- e. All nuts, brackets, and clamps shall have the same finish as the channel.
  5. Minimum Channel Thickness: Steel sheet, 14 gage, 0.0747 inch.
  6. Minimum Channel Dimensions: 1-5/8 inch width by 13/16 inch height with factory-punched attachment holes.
  7. Provide plastic galvanic isolators for connecting bare copper pipe for use with pre-engineered support strut system where indicated.
- D. Hanger Rods:
1. Material:
    - a. Indoor Dry Locations: Zinc-plated steel.
    - b. Indoor Damp or Wet Locations or Outdoor Locations: Zinc-plated steel or type 304 stainless steel.
    - c. Natatorium or other treated pool environments: Type 316 stainless steel.
  2. Threaded both ends or continuously threaded.
  3. Minimum Size: Reference piping specification sections for rod thicknesses.
  4. Threaded Rods: Threaded rods are not allowed for floor supports except when the maximum length of the rod is less than 12". Threaded rod sizes shall be the same size diameter as specified for pipe hanger rods based upon pipe size being supported. Refer to system piping specification sections for rod size requirements.
- E. Wire Rope Pipe Hanging Systems:
1. Manufacturers:
    - a. ASC Engineered Solutions.
    - b. Gripple.
  2. General: Wire rope hanger system shall have a minimum 5 to 1 safety factor based upon the applied working load being supported.
  3. Source Limitations: Furnish associated fittings, accessories, and hardware produced by a single manufacturer.
  4. Cast-in-place Concrete Insert: Pressed steel body with sintered steel wedge, 302 stainless steel spring and UV stabilized homopolymer polypropylene end cap. Model: Gripple Spider Hanging Kit.
  5. Cable Stud: Carbon steel, zinc-coated, designed for attachment to concrete inserts. Model: ASC Engineered Solutions C120.
  6. Cable Coupling: Carbon steel, zinc-coated, designed for attachment to threaded rods. Model: ASC Engineered Solutions C130.
  7. Cable Eyelet: Carbon steel, zinc-coated, designed to be directly attached to structural supports via anchors or fasteners. Model: ASC Engineered Solutions C150.
  8. Cable Toggle: Carbon steel, zinc-coated, with toggle designed for insertion into 1/2 inch hole through steel deck hat channel and provides anchor when pulled in tension. Model: ASC Engineered Solutions C160.
  9. Swivel Toggle Insert: Single assembly attached to wire rope cable, manufactured from plated carbon steel toggle, pins, and shackles; swivel insert engineered to be compatible with concrete insert.
  10. Wire Rope: High tensile steel wire rope, to ASTM A1023, Class A zinc coating; minimum 7 by 7 cross-sectional thread construction; having a tensile strength of 256,000 psi; No.3 wire size minimum.
  11. Adjustable Fastener: Mild steel (type UG2), bright zinc plated, one-channel body; encasing a series of Type 302 stainless-steel springs with serrated self-locking grade 40 chrome steel balls, adjustable by means of an integrated mechanism, capable of accommodating load of 500 lb. Model: Gripple No. 2, 3 or 4 UniGrip.

## 2.2 HORIZONTAL PIPING HANGERS AND SUPPORTS

- A. Manufacturers:
1. Armacell.
  2. ASC Engineered Solutions.
  3. Cooper B-Line, Inc.

4. Elite Components.
  5. ERICO/Michigan Hanger Co./Caddy
  6. Ferguson/FNW.
  7. Halfen-DEHA.
  8. Hilti.
  9. National Pipe Hanger Corporation.
  10. PHD Manufacturing.
  11. Piping Technology and Products, Inc.
  12. Power-Strut.
  13. Unistrut.
- B. Single Hangers:
1. Band Hanger: Carbon steel, adjustable band, adjustable swivel.
  2. Split Ring: Carbon steel, adjustable swivel, split ring type.
  3. Clevis Hanger: Carbon steel, adjustable, clevis type.
  4. Roll Support Hanger: Adjustable steel yoke, cast iron roll.
- C. Trapeze and Strut-mounted Supports:
1. Two-piece clamp: Designed for use with channel strut, held in place at channel shoulder when clamp attachment nut is tightened.
  2. Roll Support: Adjustable cast iron roll attached to metal channel strut framing system with brackets and nuts.
- D. Hangers and strut-mounted supports with pre-manufactured polymer inserts:
1. Manufacturers:
    - a. ASC Engineered Solutions.
    - b. Holdrite.
    - c. Klo-Shure.
  2. Strut-mounted pipe clamps and clevis hangers with pre-manufactured polymer inserts designed to receive butted insulation internally. Inserts shall support piping independent of insulation to avoid crushing. Installed system shall provide equal thermal and vapor barrier performance as systems with continuous unbroken insulation. Metal shields are not required with clevis hangers of this type.
- E. Spring Hangers:
1. Reference Section "Vibration Isolation for HVAC" for spring isolation hangers.
- F. Wall Supports:
1. Two-hole strap, galvanized steel or copper to suit pipe material. Provide rigid insulation between strap and pipe to maintain continuous insulation and vapor barrier where required.
  2. Welded steel bracket reinforced with angle or strut. Support pipe from bracket using horizontal pipe hanger or support appropriate for the pipe type.
- G. Floor Supports:
1. Pipe Saddle: Cast iron adjustable pipe saddle, lock nut, nipple, floor flange, and concrete pier or steel support.
  2. Roller Support: Adjustable cast iron roll and stand, steel screws, and concrete pier or steel support.
- H. Pre-Insulated Supports:
1. Manufacturers:
    - a. Aeroflex USA, Inc.
    - b. Armacell.
    - c. ASC Engineered Solutions
    - d. Buckaroos, Inc.
    - e. Cooper B-Line, Inc.
    - f. Pipe Shields, Inc.
  2. General Construction and Requirements:

- a. Flexible elastomeric insulation with integral high-density pipe support insert shall conform to ASTM C534, Type I.
  - b. Surface Burning Characteristics: Assembly shall have a flame spread index/smoke developed index of 25/50, maximum, when tested in accordance with ASTM E84 or UL 723.
  - c. Waterproof calcium silicate insulation shall conform to ASTM C795.
  - d. Rigid phenolic foam insulation shall conform to ASTM C1126, Type III.
  - e. Insulation inserts shall be surrounded by a 360 degree jacket or shield.
3. Pipe insulation protection shields to be provided at the hanger points and guide locations on pipes requiring insulation as indicated on drawings.

### 2.3 SADDLES AND SHIELDS

- A. Pipe Covering Protection Saddles:
1. Manufacturers: Same as hanger and Supports.
  2. Meet MSS SP-58 Type 39A or B, 100-psi average compressive strength, with center rib for pipes 12 inches and larger. Saddles shall cover approximately one sixth of the circumference of the pipe and shall be 12 inches long.
- B. Insulation Protection Shield:
1. Sheet metal construction, meeting MSS SP-58 Type 40, of 18 gauge for 5-1/2 inches inside dimension and smaller, 16 gauge for 6-1/2 inches to 10-3/4 inches inside dimension, 14 gauge for 11-3/4 inches to 17 inches inside dimension, and 12 gauge for 18 inches to 28 inches inside dimension.
  2. Shield shall cover half of the circumference of the pipe and shall be of length indicated by manufacturer for pipe size and thickness of insulation.
  3. Lengths for pipes greater than 2 inches: Minimum 8 inch long section at each support.
  4. For pipes 2 inch and smaller without pre-insulated supports, provide insulation protection shields installed between hanger and pipe which meets the following minimum length requirements:

Pipe Size (NPS)	Insulation Thickness (inches)	Minimum Shield Length, (in)					
		5	6	7	8	9	10
		Hanger Spacing, (ft)					
≤ 1	0.5	5	6	8	-	-	-
	1	3	5	5	-	-	-
	1.5	3	5	5	-	-	-
	2	3	3	3	-	-	-
	3	3	3	3	-	-	-
≤ 2	0.5	8	8	11	11	12	14
	1	5	6	8	9	11	11
	1.5	5	6	8	8	9	9
	2	5	5	6	6	8	8
	3	5	5	6	6	6	8

- C. 360 Degree Insulation Protection Shield:
1. Shield shall cover all of the circumference of the pipe with two half circumference sections held together with bolts and nuts and shall be of length indicated by manufacturer for pipe size and thickness of insulation.
- D. Plastic Saddles and Shields:
1. Manufacturers:
    - a. Armacell.
    - b. Eaton.
    - c. Hydra-Zorb.
    - d. PHD Manufacturing.
    - e. Zsi Foster.

2. Polymer-based, snap-on or clip-on design, with non-adhesive surface and lip to allow lateral movement of piping without damaging insulation, field-paintable.

## 2.4 VERTICAL-PIPING SUPPORTS

- A. Manufacturers:
  1. ASC Engineered Solutions.
  2. Cooper B-Line, Inc.
  3. Halfen-DEHA.
  4. Hilti.
  5. ERICO/Michigan Hanger Co.
  6. National Pipe Hanger Corporation.
  7. PHD Manufacturing.
  8. Piping Technology and Products, Inc.
  9. Power-Strut.
  10. Unistrut.
- B. Components shall be factory fabricated of materials, design, and manufacturer complying with MSS SP-58.
  1. Components shall have galvanized coatings where installed for piping and equipment that will not have factory applied or field-applied finish.
  2. Pipe attachments shall be copper-plated or have nonmetallic coating for electrolytic protection where attachments are in direct contact with copper tubing.
  3. Components as listed below shall be made of 304 stainless steel where installed in corrosive environments and/or where indicated on the drawings.
- C. Riser Clamps with pre-manufactured polymer insert:
  1. Manufacturers:
    - a. Hydra-Zorb; Titan Riser Clamp.
    - b. National Pipe Hanger.
    - c. Pipe Hangers, Inc.
  2. Riser clamp with pre-manufactured polymer inserts designed to withstand vertical loading and receive butted insulation internally. Inserts shall support piping independent of insulation to avoid crushing. Installed system shall provide equal thermal and vapor barrier performance as systems with continuous unbroken insulation.

## 2.5 PIPE ALIGNMENT GUIDES

- A. Factory fabricated, constructed of cast semi-steel or heavy fabricated steel when applied to steel pipe and copper when applied to copper. Guide shall consist of bolted two-section outer cylinder and base with two-section guiding spider that bolts tightly to pipe. Length of guides shall be as recommended by manufacturer to allow indicated travel.
  1. Pipe Diameter 8 inches and Smaller: Spider or sleeve type.
  2. Pipe Diameter 10 inches and Larger: Roller type.
  3. Pipe Diameter 18 to 30 inches: 1 inch U-bolt.

## 2.6 PIPE ANCHORS

- A. Pre-Insulated Anchors: Galvanized steel or stainless steel assembly with high density insulation insert and no metal-to-metal contact.
- B. Anchor Clamps: Assembly with multi-piece clamp, constructed of compatible material with piping or with dielectric barrier.

**2.7 PRE-ENGINEERED ROOF EQUIPMENT SUPPORTS**

- A. Reference Section "Vibration Isolation for HVAC" for vibration isolated pre-engineered roof equipment supports.
- B. Manufacturers: Subject to compliance with requirements, provide roof equipment supports from the equipment manufacturer or from one of the following:
  - 1. AES Industries.
  - 2. Caldyn, California Dynamics Corp.
  - 3. Custom Curb, Inc.
  - 4. Kinetics Noise Control.
  - 5. Mason Industries, Inc.
  - 6. Pate Company.
  - 7. Thybar.
  - 8. Vibration Eliminator Co., Inc.
  - 9. Vibration Mounting and Controls (VMC Group).
  - 10. Vibro-Acoustics.
- C. Single Rail Equipment Supports:
  - 1. Construction:
    - a. Base plate with fully mitered raised cant and step to match roof insulation thickness.
    - b. Welded, minimum 18 gauge galvanized steel shell, internally reinforced to load bearing factors of equipment being supported.
    - c. Factory installed treated wood nailer.
    - d. 4 inch, minimum 18 gauge nailer jacket with counterflashing where equipment will not fully cover the equipment support.
- D. Roof Curbs:
  - 1. Construction:
    - a. Comply with NRCA standards.
    - b. Base plate with fully mitered raised cant and step to match roof insulation thickness.
    - c. Welded, minimum 18 gauge galvanized steel shell, internally reinforced to load bearing factors of equipment being supported.
    - d. Minimum 1-1/2 inch thick, 3 pound density rigid insulation internal to shell to maintain continuous roof insulation.
    - e. Factory installed treated wood nailer and drain nipple.
    - f. Sloped to match roof structure to enable level installation.

**2.8 ANCHORS AND FASTENERS**

- A. Manufacturers:
  - 1. Hilti, Inc.
  - 2. Illinois Tool Works, Inc.
  - 3. Phillips.
  - 4. Powers Fasteners, Inc.
  - 5. Rawl.
  - 6. Simpson Strong-Tie Company Inc.
- B. Unless otherwise indicated and where not otherwise restricted, use the anchor and fastener types indicated for the specified applications.
  - 1. Concrete: Use preset concrete inserts or expansion anchors.
  - 2. Solid or Grout-Filled Masonry: Use expansion anchors.
  - 3. Hollow Masonry: Use toggle bolts.
  - 4. Hollow Stud Walls: Use toggle bolts.
  - 5. Steel: Use beam clamps.
  - 6. Sheet Metal: Use sheet metal screws.

7. Wood: Use wood screws.
  8. Plastic and lead anchors are not permitted.
  9. Hammer-driven anchors and fasteners are permitted only as follows:
    - a. Nails are permitted for attachment of nonmetallic boxes to wood frame construction.
    - b. Staples are permitted for attachment of nonmetallic-sheathed cable to wood frame construction.
- C. Preset Concrete Inserts: Continuous metal channel (strut) and spot inserts specifically designed to be cast in concrete ceilings, walls, and floors.
1. Comply with MFMA-4.
  2. Channel Material: Use galvanized steel.
  3. Minimum Channel Thickness: Steel sheet, 12 gage, 0.1046 inch minimum base metal thickness.
  4. Spot Inserts: Carbon steel with zinc plating or galvanized steel body and base plate, with protective sleeve for anchor rod insert, sized to accommodate anchor rod dimensions.
  5. Manufacturers:
    - a. Same as manufacturer of metal channel (strut) framing system.
    - b. DeWalt "Bang-It" concrete inserts.
- D. Post-Installed Concrete and Masonry Expansion Anchors:
1. Evaluated and recognized by ICC Evaluation Service, LLC (ICC-ES) for compliance with applicable building code.
  2. Self-drilling, drilled flush or shell type. Size inserts to suit threaded rods.
- E. Beam Clamps: MSS SP-58 C-Type or adjustable, Types 19 through 23, 25 or 27 through 30 based on required load.
1. Material: ASTM A36/A36M carbon steel or ASTM A181/A181M forged steel.
  1. Provide clamps with hardened steel cup-point set screws and lock-nuts for anchoring in place.
- F. Vibration Isolation Anchors: Reference Section "Vibration Isolation for HVAC" for vibration isolation anchors.

## 2.9 MISCELLANEOUS MATERIALS

- A. Steel Plates, Shapes, and Bars: ASTM A 36.
- B. Malleable Iron: ASTM A47
- C. Cement Grout: Portland cement (ASTM C 150, Type I or Type III) and clean uniformly graded, natural sand (ASTM C 404, Size No. 2). Mix ratio shall be 1.0 part cement to 3.0 parts sand, by volume, with minimum amount of water required for placement and hydration.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Verify that field measurements are as indicated.
- B. Verify that mounting surfaces are ready to receive support and attachment components.
- C. Verify that conditions are satisfactory for installation prior to starting work.

### 3.2 INSTALLATION GENERAL

- A. Install products in accordance with manufacturer's instructions.
- B. Provide hangers and supports according to the Pipe Hanger and Support Schedule below.

- C. Install anchors and fasteners in accordance with ICC Evaluation Services, LLC (ICC-ES) evaluation report conditions of use where applicable.
- D. Provide independent support from building structure. Do not provide support from piping, ductwork, conduit, or other systems.
- E. Unless specifically indicated or approved by Architect, do not provide support from suspended ceiling support system or ceiling grid.
- F. Unless specifically indicated or approved by Architect, do not provide support from roof deck.
- G. Do not penetrate or otherwise notch or cut structural members without approval of Structural Engineer.
- H. Provide thermal insulated pipe supports complete with hangers and accessories. Install thermal insulated pipe supports during the installation of the piping system.
- I. Provide vibration isolators at hangers and supports where specified in Section "Vibration Isolation for HVAC".

### 3.3 INSTALLATION OF HANGERS AND SUPPORTS

- A. Install in accordance with ASME B31.9, ASTM F708, or MSS SP-58 unless indicated otherwise.
- B. If type of hanger or support for a particular situation is not indicated, select appropriate type using MSS SP-58 recommendations.
- C. Space attachments within maximum piping span length specified in Division 23 piping sections.
- D. Install hangers to provide minimum 1/2 inch space between finished covering and adjacent work.
- E. Install hangers, supports, clamps and attachments to support piping properly from building structure.
- F. Do not attach to ceilings, equipment, ductwork, conduit and other non-structural elements such as floor and roof decking.
- G. Hanger and clamps sizing:
  - 1. Cold Piping: Provide pipe hangers sized for the pipe outside diameter plus insulation thickness.
  - 2. Hot Piping: Provide pipe hangers sized for the pipe outside diameter plus insulation thickness.
  - 3. Vertical Piping: Provide clamps sized for the pipe outside diameter and extend clamp through insulation.
  - 4. Refer to Section "HVAC Insulation" for definition of hot and cold piping and required insulation thickness.
- H. Where several pipes can be installed in parallel and at the same elevation, Contractor has option to provide metal channel strut framing. Install supports with maximum spacing specified within Division 23 piping sections.
  - 1. Space strut framing at the required distance for the smallest pipe size or install intermediate supports for smaller diameter pipe as specified above for individual pipe hangers.
  - 2. Where strut systems are attached to walls, install anchor bolts per manufacturer's recommendations.
    - a. Uninsulated Copper Pipe: Install with plastic galvanic isolators
    - b. Insulated Tube or Pipe: Install with 360° insulation protection shields or pre-engineered thermal hanger-shield inserts as specified in Section "HVAC Insulation".
- I. Install building attachments within concrete or to structural steel.
  - 1. Install additional attachments at concentrated loads, including valves, flanges, guides, strainers, expansion joints, and at changes in direction of piping as specified in Division 23 piping sections.

2. Install concrete inserts before concrete is placed; fasten insert to forms. Where concrete with compressive strength less than 2,500 psi is indicated, install reinforcing bars through openings at top of inserts.
- J. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories. Provide two nuts on threaded supports to securely fasten the support.
- K. Install appropriate types of hangers and supports to allow controlled movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends and similar units.
- L. Load Distribution: Install hangers and supports so that piping live and dead loading and stresses from movement will not be transmitted to connected equipment.
- M. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes, and so that maximum pipe deflections allowed by ASME B31.9 Building Services Piping Code is not exceeded.
- N. Insulated Piping: Comply with the following installation requirements.
1. Riser Clamps: Attach riser clamp to piping with riser clamps projecting through insulation. Do not use riser clamps to support horizontal, insulated piping. Seal insulation for hot piping and protect vapor barrier for cold piping as specified in Division 23 Section "HVAC Insulation".
    - a. Contractor's Option: Provide riser clamps with pre-manufactured polymer insert.
  2. Pipe Covering Protection Saddles: Install pipe covering protection saddles where insulation without vapor barrier is indicated. Fill interior voids with segments of insulation that match adjoining pipe insulation.
    - a. If insulation protection shields are used instead of protection saddles on hot piping where vapor barrier is not required, provide high density insulation insert sized for the insulation thickness used as specified in Division 23 Section "HVAC Insulation".
  3. Insulation Protection Shield: Install insulation protection shield with high density insulation insert, sized for the insulation thickness used as specified in Division 23 Section "HVAC Insulation". Do not use polymer-based shields for hot piping.
    - a. Exception for 2 inch and smaller horizontal piping with cellular glass, flexible elastomeric, or polyisocyanurate insulation: High density insulation insert is not required. Provide insulation protection shield over the insulation with length specified for pipe size and insulation thickness to prevent puncture or other damage.
  4. Contractor's Option: Provide pre-engineered thermal hanger inserts for piping insulated with flexible elastomeric insulation at pipe supports for piping 2-1/2 inches and larger.
  5. Contractor's Option: Provide strut-mounted pipe clamps and clevis hangers with pre-manufactured polymer inserts.
- O. Strut Framing Systems: Channel strut systems can be used at the Contractors option in lieu of individual hangers for horizontal pipes. Arrange for grouping of parallel runs of horizontal piping. Space channel strut systems at the required distance for the smallest pipe supported. Provide channel gauge and hanger rods per the manufacturer's recommendations for the piping supported. Where strut systems are attached to walls, install anchor bolts per manufacturer's recommendations.
1. Uninsulated Copper Pipe: Install with plastic galvanic isolators
  2. Insulated Tube or Pipe: Install with 360 degree insulation protection shields or pre-engineered thermal hanger-shield inserts as specified in Division 23 Section "HVAC Insulation".
- P. Vertical Piping Risers:
1. Reference Section "Vibration Isolation for HVAC" for piping riser supports.
- Q. Wire Rope Hanging Systems:
1. Install in accordance with manufacturer's instructions.
  2. Supported load shall not exceed manufacturer's recommended load rating.
  3. Applications for Pipe Supports:
    - a. 3 inch and smaller.

- b. Wire rope hanging system is not allowed for steam or steam condensate piping.
4. Do not support pipe by wrapping the rope around the pipe.
5. Provide appropriate hanger or support compatible with the wire rope hanging system adjustable fastener as specified in the Pipe Hanger and Support Schedule.
6. Install cast-in-place concrete inserts in elevated concrete slabs.
7. Install bream clamps for attachment to structural beams as required.

### 3.4 INSTALLATION OF PIPE ALIGNMENT GUIDES

- A. Install pipe alignment guides on piping that adjoins expansion joints, as required by expansion joint manufacturer, and elsewhere as indicated on plans and specification sections to eliminate binding and torsional stress on piping systems. Install guides per ASME B31.9 unless noted otherwise. Install pipe insulation at guide to not interfere with movement of pipe within the guide.
- B. Install guide to accommodate 1/2 the thermal movement at the adjacent expansion joint.
- C. Anchor to building substrate.

### 3.5 INSTALLATION OF ANCHORS

- A. Install anchors at proper locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.
- B. Fabricate and install anchors by welding steel shapes, plates, and bars to piping and to structure. Comply with ASME B31.9 and with AWS Standards D1.1.
- C. Spacing: Where not otherwise indicated, install anchors at ends of principal pipe runs, at intermediate points in pipe runs between expansion loops and bends. Make provisions for preset of anchors as required to accommodate both expansion and contraction of piping.

### 3.6 INSTALLATION OF ROOF EQUIPMENT SUPPORTS

- A. Attach roof equipment support to the roof structure according to the manufacturer's installation instructions.
- B. Provide multiple single rail equipment supports to uniformly support the equipment.
- C. Provide rigid backing material (e.g., insulation, wood, etc.) to maintain cant slope.
- D. Install supports to maintain continuous insulation on roof.
- E. Provide vibration isolators between roof equipment support and equipment according to Division 23 Section "Vibration Isolation for HVAC."
- F. If vibration isolation is not required or units are internally isolated, attach equipment directly to pre-engineered roof equipment support using one of the following:
  1. Single Rail Equipment Supports: Secure each equipment support leg to the rail with a minimum of 4 points of connection per leg.
  2. Roof Curbs:
    - a. Secure each corner of the equipment to the curb nailer using a minimum of 4 lag screws, located along the length of the equipment.
    - b. Secure equipment to the curb using hold-down brackets. Provide minimum 6 inch long, 14 gauge galvanized steel brackets sized to wrap around top of curb and under equipment base rail with sufficient horizontal offset to cover overlap gap between the equipment rail and curb. Secure bracket to equipment and curb nailer using a minimum of 8 points of connection per bracket. Provide one bracket at each corner along the length of the unit.
  3. Hold-Down Brackets: Coordinate with the pre-engineered roof equipment support manufacturer to determine the quantity and size of hold-down brackets and fasteners, with installation instructions, for each equipment to meet the following criteria:

- a. Building Design Risk Category: III.
- b. Design Wind Speed: 169 mph.
- c. Submit design and installation requirements as a Deferred Submittal.

### 3.7 EQUIPMENT SUPPORT AND ATTACHMENT

- A. Use metal fabricated supports or supports assembled from metal channel (strut) to support equipment as required.
- B. Use metal channel (strut) secured to studs to support equipment surface-mounted on hollow stud walls.
- C. Use metal channel (strut) to support surface-mounted equipment in wet or damp locations to provide space between equipment and mounting surface.
- D. Securely fasten floor-mounted equipment. Do not install equipment such that it relies on its own weight for support.
- E. Preset Concrete Inserts and Expansion Anchors: Use manufacturer provided closure strips to inhibit concrete seepage during concrete pour.
  1. Where concrete slabs form finished ceiling, locate anchors flush with slab surface.
- F. Secure fasteners according to manufacturer's recommended torque settings.
- G. Remove temporary supports.
- H. Fabricate structural steel supports to suspend equipment from structure above or support equipment from floor.
- I. Grouting: Place grout under supports for piping and equipment.

### 3.8 METAL FABRICATION

- A. Cut, drill, and fit miscellaneous metal fabrications for pipe anchors and equipment supports. Install and align fabricated anchors in indicated locations.
- B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.
- C. Field Welding: Comply with AWS D1.1 for procedures of manual shielded metal-arc welding, appearance and quality of welds made, methods used in correcting welding work, and the following:
  1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  2. Obtain fusion without undercut or overlap.
  3. Remove welding flux immediately.
  4. Finish welds at exposed connections so that no roughness shows after finishing, and so that contours welded surfaces to match adjacent contours.

### 3.9 FIELD QUALITY CONTROL

- A. Examine support and attachment components for damage and defects.
- B. Hanger Adjustment: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.
- C. Repair cuts and abrasions in galvanized finishes using zinc-rich paint recommended by manufacturer. Replace components that exhibit signs of corrosion.
- D. Touch-Up Painting: Immediately after erection of anchors and supports, clean field welds and abraded areas of shop paint and paint exposed areas with same material as used for shop

painting to comply with SSPC-PA-1 requirements for touch-up of field-painted surfaces. Comply with Division 09 Section "Painting."

1. Apply by brush or spray to provide a minimum dry film thickness of 2.0 mils.
- E. For galvanized surfaces clean welds, bolted connections and abraded areas and apply galvanizing repair paint to comply with ASTM A 780.
- F. Correct deficiencies and replace damaged or defective support and attachment components.

### 3.10 PIPE HANGER AND SUPPORT SCHEDULE

- A. Additional hanger and support requirements are in Sections specifying piping systems and equipment.
- B. Provide the following acceptable hangers and supports for each type of piping system. Hangers and supports may be single type or strut-mounted:
- C. Single Hangers:
1. All pipe sizes 1-1/2 inch and less:
    - a. Band hanger.
    - b. Swivel split ring.
    - c. Clevis hanger.
  2. Cold and Hot pipe sizes 2 inches and greater where pipes are in stationary position: Clevis hanger.
  3. Cold and Hot pipe sizes 2 inches and greater for pipes in the following locations: Roll support hanger.
    - a. Axial movement due to thermal expansion or contraction generates swing angles in excess of 4 degrees.
    - b. Between anchor locations shown on the drawings.
- D. Trapezes and Strut-mounted Supports:
1. Pipes in stationary position: Two-piece clamp, strut clamp or U-bolts.
  2. Cold and Hot pipe sizes 2 inches and greater in the following locations: Roll support.
    - a. Axial movement due to thermal expansion or contraction generates swing angles in excess of 4 degrees.
    - b. Between anchor locations shown on the drawings.
- E. Wall Supports:
1. Pipe sizes 3 inches and less:
    - a. Two-hole strap mounted to wall.
    - b. Welded steel bracket with reinforced angle or strut.
  2. Pipe sizes 4 inch and greater:
    - a. U-bolt.
    - b. Welded steel bracket with reinforced angle or strut.
- F. Floor Supports:
1. Pipes in stationary position: Pipe saddle.
  2. Cold and Hot pipe sizes 2 inches and greater in the following locations: Roll support.
    - a. Axial movement due to thermal expansion or contraction is greater than one inch.
    - b. Between anchor locations shown on the drawings.

END OF SECTION

**SECTION 23 05 50 - VIBRATION ISOLATION FOR HVAC****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Vibration isolation requirements.
- B. Vibration-isolated equipment support bases.
- C. Vibration isolators.

**1.2 COORDINATION**

- A. Contractor's Responsibility:
  - 1. Verify the completeness of the isolation installation and the overall suitability of the equipment to meet the intent of this specification. Any additional equipment needed to meet the intent of this specification, even if not specifically mentioned herein or in the Contract Documents, shall be supplied by the Contractor without claim for additional payment.
  - 2. Performance or waiving of inspection, testing or surveillance for any portion of the Work shall not relieve the Contractor of the responsibility to conform strictly with the Contract Documents. The Contractor shall not construe performance or waiving of inspection, testing or surveillance by the Owner or Architects to relieve the Contractor from total responsibility to perform in strict accordance with the Contract Documents.
  - 3. Coordinate selection and arrangement of vibration isolation components with the actual equipment to be installed.
  - 4. Coordinate the work with other trades to provide additional framing and materials required for installation.
  - 5. Coordinate compatibility of support and attachment components with mounting surfaces at the installed locations.
  - 6. Sequencing:
    - a. Do not install products on or provide attachment to concrete surfaces until concrete has fully cured.
- B. Manufacturer's Responsibility:
  - 1. Determine vibration isolation types for all equipment and systems in accordance with the local governing code.
  - 2. Calculate the static deflection requirements for all equipment and systems to provide uniform deflection based on distributed operating weight of actual installed equipment.
  - 3. Select the vibration isolation systems to provide static deflection indicated on the Vibration Isolation Schedule and as specified below. Determine the mounting sizes and layout.
  - 4. Guarantee specified isolation system deflection.
  - 5. Select and size vibration isolators to not exceed the recommended loading of the isolators.
  - 6. Provide installation instructions, drawings and field supervision to ensure proper installation and performance.
  - 7. Verify that all equipment to be isolated has sufficient support structure to distribute equipment loads onto isolators.

**1.3 SUBMITTALS**

- A. Product Data: Provide manufacturer's standard catalog pages and data sheets for products, including materials, fabrication details, dimensions, and finishes.

1. Vibration Isolators: Include rated load capacities and deflections; include information on color coding or other identification method for spring element load capacities. Include clearly outlined procedures for installing and adjusting the isolators.
- B. Shop Drawings:
  1. Include dimensioned plan views and sections indicating proposed arrangement of vibration isolators on each piece of isolated equipment. Indicate equipment weights and static deflections.
  2. Vibration-Isolated Equipment Support Bases: Include base weights, including concrete fill where applicable. Indicate equipment mounting provisions.
  3. Piping isolators shown and identified on piping layout drawings.
  4. Concrete foundations, supports, and required reinforcing and forms. These appurtenances shall be provided by another trade. This trade shall furnish the shop drawings, including the following:
    - a. Concrete reinforcing steel details and templates for all foundations and supports.
    - b. Required hanger bolts.
    - c. All other appurtenances necessary for proper installation of equipment.
- C. Vibration Isolation System Schedule: Include the following for each isolation element:
  1. Manufacturer, isolator type, model number, size.
  2. Height when uncompressed and static deflection.
  3. Spring constant.
  4. Spring outside diameter, free operating, and solid heights.
  5. Design of supplementary bases.
  6. Details of attachment to load-bearing structure or supplementary framing.
- D. Post-Installation Inspection Report:
  1. Vibration isolation vendor notice of inspection of all vibration isolators.
  2. Vibration isolation vendor notice of approval that all vibration isolators have been properly installed and conform to the specification.
  3. Itemized list of deficiencies.
  4. Vibration Isolation System Schedule.
  5. For each isolator containing steel springs, record the following:
    - a. Size.
    - b. Uncompressed height.
    - c. Design static deflection.
    - d. Measured static deflection.

#### **1.4 QUALITY ASSURANCE**

- A. All vibration isolation equipment shall be furnished by one manufacturer unless specifically approved otherwise in writing by the Engineer.
- B. All vibration isolation equipment and materials shall be new and manufactured specifically for the purpose intended.
- C. Maintain at the project site a copy of each reference document that prescribes execution requirements.
- D. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section, with not less than three years of documented experience.

#### **1.5 DELIVERY STORAGE AND HANDLING**

- A. Receive, inspect, handle, and store products in accordance with manufacturer's instructions.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. BRD Noise and Vibration Control.
- B. Caldyn, California Dynamics Corp.
- C. Kinetics Noise Control.
- D. Mason Industries, Inc.
- E. Thybar Corporation.
- F. Vibration Eliminator Co., Inc.
- G. Vibration Mounting and Controls.
- H. Vibro-Acoustics.

**2.2 VIBRATION ISOLATION REQUIREMENTS**

- A. Construct vibration isolators out of resilient materials resistant to oil, ozone, and oxidant.
- B. Select vibration isolators to provide the static deflection as specified in Part 2 "Products" unless otherwise specified for the application listed in Part 3 "Execution."
- C. Where a pipe run connects multiple equipment, select the pipe isolators for the entire run to suit the connected equipment of greatest static deflection.
- D. Vibration isolators shall have either known undeflected heights or calibration markings so that the amount of deflection can be verified after adjustment to determine that the load is within the proper range of the device and that the correct degree of vibration isolation is provided according to the design.
- E. Vibration isolators, base frames, and inertia bases shall provide uniform deflection and stability under all operating loads.
- F. Isolators for fans shall be sized so that thrust restraints (which would act against turning moment caused by static pressure) are not required.
- G. Lateral restraining isolators shall have the same static deflection as the vertical isolators for the equipment being isolated.
- H. The theoretical vertical natural frequency for each support point based upon load per isolator and isolator stiffness shall not differ from the design objectives for the equipment as a whole by more than plus/minus 10 percent.
- I. All elastomeric mountings shall have a Shore hardness of 30 to 60 plus/minus 5 after minimum aging of 20 days or corresponding over-aging, or as specified herein.
- J. Elastomeric isolators that will be exposed to temperatures below 32 degrees F shall be fabricated of natural rubber instead of neoprene.
- K. Equipment mounted on vibration isolated bases shall have minimum operating clearance of 1 inch between the base and floor or support beneath unless noted otherwise.
- L. Vibration Isolator Assemblies with Steel Springs:
  - 1. Housed or caged spring isolators are not acceptable.
  - 2. Assemblies shall use bare springs, color coded or otherwise identify springs to indicate load capacity.
  - 3. Spring diameter shall not be less than 0.8 of the loaded operating height of the spring.
  - 4. The ratio of the horizontal to vertical spring constant shall be between 1 and 2.

5. Springs shall be sized to be non-resonant with equipment forcing frequencies or support structure natural frequencies.
  6. Assembly shall be designed and installed so that the ends of the spring remain parallel during and after the spring installation.
  7. Springs shall operate in the linear portion of their load versus deflection curve over a deflection range of not less than 50 percent above the design deflection.
- M. Vibration isolators exposed to weather and other corrosive environments shall be protected with factory corrosion resistance.
1. Exterior applications:
    - a. Springs: Cadmium-plated and neoprene coated.
    - b. Nuts and bolts: Cadmium plated.
    - c. Other metal mounting parts: Hot-dip galvanized.
  2. Interior applications: Painted.

### 2.3 VIBRATION ISOLATED EQUIPMENT SUPPORT BASES

- A. Pre-Engineered Roof Equipment Support (Type RES):
1. Reference Section "Hangers and Supports for HVAC Piping and Equipment" for specification of non-vibration isolated, pre-engineered roof equipment supports.
- B. Structural Rails (Type SR):
1. Assembly: Structural steel channels furnished with double-deflection neoprene mountings or spring isolators.
  2. Base: All metal mounting parts shall be covered with neoprene to avoid corrosion and metal-to-metal contact.
  3. Selection: Channel length and isolator type with deflection as required for proper isolation of equipment.
  4. Type SR: Mason Industries Type RND or approved equal.
- C. Vibration Isolation Roof Curb (Type CMB):
1. Description: Engineered, structural steel frame mounted directly to the structure with an upper floating section on adjustable steel springs. The upper frame shall provide continuous support for the equipment.
  2. Steel springs shall rest on minimum 1/4 inch thick elastomeric pads and have a minimum static deflection as specified in Part 3.
  3. All-directional elastomeric snubber bushings shall be minimum 1/4 inch thick.
  4. Weatherproofing: Continuous galvanized flexible counterflashing nailed over the lower curb's waterproofing and joined at the corners by elastomeric bellows.
  5. Access Ports: Provided for all spring locations with removable waterproof covers to allow for adjustment or replacement of springs.
  6. Lower curbs shall have provision for 2 inches insulation.
  7. Type CMB: Mason Industries Type RSC or approved equal.

### 2.4 VIBRATION ISOLATORS

- A. Ribbed Neoprene "Waffle" Pads (Type WP):
1. Assembly: Single ribbed or crossed double ribbed elastomer in-shear pads, in one or more layers separated and bonded to a minimum 1/4 inch thick galvanized steel shim plate as required to provide selected deflection.
  2. Thickness: Each layer 5/16 inch thick.
  3. Selection: Maximum durometer of 50 and designed for 15 percent strain, static deflection of 0.05 inches.
  4. Type WP: Mason Industries Type W, Type WSW, or approved equal.
- B. Neoprene and Cotton Duck Pads (Type DP):
1. Assembly: Neoprene and cotton duck construction, 12 Plys per 1/2 inch thickness.

2. Selection: Thickness or multiple pads in series as required to limit maximum loading to 500 psi and static deflection of 0.1 inches.
  3. Type DP: Mason Industries Type HL, or approved equal.
- C. Double Deflecting Neoprene Mounts (Type DDNM):
1. Assembly: Laterally stable, double deflecting, neoprene encapsulated mount with bolt holes for attachment to supporting structure.
  2. Selection: Maximum durometer of 50 and designed for 15 percent strain, static deflection of 0.4 inches unless specified otherwise.
  3. Type DDNM: Mason Industries Type ND or approved equal.
- D. Restrained Neoprene Mounts (Type RNM)
1. Assembly: Restrained neoprene mounting element encapsulated in a metal housing to prevent bulging of the neoprene element with bolt holes for attachment to supporting structure. Assembly shall be designed to provide isolation in tension, shear or compression.
  2. Selection: Maximum durometer of 50 and designed for 15 percent strain, static deflection of 0.25 inches.
  3. Type RNM: Mason Industries Type RBA or approved equal.
- E. Steel Spring Neoprene Mounts (Type SPNM):
1. Assembly: Single or multiple free-standing and laterally stable steel springs without a housing.
    - a. Light capacity base: Molded elastomeric neoprene load plate.
    - b. Heavy capacity base: Springs welded to the load plate assembly furnished with integral elastomeric pad.
    - c. Leveling Device: Rigidly connected to equipment or frame.
  2. Selection:
    - a. Minimum static deflection for equipment mounted on grade slabs shall be 1 inch unless specified otherwise.
    - b. Minimum static deflection for equipment mounted above grade (suspended) slabs shall be 2 inches unless specified otherwise.
  3. Type SPNM: Mason Industries Type SLFH or approved equal.
- F. Constrained Steel Spring Neoprene Mounts (Type CSNM):
1. Assembly: Single or multiple free-standing and laterally stable steel springs assembled into a factory-fabricated housing with integral leveling device and stops to limit vertical movement of the isolated equipment during a temporary weight reduction. Include rigid blocking to support equipment during rigging to maintain identical installed and operating heights of the isolator. Housing shall maintain a minimum clearance of 1 inch around restraining bolts and the spring so as not to interfere with the spring operation.
    - a. Leveling Device: Rigidly connected to equipment or frame. Limit stops shall provide minimum 1/4 inch clearance between housing and isolator base plate under normal operation.
    - b. Equipment Wind Loading Applications: Provide tapped hole in top and bottom plates for bolting to equipment and the roof or supporting structure with a neoprene mounting sleeve.
  2. Base: Minimum 1/4 inch thick neoprene pad under housing.
  3. Selection: Minimum static deflection of 2 inches unless specified otherwise.
  4. Type CSNM: Mason Industries Type SLR or approved equal.
- G. Neoprene Bushing (Type NR):
1. Assembly: Neoprene restraint, rubber-in-shear bushings for lightweight, suspended equipment supported from structure with all-thread rod and angle iron or Unistrut.
  2. Selection: Maximum durometer of 50 and designed for 15 percent strain, static deflection of 0.15 inches.
  3. Type NR: Mason Industries Type HMIB or approved equal.
- H. Double Deflection Neoprene Hangers ((Type DDNH)

1. Assembly: Steel hanger box containing a laterally stable, double deflecting, neoprene isolator. Neoprene isolator shall prevent contact between the lower hanger rod and hanger box and short-circuiting the isolating function.
    - a. Housing: Bottom opening sized to allow hanger rod to swing through a 30 degree arc.
  2. Selection: Maximum durometer of 50 and designed for 15 percent strain, static deflection of 0.4 inches.
  3. Type DDNH: Mason Industries Type HD or approved equal.
- I. Spring and Neoprene Hanger (Type SPNH)
1. Assembly: Steel hanger box containing a laterally stable, double deflecting, neoprene isolator in series with a steel spring.
    - a. Housing: Include a neoprene bushing to prevent contact between the lower hanger rod and hanger box and short-circuiting the isolating function. Bottom opening sized to allow hanger rod to swing through a 30 degree arc.
  2. Selection:
    - a. Neoprene isolator: Maximum durometer of 50 and designed for 15 percent strain, static deflection of 0.4 inches unless specified otherwise.
    - b. Spring isolator: Minimum static deflection of 2 inches unless specified otherwise.
  3. Type SPNH: Mason Industries Type 30N or approved equal.
- J. Neoprene Mounting Sleeves, Grommets, and Bushings: Designed to prevent steel-to-steel contact within vibration isolators.
- K. Flexible Connectors:
1. Pipe: Refer to Section "Hydronic Piping Specialties."
  2. Duct: Refer to Section "Air Duct Accessories."
- L. Pipe Riser Anchor (Type PRA)
1. Assembly: Telescoping arrangement of two sizes of steel tubing separated by minimum 1/2 inch thick, 60 durometer neoprene. Anchor shall include tapped hole on the top plate for bolt attachment to riser clamp. Anchor shall allow for all-directional movement.
  2. Selection: Static deflection of 0.1 inches, maximum allowable load on the isolation material shall not exceed 500 psi.
  3. Type PRA: Mason Industries Type ADAH or approved equal.
- M. Pipe Riser Guide (Type PRG):
1. Assembly: Telescoping arrangement of two sizes of steel tubing separated by minimum 1/2 inch thick, 60 durometer neoprene with set screw to prevent lateral movement. Guide shall include tapped hole on the top plate for bolt attachment to riser clamp.
  2. Type PRG: Mason Industries Type VSGH or approved equal.
- N. Riser Suspension Anchor (Type PRSA):
1. Assembly: Steel hanger box containing laterally stable steel spring with integral deflection scale, adjustment plate, and nut. Housing shall include tapped hole at the top for hanger rod attachment.
  2. Selection: Minimum static deflection of 4 inches.
  3. Type PRSA: Mason Industries Type HES or approved equal.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Verify that mounting surfaces are ready to receive vibration isolation and associated attachments.

#### **3.2 INSTALLATION - GENERAL**

- A. Install in accordance with manufacturer's instructions.

- B. External spring isolators are not required if unit is provided with internal spring isolation. If external spring isolators are provided, internal spring isolation shall not be approved.
- C. Mount or suspend all equipment, piping, ductwork, etc. from approved foundations and supports as specified herein or as shown on the drawings.
- D. Secure fasteners according to manufacturer's recommended torque settings.
- E. Support piping, ductwork, conduit, and mechanical equipment from the building structure. Do not support from other equipment, piping, or ductwork.
- F. Install isolators to prevent short-circuiting of the isolation.
- G. All wiring connections to mechanical equipment on isolators shall have a minimum 18 inch long flexible conduit in a "U" shaped loop. Coordinate with Division 26.
- H. Flexible Connectors: Install flexible connectors sized to match equipment connections and to provide sufficient slack for vibration isolation as required.
- I. Equipment connected to water or other fluid piping shall be erected on isolators or isolated foundations at correct operating heights prior to connection of piping. Block-up equipment with temporary shims to final operating height. When the system is assembled full load is applied, adjust the isolators shall be adjusted to allow shim removal.
- J. Refer to Division 23 Section "Common Work Results for HVAC" for noise critical spaces.

### **3.3 INSTALLATION OF VIBRATION ISOLATED EQUIPMENT SUPPORT BASES**

- A. All floor-mounted equipment shall be erected on housekeeping pads. Refer to Section "Common Work Results for HVAC" for concrete housekeeping pad requirements.
- B. Maintain minimum 4 inches clearance between isolated equipment and the walls, ceiling, floors, columns, and any other equipment not installed on vibration isolators.
- C. Set steel bases for one inch clearance between housekeeping pad and base.
- D. Set concrete inertia bases for 2 inches clearance between housekeeping pad and base.
- E. Adjust equipment to be level.
- F. Verify no material is left to short-circuit the isolator.
- G. For equipment support bases installed on the roof, coordinate with the pre-engineered roof equipment support manufacturer to determine the quantity and size of hold-down brackets, isolators, and fasteners, with installation instructions, for each equipment to meet the following criteria:
  - 1. Building Design Risk Category: III.
  - 2. Design Wind Speed: 169 mph.
- H. Type CMB:
  - 1. Attach roof equipment support to the roof structure according to the manufacturer's installation instructions.
  - 2. Provide flexible duct connector using a foam rubber gasket to seal against the unit bottom.
  - 3. Provide rigid backing material (e.g., insulation, wood, etc.) to maintain cant slope on roof equipment support bases.
  - 4. Install roof equipment support bases to maintain continuous insulation on roof.

### **3.4 INSTALLATION OF VIBRATION ISOLATORS**

- A. Neoprene Mounting Sleeves, Grommets, and Bushings: Install on vibration isolators to prevent any metal to metal contact.
- B. Spring Isolators:

1. On closed spring isolators, adjust so side stabilizers are clear under normal operating conditions.
  2. Install springs so that the ends of springs remain parallel and all springs are installed with adjustment bolts.
  3. Locate isolation hangers at the top of hanger rods.
  4. Type SPNM: Unless otherwise specified, isolators need not be bolted to the floor for indoor installations.
  5. Type SPNH and DDNH: Install the hanger box to allow it to rotate a full 360 degrees without encountering any obstruction.
- C. Isolating Pipe Anchors:
1. Weld anchor base to support steel or bolt base plate to structure. Weld or bolt pipe clamp or bracket to anchor.

### 3.5 EQUIPMENT ISOLATION

- A. Air Handling Units:
1. Units that are furnished with internal structural frames and external lugs (both of suitable strength and rigidity), or without any severe overhangs, do not require an additional structural frame installed beneath the unit.
  2. Support condensate drain pipes from the isolated air handling unit frame.
  3. Slab-on-Grade: Housekeeping pad base, Type SPNM isolation with 1 inch static deflection.
  4. Suspended: Type SPNH isolation with 2 inch static deflection.
  5. Roof-mounted:
    - a. Provide steel dunnage base for units without internal isolation, Type CSNM isolation with 2 inch static deflection.
    - b. Provide steel dunnage base for units with internal isolation, Type DDNM isolation.
- B. VAV Terminal Units:
1. Fan-Powered: Flexible duct connectors with Type SPNH isolation with 1 inch static deflection.
  2. All other Types: Flexible duct connectors.
- C. Centrifugal or Scroll Chillers:
1. Slab-on-Grade: Housekeeping pad base, Type WP isolation continuous along support.
- D. Cooling Towers:
1. Slab-on-Grade: Structural steel rails, Type WP isolation continuous along support.
- E. Boilers:
1. All Applications: Housekeeping pad base, Type WP isolation continuous along support.
- F. Inline Pumps:
1. Pump supported in-line with piping: Provide vibration isolators on the piping per the article "Pipe Isolation" below.
  2. Pump supported independent of piping:
    - a. Provide flexible connectors on each side of pump. The vertical load shall be carried by the supports, not by the flexible couplings.
    - b. Floor Mounted, Slab-on-Grade: Provide housekeeping pad with Type WP or Type DP, type as required to support weight of pump and components, isolation continuous along support.
    - c. Floor Mounted, Suspended Slab:
      - 1) 5 hp and smaller: Housekeeping pad with Type WP isolation continuous under support.
      - 2) Greater than 5 hp: Housekeeping pad under Type CIB base, Type SPNM isolation with 0.75 inch static deflection.
    - d. Suspended: Type SPNH isolation with 2 inch static deflection.

- G. Fans
  - 1. Suspended:
    - a. Fans 1 hp and less: Type NR isolation with 0.15 inch static deflection.
    - b. Fans greater than 1 hp: Type SPNH isolation with 2 inch static deflection.
  - 2. Roof-mounted:
    - a. Curb mounting: Type RES curb base, with closed cell sponge gasket for sealing, continuous along support sealed to curb top rail.
    - b. Rail mounting:
      - 1) Fans 10 hp and less: Type RES rail base, Type DDNM with 0.75 inch static deflection.
      - 2) Fans greater than 10 hp: Type RES rail base, Type SPNM with 2 inch static deflection.
- H. Unit Heaters: Type SPNH isolation with 2 inch static deflection.
- I. All other equipment not specifically identified in this specification that contains rotating or vibrating elements and any associated electrical apparatus installed by this division that contains transformers or inductors shall be installed on Type DDNM or RNM neoprene isolators as appropriate.

### 3.6 PIPING ISOLATION

- A. Provide isolation supports on the following HVAC pipe:
  - 1. Piping within 50 feet of the following connected rotating equipment. Provide Type SPNH or SPNM isolators. The first three isolators both upstream and downstream of equipment shall have a static deflection equal to that of the equipment isolators, up to a maximum of 2 inches. The static deflection of the remaining pipe isolators shall be 0.75 inch.
    - a. Chillers.
    - b. Pumps with motors greater than 5 hp.
    - c. Base mounted air handling units with fan motors greater than 5 hp and no internal isolation.
  - 2. Piping within 20 feet of the following suspended equipment: Provide Type SPNH isolators. The first isolator both upstream and downstream of equipment on springs shall have a static deflection equal to that of the equipment isolators, up to a maximum of 2 inches. The static deflection of the remaining pipe isolators shall be 0.75 inch.
    - a. Pipes connected without flexible connectors to suspended equipment that is installed with spring vibration isolators.
    - b. Pipes connected without flexible connectors to suspended in-line pumps.
  - 3. Piping installed below or adjacent to noise sensitive areas:
    - a. Refer to Section "Common Work Results for HVAC" for definition of noise sensitive areas.
    - b. Isolate all piping larger than 2 inch from the structure with spring and rubber type SPNH or SPNM isolators with 0.75 inch deflection.
    - c. Isolate all 2 inch and smaller HVAC piping from the structure with sponge neoprene, felt, or glass/mineral fiber sleeves between the pipe and pipe clamp or with Type WP pads between the clamp and the structure. The sleeve shall be not less than 1/8-inch in thickness when compressed.
- B. Provide flexible connectors for piping system connections on equipment side of shutoff valves for the following:
  - 1. Pumps except suspended in-line pumps supported by the piping.
  - 2. Mechanical equipment supported or suspended by spring isolators.
  - 3. Where indicated on Drawings.
- C. Provide resilient diagonal mountings or other approved devices as required to limit piping motion due to equipment startup or shut down to a maximum of 1/8 inch.

- D. Where supplementary steel is required to support pipes, size the supplementary steel so that maximum deflection between supports does not exceed 0.08 inches. Isolate the supplementary steel from building structure using the same isolator required for the pipe. Rigidly suspend or support the pipe from the supplementary steel.
- E. Provide pre-compressed hanger rod isolators for all pipes greater than 12 inch diameter and all supplementary steel supports used for the large pipe. Factory set the pre-compression at 75 percent of rated deflection.
- F. Where isolated pipe 8 inch and larger is supported from exposed steel beams, use welded channel beam attachments located directly under the web of the beam. For piping 6 inch and smaller, beam clamps may be used in lieu of welding, subject to approval of beam clamp selection.
- G. Vertical Piping Riser Supports:
  - 1. Do not exceed pipe stresses allowed by ASME B31.9.
  - 2. Provide multiple supports along riser so that each isolator support is loaded for 50 psi maximum. Provide tapped hole in top of support for rigid attachment of pipe riser clamp to support.
  - 3. Riser Supports: Pipe clamp on top of Type DP or Type WP.
  - 4. Risers Subject to Thermal Expansion:
    - a. Support vertical pipe risers subjected to thermal expansion and/or contraction with spring isolators, anchors, and guides designed to ensure loading within design limits at support points. Perform design calculations for sizing the riser supports incorporating the initial load, initial deflection, change in deflection, final load and change in load at support locations. Design calculations must include anchor loads when installed, cold filled and at operating temperature and pipe stress at end connections and branch locations. Design system for an initial spring deflection of at least 4 times the thermal movement. Design must be stamped and signed by a licensed professional engineer.
    - b. Spring Isolators: Type SPNH, DDNH, or PRSA.
    - c. Anchors: Type PRA.
    - d. Guides: Type PRG.
    - e. Reference Section "Expansion Fittings and Loops for HVAC Piping" for expansion joints.

### 3.7 DUCT ISOLATION

- A. Connect ducts to equipment, fans, fan casings, and fan plenums with flexible connectors.
- B. Support grease exhaust ducts with Type SPNH and/or SPNM isolators as appropriate. Install neoprene riser guides if lateral restraint is required in shafts.

### 3.8 FIELD QUALITY CONTROL

- A. Arrange for inspection of all isolation and noise control equipment by the vibration isolation vendor and submit post-installation inspection report.
- B. The installation of all vibration isolation systems shall be under the supervision of the manufacturer's representative.
- C. Guarantee: If, in the actual installation, any equipment fails to meet the vibration control requirements specified herein, that equipment shall be corrected or replaced without claim for additional payment, inclusive of all labor and material costs. Such corrective measures shall be done within a time schedule specified by the Owner.

END OF SECTION

**SECTION 23 05 53 - IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Nameplates.
- B. Tags.
- C. Adhesive-backed duct markers.
- D. Stencils.
- E. Pipe markers.
- F. Ceiling tacks.
- G. Engraved plastic-laminate signs.

**1.2 SUBMITTALS**

- A. Custom Signage: Submit list of wording, symbols, letter size, and color coding for mechanical identification.
- B. Valve Tag Schedule: Submit 8-1/2 x 11 inch typewritten valve schedule. Furnish one extra copy for each maintenance manual. Include the following information in the schedule:
  - 1. Valve tag number.
  - 2. Piping system and system abbreviation as shown on tag.
  - 3. Location of valve (room or space).
  - 4. Variations for identification (if any).
  - 5. Function. Specially mark valves which are intended for emergency shut-off and similar special uses in margin of schedule.
  - 6. Valve manufacturer's name and model number.
- C. Product Data: Submit manufacturer's technical product data for each product required.
- D. Manufacturer's Installation Instructions: Indicate special procedures and installation for each product required.

**1.3 SPARE PARTS**

- A. Furnish minimum of 5 percent extra stock of each mechanical identification material required for each system that uses the identification material.
- B. Furnish not less than 3 additional numbered valve tags for each piping system.
- C. Where stenciled markers are provided, clean and retain stencils after completion of stenciling and include used stencils in extra stock along with stenciling paints and applicators.

**PART 2 - PRODUCTS AND MATERIALS****2.1 ACCEPTABLE MANUFACTURERS**

- A. Advanced Graphic Engraving, LLC.
- B. Brady Corporation.
- C. Brimar Industries, Inc.

- D. Craftmark.
- E. Industrial Safety Supply Co., Inc.
- F. Kolbi Pipe Marker Co.
- G. MIFAB, Inc.
- H. Seton Identification Products, a Tricor Direct Company..

## 2.2 IDENTIFICATION APPLICATIONS AND REQUIREMENTS

- A. General:
  - 1. Provide manufacturer's standard products of categories and types required for each application as referenced in other Division 23 sections. Where more than a single type is specified for application, selection is the installer's option, but provide single selection for each product category.
  - 2. Lettering: Coordinate names, abbreviations, and other designations used in mechanical identification work with the corresponding designations shown on the drawings, scheduled, and specified. If not otherwise indicated, provide numbering, lettering, and wording as recommended by the manufacturer or as required for proper identification, operation, and maintenance of mechanical systems and equipment.
  - 3. Where multiple systems of same generic name are shown and specified, provide identification which indicates individual system number as well as service (e.g., Boiler No. 3, Air Supply No. 1H, etc.).
- B. Air Handling Units: Nameplates, stencils, or engraved plastic laminate signs.
- C. Air Terminal Units: Tags, stencils, or engraved plastic laminate signs.
- D. Automatic Controls: Tags, use the same naming convention coordinated with the building automation system.
- E. Control Panels: Nameplates.
- F. Dampers: Ceiling tacks where located above lay-in ceiling. Do not use ceiling tacks in a gyp ceiling.
- G. Ductwork: Adhesive-backed duct markers. Stencils are only acceptable for concealed ductwork, exterior ductwork, or in mechanical rooms.
- H. Fans: Nameplates, stencils, or engraved plastic laminate signs.
- I. Heat Transfer Equipment: Nameplates, stencils, or engraved plastic laminate signs.
- J. Humidifiers: Nameplates or engraved plastic laminate signs.
- K. Instrumentation: Tags.
- L. Major Control Components including Variable Frequency Drives: Nameplates or engraved plastic laminate signs.
- M. Piping: Pipe Markers.
- N. Pumps: Nameplates or engraved plastic laminate signs.
- O. Relays: Tags.
- P. Small-sized Equipment: Tags.
- Q. Tanks: Nameplates or engraved plastic laminate signs.
- R. Thermostats: Nameplates.
- S. Valves: Tags. Ceiling tacks are acceptable where located above a lay-in ceiling. Do not use ceiling tacks in a gyp ceiling.

- T. Water Treatment Devices: Nameplates or engraved plastic laminate signs.
- U. General Signs: Engraved plastic laminate signs.

### 2.3 NAMEPLATES

- A. Nomenclature: Include the following, matching terminology on schedules as closely as possible:
  - 1. Name and mark number.
  - 2. Equipment service.
  - 3. Design capacity.
  - 4. Other design parameters such as pressure drop, entering and leaving conditions, rpm, etc.
- B. Size: 2-1/2 inch x 4 inch for control panels and components, 4-1/2 inch x 6 inch for equipment.
- C. Letter Color: White.
- D. Letter Height: 1/4 inch.
- E. Background Color:
  - 1. Cooling equipment: Green.
  - 2. Heating equipment: Yellow.
  - 3. Combination cooling and heating equipment: Yellow/Green.
  - 4. Energy reclamation equipment: Brown.
  - 5. Hazardous equipment: Colors and designs recommended by ASME.
  - 6. Equipment and components that do not meet any of the above criteria: Blue.
- F. Plastic: Conform to ASTM D709.

### 2.4 TAGS

- A. Plastic Laminate Tags: Laminated three-layer plastic, minimum 3/32 inch thick, with engraved black letters on light contrasting background color. Tag size minimum 1-1/2 inch diameter and 5/32 inch hole for fastener.
- B. Solid Plastic Tags: Solid plastic, minimum 3/32 inch thick, with printed black letters on white color. Tag size minimum 1-1/2 inch diameter and 5/32 inch hole for fastener.
- C. Metal Tags: Provide 19-gauge polished brass with stamped letters. Tag size minimum 1-1/2 inch diameter with smooth edges and 5/32 inch hole for fastener. Fill tag engraving with black enamel paint.
- D. Accident Prevention Tags: Pre-printed or partially pre-printed, of plasticized card stock with matte finish suitable for writing, minimum 3-1/4 inch x 5-5/8 inch size, with brass grommet in hole for fastener. Order with appropriate pre-printed wording (e.g., DANGER, CAUTION, DO NOT OPERATE, etc.).
- E. Tag Fasteners: Solid brass chain (wire link or beaded type), or solid brass S-hooks of the size required for proper attachment of tags to valves, manufactured specifically for that purpose.
- F. Valve Tag Chart: Typewritten letter size list in anodized aluminum or finished hardwood frame, covered with SSB-grade sheet glass. Provide frame and mounting screws for removable mounting.
- G. Letter Height:
  - 1. System Abbreviation: Minimum 1/4 inch.
  - 2. Valve Number: Minimum 1/2 inch.

### 2.5 ADHESIVE-BACKED DUCT MARKERS

- A. Material: High gloss acrylic adhesive-backed vinyl film 0.0032 inch; printed with UV and chemical resistant inks.

- B. Style: Individual label.
- C. Nomenclature: Include air handling unit identification number, duct size, service, and arrows indicating direction of flow.
- D. Specialty Exhaust: Identify the specialty using the system terminology (e.g., Grease, Dishwasher, Dryer, Fume Hood, etc.).
- E. Color: Yellow background with black lettering or blue background with white lettering.
  - 1. Hazardous Exhaust: Use colors and designs recommended by ASME A13.1.

## 2.6 STENCILS

- A. Stencils: With clean cut symbols and letters of following size, complying with ASME A13.1:
  - 1. 3/4 to 1-1/4 inch Outside Diameter of Insulation or Pipe: 8 inch long color field, 1/2 inch high letters.
  - 2. 1-1/2 to 2 inch Outside Diameter of Insulation or Pipe: 8 inch long color field, 3/4 inch high letters.
  - 3. 2-1/2 to 6 inch Outside Diameter of Insulation or Pipe: 12 inch long color field, 1-1/4 inch high letters.
  - 4. 8 to 10 inch Outside Diameter of Insulation or Pipe: 24 inch long color field, 2-1/2 inch high letters.
  - 5. Over 10 inch Outside Diameter of Insulation or Pipe: 32 inch long color field, 3-1/2 inch high letters.
  - 6. Ductwork and Equipment: 2-1/2 inch high letters.
  - 7. Access Doors: 3/4 inch high letters.
  - 8. Operational Instructions: 3/4 inch high letters.
  - 9. Provide arrows indicating direction of flow.
- B. Stencil Paint: Oil based, alkyd enamel, either brushing grade or pressurized spray-can form and grade, black color, except for piping. For piping systems use colors conforming to ASME A13.1.

## 2.7 PIPE MARKERS

- A. Semi-rigid Plastic Pipe Markers: Factory fabricated, flexible, semi-rigid plastic, preformed to fit around pipe or pipe covering; minimum information indicating flow direction arrow and identification of fluid being conveyed.
- B. Plastic Tape Pipe Markers: Flexible, vinyl film tape with pressure sensitive adhesive backing and printed markings, minimum 3 mil thick.
  - 1. Width: 1-1/2 inch for pipes less than 6 inches (including insulation), 2-1/2 inch for pipes 6 inches and larger (including insulation).
- C. Pipe Marker with Insulation: 1 inch thick molded fiberglass insulation with jacket for each plastic pipe marker to be installed on uninsulated pipes subjected to fluid temperatures of 125 degrees F or greater. Insulation shall extend 2 inches beyond each end of plastic pipe marker.
- D. Underground Plastic Pipe Markers: Bright colored continuously printed plastic ribbon tape, minimum 6 inches wide by 4 mil thick, manufactured for direct burial service.
  - 1. Detection: Provide multi-ply tape consisting of solid aluminum foil core between two layers of plastic ribbon tape.
- E. Nomenclature: Manufacturer's standard pre-printed nomenclature which best describes piping system. Differentiate between supply and return. In the case of a variance, provide nomenclature as selected by the Engineer.
- F. Arrows: Provide pipe markers with integral arrows indicating direction of flow or as a separate unit of plastic.
- G. Color:

1. Conform to ASME A13.1.
2. Heating, Cooling, and Boiler Feedwater: Green with white letters.
3. Toxic and Corrosive Fluids: Orange with black letters.
4. Compressed Air: Blue with white letters.

H. Letter Height: Minimum 1/2 inch for pipes up to 3 inch, minimum 1 inch for larger pipes.

## 2.8 CEILING TACKS

- A. Description: Steel with 3/4 inch diameter color coded head.
- B. Color:
  1. HVAC Equipment: Yellow.
  2. Fire Dampers and Smoke Dampers: Red.
  3. Heating/Cooling Valves: Blue.

## 2.9 ENGRAVED PLASTIC-LAMINATE SIGNS

- A. General: Engraving stock melamine plastic laminate, engraved with manufacturer's standard letter style, black with white core letter color except as otherwise indicated, punched for mechanical fastening except where adhesive mounting is necessary because of substrate.
- B. Thickness: 1/16 inch thick for units up to 20 square inches, or 8 inches in length; 1/8 inch thick for larger units.
- C. Fasteners: Self-tapping stainless steel screws, except contact-type permanent adhesive where screws cannot or should not penetrate the substrate.
- D. Nomenclature: When used to identify equipment, match terminology on schedules, including the following:
  1. Name and mark number.
  2. Equipment service.
  3. Design capacity.
- E. Access Panel Markers: Laminated three-layer plastic, minimum 1/16 inch thick and 1/8 inch hole for fastener, with abbreviations and numbers corresponding to concealed valve.

## PART 3 - EXECUTION

### 3.1 PREPARATION

- A. Degrease and clean surfaces to receive adhesive for identification materials.
- B. Prepare surfaces in accordance with Division 09 for stencil painting.

### 3.2 GENERAL INSTALLATION

- A. Coordination: Where identification is to be applied to surfaces which require insulation, painting or other covering or finish, including valve tags in finished mechanical spaces, install identification after completion of covering and painting. Install identification prior to installation of acoustical ceilings and similar removable concealment.
- B. Install products in accordance with manufacturer's instructions.
- C. Install nameplates with corrosive-resistant mechanical fasteners, or adhesive. Apply with sufficient adhesive to ensure permanent adhesion and seal with clear lacquer.
- D. Install tags on piping 3/4 inch diameter and smaller.
- E. Install in clear view and align with axis of piping.

- F. Apply stencil painting in accordance with Division 09.
- G. Identify service, flow direction, and pressure.

### 3.3 PIPING IDENTIFICATION

- A. General: Install identification on the most obviously visible portion of the pipe from the point of access.
- B. Install plastic tape pipe markers complete around pipe in accordance with manufacturer's instructions.
- C. Install underground plastic pipe markers 6 to 8 inches below finished grade, directly above buried pipe during back-filling/top-soiling of each underground piping system. Where multiple pipes are buried in common trench and do not exceed overall width of 16 inches, install single pipe marker. For tile fields and similar artificial field installations, mark only edge pipe lines of field.
- D. Pipes less than 6 inches diameter (including insulation): Provide full-band pipe markers with 360 degree coverage.
- E. Pipes 6 inches diameter and larger (including insulation): Provide either full-band or strip-type pipe markers.
- F. Location: Install piping identification where piping is exposed to view, concealed by a removable ceiling system, located in accessible maintenance spaces (shafts, tunnels, plenums, etc.) and exterior non-concealed locations as follows:
  - 1. Within 5 feet of each valve, tee, and control device.
  - 2. Within 5 feet of each branch, excluding branches less than 25 feet in length to fixtures or terminal heating and cooling units.
  - 3. Within 5 feet of each side of a penetration of a wall, floor, ceiling, structure, or enclosure.
  - 4. At access doors, manholes and similar access points which permit view of concealed piping.
  - 5. Within 5 feet of equipment outlets and other points of origination and termination.
  - 6. Spaced intermediately at a maximum spacing of 50 feet along each riser and run. Reduce spacing to 25 feet in congested areas where there are more than two piping systems or pieces of equipment.

### 3.4 VALVE IDENTIFICATION

- A. Provide a tag on each valve, cock, and control device. Exclude check valves, valves within factory-fabricated equipment, HVAC terminal devices, and similar rough-in connections of end-use fixtures and units.
- B. Mount valve tag chart and schedule frame in mechanical room, or where indicated on plans. If not indicated, mount where directed by Engineer. Where more than one mechanical room is included on the project, mount framed copies of valve tag chart and schedule in each mechanical room.

### 3.5 DUCTWORK IDENTIFICATION

- A. Install identification on the most obviously visible portion of the duct from the point of access.
- B. Location: Install ductwork identification where ductwork is exposed to view, concealed by a removable ceiling system, located in accessible maintenance spaces (shafts, tunnels, plenums, etc), and exterior non-concealed locations as follows:
  - 1. Within 5 feet of each control damper or balancing damper, excluding balancing dampers installed in duct take-offs to individual grilles, registers, or diffusers that are less than 25 feet in lengths and installed in the same space as the air device.

2. Within 5 feet of each branch duct, excluding branch ducts that are less than 25 feet in length and located in the same space as the main duct.
3. Within 5 feet of each side of a penetration of a wall, floor, ceiling, structure, or enclosure.
4. Spaced intermittently at a maximum spacing of 50 feet along each duct run. Reduce spacing to 25 feet in congested areas when there are more than two types of duct systems or pieces of equipment.
5. Within 5 feet of equipment outlets and other points of origin or termination.
6. Install marker on the most obviously visible portion of the duct from point of access.

### **3.6 ACCESS DOOR IDENTIFICATION**

- A. Provide identification on each access door, indicating purpose of access, maintenance and operating instructions, and appropriate safety and procedural information.
- B. Where access doors are concealed above a removeable ceiling system or similar concealment, tags may be used in lieu of specified identification.

### **3.7 CEILING TACK INSTALLATION**

- A. Locate ceiling tacks to locate valves or dampers above lay-in panel ceilings. Locate in corner of panel closest to equipment.

### **3.8 EQUIPMENT IDENTIFICATION**

- A. Install nameplates and engraved plastic laminate signs for identification of equipment. Provide additional signs and lettering as follows:
  1. To distinguish between multiple units in close proximity.
  2. To inform operator of operational requirements.
  3. To indicate safety and emergency precautions.
  4. To warn of hazards and improper operations.
- B. Adjust lettering size based on viewing distance from normal location of identification:
  1. Less than 2 feet: Minimum 1/4 inch.
  2. Up to 6 feet: Minimum 1/2 inch.
  3. Greater than 6 feet: Proportionally increase letter size based on recommendations above.
  4. Provide secondary lettering 2/3 to 3/4 of size of principal lettering.
  5. Stencils may be used in lieu of nameplates when lettering greater than 1 inch is needed for proper identification because of distance from normal location of required identification.
- C. Where equipment to be identified is concealed above acoustical ceilings or similar removeable concealment, equipment tags may be installed in the concealed space to reduce the amount of text in exposed sign.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 05 93 - TESTING ADJUSTING AND BALANCING FOR HVAC****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. General testing, adjustment, and balancing requirements.
- B. Testing, adjustment, and balancing of air systems.
- C. Testing, adjustment, and balancing of hydronic systems.
- D. Testing, adjustment, and balancing of domestic water systems.
- E. Testing, adjustment, and balancing of specialty systems:
  - 1. Smoke control systems.
- F. Sound and vibration measurement of equipment operating conditions.
- G. This section excludes:
  - 1. Testing boilers and pressure vessels for compliance with safety codes;
  - 2. Specifications for materials for patching mechanical systems;
  - 3. Specifications for materials and installation of adjusting and balancing devices. If devices must be added to achieve proper adjusting and balancing, refer to the respective system sections for materials and installation requirements.
  - 4. Requirements and procedures for piping and ductwork systems leakage tests.

**1.2 DEFINITIONS**

- A. TAB: Testing, adjusting, and balancing.
- B. Test: To determine quantitative performance of equipment.
- C. Adjust: To regulate the specified fluid flow rate and air patterns at the terminal equipment (e.g., reduce fan speed, throttling).
- D. Balance: To proportion flows within the distribution system (submains, branches, and terminals) according to specified design quantities.
- E. Procedure: Standardized approach and execution of sequence of work operations to yield reproducible results.
- F. Report forms: Data sheets arranged for collecting test data in logical order for submission and review. Data should also form the permanent record to be used as the basis for required future testing, adjusting, and balancing.
- G. Terminal: The point where the controlled fluid enters or leaves the distribution system. Examples include inlets and outlets on water terminals, inlets and outlets from air terminal units, and inlets and outlets on air terminals such as registers, grilles, diffusers, louvers, and hoods.
- H. Main: Duct or pipe containing the major or entire fluid flow of the system.
- I. Submain: Duct or pipe containing part of the system capacity and serving two or more branch mains.
- J. Branch main: Duct or pipe serving two or more terminals.
- K. Branch: Duct or pipe serving a single terminal.

**1.3 SUBMITTALS**

- A. Qualifications:

1. Submit qualifications of TAB agency.
  2. Submit qualifications of TAB supervisor.
  3. Submit qualifications of the smoke control system inspector.
- B. TAB Plan: Submit a written plan indicating the testing, adjusting, and balancing standard to be followed and the specific approach for each system and component.
- C. Sample Forms: Submit sample forms if they are other than the standard forms available from the certification association followed for the project.
- D. Control System Coordination Reports: Communicate in writing to the controls installer all setpoint and parameter changes made or problems and discrepancies identified during TAB that affect, or could affect, the control system setup and operation.
- E. Progress Reports.
- F. Certified TAB Reports:
1. General:
    - a. Submit within two weeks after completion of testing, adjusting, and balancing.
    - b. Revise TAB plan to reflect actual procedures and submit as part of final report.
    - c. Indicate deficiencies in systems that would prevent proper testing, adjusting, and balancing of systems and equipment to achieve specified performance.
  2. Draft Report: Submit draft copies of report for review prior to final acceptance of Project. Draft reports may be hand written, but must be complete, factual, accurate, and legible. Organize and format draft reports in the same manner specified for the final reports. Submit 2 complete sets of draft reports. Only 1 complete set of draft reports will be returned.
  3. Final Report: Upon verification and approval of draft reports, prepare final reports, type written, and organized and formatted as specified below. Submit 2 complete sets of final reports. The final report shall be certified proof of the following:
    - a. The systems have been tested, adjusted, and balanced in accordance with the referenced standards.
    - b. The report reflects an accurate representation of how the systems have been installed.
    - c. The report reflects a true representation of how the systems are operating at the completion of the testing, adjusting, and balancing procedures.
    - d. The report is an accurate record of all final quantities measured to establish normal operating values of the systems.
  4. Report Format: Provide reports in soft cover, letter size, 3-ring binder manuals, complete with index page and indexing tabs, and cover identification at front and side. Include set of reduced size drawings indicating air outlets, equipment, and thermostat locations identified to correspond with report forms. Divide the report into the following divisions:
    - a. General Information and Summary
      - 1) Include project name, location, altitude, and date.
      - 2) Identify TAB agency, contractor, owner, architect, and engineer.
      - 3) Include addresses, contact names, and telephone numbers.
      - 4) Include certification sheet containing the seal, name, address, telephone number, and signature of the certified TAB Supervisor.
      - 5) Include actual instrument list, with manufacturer name, serial number, and date of calibration.
    - b. Air Systems
    - c. Hydronic Systems
    - d. Temperature Control Systems
    - e. Special Systems
    - f. Sound and Vibration Systems
  5. Report Forms: Standard forms prepared by the TAB certification standard being followed for each respective item and system to be tested, adjusted, and balanced. If not specified, follow ASHRAE 111.

6. Units of Measure: Report data in I-P (inch-pound) units only.
- G. Smoke Control System Test Report: A complete report of the testing and verification of the smoke control system shall be prepared by the special inspector or special inspection agency and submitted for approval. A copy of the final, approved report shall be submitted to the local fire code official and Owner.
- H. Project Record Documents: Provide drawings that record actual locations of flow measuring stations and balancing devices.

#### 1.4 QUALITY ASSURANCE

- A. Comply with ASHRAE Standard 111, Practices for Measurement, Testing, Adjusting, and Balancing of Building Heating, Ventilation, Air-Conditioning, and Refrigeration Systems.
- B. Comply with ASHRAE Handbook, HVAC Applications Volume, Chapter "Testing, Adjusting, and Balancing", most current edition.
- C. TAB Agency Qualifications:
  1. Act as the single source of responsibility for TAB of the HVAC systems.
  2. Staff the project at all times by qualified personnel.
  3. Have a minimum of 5 years documented experience on projects with TAB requirements similar to those required for the project.
  4. Certified by one of the following Certification Associations:
    - a. NEBB: National Environmental Balancing Bureau, Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems.
- D. TAB Supervisor and Technician Qualifications:
  1. Certified by the same organization as TAB agency.
  2. TAB Supervisor shall be a professional engineer licensed in the state in which the project is located.
- E. Smoke Control System Inspector Qualifications: A special inspector or agency with expertise in fire protection engineering, mechanical engineering and has a certification from an acceptable Certification Association.

## PART 2 - PRODUCTS AND MATERIALS – NOT USED

## PART 3 - EXECUTION

### 3.1 GENERAL REQUIREMENTS

- A. Begin work after systems to be tested, adjusted, or balanced are fully operational, duct systems are sealed, piping systems have been tested for leaks, and equipment is operational. Complete work prior to Substantial Completion of the project.
- B. Test, adjust, and balance the air systems before hydronic, steam, and refrigerant systems.
- C. Test, adjust and balance air conditioning systems during summer season and heating systems during winter season, including at least a period of operation at outside conditions within 5 deg. F wet bulb temperature of maximum summer design condition, and within 10 deg. F dry bulb temperature of minimum winter design condition. Take final temperature readings during seasonal operation.
- D. Coordinate with Division 22 drawings for testing, adjusting, and balancing scope of work.
- E. Coordinate the efforts of factory-authorized service representatives for systems and equipment, HVAC controls installers, and other mechanics to operate HVAC systems and equipment to support and assist TAB activities.

- F. Submit progress reports at least once a week to the General Contractor to communicate status of work so that the TAB work is completed in a timely manner.
- G. Notice of Tests: Provide seven days advance notice for each test. Include scheduled test dates and times.
- H. Where HVAC systems and/or components interface with life safety systems, including fire and smoke detection, alarm, and control, coordinate scheduling and testing and inspection procedures with the authorities having jurisdiction.
- I. Coordinate schedule for testing of smoke control systems with the local fire code official for on-site observance of testing procedures.
- J. All required instrumentation shall be calibrated to tolerances specified in the referenced standards within a period of six months prior to starting the project.

### 3.2 EXAMINATION

- A. Verify that systems are complete and operable before commencing work. Ensure the following conditions:
  - 1. Systems are started and operating in a safe and normal condition.
  - 2. Temperature control systems are installed complete and operable.
  - 3. Proper thermal overload protection is in place for electrical equipment.
  - 4. Motors and bearings are lubricated.
  - 5. Final filters are clean and in place. If required, install temporary media in addition to final filters.
  - 6. Duct systems are clean of debris.
  - 7. Fans are rotating correctly and belts have tension.
  - 8. Fire, smoke, fire/smoke, and volume dampers are in place and open.
  - 9. Air coil fins are cleaned and combed.
  - 10. Volume dampers are installed at locations needed for balancing the air systems.
  - 11. Access doors are closed and duct end caps are in place.
  - 12. Air outlets are installed and connected.
  - 13. Visually inspect duct systems to ensure they are sealed and leakage is minimized.
  - 14. Hydronic systems are flushed, filled, and vented.
  - 15. Hydronic systems are tested for leaks.
  - 16. Test ports, gauge cocks, thermometer wells, flow-control devices, and balancing valves are properly installed and that their location is accessible.
  - 17. Pumps are rotating correctly.
  - 18. Proper strainer baskets are clean and in place.
  - 19. Service and balance valves are open.
  - 20. Expansion tanks are not air bound and have appropriate charge.
  - 21. Air vents are operating freely.
- B. Submit field reports. Report defects and deficiencies that will or could prevent proper system balance.
- C. Beginning of work means acceptance of existing conditions.

### 3.3 PREPARATION

- A. Pre-Balancing Conference: Prior to beginning of the testing, adjusting, and balancing procedures, schedule and conduct a coordination meeting with all installers whose work will be tested, adjusted, or balanced.
- B. Furnish all instruments required for testing, adjusting, and balancing operations.
  - 1. Verify all instruments have been calibrated.
  - 2. Furnish instruments as recommended by the manufacturer for the TAB application.
  - 3. Furnish instruments that are best suited to the function being measured.

4. Furnish instruments with minimum scale and maximum subdivisions and with scale ranges proper for the value being measured.
- C. Furnish additional balancing devices as required for TAB to the appropriate contractor for installation.
- D. Obtain copies of approved shop drawings of air handling equipment, terminal outlets, and temperature control diagrams.
- E. Obtain manufacturer's fan and terminal device outlet factors and recommended procedures for testing. Prepare a summation of required outlet volumes to permit a crosscheck with required fan volumes.
- F. Determine best locations in main and branch ductwork for most accurate duct traverses.
- G. Prepare schematic diagrams of system "as-built" ductwork and piping layouts to facilitate reporting.

### 3.4 ADJUSTMENT TOLERANCES

- A. Air Handling Systems: Balance main ducts and equipment to within plus or minus 5 percent of design airflow.
- B. Air Outlets and Inlets: Balance branch ducts and terminal devices to within plus or minus 10 percent of design airflow.
- C. Hydronic Systems: Balance to within plus or minus 5 percent of design flow.

### 3.5 RECORDING AND ADJUSTING

- A. Record data regarding design conditions from contract documents and installed conditions from shop drawings including equipment identification number, model number, location, area served, manufacturer, model number, serial number, motor nameplate horsepower and rpm, fan rpm, capacity and electrical voltage, amps and phases.
- B. For all systems measure and record the ambient conditions at the time of testing and balancing. Include the following:
  1. Dry bulb temperature.
  2. Relative humidity.
  3. Cloud cover.
  4. Wind speed.
  5. Time.
- C. Field Logs: Maintain written logs including:
  1. Running log of events and issues.
  2. Discrepancies, deficient or uncompleted work by others.
  3. Contract interpretation requests.
  4. Lists of completed tests.
- D. Ensure recorded data represents actual measured or observed conditions.
- E. Permanently mark settings of valves, dampers, and other adjustment devices allowing settings to be restored. Set and lock memory stops.
- F. Mark on drawings the locations where traverse and other critical measurements were taken and cross reference the location in the final report.
- G. After adjustment, take measurements to verify balance has not been disrupted or that such disruption has been rectified.
- H. Cut insulation around ductwork and piping for installation of test probes to the minimum extent necessary to allow adequate performance of procedures.

- I. Patch and seal insulation, vapor barrier, ductwork, and housings, using materials identical to those removed.
- J. Seal ducts and piping and test and repair leaks.
- K. Leave systems in proper working order, replacing belt guards, closing access doors, closing doors to electrical switch boxes, and restoring thermostats to specified settings.
- L. At final inspection, recheck random selections of data recorded in report. Recheck points or areas as selected and witnessed by the Owner.
- M. Check and adjust systems approximately six months after final acceptance and submit report.
- N. When averaging values, take a sufficient quantity of readings which will result in a repeatability error of less than 5 percent. When measuring a single point, repeat readings until 2 consecutive values are obtained.
- O. Take all readings at eye level of the indicated value to prevent parallax.
- P. Use pulsation dampeners where necessary to eliminate error involved in estimating average of rapidly fluctuation readings.
- Q. Take measurements in the system where best suited for the task.
- R. Retest, adjust, and balance systems subsequent to significant system modifications, and resubmit test results.

### **3.6 AIR SYSTEM TESTING AD USTMENT AND BALANCING PROCEDURE**

- A. Check filters for cleanliness.
- B. Check dampers (both volume and fire) for correct and locked position, and temperature control for completeness of installation before starting fans.
- C. Verify volume dampers are installed at locations needed for balancing the air systems.
- D. Prepare report test sheets for both fans and outlets. Obtain manufacturer's outlet factors and recommended procedures for testing. Prepare a summation of required outlet volumes to permit a crosscheck with required fan volumes.
- E. Determine best locations in main and branch ductwork for most accurate duct traverses.
- F. Place outlet dampers in the full open position.
- G. Prepare schematic diagrams of system "as-built" ductwork and piping layouts to facilitate reporting.
- H. Lubricate all motors and bearings.
- I. Check fan belt tension.
- J. Check fan rotation.
- K. Energize fan motors and adjust air handling and distribution systems to provide required or design supply, return, and exhaust air quantities at site altitude. Replace fan and motor pulleys as required to achieve design conditions.
- L. Make air quantity measurements in ducts by Pitot tube traverse of entire cross sectional area of duct.
- M. Measure air quantities at air inlets and outlets.
- N. Adjust distribution system to obtain uniform space temperatures free from objectionable drafts and noise.

- O. Use volume control devices to regulate air quantities only to extent that adjustments do not create objectionable air motion or sound levels. Affect volume control by duct internal devices such as dampers and splitters.
- P. Vary total system air quantities by adjustment of fan speeds. Provide drive changes required. Vary branch air quantities by damper regulation.
- Q. Provide system schematic with required and actual air quantities recorded at each outlet or inlet.
- R. Measure static air pressure conditions on air supply units, including filter and coil pressure drops, and total pressure across the fan. Make allowances for 50 percent loading of filters.
- S. Adjust outside air automatic dampers, outside air, return air, and exhaust dampers for design conditions.
- T. Measure temperature conditions across outside air, return air, and exhaust dampers to check leakage.
- U. Where modulating dampers are provided, take measurements and balance at design conditions. Balance variable volume systems at design air flow rate and at minimum air flow rate.
- V. Measure building static pressure and adjust supply, return, and exhaust air systems to provide required relationship to maintain building pressure setpoint.
- W. For variable air volume boxes, set volume controller to air flow setting indicated. Confirm connections properly made and confirm proper operation for automatic variable air volume temperature control.
- X. On fan powered VAV boxes, adjust air flow switches for proper operation.
- Y. Procedure for establishing minimum and absolute minimum outdoor air damper position on air handling units:
  - 1. Open the minimum outdoor air damper and return air damper fully. Close the economizer air damper.
  - 2. Operate supply fan at design speed and measure the outdoor airflow.
  - 3. If the outdoor airflow is above the scheduled minimum ventilation airflow, adjust the damper linkage on the minimum outdoor air damper so that outdoor airflow equals the scheduled minimum ventilation airflow with damper fully stroked.
  - 4. If outdoor airflow is below the scheduled minimum ventilation airflow, adjust the damper linkage on the return air damper so that outdoor airflow equals the schedule minimum ventilation airflow with the damper fully stroked.
  - 5. Convey the measured setpoint and/or damper position to the BAS installer and note on air balance report.
  - 6. Repeat this procedure to determine damper position for absolute minimum ventilation.

### **3.7 HYDRONIC SYSTEM TESTING ADJUSTMENT AND BALANCING PROCEDURE**

- A. Open valves to full open position. Close coil bypass valves.
- B. Remove and clean all strainers.
- C. Check pump rotation.
- D. Clean and set automatic fill valves for required system pressure.
- E. Check expansion tanks to determine that they are not air bound and that the system is completely full of water.
- F. Check air vents at high points of systems and determine if all are installed and operating freely (automatic type) or to bleed air completely (manual type).
- G. Set temperature controls so all coils are calling for full flow.
- H. Check operation of automatic bypass valves.

- I. Check and set operating temperatures of chillers to design requirements.
- J. Lubricate all motors and bearings.
- K. Adjust water systems to provide required or design quantities.
- L. Use calibrated Venturi tubes, orifices, or other metered fittings and pressure gages to determine flow rates for system balance. Where flow metering devices are not installed, base flow balance on correlated flow from temperature and pressure gauges across the heat transfer elements in the system.
- M. Adjust systems to provide specified pressure drops and flows through heat transfer elements prior to thermal testing. Perform balancing by measurement of temperature differential in conjunction with air balancing.
- N. Affect system balance with automatic control valves fully open to heat transfer elements.
- O. Affect adjustment of water distribution systems by means of balancing cocks, valves, and fittings. Do not use service or shut-off valves for balancing unless indexed for balance point.
- P. Where available pump capacity is less than total flow requirements or individual system parts, full flow in one part may be simulated by temporary restriction of flow to other parts.
- Q. Balance cooling tower water distribution systems to ensure even water flow to each tower cell.
- R. Test cooling tower systems for capacity, recording pump flow and head, fan airflow, ambient air wet and dry bulb temperatures at tower inlet and outlet and tower inlet and outlet water temperatures.
- S. Record the necessary information for optimizing pump operation as defined on the controls drawings. Give this information to the controls contractor for building automation system programming.

### **3.8 DOMESTIC WATER SYSTEM TESTING ADJUSTMENT AND BALANCING PROCEDURE**

- A. Before balancing the system perform these steps:
  - 1. Open valves to full open position.
  - 2. Examine plumbing system and equipment installations to verify that indicated balancing devices, such as test ports, gauge cocks, thermometer wells, flow-control devices and balancing valves and fittings are properly installed, and that their locations are accessible and appropriate for effective balancing and for efficient system and equipment operation.
  - 3. Remove and clean all strainers.
  - 4. Check pump rotation.
  - 5. Check expansion tanks to determine that they are not air bound and that the system is completely full of water.
  - 6. Lubricate all motors and bearings.

### **3.9 SMOKE CONTROL SYSTEM TESTING ADJUSTMENT AND BALANCING PROCEDURE**

- A. Perform leakage testing of the smoke control ductwork in accordance with Section "Metal Ducts".
- B. Measure and record airflows for each smoke control condition in the supply and exhaust ducts and at each inlet and outlet.
- C. Verify fan operation for correct rotation and measure airflow, pressures, voltage, amperage, rpm and belt tension.
- D. Measure and verify pressure differences across smoke barriers including stairways and elevator shafts for each smoke control condition.

- E. Verify that the smoke control system operates according to the control sequences for each specified condition including verification of override from the fire-fighter's control panel and simulation of standby power conditions.

### **3.10 TESTING FOR SOUND AND VIBRATION**

- A. Test and adjust mechanical systems for sound and vibration in accordance with the detailed instructions of the referenced standards:
  - 1. ASHRAE: ASHRAE Handbook, HVAC Applications Volume, Chapter "Sound and Vibration Control", most current edition.
  - 2. NEBB: "Procedural Standards for the Measurement and Assessment of Sound and Vibration."
- B. Other than sound data, failure of an item includes a deviation of more than 10 percent from setpoint. Failure of more than 10 percent of selected items shall result in rejection of final testing, adjusting, and balancing report.
  - 1. For sound pressure readings, a deviation of 3 dB shall result in rejection of final testing. Variations in background noise must be considered.
- C. Prepare and submit report of recommendations for correcting any sound or vibration levels that are outside of manufacturer's tolerances, ASHRAE standards and/or values specified in the contract documents.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 07 00 - HVAC INSULATION****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Piping Insulation.
- B. External Ductwork Insulation.
- C. Equipment Insulation.

**1.2 RELATED REQUIREMENTS**

- A. Division 23 Section "Hangers & Supports for HVAC Piping & Equipment," for insulation shields, pipe saddles, and high-density insulation inserts.
- B. Division 23 Section "Buried Hydronic Piping," for insulation of piping installed below grade.
- C. Division 23 Section "Metal Ducts" for duct liner insulation.

**1.3 DEFINITIONS**

- A. Cold Pipe: Piping that carries fluid with a minimum operating temperature less than 60 degrees F.
- B. Hot Pipe: Piping that carries fluid with a minimum operating temperature greater than 105 degrees F.
- C. Cold Duct: Ductwork that carries airflow with a minimum operating temperature less than 65 degrees F temperature.
- D. Hot Duct: Ductwork that carries airflow with a minimum operating temperature greater than 75 degrees F temperature.
- E. Neutral Ductwork: Ductwork that carries airflow with temperatures between the defined cold and hot temperatures.
- F. Cold Equipment: Equipment that carries fluids with a minimum operating temperature less than 60 degrees F.
- G. Hot Equipment: Equipment that carries fluids with a minimum operating temperature greater than 105 degrees F.
- H. Exposed: Insulation that is visible from the occupied space.
- I. Exposed to Weather: Insulation that is exposed to potential damage caused by weather, including sunlight, moisture, wind, and solar radiation.
- J. Exterior: Locations outside of or within the building envelope (walls, roof, floors, etc) as defined by the architectural drawings and specifications.
- K. Unconditioned Spaces: An enclosed space within a building that is not provided with mechanical heating or cooling.

**1.4 SUBMITTALS**

- A. Product Data: Submit technical product data, thermal characteristics, and materials for each type of mechanical insulation.

- B. Insulation Schedule: Include product name, conductivity k-value, thickness, and furnished accessories for each service.
- C. Maintenance Data: Submit maintenance data and replacement material lists for each type of mechanical insulation. Include this data and product data in maintenance manual.
- D. Manufacturer's Instructions: Include installation instructions for storage, handling, protection, examination, preparation, and installation of the product.

### 1.5 QUALITY ASSURANCE

- A. Manufacturer Qualification: Company specializing in manufacturing the products specified in this section with not less than three years of documented experience.
- B. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- C. Flame/Smoke Ratings: Provide composite mechanical insulation (insulation, jackets, coverings, sealers, mastics and adhesives) with flame-spread index of 25 or less and smoke-developed index of 50 or less, as tested by UL 723 or ASTM E84 (NFPA 255) method.
  - 1. Exception: Exterior mechanical insulation may have flame spread index of 75 and smoke developed index of 150.
  - 2. Exception: Industrial mechanical insulation that will not affect life safety egress of building may have flame spread index of 75 and smoke developed index of 150.
  - 3. Exception: Polyisocyanurate insulation that is not installed in a return air plenum may have a flame spread index of 25 and smoke developed index of 450.

### 1.6 DELIVERY STORAGE AND HANDLING

- A. Accept materials on site, labeled with manufacturer's identification, product density, and thickness.
- B. Protect insulation from weather and construction traffic, dirt, water, chemical, and mechanical damage; store in original wrapping.

### 1.7 FIELD CONDITIONS

- A. Maintain ambient conditions required by manufacturers of each product.
- B. Maintain temperature before, during, and after installation for minimum of 24 hours.

## PART 2 - PRODUCTS

### 2.1 PIPING INSULATION MATERIALS

- A. Cellular Glass:
  - 1. Manufacturers:
    - a. Owens Corning.
  - 2. Insulation: ASTM C552, Type II, Grade 6, rigid closed glass cells pre-formed for the application.
    - a. K-value: ASTM C518 or C177, maximum 0.34 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 450 degrees F.
    - c. Maximum Service Temperature: 800 degrees F.
    - d. Density: Minimum 6.12 pounds per cubic feet.
- B. Polyisocyanurate:
  - 1. Manufacturers:

- a. Dyplast Products.
  - b. Johns Manville.
  - c. Approved equal.
  - 2. Insulation: ASTM C591, Grade 2, Type IV for ASTM E84 25/50 compliance, Type I for ASTM E84 25/450 compliance; rigid molded, pre-formed for the application.
    - a. K-value: ASTM C518 or C177, maximum 0.2 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 297 degrees F
    - c. Maximum Service Temperature: 300 degrees F.
    - d. Density: Maximum 6 pounds per cubic feet.
- C. Flexible Elastomeric:
- 1. Manufacturers:
    - a. Aeroflex USA, Inc.
    - b. Armacell LLC.
    - c. K-Flex USA.
  - 2. Insulation: ASTM C534, Grade I, flexible elastomeric cellular rubber insulation, pre-formed for the application.
    - a. K-value: ASTM C518 or C177, maximum 0.28 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 297 degrees F
    - c. Maximum Service Temperature: 220 degrees F for Grade I, 300 degrees F for Grade II.
  - 3. Factory Applied Jacket:
    - a. Polymeric Coating: Multi-ply, polymeric blend coating, 16 mils thick, designed to prevent damage to underlying insulation from sunlight, installation, and physical abuse, with water vapor permeance of 0.03 perms. Reference Piping Jacket Schedule in Part 3 of this specification for application of this jacket.
- D. Field-Applied Jacket:
- 1. Canvas: UL listed 6 oz/sq yd plain weave cotton fabric treated with dilute fire retardant lagging adhesive.
  - 2. Semi-rigid PVC: One-piece, pre-molded PVC cover conforming to ASTM D1784, including factory-furnished, pre-cut insulation blanket inserts for fittings.
    - a. Outdoor Applications: Provide minimum 30 mils thickness and UV protection.
    - b. Manufacturers:
      - 1) Johns Manville Zeston PVC Jacketing and 2000 Series Fitting Covers
      - 2) Proto Corp LoSmoke PVC Jacketing and Pro Fitting Covers.
      - 3) Or approved equal.
  - 3. Rigid Aluminum Shell: One-piece, pre-formed cover conforming to ASTM C1729 with weather-proof construction. Shell shall have the following minimum thickness based on the outer insulation diameter:

Outer Insulation Diameter (in)	Minimum Aluminum Jacket Thickness, (in)		
	Non-Rigid Insulation	Rigid Insulation	Finish
≤ 8	0.016	0.016	Stucco
12	0.020	0.016	Stucco
≤ 24	0.024	0.016	Stucco
≤ 36	0.032	0.020	See Note 1
36	0.040	0.024	See Note 1

Note 1: Use corrugated finish for non-rigid insulation. Use stucco finish for rigid insulation.

- a. Banding:
  - 1) For piping less than or equal to 8 inches, provide 0.020 inch thick, 3/4 inch wide aluminum bands.
  - 2) For piping larger than 8 inches, provide 0.020 inch thick, 3/4 inch wide stainless steel bands.
- 4. Multilayer Laminate Vapor Barrier Cladding: UV-resistant multi-ply outer layer and cold weather acrylic adhesive. Provide VentureClad Plus 1579 CW, or approved equal.
  - a. Water Vapor Transmission: 0.0 perms per ASTM E96.

- b. Puncture Resistance: Minimum 65 pounds per ASTM D1000.
- 5. Rubberized Asphalt Vapor Barrier Cladding: UV-resistant aluminum outer layer, multi-ply cross-laminated polyethylene film, and rubberized asphalt formulated for use on faced insulated duct and piping applications. Provide Polyguard Products, Inc. Alumaguard 60 mils thick cladding, Alumaguard Low Temp (LT) 35 mils thick cladding, or approved equal.
  - a. Water Vapor Transmission: 0.0 perms per ASTM E96.
  - b. Puncture Resistance: Minimum 15 pounds per ASTM D1000.
- E. Pipe Insulation Accessories: Provide staples, bands, wires, cement, and other appurtenances as recommended by insulation manufacturer for applications indicated.
- F. Adhesives, Sealers, Mastics, and Protective Finishes: As recommended by insulation manufacturer for applications indicated.
  - 1. Lagging Adhesive: Comply with MIL-A-3316C, Class 1, Grade A. Provide Foster 30-36, Childers CP-50AHV2, or equal.
  - 2. Weather Barrier Breather Mastic: Permeance shall be 1.0 perms or less at 62 mils dry per ASTM E96, Procedure B. Provide Foster 46-50, Childers CP-10/11 or equal.
  - 3. Solvent-Based Vapor Barrier Mastic: Comply with MIL-PRF-19565C, Type II, with water vapor permeance 0.05 perms or less at 35 mils dry per ASTM F 1249.
  - 4. Water-Based Vapor Barrier Mastic: Comply with MIL-PRF-19565C, Type II, with water vapor permeance in accordance with ASTM C755 for insulation application. Provide Foster 30-80, Childers CP-38, or equal.

Table: Recommended Maximum Permeance of Water Vapor Retarders (Note 1)

Insulation Application	Insulation Permeability, Less than 4.0 perm-in. (Note 2)	Insulation Permeability, 4.0 or greater perm-in. (Note 2)
	Vapor Retarder perms	Vapor Retarder perms
Pipe and vessels (33 F to ambient)	0.05	0.05
Pipe and vessels (-40 F to 32 F)	0.02	0.02
Ducts (40 F to ambient)	1.0	0.03

## Notes:

- 1. Water vapor permeance of the vapor retarder in perms when tested in accordance with Test Methods E96.
- 5. Water vapor permeability of the insulation material when tested in accordance with Test Methods E96.
- G. Insulation Diameters: Comply with ASTM C585 for inner and outer diameters of rigid thermal insulation.
- H. Pipe, Valve and Fitting Covers: Comply with ASTM C450 for fabrication of fitting covers for pipe, valves and fittings.
- I. High Density Insulation Billets:
  - 1. Calcium Silicate: ASTM C533 and C795.
  - 2. Flexible elastomeric: ASTM C534, Type 1.
  - 3. Polystyrene: ASTM C578, Type XIII.
  - 4. Phenolic: ASTM C1126, Type III, Grade 1.

**2.2 EXTERNAL DUCTWORK INSULATION MATERIALS**

- A. Flexible Mineral Fiber (rock, slag, or glass):
  - 1. Manufacturers:
    - a. CertainTeed Corp.
    - b. Johns Manville.
    - c. Knauf Insulation.
    - d. Owens Corning.

2. Insulation: ASTM C553, Type I or II, flexible mineral fiber blanket.
    - a. K-value: ASTM C518 or C177, maximum 0.31 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 20 degrees F
    - c. Maximum Service Temperature: 450 degrees.
    - d. Density:
      - 1) 1.5 pounds per cubic foot.
  3. Factory Applied Vapor Barrier Jacket: ASTM C1136, Type II.
    - a. Foil Scrim Kraft (FSK): Kraft paper with glass fiber yarn and bonded to aluminized film, water vapor permeance of 0.02 perms and 2 inch stapling tab.
    - b. Polypropylene Scrim Kraft (PSK): Kraft paper with glass fiber yarn and bonded to metalized polypropylene, water vapor permeance of 0.02 perms and 2 inch stapling tab.
- B. Rigid Mineral Fiber (rock, slag, or glass):
1. Manufacturers:
    - a. Johns Manville.
    - b. Knauf Insulation.
    - c. Owens Corning.
  2. Insulation: ASTM C612, Type IA or IB, rigid mineral fiber board.
    - a. K-value: ASTM C518 or C177, maximum 0.25 at 75 degrees F.
    - b. Minimum Service Temperature: 0 degrees F
    - c. Maximum Service Temperature: 450 degrees.
    - d. Density:
      - 1) 3.0 pounds per cubic foot.
  3. Factory Applied Vapor Barrier Jacket: ASTM C1136, Type II.
    - a. All-Service Jacket (ASJ): Paper/Foil/Scrim, water vapor permeance of 0.02 perms.
    - b. Foil Scrim Kraft (FSK): Kraft paper with glass fiber yarn and bonded to aluminized film, water vapor permeance of 0.02 perms.
    - c. Polypropylene Scrim Polyester (PSP): Polyester paper with glass fiber yarn and bonded to polypropylene, water vapor permeance of 0.02 perms.
    - d. Color: White.
- C. Cellular Glass:
1. Manufacturers:
    - a. Owens Corning.
  2. Insulation: ASTM C552, Type I, Grade 6, rigid closed glass cells, block form.
    - a. K-value: ASTM C518 or C177, maximum 0.31 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 450 degrees F.
    - c. Maximum Service Temperature: 800 degrees F.
    - d. Density: Minimum 6 pounds per cubic feet.
- D. Polyisocyanurate:
1. Manufacturers:
    - a. Dyplast Products.
    - b. Johns Manville.
    - c. Approved equal.
  2. Insulation: ASTM C591, Grade 2, Type IV for ASTM E84 25/50 compliance, Type I for ASTM E84 25/450 compliance; rigid board.
    - a. K-value: ASTM C518 or C177, maximum 0.2 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 297 degrees F
    - c. Maximum Service Temperature: 300 degrees F.
    - d. Density: Maximum 6 pounds per cubic feet.
- E. Flexible Elastomeric:
1. Manufacturers:
    - a. Aeroflex USA, Inc.
    - b. Armacell LLC.
    - c. K-Flex USA.

2. Insulation: ASTM C534, Grade 1, flexible elastomeric cellular rubber insulation, sheet form.
    - a. K-value: ASTM C518 or C177, maximum 0.28 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 40 degrees F
    - c. Maximum Service Temperature: 180 degrees F.
  3. Factory Applied Jacket:
    - a. Flexible Metal Cladding: Metallic factory-laminated cladding, 17.5 mils thick, designed to prevent damage to underlying insulation from sunlight, installation, and physical abuse, with water vapor permeance of 0.00 perms. Provide ArmaTuff or equal. Reference Duct Jacket Schedule in Part 3 of this specification for application of this jacket.
- F. Field-Applied Jacket:
1. Aluminum: ASTM B209, 3003 alloy, H-14 temper, with 3-mil thick polyfilm moisture barrier to interior surface.
    - a. Thickness: 0.032 inch sheet.
    - b. Finish: Smooth or Stucco. Reference Part 3 for jacket applications.
    - c. Joining: Longitudinal slip joints and 2 inch laps.
    - d. Fittings: 0.032 inch thick die shaped fitting covers with factory attached protective liner.
    - e. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel.
  2. Multilayer Laminate Vapor Barrier Cladding: UV-resistant multi-ply outer layer and cold weather acrylic adhesive. Provide VentureClad Plus 1579 CW, or approved equal.
    - a. Water Vapor Transmission: 0.0 perms per ASTM E96.
    - b. Puncture Resistance: Minimum 65 pounds per ASTM D1000.
  3. Rubberized Asphalt Vapor Barrier Cladding: UV-resistant aluminum outer layer, multi-ply cross-laminated polyethylene film, and rubberized asphalt formulated for use on faced insulation. Provide Polyguard Products, Inc. Alumaguard 60 mils thick cladding, Alumaguard Low Temp (LT) 35 mils thick cladding, or approved equal.
- G. Ductwork Insulation Accessories: Provide staples, bands, wires, tape, pins with insulation retaining washers, anchors, corner angles and other appurtenances as recommended by insulation manufacturer for applications indicated.
- H. Adhesives, Sealers, Mastics, and Protective Finishes: Provide cements, adhesives, coatings, sealers, mastics, protective finishes, and similar compounds as recommended by insulation manufacturer for applications indicated.
1. Mineral Fiber Lagging Adhesive: Comply with ASTM C916, Type 2 or MIL-A-3316C, Class 2, Grade A. Provide Foster 85-60, Childers CP-127, or equal water-based adhesive.
  2. Vapor Barrier Tape: Kraft paper reinforced with glass fiber yarn and bonded to aluminized film, with pressure sensitive rubber-based adhesive.
  3. Water-Based Vapor Barrier Mastic: Comply with MIL-PRF-19565C, Type II, with water vapor permeance 0.05 perms or less at 47 mils dry per ASTM E96. Provide Fosters 30-80, Childers CP-38, Design Polymerics 3040, or equal.
  4. Solvent-Based Vapor Barrier Mastic: Comply with MIL-PRF-19565C, Type II, with water vapor permeance 0.05 perms or less at 35 mils dry per ASTM F 1249.
  5. Tie Wire: Annealed steel, 16 gauge, 0.0508 inch diameter.

### 2.3 EQUIPMENT INSULATION MATERIALS

- A. Flexible Mineral Fiber (rock, slag, or glass):
1. Manufacturers:
    - a. CertainTeed Corp.
    - b. Johns Manville.
    - c. Knauf Insulation.
    - d. Owens Corning.

2. Insulation: ASTM C553, Type I and II or ASTM C547 Type II, flexible mineral fiber blanket.
    - a. K-value: ASTM C518 or C177, maximum 0.31 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 20 degrees F
    - c. Maximum Service Temperature: 450 degrees F for ASTM C553 Types I and II, 1200 degrees F for ASTM C547 Type II.
    - d. Density: Minimum 1.5 pounds per cubic foot.
  3. Factory Applied Vapor Barrier Jacket: ASTM C1136, Type II.
    - a. Foil Scrim Kraft (FSK): Kraft paper with glass fiber yarn and bonded to aluminized film, water vapor permeance of 0.02 perms and 2 inch lap.
    - b. Color: White.
- B. Flexible Removeable and Reusable Blanket Insulation:
1. Manufacturers:
    - a. Auburn Manufacturing.
    - b. Approved equal.
  2. Insulation: ASTM C553, Type V, flexible, noncombustible.
    - a. Comply with ASTM C1695.
    - b. K-value: ASTM C518 or C177, maximum 0.37 at 100 degrees F.
    - c. Minimum Service Temperature: 32 degrees F
    - d. Maximum Service Temperature: 500 degrees.
- C. Rigid Mineral Fiber (rock, slag, or glass):
1. Manufacturers:
    - a. Johns Manville.
    - b. Knauf Insulation.
    - c. Owens Corning.
  2. Insulation: ASTM C612, Type IA or IB, rigid mineral fiber board.
    - a. K-value: ASTM C518 or C177, maximum 0.25 at 75 degrees F.
    - b. Minimum Service Temperature: 0 degrees F
    - c. Maximum Service Temperature: 450 degrees.
    - d. Density: Minimum 3.0 pounds per cubic foot.
  3. Factory Applied Vapor Barrier Jacket: ASTM C1136, Type II.
    - a. All-Service Jacket (ASJ): Paper/Foil/Scrim, water vapor permeance of 0.02 perms.
    - b. Foil Scrim Kraft (FSK): Kraft paper with glass fiber yarn and bonded to aluminized film, water vapor permeance of 0.02 perms.
    - c. Color: White.
- D. Cellular Glass:
1. Manufacturers:
    - a. Owens Corning.
  2. Insulation: ASTM C552, Type I, Grade 6, rigid closed glass cells, block form.
    - a. K-value: ASTM C518 or C177, maximum 0.31 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 450 degrees F.
    - c. Maximum Service Temperature: 800 degrees F.
    - d. Density: Minimum 6.12 pounds per cubic feet.
- E. Flexible Elastomeric:
1. Manufacturers:
    - a. Aeroflex USA, Inc.
    - b. Armacell LLC.
    - c. K-Flex USA.
  2. Insulation: ASTM C534, Grade I or II, flexible elastomeric cellular rubber insulation, sheet form.
    - a. K-value: ASTM C518 or C177, maximum 0.28 at 75 degrees F.
    - b. Minimum Service Temperature: Minus 40 degrees F
    - c. Maximum Service Temperature: 220 degrees F for Grade I, 300 degrees F for Grade II.

- F. Field-Applied Jacket:
1. Canvas: UL listed, minimum 8 oz/sq yd plain weave cotton fabric treated with dilute fire retardant lagging adhesive.
  2. Aluminum: ASTM B209, 3003 alloy, H-14 temper, with 3-mil thick polyfilm moisture barrier to interior surface.
    - a. Thickness: 0.032 inch sheet.
    - b. Finish: Smooth.
    - c. Joining: Longitudinal slip joints and 2 inch laps.
    - d. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel.
  3. Stainless Steel: ASTM A666, Type 304 stainless steel.
    - a. Thickness: 0.010 inch sheet.
    - b. Finish: Smooth.
    - c. Metal Jacket Bands: 3/8 inch wide; 0.010 inch thick stainless steel.
  4. Multilayer Laminate Vapor Barrier Cladding: UV-resistant multi-ply outer layer and cold weather acrylic adhesive. Provide VentureClad Plus 1579 CW, or approved equal.
    - a. Water Vapor Transmission: 0.0 perms per ASTM E96.
    - b. Puncture Resistance: Minimum 65 pounds per ASTM D1000.
  5. Rubberized Asphalt Vapor Barrier Cladding: UV-resistant aluminum outer layer, multi-ply cross-laminated polyethylene film, and rubberized asphalt formulated for use on faced insulation. Provide Polyguard Products, Inc. Alumaguard 60 mils thick cladding, Alumaguard Low Temp (LT) 35 mils thick cladding, or approved equal.
- G. Equipment Insulation Accessories: Provide staples, bands, wire, wire netting, tape, corner angles, anchors, stud pins, and other appurtenances as recommended by insulation manufacturer for applications indicated.
- H. Adhesives, Sealers, Mastics, and Protective Finishes: Provide cements, adhesives, coating, sealers, mastics, and protective finishes as recommended by insulation manufacturer for applications indicated.
1. Mineral Fiber Lagging Adhesive: Comply with ASTM C916, Type 2 or MIL-A-3316C, Class 2, Grade A. Provide Foster 85-60, Childers CP-127, or equal water-based adhesive.
  2. Water-Based Vapor Barrier Mastic: Comply with MIL-PRF-19565C, Type II, with water vapor permeance 0.05 perms or less at 47 mils dry per ASTM E96. Provide Foster 30-80, Childers CP-38, Design Polymeric 3040, or equal.
  3. Lagging Adhesive: Comply with MIL-A-3316C, Class 1, Grade A. Provide Foster 30-36. Childers CP-50AHV2 or equal.
  4. Tie Wire: Annealed steel, 16 gauge, 0.0508 inch diameter.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Test piping and ductwork for design pressure, liquid tightness, and continuity prior to applying insulation materials.
- B. Verify that surfaces are clean and dry, with foreign material removed.

#### **3.2 PROTECTION AND REPLACEMENT**

- A. Provide all required protection for insulation (installed and uninstalled) throughout the duration of construction to avoid exposure to plaster, dust, dirt, paint, moisture, deterioration, and physical damage.

- B. Repair existing mechanical insulation that is damaged during this construction period. Use insulation of same type and thickness as existing insulation. Install new jacket lapping and sealed over existing.
- C. Replace damaged insulation which cannot be repaired satisfactorily at no additional expense to the Owner, including insulation with vapor barrier damage and insulation that has been exposed to moisture during shipping, storage, or installation. Drying the insulation is not acceptable. Dry surfaces prior to installation of new insulation that replaces the damaged or wet insulation.

### 3.3 INSTALLATION GENERAL

- A. Install in accordance with manufacturer's instructions.
- B. Install in accordance with NAIMA National Insulation Standards.

### 3.4 PIPING SYSTEM INSULATION INSTALLATION

- A. Maintain continuous thermal and vapor-retarder integrity throughout entire installation and protect it from puncture and other damage.
- B. Install insulation on pipe systems subsequent to installation of heat tracing, painting, testing, and acceptance of tests.
- C. Install insulation materials with smooth and even surfaces. Insulate each continuous run of piping with full-length units of insulation, with a single cut piece to complete run. Do not use cut pieces or scraps abutting each other.
- D. Exposed Piping: Locate insulation and cover seams in least visible locations.
- E. Cold Pipe Insulation:
  - 1. Insulate entire system, including fittings, valves, unions, flanges, strainers, flexible connections, pump bodies, and expansion joints.
  - 2. Provide vapor barrier jacket according to the Piping Jacket Schedule.
  - 3. Provide high density insulation material under supports or pre-insulated supports. Protect insulation with shields to prevent puncture or other damage. Refer to Section "Hangers & Supports for HVAC Piping & Equipment" for pre-insulated supports and insulation shields. and for exception where high density insulation inserts are not required.
  - 4. High density insulation material shall extend a minimum 2 inches past the pipe shield on each side.
  - 5. Secure all-service jacket with self-sealing longitudinal laps.
  - 6. Butt pipe insulation tightly at insulation joints. Apply wet coat of vapor barrier lap cement on joint and seal with 3 inch wide vapor barrier tape or band and coat all taped seams and staple penetrations with vapor barrier coating to prevent moisture ingress.
- F. Hot Pipe Insulation:
  - 1. Insulate entire system, including fittings, valves, unions flanges, strainers, flexible connections, pump bodies, and expansion joints.
  - 2. Provide jackets without vapor barrier according to the Piping Jacket Schedule. Jackets with vapor barrier are allowed.
  - 3. Provide high density insulation material or pre-insulated supports where supports are installed outside of the insulation. Protect insulation with shields to prevent puncture or other damage. Refer to Section "Hangers & Supports for HVAC Piping & Equipment" for pre-insulated supports and insulation shields and for exception where high density insulation inserts are not required.
  - 4. High density insulation material shall extend a minimum 2 inches past the pipe shield on each side.
  - 5. Secure all-service jacket with self-sealing longitudinal laps.
  - 6. Butt pipe insulation tightly at insulation joints and wrap insulation around supports. Apply 3 inch wide vapor barrier tape or band over joint.

- G. Insulation of Fittings, Valves, Strainers, Flanges, and Unions:
1. Insulate fittings, joints, and valves with molded insulation of like material, vapor barrier coating, and thickness as adjacent pipe. Provide pre-formed insulation pieces, segmented insulation, or sectional pipe insulation for the application. Provide the same insulation jacket as adjoining pipe.
  2. Sectional pipe insulation: Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Hold sectional cuts in place with tie wire or bands. Wire and bands shall be compatible with insulation and jacket.
  3. Segmented pipe insulation: Cover segmented insulated surfaces with a layer of finishing cement and finish with a coating or mastic. Reinforce the mastic with fabric-reinforcing mesh. Trowel the coating or mastic to a smooth and well-shaped contour.
  4. Butt each insulation piece tightly against adjoining piece of insulation. Bond pieces together according to Cold Pipe or Hot Pipe installation instructions.
  5. Insulate valves up to and including the bonnets, valve stuffing-box studs, bolts, and nuts with a removeable insulation cover. Sectional valve insulation covers shall divide the section along the vertical center line of the valve body.
  6. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover.
  7. Insulate flanges and unions with a removeable insulation cover. Sectional pipe insulation covers shall divide the section along the center line of pipe.
  8. When removeable covers are made from sectional block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, around the insulated device with tie wire. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
  9. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation. PVC fitting covers with end caps are also acceptable. Tape PVC covers to adjoining insulation facing using PVC tape.
  10. Stencil or label the outside insulation jacket of each union with the word "union." Match size and color of pipe labels.
- H. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.
- I. Extend piping insulation without interruption through walls, floors and similar piping penetrations, except where otherwise indicated. Maintain vapor barrier through the penetration.
- J. Exterior Piping and Piping Exposed to Weather:
1. General: Provide piping jacket around insulation as scheduled in the Piping Jacket Schedule. Jacket material shall be approved by the jacket manufacturer for use with the specific insulation material that it covers. Locate longitudinal seams of outer shell (aluminum, flexible elastomeric, or cladding as applicable) at bottom of pipe. Provide insulation shields so that the piping supports cannot puncture, cut or break the jacket.
  2. Rigid aluminum shell: Space attachment bands 12 inches on center and directly centered over end joints.

### 3.5 PIPING SYSTEM INSULATION SCHEDULE

- A. Reference Pipe Insulation Thickness Schedule at the end of this specification for thickness requirements based on insulation conductivity.
- B. Do not apply insulation to piping that operates outside of the minimum and maximum service temperature range.

- C. Omit insulation on the following:
1. Hot piping within radiation enclosures or unit cabinets.
  2. Cold piping within unit cabinets provided piping is located over drain pan.
  3. Heating piping between coil and shutoff valves provided piping is located within heated space and not more than three feet from coil.
  4. Condensate piping between steam trap and union.
  5. Steam relief vent piping.
  6. Chiller emergency refrigerant vent piping.
  7. Flexible connections and expansion joints in pipes with fluids above ambient temperatures.
- D. Exterior Piping: Insulate all exterior HVAC piping with one of the following:
1. Cellular glass.
  2. Flexible elastomeric, use high temperature formula for systems with operating temperatures above 220 F. (not acceptable for steam, steam condensate or hot water piping systems with temperatures above 300 F).
- E. Cold Piping (40 degrees F (4.4 degrees C) to 60 degrees F):
1. Service:
    - a. Chilled water supply and return piping.
    - b. Domestic make-up water piping between the backflow preventer and HVAC system connection.
    - c. Air conditioner condensate drain piping.
    - d. Condenser water supply and return piping when used for free cooling.
    - e. Water-source heat pump supply and return water piping.
  2. Insulate each piping system specified above with one of the following types and thicknesses of insulation:
    - a. Cellular glass.
    - b. Polyisocyanurate.
    - c. Flexible elastomeric.
    - d. Phenolic.
- F. Warm Temperature Piping (105 degrees to 140 degrees F (40 to 94 degrees C)):
1. Service:
    - a. Heating hot water supply and return piping.
    - b. Refrigerant liquid lines between the condensing unit and expansion valve.
  2. Insulate each piping system specified above with one of the following types of insulation.
    - a. Cellular glass.
    - b. Polyisocyanurate.
    - c. Flexible elastomeric.
    - d. Phenolic.
- G. Hot Non-Steam Piping (141 to 200 degrees F (61 to 94 degrees C)):
1. Service:
    - a. Heating hot water supply and return piping.
    - b. Heated fuel piping.
  2. Acceptable Insulation:
    - a. Cellular glass.
    - b. Calcium silicate.
    - c. Polyisocyanurate.
    - d. Flexible elastomeric .
    - e. Phenolic.

### 3.6 PIPE INSULATION THICKNESS SCHEDULE

- A. IECC – 2015 Requirements, Pipe Insulation

#### Minimum Pipe Insulation Thickness

Insulation Conductivity	Nominal Pipe or Tube Size (in.)
-------------------------	---------------------------------

Fluid Operating Temp. Range (°F) And Usage	Conductivity, Btu·in./(hr·ft <sup>2</sup> ·°F)	Mean Rating Temp., °F.	Insulation Thickness, in.				
			1	1 to 1-1/2	1-1/2 to 4	4 to 8	≥8
350°F	0.32–0.34	250	4.5	5.0	5.0	5.0	5.0
251°F–350°F	0.29–0.32	200	3.0	4.0	4.5	4.5	4.5
201°F–250°F	0.27–0.30	150	2.5	2.5	2.5	3.0	3.0
141°F–200°F	0.25–0.29	125	1.5	1.5	2.0	2.0	2.0
105°F–140°F	0.21–0.28	100	1.0	1.0	1.5	1.5	1.5
40°F–60°F	0.21–0.27	75	0.5	0.5	1.0	1.0	1.0
40°F	0.20–0.26	50	0.5	1.0	1.0	1.0	1.5

## Notes:

- a. For piping smaller than 1-1/2 inch and located in partitions within conditioned spaces, reduction of these thicknesses by 1 inch shall be permitted (before thickness adjustment required in footnote b) but not to a thickness less than 1 inch.
- b. For insulation outside the stated conductivity range, the minimum thickness (T) shall be determined as follows:  $T = r \left[ \frac{1}{t/r} \left( \frac{K}{k} \right) - 1 \right]$  where
  - 1) T minimum insulation thickness (in.),
  - 2) r actual outside radius of pipe (in.),
  - 3) t insulation thickness listed in this table for applicable fluid temperature and pipe size,
  - 4) K conductivity of alternate material at mean rating temperature indicated for the applicable fluid temperature (Btu·in./hr·ft<sup>2</sup>·°F); and
  - 5) k the upper value of the conductivity range listed in this table for the applicable fluid temperature.
- c. Insulation thicknesses are based on energy efficiency considerations only. Add insulation where noted on the drawings.
- d. For piping that shall be installed below grade, reference Division 23 section "Underground Hydronic and Steam Piping."
- e. The table is based on steel pipe. Non-metallic pipes schedule 80 thickness or less shall use the table values. For other non-metallic pipes having thermal resistance greater than that of steel pipe, reduced thicknesses are permitted if documentation is provided showing that the pipe with the proposed insulation has no more heat transfer per foot than a steel pipe of the same size with the insulation thickness shown on the table.

**3.7 PIPING JACKET SCHEDULE**

- A. Exposed piping within mechanical rooms (below 10 feet):
  1. Semi-rigid PVC.
  2. Rigid aluminum shell.
- B. Exposed piping within mechanical rooms (above 10 feet):
  1. Semi-rigid PVC.
  2. Rigid aluminum shell.
- C. Exposed piping:
  1. All-service jacket.
  2. Semi-rigid PVC.
- D. Piping within return air plenums:
  1. All-service jacket.
- E. Exterior piping and piping exposed to weather:
  1. Rigid aluminum shell.

**3.8 DUCTWORK INSULATION SYSTEM INSTALLATION**

- A. Maintain continuous thermal and vapor-barrier integrity throughout entire installation and protect it from puncture and other damage.
- B. Install insulation on duct systems subsequent to painting, testing, and acceptance of tests.
- C. Install insulation materials with smooth and even surfaces.
- D. Clean and dry ductwork prior to insulating. Butt insulation joints firmly together to ensure complete and tight fit over surfaces to be covered.
- E. Install insulation without sag on underside of duct. Where rectangular ducts are 24 inches in width or greater, secure external insulation to the bottom of the duct with mechanical fasteners, spaced on 18 inches on center (maximum). Fasteners shall include 2-inch square self-sticking galvanized carbon-steel base plates with minimum 0.106-inch diameter zinc-coated, low carbon steel, fully annealed shank spindle, length to suit depth of insulation. Secure insulation to spindles with self-locking washers incorporating a spring steel insert to ensure permanent cap retention. Lift duct off trapeze hangers and insert spacers to avoid insulation compression.
- F. Stop and point insulation around access doors and damper operators to allow operation without disturbing wrapping.
- G. Corner Angles: Except for oven and hood exhaust duct insulation, install corner angles on external corners of insulation on ductwork in exposed finished spaces before covering with jacketing.
- H. Lined Ductwork: At interface of lined and wrapped ductwork, overlap lined ductwork by 2 feet (minimum) with wrapped insulation.
- I. Cold Ducts:
  - 1. Insulate entire system, including fittings, joints, flanges, expansion joints, and air duct accessories.
  - 2. Provide vapor barrier jacket according to the Ductwork Jacket Schedule.
  - 3. Seal joints with vapor barrier mastic.
  - 4. Continue insulation, including vapor barrier, through walls, sleeves, hangers, and other duct penetrations.
  - 5. Seal vapor barrier penetrations by mechanical fasteners with vapor barrier adhesive.
  - 6. Where cold ducts are installed in mechanical rooms or non-conditioned spaces (excludes return air plenums), prevent condensation from forming on the duct supports by providing one or more of the following:
    - a. Install thermal break such as rigid board insulation between the support and duct.
    - b. Wrap support that is in contact with the duct with external duct wrap insulation to prevent condensation. Wrap shall extend a minimum of 12 inches from point of contact of the support with the duct. Tape joints to provide a thermal and vapor barrier. Coat all taped joints, punctures and seams with 4 inch wide coating of vapor barrier mastic.
    - c. If a support device similar to Unistrut is used, foam fill or stuff tube.
- J. Hot and Neutral Ducts:
  - 1. Insulate entire system, including fittings, joints, flanges, expansion joints, and air duct accessories.
  - 2. Provide jackets with or without vapor barrier according to the Ductwork Jacket Schedule.
  - 3. Secure joints with staples, tape, or wires.
  - 4. Insulate fittings and joints. Where service access is required, bevel and seal ends of insulation.
- K. Exterior Ductwork and Ductwork Exposed to Weather:

1. Slope ductwork to ensure that water cannot pond anywhere on the duct. Do not vary the insulation thickness to achieve drainage.
2. Jackets shall be approved by the jacket manufacturer for use with the specific insulation material it covers.
3. Locate longitudinal seams of jacket at bottom of duct. Install jacket in strict conformance with cladding manufacturer's instructions.
4. Seal joints with vapor barrier mastic and reinforcing mesh as recommended by manufacturer or protective jacket as specified.
5. Install aluminum jacket with three metal jacket bands per section.
6. Multilayer Laminate Vapor Barrier Cladding: Install cladding only when ambient temperature is above 50 degrees F. Provide low-temp products for installation in low ambient temperatures down to 10 degrees F.
7. Rubberized Asphalt Vapor Barrier Cladding: Install cladding for use in ambient temperatures as low as minus 10 degrees F.
8. Cover seams in flexible metal cladding with ArmaTuff seal tape or equal.

### 3.9 DUCTWORK SYSTEM INSULATION SCHEDULE

- A. Omit insulation on the following:
  1. Fibrous glass ductwork (ductboard).
  2. Lined ductwork that is interior to the building unless otherwise indicated on the drawings.
  3. Ductwork with sound absorbing linings unless otherwise indicated on the drawings.
- B. Prohibited insulation:
  1. Polyisocyanurate installed within a return air plenum.
- C. Outdoor Air:
  1. Service:
    - a. Interior untreated outdoor air intake ducts.
    - b. Combustion air intake ducts.
  2. Acceptable Insulation:
    - a. Flexible mineral fiber.
    - b. Rigid mineral fiber.
    - c. Cellular glass.
    - d. Polyisocyanurate.
    - e. Flexible elastomeric.
- D. Supply Air:
  1. Service:
    - a. Supply ducts from air handling equipment.
    - b. Insulate neck and bells of supply diffusers.
  2. Acceptable Insulation:
    - a. Flexible mineral fiber.
    - b. Rigid mineral fiber.
    - c. Cellular glass.
    - d. Polyisocyanurate.
    - e. Flexible elastomeric.
- E. Return Air:
  1. Service:
    - a. Interior ductwork within 10 feet of exterior roof or wall penetrations.
    - b. Interior ductwork routed through or from unconditioned spaces and plenums.
  2. Acceptable Insulation:
    - a. Flexible mineral fiber.
    - b. Rigid mineral fiber.
    - c. Cellular glass.
    - d. Polyisocyanurate.
    - e. Flexible elastomeric.

- F. Exhaust Air.
1. Service:
    - a. Interior ductwork within 10 feet of exterior roof or wall penetrations.
    - b. Interior ductwork routed through conditioned spaces (excludes ductwork routed in shafts) that is exhausting from unconditioned spaces (such as loading docks, garages, etc.).
    - c. Interior ductwork downstream of heat recovery device (wheel, plate, heat pipe, etc.) to exterior discharge outlet.
    - d. Exterior ductwork upstream of heat recovery device (wheel, plate, heat pipe, etc.).
    - e. Range and kitchen hood non-grease exhaust ductwork.
    - f. Dishwasher exhaust ducts within 10 feet of discharge to the outdoors.
  2. Acceptable Insulation:
    - a. Flexible mineral fiber.
    - b. Rigid mineral fiber.
    - c. Cellular glass.
    - d. Polyisocyanurate.
    - e. Flexible elastomeric.
- G. Range and hood grease exhaust ductwork: Refer to Section "Air Duct Accessories" for requirements of fire-rated wrap insulation for grease exhaust duct.
- H. Relief Air.
1. Service:
    - a. Interior ductwork within 10 feet of exterior roof or wall penetrations.
    - b. Downstream of heat recovery device (wheel, plate, heat pipe, etc.) to exterior discharge outlet.
  2. Acceptable Insulation:
    - a. Flexible mineral fiber.
    - b. Rigid mineral fiber.
    - c. Cellular glass.
    - d. Polyisocyanurate.
    - e. Flexible elastomeric.
- I. HVAC plenums and unit housings not pre-insulated at factory or lined.
1. Acceptable Insulation:
    - a. Flexible mineral fiber.
    - b. Rigid mineral fiber.
    - c. Cellular glass.
    - d. Polyisocyanurate.
    - e. Flexible elastomeric.
- J. Exterior Ductwork:
1. Service:
    - a. Supply ductwork.
    - b. Return ductwork.
    - c. Exhaust ductwork.
    - d. Pre-conditioned outside air downstream of conditioning unit.
    - e. Plenums and unit housings not pre-insulated at factory or lined.
  2. Acceptable Insulation:
    - a. Cellular glass.
    - b. Polyisocyanurate.
    - c. Flexible elastomeric.
    - d. Omit insulation on phenolic foam ductwork and fittings. Refer to Division 23 Section "Nonmetal Ducts."

**3.10 DUCT SYSTEM INSULATION THICKNESS SCHEDULE**

- A. Flexible Mineral Fiber:
  - 1. Interior Ductwork:
    - a. 0
    - b. 1.5 pounds per cubic foot density:
      - 1) 2 inch thick, minimum R-6.0.
  - 2. Meet R-value installed at maximum 25% compression, application limited to concealed locations.
- B. Rigid Mineral Fiber:
  - 1. Interior Ductwork:
    - a. 3 pounds per cubic foot density:
      - 1) 1-1/2 inch thick, minimum R-6.0.
  - 2. Ductwork installed in machine, fan, and mechanical equipment rooms:
    - a. 2 inch thick, minimum R-8.0.
  - 3. Exterior Ductwork or Ductwork Exposed to Weather, or Ductwork:
    - a. 2 inch thick, minimum R-8.0.
  - 4. Ductwork in an Unconditioned Space:
    - a. 1-1/2 inch thick, minimum R-6.0.
- C. Cellular Glass:
  - 1. Interior Ductwork:
    - a. 2 inch thick, minimum R-6.0.
  - 2. Exterior Ductwork or Ductwork Exposed to Weather, or Ductwork:
    - a. 2-1/2 inch thick, minimum R-8.0.
  - 3. Ductwork in an Unconditioned Space:
    - a. 2 inch thick, minimum R-6.0.
- D. Polyisocyanurate:
  - 1. Interior Ductwork:
    - a. 1 inch thick, minimum R-6.0.
  - 2. Exterior Ductwork or Ductwork Exposed to Weather:
    - a. 1-1/2 inch thick, minimum R-8.0.
  - 3. Ductwork in an Unconditioned Space:
    - a. 1 inch thick, minimum R-6.0.
- E. Flexible Elastomeric:
  - 1. Interior Ductwork:
    - a. 1-1/2 inch thick, minimum R-6.0.
  - 2. Exterior Ductwork or Ductwork Exposed to Weather:
    - a. 2 inch thick, minimum R-8.0.
  - 3. Ductwork in an Unconditioned Space:
    - a. 1-1/2 inch thick, minimum R-6.0.

**3.11 DUCTWORK JACKET SCHEDULE**

- A. Omit jacket on internally lined ductwork.
- B. Exposed ductwork within mechanical rooms (below 10 feet):
  - 1. Foil Scrim Kraft (FSK).
  - 2. Polypropylene Scrim Kraft (PSK).
  - 3. All-Service Jacket (ASJ).
  - 4. Polypropylene Scrim Polyester (PSP).
  - 5. Flexible Metal Cladding (flexible elastomeric only).
  - 6. Aluminum with smooth finish.
- C. Exposed ductwork within mechanical rooms (above 10 feet):
  - 1. Foil Scrim Kraft (FSK).

2. Polypropylene Scrim Kraft (PSK).
  3. All-Service Jacket (ASJ).
  4. Polypropylene Scrim Polyester (PSP).
  5. Flexible Metal Cladding (flexible elastomeric only).
- D. Exposed ductwork:
1. Foil Scrim Kraft (FSK).
  2. Polypropylene Scrim Kraft (PSK).
  3. All-Service Jacket (ASJ).
  4. Polypropylene Scrim Polyester (PSP).
  5. Flexible Metal Cladding (flexible elastomeric only).
  6. Aluminum with smooth finish.
- E. Ductwork within return air plenums:
1. Foil Scrim Kraft (FSK).
  2. Polypropylene Scrim Kraft (PSK).
  3. All-Service Jacket (ASJ).
  4. Polypropylene Scrim Polyester (PSP).
  5. Flexible Metal Cladding (flexible elastomeric only).
- F. Ductwork in an unconditioned space:
1. Foil Scrim Kraft (FSK).
  2. Polypropylene Scrim Kraft (PSK).
  3. All-Service Jacket (ASJ).
  4. Polypropylene Scrim Polyester (PSP).
  5. Flexible Metal Cladding (flexible elastomeric only).
- G. Exterior ductwork and ductwork exposed to weather:
1. Flexible Metal Cladding (flexible elastomeric only).
  2. Aluminum with stucco finish.
  3. Multilayer Laminate Vapor Barrier Cladding.
  4. Rubberized Asphalt Vapor Barrier Cladding.
  5. Heavy duty multilayer composite (polyolefin insulation only).

### **3.12 EQUIPMENT INSULATION INSTALLATION**

- A. Install insulation subsequent to painting, testing, and acceptance of tests.
- B. Install insulation materials with smooth and even surfaces and on clean and dry surfaces. Redo poorly fitted joints. Do not use mastic or joint sealer as filler for gapping joints and excessive voids resulting from poor workmanship.
- C. Protect insulation to prevent puncture and other damage.
- D. Exposed Equipment: Locate insulation and cover seams in least visible locations.
- E. Equipment Requiring Access for Maintenance, Repair, or Cleaning: Install insulation so it can be easily removed and replaced without damage.
- F. Do not apply insulation to equipment, breechings, or stacks while hot.
- G. Do not insulate flanges and unions of equipment carrying fluids less than 105 degrees F.
- H. Provide neatly beveled edge at interruptions of insulation.
- I. Fasten insulation to equipment with studs, pins, clips, adhesives, wires, or bands.
- J. Stagger insulation joints for both single and double layer application, where feasible. Apply each layer of insulation separately. Tape all joints using glass cloth or a suitable, matching acrylic adhesive tape; minimum 3 inches wide.

- K. Coat insulated surfaces of calcium silicate with layer of insulating cement, troweled in workmanlike manner, leaving a smooth continuous surface. Fill in scored block, seams, chipped edges and depressions, and cover over wire netting and joints with cement of sufficient thickness to remove surface irregularities.
- L. Cover insulated surfaces with jacketing, factory or field applied, neatly fitted and firmly secured. Lap seams at least 2 inches. Apply over vapor barrier where applicable. Tape all joints using glass cloth or a suitable, matching acrylic adhesive tape; minimum 3 inches wide.
- M. Cold Equipment:
  - 1. Insulate entire system, including flanges and unions. Maintain continuous vapor-barrier integrity throughout entire installation and protect it from puncture and other damage.
  - 2. Provide vapor barrier jacket, factory or field applied over mineral fiber insulation. Finish with glass cloth or vapor barrier adhesive.
  - 3. Seal vapor barrier penetrations by mechanical fasteners with vapor barrier adhesive.
- N. Hot Equipment:
  - 1. Insulate entire system, including flanges and unions.
  - 2. Provide jacket, with or without vapor barrier, factory or field applied over mineral fiber insulation. Finish with glass cloth or vapor barrier adhesive.
- O. Exterior Equipment and Equipment Exposed to Weather:
  - 1. Jackets shall be approved by the jacket manufacturer for use with the specific insulation material it covers.
  - 2. Seal joints with vapor barrier mastic and reinforcing mesh as recommended by manufacturer or protective jacket as specified.
  - 3. Install aluminum or stainless steel jacket with three metal jacket bands per section.
  - 4. Multilayer Laminate Vapor Barrier Cladding: Install cladding only when ambient temperature is above 50 degrees F. Provide low-temp products for installation in low ambient temperatures down to 10 degrees F.
  - 5. Rubberized Asphalt Vapor Barrier Cladding: Install cladding for use in ambient temperatures as low as minus 10 degrees F.

### 3.13 EQUIPMENT INSULATION SCHEDULE

- A. Omit Insulation on the following:
  - 1. Boiler manholes, handholes, cleanouts, ASME stamp, and manufacturer's nameplates.
  - 2. Factory pre-insulated equipment.
- B. Do not apply insulation to equipment that operates outside of the minimum and maximum service temperature range.
- C. Provide flexible removable and reusable blanket insulation sections to cover parts of equipment which must be opened periodically for maintenance; include metal vessel covers, fasteners, flanges, frames and accessories.
- D. Cold Equipment:
  - 1. Service:
    - a. Refrigeration equipment, including chillers, tanks and pumps.
    - b. Cold surfaces not factory insulated.
    - c. Drip pans under chilled equipment.
    - d. Chilled water buffer tank.
    - e. Chilled water expansion tanks, air separators and piping accessories.
    - f. Chilled water pumps.
  - 2. Acceptable Insulation:
    - a. Flexible Mineral Fiber:
      - 1) 1-1/2 inch thick for cold surfaces above 35 degrees F.
      - 2) 2 inch thick for surfaces 35 degrees F and lower.
    - b. Rigid Mineral Fiber:

- 1) 1-1/2 inch thick for cold surfaces above 35 degrees F.
      - 2) 2 inch thick for surfaces 35 degrees F and lower.
    - c. Cellular Glass:
      - 1) 1-1/2 inch thick for surfaces above 35 degrees F.
      - 2) 2 inches thick for surfaces 35 degrees F and lower.
    - d. Flexible Elastomeric:
      - 1) 1-1/2 inch thick for surfaces above 35 degrees F.
      - 2) 2 inch thick for surfaces 35 degrees F and lower.
- E. Hot Equipment:
  1. Service:
    - a. Boilers.
    - b. Hot water buffer tanks.
    - c. Hot water expansion tanks, air separators, and piping accessories.
    - d. Hot water pumps.
  2. Acceptable Insulation:
    - a. Flexible Mineral Fiber:
      - 1) 3 inch thick for steam boilers and steam-jacketed heat exchangers.
      - 2) 2 inch thick for all other applications.
    - b. Rigid Mineral Fiber:
      - 1) 3 inch thick for steam boilers and steam-jacketed heat exchangers.
      - 2) 2 inch thick for all other applications.
    - c. Calcium Silicate
      - 1) 4-1/2 inches thick for low-pressure boilers and steam-jacketed heat exchangers.
      - 2) 3 inch thick for all other applications.
- F. Coils
  1. Application Requirements: Insulate the following coils that are installed in cold ducts:
    - a. Hydronic coils.
    - b. Refrigerant coils.
    - c. Steam coils.
    - d. Duct mounted electric heaters (do not insulate the control panel of the heater).
  2. Acceptable Insulation:
    - a. For ducts with exterior wrap, apply the same insulation as installed on the duct.
    - b. For ducts with interior duct liner, apply one of the following:
      - 1) Flexible Mineral Fiber: 1-1/2" thick, minimum R4.2.
      - 2) Rigid Mineral Fiber: 1" thick, minimum R-4.2.
      - 3) Cellular Glass: 1-1/2" thick, minimum R-4.2.
      - 4) Flexible Elastomeric: 1" thick, minimum R-4.2.
- G. Breechings, Chimneys, and Stacks:
  1. Service:
    - a. Breechings between heating equipment outlet and stack or chimney connection, except for double wall or factory insulated breechings.
    - b. Stack from bottom to top except for factory insulated stacks.
  2. Acceptable Insulation:
    - a. Flexible Mineral Fiber: 2 inch thick.
    - b. Calcium Silicate: 2 inch thick.
- H. Generator Exhaust:
  1. Service:
    - a. Emergency generator exhaust piping from generator outlet to discharge.
  2. Acceptable Insulation: Insulate each generator exhaust with one of the following types and thicknesses of insulation.
    - a. Flexible Mineral Fiber (ASTM C547 Type II only): 2 inch thick.
    - b. Calcium Silicate: 2 inch thick.

**3.14 EQUIPMENT JACKET SCHEDULE**

- A. Omit jacketing on equipment pre-insulated and jacketed from the factory.
- B. Interior Equipment (all except flexible elastomeric insulation):
  - 1. Canvas.
  - 2. Aluminum.
  - 3. Stainless steel.
- C. Equipment in unconditioned spaces (all except flexible elastomeric insulation):
  - 1. Canvas.
  - 2. Aluminum.
  - 3. Stainless steel.
- D. Exterior Equipment or Equipment Exposed to Weather:
  - 1. Aluminum.
  - 2. Stainless Steel.
  - 3. Multilayer Laminate Vapor Barrier Cladding.
  - 4. Rubberized Asphalt Vapor Barrier Cladding.
- E. Exterior Generator Exhaust or Generator Exhaust Exposed to Weather:
  - 1. Aluminum.
  - 2. Stainless Steel.

END OF SECTION

**SECTION 23 08 00 - COMMISSIONING OF HVAC SYSTEMS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Commissioning process requirements for HVAC systems, assemblies, and equipment.

**1.2 SUMMARY**

- B. Commissioning Authority
  - 1. Retain the services of a third-party registered design professional or approved agency that is regularly engaged in conducting commissioning to perform the duties of the Commissioning Authority including development of the commissioning plan, supporting documentation, and reports.
- A. This section covers the Contractor's responsibilities for commissioning; each subcontractor or installer responsible for the installation of a particular system or equipment item to be commissioned shall be responsible for the commissioning activities relating to that system or equipment item.
- B. The Commissioning Authority (CxA) shall direct and coordinate all commissioning activities and provide Prefunctional Checklists and Functional Test Procedures for Contractor's use.
- C. The entire HVAC system and its appurtenances shall be commissioned, including controls, ductwork, piping, noise and vibration control devices, specialty systems (e.g., smoke control systems), and other systems identified elsewhere in the Contract Documents.
- D. The Prefunctional Checklist and Functional Test requirements specified in this section are in addition to, not a substitute for, inspection or testing specified in other sections.

**1.3 RELATED REQUIREMENTS**

- A. Division 01 Commissioning requirements that apply to all types of work.

**1.4 REFERENCE STANDARDS**

- A. ASHRAE Guideline 0 – The Commissioning Process, most current edition.
- B. ASHRAE Guideline 1.1 - The HVAC Commissioning Process; most current edition.

**1.5 DEFINITIONS**

- C. Refer to Division 01 "General Commissioning Requirements" for additional abbreviations and definitions.
- A. BAS: Building Automation System.
- B. Commissioning Authority (CxA): An entity who coordinates the commissioning team to implement the Commissioning Process.
- C. Commissioning Plan: A document that outlines the organization, schedule, allocation of resources, and documentation requirements of the Commissioning Process.
- D. Commissioning Process: A quality-focused process for enhancing the delivery of a project. The process focuses on verifying and documenting that the facility and all of its systems and assemblies are planned, designed, installed, tested, operated, and maintained to meet the OPR. Commissioning is intended to achieve the following objectives:

1. Verify that applicable systems and equipment are designed and installed according to the manufacturer's recommendations and to industry accepted minimum standards.
  2. Verify that applicable systems and equipment receive adequate operational checkout by installing contractors.
  3. Verify and document proper performance of equipment and systems.
  4. Verify that O&M documentation provided to the Owner is complete.
  5. Verify that the Owner's operating personnel are adequately trained.
- E. Commissioning Report: A report that includes the following:
1. Results of final functional performance tests. Organize equipment and components specified by other Divisions in separate sections for independent review.
  2. List of functional performance testing procedures used during commissioning, including measurable criteria for test acceptance.
  3. Itemization of resolved deficiencies found during preliminary commissioning.
  4. List of deferred tests that cannot be performed at the time of final commissioning report preparation because of climatic conditions.
- F. Functional Performance Test (FPT): A test that verifies the equipment or item being tested performs in the manner intended.
- G. Operations and Maintenance Manual (O&M): A system-focused composite document that includes the operation manual, maintenance manual, and additional information of use to the Owner during the occupancy and operation of the building.
- H. Pre-Functional Checklist (PFC): A checklist that verifies all components and accessories related to a system that will be subjected to an FPT are present and functional.
- I. Systems, Subsystems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, subsystems, equipment, and components.
- J. TAB: Testing, Adjusting, and Balancing.

## 1.6 SUBMITTALS

- A. Updated Submittals: Keep the Commissioning Authority informed of all changes to the HVAC system documentation made during installation, and startup; revise and resubmit when substantial changes are made.
- D. Submit a commissioning plan that includes the following:
1. General project information and commissioning goals.
  2. Commissioning team information.
  3. Narrative description of commissioning process activities, schedules, responsibilities, and personnel required during commissioning.
  4. List of equipment and systems to be tested with description of tests to be performed. Include an explanation of the original design intent.
  5. List of functions to be tested, including calibration and economizer controls.
  6. List of conditions under which the tests shall be performed.
  7. List of measurable criteria for performance.
- B. Draft Prefunctional Checklists and Functional Test Procedures for Control System: Detailed written plan indicating the procedures to be followed to test, checkout and adjust the control system prior to full system Functional Testing; include at least the following for each type of equipment controlled:
1. System name.
  2. List of devices.
  3. Step-by-step procedures for testing each controller after installation, including:
    - a. Process of verifying proper hardware and wiring installation.
    - b. Process of downloading programs to local controllers and verifying that they are addressed correctly.

- c. Process of performing operational checks of each controlled component.
    - d. Plan and process for calibrating valve and damper actuators and all sensors.
    - e. Description of the expected field adjustments for transmitters, controllers and control actuators should control responses fall outside of expected values.
  4. Copy of proposed log and field checkout sheets to be used to document the process; include space for initial and final read values during calibration of each point and space to specifically indicate when a sensor or controller has "passed" and is operating within the contract parameters.
  5. Description of the instrumentation being used for testing.
  6. Indicate the tests required on each system that should be completed prior to TAB using the control system for TAB work. Coordinate with the Commissioning Authority and TAB contractor for this determination.
- C. Submit startup reports pre-functional tests, and trend logs for review by the Commissioning Authority.
- E. Submit a copy of the preliminary commissioning report. Preliminary commissioning report shall include the following:
1. Results of preliminary functional performance tests. Organize equipment and components specified by other Divisions in separate sections for independent review.
  2. List of functional performance testing procedures used during commissioning, including measurable criteria for test acceptance.
  3. Completed Commissioning Compliance Checklist.
  4. Itemization of deficiencies found during testing that have not been corrected at the time of preliminary commissioning report preparation.
  5. List of deferred tests that cannot be performed at the time of preliminary commissioning report preparation because of climatic conditions.
  6. List of climatic conditions required for the performance of the deferred tests.
- F. Submit a final commissioning report that includes the following:
1. Results of final functional performance tests. Organize equipment and components specified by other Divisions in separate sections for independent review.
  2. List of functional performance testing procedures used during commissioning, including measurable criteria for test acceptance.
  3. Itemization of resolved deficiencies found during preliminary commissioning.
  4. Submit report to the Engineer and Owner within 90 days of the date of receipt of the certificate of occupancy.
- D. Project Record Documents:
1. Submit as-built drawings indicating changes that occurred during the construction phase.
  2. Submit updated version of control system documentation, for inclusion with operation and maintenance data.
  3. Show actual locations of all sensors on project record drawings.
- G. O&M Manual: The O&M manual shall expand upon the more traditional operating and maintenance documentation to include information gathered during the commissioning process. Include the following for each system:
1. Manufacturer information.
  2. Equipment specifications and recommendations.
  3. Programming procedures and data points.
  4. Narratives.
  5. Other means of illustrating to the Owner how the building, equipment, and systems are intended to be installed, maintained, and operated.
  6. Label that includes required regular maintenance actions for equipment and systems.
    - a. Include in the label the title or publication number for the O&M manual for the model and type of product.
  7. Site information, including facility description, history, and current requirements.
  8. Site contact information.

9. Description of major systems.
10. As-built control schematics for each commissioned system.
11. As-built control sequences for each commissioned system, including final setpoints and list of all control points.
12. Final parameters of all peripheral equipment (e.g., final parameters resident in a VFD).
13. Recommended operating procedures for each piece of primary equipment.
14. Instructions for integrated building systems.
15. Instructions for basic troubleshooting.
16. Recommended schedule of maintenance requirements and frequency, troubleshooting guidelines, and emergency procedures.
17. Site equipment inventory and maintenance notes.
18. Site events log.
19. Copy of all special inspection verifications required by the enforcing agency or standards.

## **PART 2 - PRODUCTS**

### **2.1 TEST EQUIPMENT**

- A. Provide all standard testing equipment required to perform startup and initial checkout and required functional performance testing. Unless otherwise noted such testing equipment will NOT become the property of Owner.
- B. If not otherwise specified, provide test equipment certified and calibrated within the past year of use. Meet the following minimum accuracy requirements:
  1. Temperature sensors and thermometers: Accuracy of plus/minus 0.5 degrees F and resolution of plus/minus 0.1 degrees F.
  2. Pressure sensors: Accuracy of plus/minus 2.0 percent of value within the range of values being measured (not full range of sensor).
- C. Equipment-Specific Tools: Where special testing equipment, tools, and instruments are specific to a piece of equipment, are only available from the vendor, and are required in order to accomplish startup or Functional Testing, provide such equipment, tools, and instruments as part of the work. Such equipment, tools, and instruments shall become the property of Owner.

## **PART 3 - EXECUTION**

### **3.1 COMMISSIONING PROCESS OVERVIEW**

- A. The following narrative provides a brief overview of the typical commissioning tasks performed during the design, construction, acceptance, and post-occupancy phases and the general order in which they occur. Coordinate with the CxA to comply with the commissioning requirements of the project.
  1. Owner furnishes documentation to support the OPR and BOD to the design team and CxA.
  2. The design team prepares construction documents to meet the OPR and BOD.
  3. The CxA develops the commissioning plan.
  4. Plans are permitted and construction-related submittals for all commissioned equipment are provided to the CxA during the normal submittal process.
  5. The CxA develops specific equipment PFCs and furnishes them to the contractor.
  6. The CxA conducts a kick-off meeting early during construction and presents the commissioning process for the project.
  7. The Contractor coordinates project construction and prepares the project for inspecting, acceptance testing, and PFCs.
  8. The Contractor coordinates with the CxA to execute and document the PFCs. The CxA reports on the PFC process including an issues report.
  9. PFCs are completed before start-up, testing and balancing, and functional testing.

10. The Contractor and responsible subcontractors shall document equipment start-up and initial checkout with assistance from manufacturer's technicians. The CxA may request copies of the manufacturer's or contractor's field start-up reports.
11. The CxA develops specific FPT plans for review by the Engineer, Contract Administrator and responsible subcontractors.
12. The Contractor coordinates TAB for the project.
13. Testing, adjusting and balancing of completed HVAC systems is completed and verified by the CxA.
14. The Contractor and responsible subcontractors complete the installation and checkout of all building control systems.
15. The CxA coordinates and executes the FPTs with the assistance of responsible subcontractors. The CxA reports on the testing process including all observed deficiencies.
16. The CxA develops a preliminary commissioning report.
17. Testing of other commissioned systems not requiring formal functional testing is completed.
18. The CxA reviews close-out documentation and schedules deferred testing.
19. The Contractor and CxA coordinate to compile the O&M manual.
20. The CxA verifies training as required by the Contract Documents is completed.
21. The CxA develops a final commissioning report.
20. Recommended energy efficiency measures.

### 3.2 PREPARATION

- A. Cooperate with the Commissioning Authority in development of the Prefunctional Checklists and Functional Test Procedures.
- B. Furnish additional information requested by the Commissioning Authority.
- C. Prepare a preliminary schedule for use by the Commissioning Authority. Develop the following schedules and update the schedule as appropriate during the course of construction:
  1. Leakage testing of duct systems.
  2. Pressure testing of piping systems.
  3. Flushing and cleaning piping systems.
  4. Equipment startup.
  5. Testing, adjusting, and balancing systems.
- D. Notify the Commissioning Authority when scheduled tests shall occur. When commissioning activities not yet performed or not yet scheduled will delay construction, notify ahead of time and be proactive in seeing that the Commissioning Authority has the scheduling information needed to efficiently execute the commissioning process.
- E. Put all HVAC equipment and systems into operation and continue operation during each working day of testing, adjusting, and balancing and commissioning, as required.
  1. Include cost of sheaves and belts that may be required for testing, adjusting, and balancing.
- F. Provide test holes in ducts and plenums where directed to allow air measurements and air balancing; close with an approved plug.
- G. Provide temperature and pressure taps in accordance with the contract documents.
  1. Provide a pressure/temperature plug at each water sensor that is an input point to the control system.

### 3.3 INSPECTING AND TESTING - GENERAL

- A. Refer to the latest adopted edition of the applicable energy code for more information.

**3.4 PREFUNCTIONAL CHECKOUT**

- A. Submit startup plans, startup reports, and PFCs for each item of equipment or other assembly to be commissioned.
- B. PFCs shall demonstrate the commissioned equipment is properly installed and ready for startup and initial operation.
- C. Perform the PFCs directed by the CxA for each item of equipment or other assembly to be commissioned.
- D. Document items from the PFCs and startup that were not completed successfully.
- E. Complete and submit all PFC forms and provide notice that the equipment is ready for testing, adjusting, and balancing.
- F. Deficiencies: Correct deficiencies and re-inspect or re-test, as applicable, at no extra cost to Owner.

**3.5 TESTING AND BALANCING COORDINATION**

- A. Coordinate commissioning schedule with TAB schedule.
- B. Notify the CxA at least 7 days in advance of testing and balancing work. Provide access for the CxA to witness test TAB work.
- C. Review the TAB plan to determine the capabilities of the control system toward completing TAB.
- D. All required Prefunctional Checklists, calibrations, startup, and component Functional Tests of the system shall be completed and approved by the CxA prior to starting TAB.
- E. Coordinate with the BAS and TAB Contractor to make available technicians, instrumentation, and tools to assist the CxA in verification of data points associated with TAB of HVAC systems.

**3.6 FUNCTIONAL PERFORMANCE TESTING**

- A. The CxA shall furnish FPT procedures to the subcontractors and equipment manufacturers for review for feasibility, safety, equipment, and warranty protection.
- B. Perform the FPTs directed by the CxA for each item of equipment or other assembly to be commissioned, including equipment, controls, and economizers. FPTs shall demonstrate the following:
  - 1. The operation, function, and maintenance serviceability for each commissioned equipment, component, and system is confirmed according to the approved plans and specifications.
  - 2. The sequence of operations, including modes, backup modes (if applicable), alarms, and mode of operation upon a loss of power and restoration of power for each control device, equipment, component, and system. Reference section Control System Functional Testing below for more information.
  - 3. Control devices, components, equipment, and systems are calibrated, adjusted, and operate in accordance with the approved plans and specifications.
  - 4. Air economizers operated in accordance with manufacturer's specifications and specified sequence of operation.
  - 5. Terminal units: For multiples of like equipment (VAV terminal units, unit heaters, etc.), commission a minimum of 50 percent of total number of units.
- C. Coordinate with the responsible sub-contractors to provide trained technicians to perform commissioning tests and/or coordinate with equipment manufacturers to make available authorized technicians for the same purpose.

- D. Test equipment under design conditions when possible. Impose simulated design conditions using an artificial load when it is not practical to test under design conditions. Provide additional equipment to impose simulated loads. Set simulated conditions as directed by the CxA and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.
  - 1. The CxA may direct that set points be altered when simulating conditions is not practical.
  - 2. The CxA may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are not practical.
- E. If tests cannot be completed because of a deficiency outside the scope of the HVAC system, document the deficiency and report it to the Owner. After deficiencies are resolved, reschedule tests.
- F. If the Commissioning Plan indicates specific seasonal testing, complete appropriate initial performance tests and documentation and schedule seasonal tests.
- G. Deficiencies: Correct deficiencies and re-inspect or re-test, as applicable, at no extra cost to Owner.

### **3.7 DEFERRED AND SEASONAL TESTING**

- A. If any PFC or FPT cannot be completed due to an unforeseen condition not within control of the Contract Administrator, defer execution of the PFC or FPT based on the recommendation of the CxA and approval of the Owner. Complete the affected testing as soon as practical.
- B. During the warranty period, complete tests purposely delayed until weather conditions are closer to the system's design conditions. The CxA shall coordinate this activity. Any final adjustments to the O&M manuals and/or as-built drawings due to the testing shall be made by the CA.

### **3.8 OPERATION AND MAINTENANCE MANUALS**

- A. See Division 01 and Section "General Mechanical Requirements for HVAC" for additional requirements.
- B. Add design intent documentation furnished by Architect to manuals prior to submission to Owner.
- C. Submit manuals related to items that were commissioned to Commissioning Authority for review; make changes recommended by Commissioning Authority.
- D. Commissioning Authority will add commissioning records to manuals after submission to Owner.

### **3.9 DEMONSTRATION AND TRAINING**

- A. See Division 01 for additional requirements.
- B. Complete all related commissioning requirements prior to final inspections.
- C. Demonstrate operation and maintenance of HVAC system to Owner' personnel; if during any demonstration, the system fails to perform in accordance with the information included in the O&M manual, stop demonstration, repair or adjust, and repeat demonstration. Demonstrations may be combined with training sessions if appropriate.
- D. These demonstrations are in addition to, and not a substitute for, Prefunctional Checklists and demonstrations to the Commissioning Authority during Functional Testing.
- E. Provide classroom and hands-on training of Owner's designated personnel on operation and maintenance of the HVAC system, control system, and all equipment items indicated to be commissioned.
- F. Provide the services of manufacturer representatives to assist instructors where necessary.

- G. Provide the services of the HVAC controls instructor at other training sessions, when requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.
- H. Document systems operations training in the commissioning report.

END OF SECTION

**SECTION 23 09 13 - INSTRUMENTATION AND CONTROL DEVICES FOR HVAC****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Control panels.
- B. Fire-Fighter Smoke Control Panel.
- C. Control valves.
- D. Control dampers.
- E. Operators.
- F. Flow measuring apparatus.
- G. Input/Output sensors and transmitters.
- H. Output control devices.
- I. Power Supplies.
- J. Thermostats.

**1.2 DEFINITIONS**

- A. BAS: Building Automation System.
- B. Control Wiring: Includes conduit, wire and wiring devices to install complete control systems including motor control circuits, interlocks, thermostats, EP and IP switches and like devices. Includes all wiring from Intelligent Devices and Controllers to all sensors and points defined in the input/output summary shown on the drawings or specified herein and required to execute the sequence of operations.
- C. Cv: Design Valve Flow Coefficient.
- D. DDC: Direct Digital Control.
- E. EPDM: Ethylene Propylene Diene Monomer.
- F. High voltage: 50 volts or higher.
- G. Low voltage: Below 50 volts.
- H. PTFE: Polytetrafluoroethylene.
- I. TEFZEL: A modified ETFE (ethylene tetrafluoroethylene) fluoroplastic.

**1.3 CONTRACTOR RESPONSIBILITIES**

- A. Reference Division 23 Section "Electrical Coordination for Mechanical Equipment" for contractor responsibilities.
- B. BAS Contractor:
  - 1. Installation of the BAS shall be by the BAS Contractor or their subcontractors.
  - 2. Low voltage control wiring.
  - 3. Coordinate high voltage control wiring to instrumentation and control devices with Division 26. Where high voltage power is required for instrumentation and control devices that is in addition to what is shown on the drawings, the BAS contractor shall cover the cost of providing this wiring.

4. All interlock wiring regardless of voltage (e.g., exhaust fan interlocked to supply fan).
  5. Coordinate with Division 26 that motor starters are provided with auxiliary contacts as required for interlocks.
  6. Coordinate power wiring to BAS controllers and instrumentation and control devices with Division 26.
  7. Coordinate installation of back-box rough-in for wall-mounted control devices sensors, etc. with Division 26. Coordinate with mechanical contractor all locations, quantities, and sizes required for installation by Division 26.
  8. Perform startup and demonstration services as specified in Section "Direct Digital Control for HVAC".
  9. Smoke Control Systems: Coordinate all control panels and devices used as part of the smoke control systems are provided with an uninterruptible power system (UPS) to allow for continuous operation of all smoke control equipment during loss of normal power until stand by power is achieved. Coordinate the type and size required for the UPS with Division 26.
- C. Sheet Metal Contractor:
1. Installation of automatic control dampers, smoke control dampers, and necessary blank off plates.
  2. Access doors where and as required.
- D. Mechanical Contractor:
1. Installation of immersion wells.
  2. Installation of flow switches.
  3. Installation of automatic control valves.
  4. Installation of pressure tappings and associated shut-off cocks.
  5. Coordinate conduit and wall box rough-in, power wiring and magnetic starter requirements for controls and mechanical equipment with Division 26.

#### 1.4 SUBMITTALS

- A. Refer to Division 01 for submittal procedures.
- B. Product Data: Provide description and engineering data for each control system component. Include dimensions, capacities, size, performance characteristics, electrical characteristics, and finishes of materials.
- C. Shop Drawings: Indicate complete operating data, system drawings, wiring diagrams, and written detailed operational description of sequences. Submit schedule of valves indicating size, flow, and pressure drop for each valve. For automatic dampers indicate arrangement, velocities, and static pressure drops for each system.
- D. Schedule for control valves and actuators, including the following:
1. Tag.
  2. Quantity.
  3. Model number.
  4. Equipment served.
  5. Flow at project design conditions.
  6. Selected valve flow coefficient (Cv). For butterfly valves, submit the corresponding valve position at which the Cv is calculated.
  7. Pressure differential drop across valve at project design flow conditions and selected Cv.
  8. Maximum close-off pressure.
  9. Valve Configuration (2-way/3-way).
  10. Valve Normal Position and Fail Position (e.g., NO/FO; normally open/fail open).
  11. Valve Size.
  12. Line Size.
  13. Valve Type.
  14. Actuator Signal Type (Open/Close, Modulating 0-10 Vdc, 2-10 Vdc, 4-20 mA, etc.)

15. Torque required to close valve at pump shutoff head.
  16. Selected actuator maximum torque output.
- E. Manufacturer's Instructions: Provide for all manufactured components.
  - F. Operation and Maintenance Data: Include inspection period, cleaning methods, recommended cleaning materials, and calibration tolerances.
  - G. Project Record Documents: Record actual locations of control components, including panels, thermostats, and sensors. Accurately record actual location of control components, including panels, thermostats, and sensors.
  - H. Warranty: Submit manufacturer warranty and ensure forms have been filled out in Owner's name and registered with manufacturer.
  - I. Fire Fighter Control Panel Graphics: Submit the mechanical smoke control system graphic display with color chart.
  - J. Fire Fighter Control Panel Verification Test Exceptions: Submit documentation to the Owner and Engineer, signed by the authority having jurisdiction, for all devices, equipment, and components approved to be exempt from the weekly verification test sequence required by the building code.

### **1.5 QUALITY ASSURANCE**

- A. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc., as suitable for the purpose specified and indicated.
- C. Control valves shall be manufactured in plants located in the United States or certified to meet the specified ASTM, ANSI and MSS standards.
- D. Measurement devices and sensors shall be calibrated using NIST traceable standards.

### **1.6 WARRANTY**

- A. Correct defective Work within a one year period after Substantial Completion.
- B. Provide extended warranty for control devices and equipment as specified herein.

## **PART 2 - PRODUCTS**

### **2.1 CONTROL PANELS**

- A. Construction:
  1. Panel shall be UL 508A listed.
  2. NEMA 250, general purpose utility enclosures with enameled finished face panel.
  3. NEMA 4X utility enclosure for outdoor or wash-down applications.
  4. Provide common keying for all panels.

### **2.2 FIRE-FIGHTER SMOKE CONTROL PANEL**

- A. General:
  1. Comply with local building code.
  2. Include manual control and override of automatic control of mechanical smoke control systems.
  3. Include a graphic display with switches for control and indicator lights for monitoring status and override of automatic control of smoke control equipment as specified herein and described on the drawings.

4. UL864 – UUKL listed as a Firefighters Smoke Control Station.
- B. Construction:
1. Unitized cabinet, primed and painted with a baked enamel, textured finish. Provide a security door with viewing window.
  2. Include an aluminum substrate for mounting of graphics, indicating lights, switches, control devices and test stations.
  3. Front panel shall have a polyester film overlay protected by a non-glare textured coating which is non-yellowing, durable and scratch resistant. The overlay shall be bonded to the front panel with an adhesive that does not delaminate and provides 100 percent bonding.
  4. Graphics: The front panel overlay shall be a multi-color graphic display showing the mechanical smoke control system as shown on the drawings. Smoke control fans within the building shall be shown on the fire-fighter's control panel. Display a clear indication of the direction of airflow and the relationship of components.
  5. Switches: Rotary or flip type for ON-OFF-AUTO, OPEN-AUTO-CLOSE, ON-OFF or OPEN-CLOSE operation as required per code for the operated equipment. Include a keyed switch for panel enable and a momentary test button for sample testing of all indicating lights.
  6. Indicating Lights: High intensity LED or pilot-lamp type lights of colors as required by code. Indicate the following:
    - a. Normal, Off, On, or Fault status of equipment.
    - b. Positive confirmation of actuation, testing, manual override, and the presence of power downstream of all disconnects.
    - c. Panel power.
    - d. Panel communication fault.
  7. Audible Signal: Provide audible signal to indicate failure of smoke control equipment.
- C. Operating Features:
1. Full monitoring and manual control capability over smoke control systems or equipment.
  2. Capability to override any operation in progress or other control signal associated with the smoke control equipment except electrical overload or personnel safety devices.
  3. Act as highest priority over the smoke control systems or equipment.
  4. Indicate actual status of systems and equipment used for smoke control.
  5. Ability to activate an audible signal if the operational proof sensor failed to provide positive feedback that the equipment operated as commanded.
  6. Alarm a failure of smoke control systems or equipment.
  7. Provisions for verification of system operation.
  8. Conduct a pre-programmed weekly test sequence to report abnormal conditions audibly, visually, and by printed report. The pre-programmed weekly test shall operate all devices, equipment, and components used for smoke control.

## 2.3 CONTROL VALVES

- A. General:
1. Factory fabricated of type, body material, and pressure class based on maximum pressure and temperature rating of piping system, unless otherwise indicated. Each valve shall be equipped with proper packing to ensure there will be no leakage at the valve stem.
  2. Pressure Ratings:
    - a. Valve body and packing rated to withstand the system static head plus the maximum pump head and the maximum temperature of the control medium (i.e. chilled water, steam, hot water, etc.).
      - 1) Minimum pressure class 150 psig.
    - b. Two-way modulating valves and their operators shall have close-off pressure ratings exceeding the dead-head condition of the pump in the system it serves.
    - c. Two-way modulating valves with equal percentage flow characteristics and their operators shall be rated to safely operate within a differential pressure range between 2 and 50 psi across the valve without cavitating.
  3. Sizing:

- a. Hydronic Systems:
  - 1) Two-Position: Line size or sized using a maximum pressure differential of 1 psi. Size butterfly valves using the 90 degree flow coefficient (Cv).
  - 2) Modulating: Select valves with an appropriate flow coefficient (Cv) to achieve a minimum design valve authority of 0.5 relative to the total pressure drop of the piping branch the valve controls. Calculate Cv based on the larger of the following:
    - a) 5-psig pressure drop at the design flow rate specified in the Schedules.
    - b) Twice the equipment design pressure drop as specified in the Schedules unless otherwise noted:
      - i) Minimum Flow Primary Bypass Valve: Refer to the drawings for the required flow rate and pressure drop.
    - c) Valve shall not be less than 1/2 Inch in size.
    - d) Size butterfly valves using the 60 degree of full open flow coefficient (Cv).
- 4. Flow Characteristics:
  - a. Hydronic Service:
    - 1) Two-way valves: Equal percentage characteristic.
    - 2) Three-way valves: Linear characteristic.
    - 3) Chiller isolation valves: Linear characteristic.
  - b. Steam Service: Linear flow characteristics.
- 5. End Connections:
  - a. Reference the Control Valve Schedule in Part 3 for allowable end connections by pipe material.
  - b. Carbon steel and stainless steel valves shall comply with ASME B16.34.
  - c. Comply with ASME B16.10 for face-to-face and end-to-end dimensions.
  - d. Threads:
    - 1) Comply with ASME B1.20.1.
    - 2) Comply with ASME B16.4 for cast iron.
    - 3) Comply with ASME B16.15 for cast copper alloys, including bronze and brass.
  - e. Flanges:
    - 1) Comply with ASME B16.5 for steel.
    - 2) Comply with ASME B16.1 for cast iron
    - 3) Comply with ASME B16.24 for cast copper alloys, including bronze and brass.
  - f. Grooved Fittings:
    - 1) Water services to 230 deg F and 250 psig.
- B. Globe Pattern:
  - 1. Size: Reference the Control Valve Schedule in Part 3 for allowable valve size and end connection by application.
  - 2. Construction:
    - a. Up to 2 inches: Class 150, ASTM B62 bronze body, bronze trim, rising stem, renewable composition disc, screwed ends with backseating capacity repackable under pressure.
      - 1) Bronze body and bonnet shall conform to ASTM B62 up to pressure class 150. Conform to ASTM B61 for pressure class 200 and higher.
    - b. Over 2 Inches: Iron body, bronze trim, rising stem, plug-type disc, flanged ends, renewable seat and disc.
      - 1) Iron body and bonnet shall conform to ASTM A126, class B.
    - c. Bonnet:
      - 1) Bronze body, Class 125: Threaded type.
      - 2) Bronze body, Class 150 or higher: Union type.
      - 3) Iron body: Bolted type.
    - d. Disc Material:
      - 1) PTFE.
      - 2) Stainless steel.

- e. Stem: Outside screw and yoke. Include extension for insulation.
  - f. Two-piece brass packing gland assembly, non-asbestos composition packing.
  - 3. Rangeability: Minimum 50:1.
  - 4. Leakage:
    - a. Up to 1-1/4 Inch: Minimum ANSI Class III per ANSI/FCI 70-2.
    - b. 1-1/2 Inch and Larger: Minimum ANSI Class IV per ANSI/FCI 70-2.
  - 5. Design and Testing:
    - a. MSS SP-80 for bronze.
    - b. MSS SP-85 for cast iron.
- C. Ball Pattern:
- 1. Size: Reference the Control Valve Schedule in Part 3 for allowable valve size by application.
  - 2. Construction:
    - a. Body:
      - 1) Bronze conforming to ASTM B61, B62, and B584.
      - 2) Forged brass with or without nickel plating conforming to ASTM B283.
      - 3) Cast carbon conforming to ASTM A216.
      - 4) Cast iron according to ASTM A126.
      - 5) Stainless steel conforming to ASTM A351.
    - b. Up to 2 inches: Two-piece construction
    - c. 2-1/2 inch to 3 inch: Three-piece construction.
    - d. Stainless steel, blowout proof stem. Include extension for insulation.
    - e. Replaceable PTFE seats and EPDM O-ring or PTFE packing seals.
  - 3. Ball: Full port with characterized insert comprised of the following material:
    - a. Stainless steel.
    - b. Chrome-plated.
    - c. Nickel-plated.
  - 4. Rangeability: Minimum 50:1.
  - 5. Leakage: Minimum ANSI Class IV per ANSI/FCI 70-2.
  - 6. Design and Testing:
    - a. MSS SP-72 for flanged ends.
    - b. MSS SP-110 for threaded and grooved ends.
- D. Butterfly Pattern:
- 1. Size: Reference the Control Valve Schedule in Part 3 for allowable valve size by application.
  - 2. Construction:
    - a. Body: Lug ends suitable for connecting to ASME B16.5 flanges, or grooved ends.
      - 1) Cast iron according to ASTM A126.
      - 2) Ductile iron according to ASTM A536.
      - 3) Cast steel according to ASTM A216.
    - b. Disc:
      - 1) Aluminum bronze.
      - 2) Stainless steel.
      - 3) One-piece nylon coated ductile iron disc. Nylon coated discs are not allowed for open loop condenser water systems.
    - c. Stem: 416 Stainless steel. Include extension for insulation.
    - d. Replaceable PTFE or EPDM seats and seals.
  - 3. Rangeability: Minimum 20:1.
  - 4. Leakage: Minimum ANSI Class IV, per ANSI/FCI 70-2.
  - 5. Design and Testing: MSS SP-67 for Class 150 and MSS SP-68 for pressure classes above 150.
- E. Manufacturers:
- 1. Belimo.
  - 2. Bray.

3. Danfoss.
  4. Fisher Controls.
  5. Griswold Controls.
  6. Honeywell.
  7. Johnson Controls, Inc.
  8. Kele.
  9. Schneider Electric.
  10. Siemens.
  11. Victaulic (Tour & Andersson).
- F. At the contractor's discretion, control valves and balancing valves may be combined into a single device. Submit pricing deduct as an alternate to the base bid.
1. Manufacturers:
    - a. Victaulic, TBV-TC/TCM Series.
- G. Pressure Independent Control Valves (PICV):
1. Sizing:
    - a. Size valve and cartridge based on design flow rate through the circuit it serves. Choose the smallest valve rated by the manufacturer capable of delivering the design flow rate unless otherwise noted.
  2. Construction:
    - a. Factory fabricated, Integrated valve body that incorporates an adjustable flow coefficient (Cv) chamber and separate pressure regulating chamber to maintain a constant differential pressure across the valve.
    - b. Field-adjustable: Capable of modifying the valve flow characteristics without removing the valve from the piping system.
    - c. Valve shall have a minimum of two integral ports factory installed capable of being used to measure pressure or temperature. If valve does not have these ports, contractor shall provide test ports on each side of valve for field verification.
    - d. 2 Inch and Smaller:
      - 1) Forged brass body conforming to ASTM B283.
    - e. 2-1/2 Inch and Larger:
      - 1) Ductile iron body conforming to ASTM A536.
      - 2) Cast carbon body conforming to ASTM A216.
      - 3) Stainless steel body conforming to ASTM A351.
    - f. Flow Regulator: Stainless steel.
    - g. Stem: Brass or stainless steel, blowout proof. Include extension for insulation.
    - h. Replaceable PTFE seats and EPDM O-ring or PTFE packing seals.
    - i. Characterizing Disc:
      - 1) Ball Type: Full port with characterized insert comprised of the following material:
        - a) Stainless steel.
        - b) Chrome-plated.
        - c) Nickel-plated.
      - 2) Plug Type: Brass, TEFZEL, or stainless steel characterizing disc.
  3. Electronic Actuator:
    - a. Direct mounted, self-calibrating type designed for minimum 60,000 full-stroke cycles at rated force.
    - b. Supplied from the same manufacturer as the valve.
    - c. Include visible position indicator.
    - d. Overload Protection: Electronic overload or digital rotation-sensation circuitry.
    - e. Fail-Safe Operation: Mechanical, spring-return mechanism or Capacitance return.
    - f. Power Requirements: 24 VAC/DC motor; accepting a 0-10 Vdc or 4-20 mA signal.
  4. PICVs shall be individually flow tested and factory verified with calibrated instruments to deviate not more than  $\pm$  5 percent through the selected operating pressure range. A calibrated performance tag shall be provided with each valve that verifies the flow in 10 degree rotation increments up to full rated flow.

5. Accuracy: PI control valve shall accurately control the flow from 0 to 100 percent rated flow within an operating pressure differential range of 5 to 50 psi across the valve.
6. Leakage: Minimum ANSI Class IV per ANSI/FCI 70-2. Valve shall be equipped with proper packing to ensure there will be no leakage at the valve stem.
7. Design and Testing:
  - a. MSS SP-72 for flanged ends.
  - b. MSS SP-110 for threaded and grooved ends.
8. PI control valves shall be provided with electronic actuator driven by a 24VAC/DC motor from a 0-10Vdc or 4-20 mA signal.
9. Extended Warranty: Minimum of 5 years from date of shipment.
10. Manufacturers:
  - a. Belimo.
  - b. Bray.
  - c. Danfoss.
  - d. Flow Control Industries.
  - e. Griswold Controls.
  - f. Honeywell.
  - g. Johnson Controls.
  - h. Oventrop.
  - i. Victaulic (Tour & Andersson).

## 2.4 CONTROL DAMPERS

- A. Dampers shall be factory fabricated and sized as shown on drawings and as specified.
- B. Individual damper sections shall not be larger than 48 inches x 60 inches. Provide a minimum of one damper actuator per section.
- C. Performance: Test in accordance with AMCA 500-D.
  1. Pressure Drop: Unless otherwise scheduled or indicated on the Drawings, size control dampers as follows:
    - a. Modulating Dampers: Provide dampers with linear flow characteristics. Size modulating dampers based on the smaller of the following.
      - 1) Maximum velocity of 1,500 feet per minute.
      - 2) Maximum Full-open air pressure drop of 0.1 inches W.C.
    - b. Two Position Dampers: Dampers shall be full duct size and selected to minimize pressure drop.
  2. Leakage:
    - a. Motorized dampers for outdoor, exhaust and relief air and for shaft and stairway vents shall be Class I leakage and shall not exceed 4.0 CFM/square foot in full closed position at 1 inch W.G. pressure differential across damper.
    - b. Motorized dampers for other applications shall be Class II leakage.
  3. All control dampers used for smoke control shall conform to UL555S. Dampers that are installed in fire rated assemblies requiring fire rating shall also conform to UL555.
    - a. Fire/smoke dampers shall have fire resistance of 1-1/2 or 3 hours in accordance with UL 555 as required for the rated assembly that damper is installed.
      - 1) Fire/smoke damper shall have elevated temperature rating of 250 F to remain open during smoke control operation.
    - b. Fire/smoke and smoke dampers shall be rated for Leakage Class I in accordance with UL555S and shall be rated for dual direction airflow.
- D. Frames: Galvanized steel, extruded aluminum, or stainless steel, welded or riveted with corner reinforcement.
  1. Use minimum 16 gauge for rectangular dampers.
  2. Use minimum 20 gauge for round dampers.
  3. For aluminum frames, use 1/8 inch thick material.
  4. All damper frames shall have a flange for duct mounting.

5. Reference Part 3 Execution for application of the material type.
- E. Blades: Galvanized steel, extruded aluminum, or stainless steel, maximum blade size 6 inches wide, 48 inches long, attached to minimum 1/2 inch shafts with set screws.
  1. Use minimum 16 gauge for rectangular dampers.
  2. Use minimum 16 gauge for round dampers.
  3. For aluminum blades, use 1/8 inch thick material.
  4. The blades shall be suitable for the air velocities to be encountered in the system.
  5. Dampers longer than the maximum blade length shall be fabricated in sections.
  6. Reference Part 3 Execution for application of the material type.
- F. Blade Seals: Synthetic elastomeric inflatable or Neoprene, mechanically attached, field replaceable.
  1. Installed along the top and bottom of the frame and on all mating surfaces.
- G. Jamb Seals: Spring stainless steel.
  1. Installed inside the frame sides.
- H. Shaft Bearings: One of the following as recommended by manufacturer for the application:
  1. Oil impregnated sintered bronze.
  2. Graphite impregnated nylon sleeve with thrust washers at bearings.
  3. Lubricant free, stainless steel, single row, ground, flanged, radial, antifriction type with extended inner race.
  4. Molded synthetic bearings.
- I. Linkage Bearings: One of the following as recommended by manufacturer for the application:
  1. Oil impregnated sintered bronze
  2. Graphite impregnated nylon.
- J. Maximum Pressure Differential: 6 inches wg.
- K. Temperature Limits: -40 to 200 degrees F.
- L. Smoke Control Damper Accessories
  1. Fire/Smoke Damper
    - a. Fire Stat: Provide UL classified dual temperature device that allows the damper to be re-opened after initial closure from high heat. Fire stat shall lock the damper closed when duct temperature exceeds temperature of 250 350 F. Fire stat shall allow the damper to remain operable from the control panel for smoke management purposes while air temperature is below the elevated temperature range specified herein.
    - b. Blade Position Indicator Switches: Provide two position indicator switches linked directly to the damper blade to enable remote indication of damper position.
    - c. Factory Sleeve: Provide minimum 20 gauge thick sleeve of length as required for the installation.
  2. Smoke Damper:
    - a. Blade Position Indicator Switches: Provide two position indicator switches linked directly to the damper blade to enable remote indication of damper position.
    - b. Factory Sleeve: Provide minimum 20 gauge thick sleeve of length as required for the installation.
- M. Manufacturers:
  1. Greenheck.
  2. CESCO.
  3. Pottorff.
  4. Nailor.
  5. Ruskin.
- N. Reference the Damper Schedule in Part 3 for basis of design damper model and material for the application.

## 2.5 OPERATORS

### A. General:

1. Voltage: Voltage selection shall be as required to achieve the required torque for the application.
  - a. Reference Part 3 for Damper Operator Voltage Schedule.
2. Type: Motor operated, with or without gears. Motor type shall be continuous duty.
3. Construction:
  - a. For Actuators Less Than 100 W: Fiber or reinforced nylon gears with steel shaft, copper alloy or nylon bearings, and pressed steel enclosures.
  - b. For Actuators from 100 to 400 W: Gears ground steel, oil immersed, shaft hardened steel running in bronze, copper alloy or ball bearings. Operator and gear trains shall be totally enclosed in dustproof cast-iron, cast-steel or cast-aluminum housing.
  - c. For Actuators Larger Than 400 W: Totally enclosed reversible induction motors with auxiliary hand crank and permanently lubricated bearings.
4. Field Adjustment:
  - a. Spring Return Actuators: Easily switchable from fail open to fail closed in the field without replacement.
  - b. Gear Type Actuators: External manual adjustment mechanism to allow manual positioning when the actuator is not powered.
5. Two-Position Actuators: Single direction, spring return or reversing type. End-switches shall be integral to the actuator to determine actuator status.
6. Modulating Actuators:
  - a. Operation: Capable of stopping at all points across full range, and starting in either direction from any point in range.
  - b. Control Input Signal:
    - 1) Three Point, Tristate, or Floating Point: Clockwise and counter-clockwise inputs. One input drives actuator to open position and other input drives actuator to close position. No signal of either input remains in last position.
    - 2) Proportional: Actuator drives proportional to input signal and modulates throughout its angle of rotation. Suitable for zero- to 10-Vdc or 2- to 10-Vdc and 4- to 20-mA signals.
    - 3) Pulse Width Modulation (PWM): Actuator drives to a specified position according to pulse duration (length) of signal from a dry contact closure, triac sink, or source controller.
  - c. Programmable Multi-Function:
    - 1) Control Input, Position Feedback, and Running Time: Factory or field programmable.
    - 2) Diagnostic: Feedback of hunting or oscillation, mechanical overload, mechanical travel, and mechanical load limit.
    - 3) Service Data: Include, at a minimum, number of hours powered and number of hours in motion.
7. Position Feedback:
  - a. Where indicated on the controls drawings, equip two-position actuators with limits switches or other positive means of a position indication signal for remote monitoring of open and close position.
  - b. Where indicated on the controls drawings, equip modulating actuators with a position feedback through current or voltage signal for remote monitoring.
  - c. Actuator shall contain position indicator and graduated scale indicating open and closed travel limits.
8. Integral Overload Protection:
  - a. Provide against overload throughout the entire operating range in both directions.
  - b. Electronic overload, digital rotation sensing circuitry, mechanical end switches, or magnetic clutches are acceptable methods of protection.
9. Attachment:

- a. Unless otherwise required for valve interface, provide an actuator designed to be directly coupled to device without the need for connecting linkages.
  - b. Attach actuator to device drive shaft in a way that ensures maximum transfer of power and torque without slippage.
10. Temperature and Humidity:
    - a. Temperature: Suitable for operating temperature range encountered by application.
    - b. Humidity: Suitable for humidity range encountered by application, non-condensing.
  11. Enclosure:
    - a. Suitable for ambient conditions encountered by application.
    - b. NEMA 4 for indoor wash-down or wet locations.
    - c. NEMA 4X, Belimo ZS-300, or equivalent; for outdoor applications.
    - d. Provide actuator enclosure with heater and control where required by application.
  12. Stroke Time:
    - a. Coordinate with stroke time indicated on the control drawings.
    - b. Unless otherwise noted, select operating speed to be compatible with equipment and system operation.
- B. Damper Operators:
1. Controls contractor shall size damper operator.
  2. Sizing: Provide smooth proportional control with sufficient power for air velocities 20 percent greater than maximum design velocity and to provide tight seal against maximum system pressures. Provide spring return for two position control and for fail safe operation.
    - a. Provide sufficient number of operators to achieve unrestricted movement throughout damper range.
    - b. Provide one operator for maximum 20 sq ft damper section or maximum 7 in-lb/sq ft damper area.
  3. Fail Positions:
    - a. Spring return to normal position as indicated on freeze, fire, temperature, or loss of power protection. Normal positions are indicated on the control drawings.
      - 1) Return air damper, normally open.
      - 2) Outside air damper, normally closed.
      - 3) Exhaust/Relief air damper, normally closed.
    - b. Operator shall fail in place for all other applications not listed under spring return.
- C. Valve Operators
1. Sizing: Select operator with sufficient torque capacity to operate the valve under all conditions and to guarantee tight shut-off of as specified against system pressure encountered.
    - a. Operators for Hydronic Control Valves: Capable of closing valve against system pump dead head.
  2. Fail Positions:
    - a. Spring return to normal position as indicated on freeze, fire, temperature, or loss of power protection.
      - 1) Pre-heat coil, normally open.
      - 2) Other devices needing fail safe operation to account for freeze protection, power failure, overheating or moisture damage, reference control drawing points list for normal position.
    - b. Operator shall fail in place for all other applications not listed under spring return.
- D. Manufacturers:
1. Damper Operators:
    - a. Belimo.
    - b. Honeywell.
    - c. Johnson Controls.
    - d. Schneider Electric (Invensys).
    - e. Siemens.
  2. Valve Operators:

- a. Belimo.
- b. Bray.
- c. Danfoss.
- d. Fisher Controls.
- e. Honeywell.
- f. Johnson Controls.
- g. Schneider Electric (Invensys).
- h. Siemens.

## 2.6 FLOW MEASURING APPARATUS

### A. Airflow Measuring Stations

1. Sensor quantity and spacing shall comply with the Equal-Area or Log-Tchebycheff method as defined in the ASHRAE Handbook of Fundamentals.
2. Element Construction: Non-corrosive material such as stainless steel, aluminum, or cadmium-plated.
3. Stations and insertion elements utilizing thermal dispersion technology shall utilize hermetically sealed thermistors for each sensor and shall be factory calibrated to NIST traceable standards.
4. Stations and insertion elements using velocity pressure shall be tested and certified in accordance with AMCA 611.
5. Air Inlet Measuring Stations:
  - a. Intended for location within an air inlet to equipment, such as a hood or louver.
  - b. Elements:
    - 1) Element constructed of 316 stainless steel, factory mounted in a circular puck constructed of 14 gauge galvanized steel. Housing shall meet NEMA 1.
    - 2) Element shall not induce a measurable pressure drop, adversely affect fan performance or amplify the sound level within the fan system by its presence in the airstream.
    - 3) Element shall not be affected by the presence of moisture, dirt, or debris in the airstream and shall be unaffected by gusting wind.
    - 4) Density corrected for ambient temperature variances and atmospheric pressure due to altitude.
  - c. Range: Minimum 100 to 2,400 fpm.
  - d. Accuracy: Plus/minus 5.0 percent of reading within the calibrated airflow range.
  - e. Options: Provide with remote monitoring panel for local display.
  - f. Manufacturers:
    - 1) Air Monitor Corporation.
    - 2) Approved equal.
6. Fan Inlet Air Flow Measuring Stations:
  - a. Located in the fan cone inlet with a minimum of two sensing elements.
  - b. Traverse Type Elements:
    - 1) The elements shall not induce a measurable pressure drop, adversely affect fan performance or amplify the sound level within the fan system by its presence in the airstream.
  - c. Surface Mount Probes:
    - 1) Thermal Dispersion Type: Two surface mounted thermal dispersion probes mounted on opposite ends of the fan cone shall monitor the airflow.
    - 2) Velocity Pressure Type: The piezometer ring probes shall monitor the pressure difference between the largest and smallest diameters of the inlet cone venturi. High and low pressure sensors shall be connected to flow tubes extending to a termination plate mounted on the fan housing.
  - d. Range: Minimum 100 to 10,000 fpm.
  - e. Accuracy: Plus/minus 3.0 percent of the measured airflow range.
  - f. Manufacturers:
    - 1) Air Monitor Corporation.

- 2) Ebtron.
  - 3) Greenheck
  - 4) Johnson Controls.
  - 5) Paragon Controls.
  - 6) Ruskin.
  - 7) Sensoco.
7. Duct Air Flow Measuring Stations
- a. Located in a configuration and size equal to that of the duct it is installed.
  - b. The airflow traverse probe shall not induce a measurable pressure drop, nor amplify the sound level within the duct by its presence in the airstream.
  - c. Flow Straightener: Provide flow straightener as required by manufacturer of construction as needed to meet the application.
  - d. Range: Minimum 400 to 4,000 fpm.
  - e. Accuracy: Plus/minus 2.0 percent of the measured airflow.
  - f. Manufacturers:
    - 1) Air Monitor Corporation.
    - 2) Ebtron.
    - 3) Johnson Controls.
    - 4) Paragon Controls.
    - 5) Ruskin.
    - 6) Sensoco.
8. Signal Processor:
- a. Microprocessor-based, field programmable, capable of local display of the measured airflow rate.
  - b. Factory calibrated to NIST traceable standards.
  - c. Accuracy: 0.1 percent of full scale, including linearity, hysteresis, dead band, and repeatability.
  - d. Output: 0 to 10 Vdc or 4-20 mA scaled output signal for remote monitoring.
- B. Water Flow Meter: Provide Water Flow Meter as specified in Division 23 Section, "Meters and Gauges for HVAC Piping."
- C. BTU Meter: Provide BTU Meter as specified in Division 23 Section, "Meters and Gauges for HVAC Piping."

## 2.7 INPUT OUTPUT SENSORS AND TRANSMITTERS

- A. General:
- 1. Performance Requirements:
    - a. Device must be compatible with project DDC controllers.
    - b. Elements used shall be general-purpose type.
    - c. Provide transmitters or transducers with sensors as required, with range suitable for the system encountered.
      - 1) Transmitters and transducers shall have offset and span adjustments.
      - 2) Shock and vibration shall not harm the transmitter or transducer.
      - 3) Transmitters and transducers shall have a zeroing capability of readjusting the transmitter zero.
    - d. Accuracy requirements shall include the combined effects of linearity, hysteresis, repeatability, and the transmitter.
  - 2. Output: Linear, proportional type over shielded cable pair, 4 - 20 mA or 0 – 10 Vdc signal.
  - 3. Input Power: Low voltage, nominal 24 Vdc.
- B. Temperature Sensors:
- 1. General: Temperature sensing elements shall have characteristics resistant to moisture, vibration, and other conditions consistent with the application without affecting accuracy and life expectancy. Sensor shall be UL 873 listed for temperature equipment.
  - 2. Performance Requirements:

- a. Thermistor:
    - 1) Accuracy (All): Plus/minus 0.36 degrees F minimum.
    - 2) Temperature Differential Accuracy: Plus/minus 0.15 degrees F minimum.
    - 3) Resolution: Plus/minus 0.2 degrees F minimum.
    - 4) Heat Dissipation Constant: 2.7 mW per degree C.
    - 5) Drift: 0.04 degree F after 10 years within temperature range.
  - b. RTD:
    - 1) Construct RTD of nickel or platinum with base resistance of 1000 ohms at 70 degrees F. 100 ohm platinum RTD is acceptable if used with project DDC controllers.
    - 2) Accuracy (All): Plus/minus 1 degree F minimum, unless otherwise noted below.
      - a) Room Sensor Accuracy: Plus/minus 0.5 degrees F minimum.
      - b) Chilled Water Accuracy: Plus/minus 0.5 degrees F minimum.
      - c) Temperature Differential Accuracy: Plus/minus 0.15 degrees F minimum.
    - 3) Resolution: Plus/minus 0.2 degree F.
    - 4) Drift: 0.04 degrees F after 10 years within temperature range.
  - c. Sensing Range:
    - 1) Provide limited range sensors if required to sense the range expected for a respective point.
  - d. Wire Resistance:
    - 1) Use appropriate wire size to limit temperature offset due to wire resistance to 1.0 degree F or use temperature transmitter when offset is greater than 1.0 degree F due to wire resistance.
    - 2) Compensate for wire resistance in software input definition when feature is available in the DDC controller.
  3. Outside Air Sensors: Watertight inlet fitting shielded from direct rays of the sun.
  4. Room Temperature Sensors:
    - a. Construct for surface or wall box, or enclosure with insulated backing suitable for exterior wall mounting.
    - b. Provide the following features:
      - 1) Non-adjustable, blank front panel.
      - 2) Setpoint reset slide switch, dial wheel, or push-button interface with an adjustable temperature range.
      - 3) Locking cover where noted on the drawings.
      - 4) Integral digital display with the following:
        - a) Indication of space temperature.
        - b) Setpoint adjustment to accommodate room setpoint.
  5. Temperature Averaging Elements:
    - a. Use on duct sensors for ductwork 10 sq ft or larger.
    - b. Use averaging elements where prone to stratification with sensor length range between 16-22 ft.
    - c. Provide for all mixed air and heating coil discharge sensors regardless of duct size.
  6. Insertion Elements:
    - a. Use in ducts not affected by temperature stratification or smaller than 10 sq ft.
    - b. Provide dry type, insertion elements for liquids, installed in immersion wells, with minimum insertion length of 2.5 inches for pipe sizes greater than 4 inches.
    - c. Immersion Well Housing: 1/2 inch NPT brass or stainless steel. Stainless steel required for piping 6 inch and larger.
- C. Humidity Sensors:
1. Elements: Accurate within 3 percent full range with linear output.
    - a. Accuracy shall include temperature effects.
  2. Resolution: Plus/minus 1 percent.
  3. Drift: Less than 1 percent full scale per year.

4. Sensing Range: 0 to 100 percent relative humidity.
  5. Room Sensors: Provide housing with integral sensor. Housing shall be plastic, NEMA 250, Type 1. Provide with insulated backing suitable for exterior wall mounting.
  6. Duct Sensors: Insertion type probe with mounting plate. Housing shall be metal, NEMA 250, Type 1.
  7. Outside Air Sensors: With element guard and mounting plate.
- D. Pressure Transmitters:
1. Duct Static Pressure:
    - a. Type: Unidirectional, fixed range.
    - a. Performance Characteristics:
      - 1) Accuracy: Plus/minus one percent of full scale.
      - 2) Thermal Effects: Temperature compensated over a minimum 40 to 120 F range. Zero and span shift of plus/minus 0.06 percent or less of full scale per degree F.
      - 3) Sensing Range: Select sensor so that the high end of the nominal sensor range is not less than 150 percent and not more than 300 percent of maximum expected input.
      - 4) Long Term Thermal Stability: Plus/minus one percent full scale per year.
    - b. Construction:
      - 1) Insertion or traverse type sensor suitable for use in flat oval, rectangular, and round duct configurations.
      - 2) Insertion length selected as appropriate for duct size.
      - 3) Traverse sensors shall have at least one pickup point every 6 inches.
      - 4) Element: Variable capacitance sensing technology.
      - 5) Housing: Fire retardant glass-filled polyester, brass, stainless steel, or aluminum.
  2. Space Static Pressure:
    - a. Type: Bi-directional, fixed range.
    - b. Performance Characteristics:
      - 1) Accuracy: Plus/minus 0.5 percent of full scale.
      - 2) Thermal Effects: Temperature compensated over a minimum 40 to 120 F range. Zero and span shift of plus/minus 0.06 percent or less of full scale per degree F.
      - 3) Sensing Range: Select sensor so that the high end of the nominal sensor range is not less than 150 percent and not more than 300 percent of maximum expected input.
      - 4) Long Term Thermal Stability: Plus/minus 0.5 percent full scale per year.
    - c. Construction:
      - 1) Sensing Port Wall Mounting: Wall plate with integral sensor, sized to fit standard single gang electrical box. Back of sensor plate fitted with union fitting for tubing connection.
      - 2) Sensing Port Ceiling Mounting: Round plate with union fitting for tubing connection.
      - 3) Sensor Element: Variable capacitance sensor technology.
      - 4) Sensor Housing: Fire retardant glass-filled polyester, brass, stainless steel, or aluminum.
  3. Hydronic Pressure:
    - a. Type: Unidirectional, fixed range.
    - a. General Sensor Performance Characteristics:
      - 1) Accuracy: Plus/minus 1.0 percent of full scale.
      - 2) Thermal Effects: Temperature compensated minimum 30 to 150 F range. Zero and span shift of plus/minus 0.02 percent or less of full scale per degree F.
      - 3) Long Term Thermal Stability: Plus/minus 0.5 percent full scale per year.

- 4) Range: Select sensor so that the scheduled differential pressure setpoint is near the midrange of the sensor pressure range.
  - b. Performance Characteristics for Chiller/Boiler Equipment Differential Pressure:
    - 1) Application: Variable-Primary Flow Systems.
    - 2) Accuracy: Plus/minus 0.05 percent of full scale.
    - 3) Thermal Effects: Temperature compensated minimum 30 to 150 F range. Zero and span shift of plus/minus 0.02 percent or less of full scale per degree F.
    - 4) Long Term Thermal Stability: Plus/minus 0.125 percent full scale per year for minimum 5 years.
    - 5) Range: Select sensor so that the scheduled differential pressure setpoint is near the midrange of the sensor pressure range.
    - 6) Manufacturers:
      - a) Rosemount, 3051S
      - b) Approved equal.
  - c. Construction:
    - 1) Suitable for the media temperature and pressure.
    - 2) Chiller/Boiler differential sensor shall have push button zero and span adjustments. No internal mechanical linkages shall be used in the transmitter.
    - 3) Element: Diaphragm type, stainless steel.
    - 4) Housing: Fire retardant glass-filled polyester, stainless steel, or aluminum.
4. Gas Pressure:
- a. Type: Uni-directional, fixed range.
  - b. Performance Characteristics:
    - 1) Accuracy: 0.35% full scale.
    - 2) Operating Temperature Range: -40 to 260 F.
    - 3) Long Term Drift: Plus/minus 0.2% full scale per year.
    - 4) Sensor Output: 4-20 mA.
    - 5) Range: Select sensor so that the scheduled pressure setpoint is near the midrange of the sensor pressure range.
  - c. Construction:
    - 1) Suitable for the media temperature and pressure.
    - 2) Sensor Element: 17-4 PH or 316L stainless steel.
    - 3) Housing: Stainless steel with FKM, EPDM or all welded seals.
- E. Equipment Operation Sensors:
1. Status Inputs for Airside Equipment:
    - a. Type: Fixed range differential pressure switch with adjustable setpoint.
    - b. Performance Characteristics:
      - 1) Range: Not greater than two times the design fan static pressure.
    - c. Construction:
      - 1) Enclosure: Comply with NEMA enclosure ratings, suitable for the ambient conditions encountered.
      - 2) Provide Insertion tube for use in duct configurations. Insertion length selected as appropriate for duct size.
      - 3) Contact Type: Single-pole, single-throw (SPST). Provide multiple poles or throw contacts to meet additional alarms required.
  2. Status Inputs for Hydronic Equipment:
    - a. Differential Pressure Switch: Fixed range type with adjustable setpoint.
      - 1) Range: Not greater than two times the design equipment differential pressure.
      - 2) Enclosure: Comply with NEMA enclosure ratings, suitable for the ambient conditions encountered.
      - 3) Contact Type: Single-pole, single-throw (SPST). Provide double-throw contacts to meet additional alarms required.
    - b. Flow Switch:

- 1) Thermal dispersion flow switch enclosed in insertion device, of material suitable for fluid encountered and magnetic setpoint coordinated with the desired flow rate.
  - a) Range: Sensitivity suitable for the maximum and minimum design flow rates of the system in which it is installed.
  - b) Enclosure: Comply with NEMA enclosure ratings, suitable for the ambient conditions encountered, with LED status indicators for visual switch indication.
  - c) Contact Type: Automatic reset upon regain of flow.
- c. Liquid Level Switch:
  - 1) Electric Probe Type:
    - a) Stainless steel construction with minimum wire lead length required to adjust probe height for appropriate water level control.
    - b) Provide individual probes to meet the required control points specified on the drawings.
3. Status Inputs for Electric Motors:
  - a. Analog Current Transducer:
    - 1) Type: Split core design, cable of being installed or removed without dismantling the primary bus cables.
    - 2) Performance Characteristics:
      - a) Accuracy: Plus/minus 2 percent of selected range.
      - b) Range: Multi-range device, suitable for the amperage encountered with internal zero and span adjustment.
      - c) Analog output signal: Generate a proportional control signal relative to the amount of current through the primary bus cables.
    - 3) Construction:
      - a) 24 V or Self-powered (passive).
      - b) Provide with integral command relay.
      - c) Device shall accept overcurrent up to twice its trip into range.
      - d) Enclosure: UL 94 approved thermoplastic, rated for V-0. No metal parts shall be exposed other than the terminals.
  - b. Binary Current Sensing Relay:
    - 1) Type: Split core with current transformers, adjustable and set to 175 percent of rated motor current.
    - 2) Self-powered (passive) with solid-state circuitry and a dry contact output.
    - 3) Adjustable trip point.
    - 4) Contact Type: Single-pole, double-throw (SPDT).
    - 5) LED indicating the on or off status.
    - 6) A conductor of the load shall be passed through the window of the device.
    - 7) Device shall accept overcurrent up to twice its trip into range.
- F. Leak Detection Sensors
  1. Leak detection sensors shall be stand alone as described in Division 23 Section, Common Work Results for HVAC". Monitor leak detection sensors as noted on the drawings.
- G. Carbon Monoxide Detectors:
  1. Factory calibrated, single or multichannel dual level detectors, using solid state sensors with three year minimum life. Sensor replacement shall take maximum 15 minutes. Suitable over temperature range of 23 to 130 degrees F.
  2. Provide individual indicators and contractors for each level, initially calibrated for 25 ppm and 200 ppm.
  3. Maximum response time to 100 ppm CO calibration gas: Two minutes.
  4. Accuracy: Plus/minus 5 ppm or plus/minus 5 percent of reading, whichever is lower.
  5. Drift: Certified by manufacturer to drift no more than 5 percent per year.
  6. Calibration: Certified by manufacturer to require calibration no more frequently than once per year.

- H. Carbon Dioxide Sensors:
1. General: Provide non-dispersive infrared (NDIR) CO<sub>2</sub> sensors with integral transducers and linear output.
    - a. Linear, CO<sub>2</sub> Concentration Range Display: 0 to 2000 ppm.
    - b. Full Scale Accuracy: Plus/minus 75 ppm at concentrations of both 600 and 1,000 ppm when measured at sea level at 77 degrees F.
    - c. Maximum Response Time: 1 minute.
    - d. Analog Output: 0-10 Vdc or 4-20 mA.
    - e. Rated Ambient Conditions:
      - 1) Air Temperature: Range of 32 to 122 degrees F.
      - 2) Relative Humidity: Range of 0 to 95 percent (non-condensing).
  2. Calibration Characteristics:
    - a. Factory calibrated and certified by the manufacturer to require calibration not more frequently than once every 5 years.
    - b. Automatically compensating algorithm for sensor drift due to sensor degradation.
    - c. Sensor shall be temperature compensated throughout entire operating range.
    - d. Maximum Drift: 2 percent per year.
  3. Construction:
    - a. Sensor Chamber: Non-corrosive material for neutral effect on carbon dioxide sample.
    - b. Duct Mounting: Provide duct mounted sensors with duct probe designed to protect sensing element from dust accumulation and mechanical damage.
    - c. Wall/Surface Mounting: Construct for surface or wall box or enclosure suitable for wall mounting.

## 2.8 OUTPUT CONTROL DEVICES

- A. Control Relays:
1. Provide relay with contact rating, configuration, and coil voltage that is suitable for the application.
  2. Provide NEMA 1 enclosure when relay is not installed in a local control panel.
  3. Control relays shall be UL listed plug-in type with dust cover and LED "energized" indicator.
  4. Time delay relays shall be UL listed solid-state plug-in type with adjustable time delay. Delay shall be adjustable plus/minus 200 percent minimum from setpoint.
  5. Electromechanical relays shall be UL listed, compact in size, provided with quick connect terminals and be impervious to shock and vibration.
  6. Electronic relays shall be microcomputer-based with PI, time proportioning control capability, have average life greater than 500,000 cycles, have a built-in transformer and have LED status indication.
- B. Fan Speed Controllers:
1. Solid-state model providing field-adjustable proportional control of motor speed. Equip with filtered circuit to eliminate radio interference.
- C. Magnetic Door or Window Contact
1. Provide contact with rating and configuration that is suitable for the application by Interlogix or approved equal.
  2. Contacts shall be UL listed and factory tested.
  3. The magnetic contacts shall be designed for easy installation and shall be replaceable without damaging the door or window.
  4. Coordinate final sensor type and location with Architect prior to ordering.

## 2.9 POWER SUPPLIES

- A. Reference Division 23 Section "Direct Digital Controls for HVAC" for DC power supply requirements.

- B. Control power transformers shall meet NEMA/ANSI standards.
- C. Control power transformers shall be UL listed for Class 2 current-limited service or provided with over-current protection on both primary and secondary circuits for Class 2 current-limited service.
- D. Connected load on the transformer shall not exceed 80 percent of the transformer's rated capacity.
- E. The core and windings shall be completely encased in a UL approved thermoplastic. No metal parts shall be exposed other than the terminals.
- F. Performance Characteristics:
  - 1. Accuracy: Plus/minus 1 percent at 5.0 A full scale output.
- G. Provide a disconnect switch for each transformer.

## 2.10 THERMOSTATS

- A. General:
  - 1. Programmable, with the following features:
    - a. LCD or LED display screen.
    - b. Button or touch-screen Interface.
    - c. 7-day programmable scheduling.
    - d. Temperature information display.
    - e. Setpoint display and adjust.
    - f. Operation mode display and adjust.
    - g. Override.
    - h. Remote temperature sensor interface terminal.
    - i. Lockout.
  - 2. Performance Requirements:
    - a. Accuracy: Plus/minus 1.0 degree F minimum.
    - b. Resolution: Plus/minus 0.2 degrees F.
    - c. Range:
      - 1) Operating Temperature: 32 degrees F to 122 degrees F minimum.
      - 2) Operating Humidity: 0 percent to 95 percent relative humidity, non-condensing.
      - 3) Setpoint Control:
        - a) Cooling: 54 degrees to 100 degrees F.
        - b) Heating: 40 degrees to 90 degrees F.
    - d. Multi-stage as required to match unit cooling and heating stages scheduled on the drawings.
- B. Room Thermostat Accessories:
  - 1. Thermostat Covers: Brushed aluminum.
  - 2. Insulating Bases: For thermostats located on exterior walls.
  - 3. Thermostat Guards: Metal mounted on separate base.
  - 4. Adjusting Key: As required for device.
  - 5. Aspirating Boxes: Where indicated for thermostats requiring flush installation.
  - 6. Integrated sensors: At the contractor's option, the following sensors may be provided with the thermostat in a single device. Refer to the drawings where additional sensors are required. Refer to "Input/Output Sensors" section of this specification for language governing performance of the integrated sensors.
    - a. Occupancy sensor.
    - b. Humidity sensor.
    - c. Carbon dioxide sensor.
- C. Immersion Thermostat:
  - 1. Remote bulb or bimetallic rod and tube type, proportional action with adjustable setpoint and adjustable throttling range.

- D. Airstream Thermostat:
  - 1. Remote bulb or bimetallic rod and tube type, proportional action with adjustable setpoint in middle of range and adjustable throttling range.
  - 2. Averaging service remote bulb element: minimum 7.5 feet or length as required to fit duct.
- E. Electric Low Limit Thermostat:
  - 1. Snap acting, single pole, single throw, manual or automatic reset switch as indicated on the drawings that trips if temperature sensed across any 12 inches of bulb length is equal to or below setpoint,
    - a. Provide double-throw contacts (one for direct equipment control, one for BAS system notification) where additional alarms are scheduled.
  - 2. Bulb length: Minimum 1 foot for every 1 square foot of coil cross sectional area.
  - 3. Provide one thermostat for every 20 sq ft of coil surface.
  - 4. Setpoint shall be adjustable.
- F. Electric High Limit Thermostat:
  - 1. Snap acting, single pole, single throw, manual reset switch that trips if temperature sensed across any 12 inches of bulb length is equal to or above setpoint,
  - 2. Bulb length: Minimum 1 foot for every 1 square foot of coil cross sectional area.
  - 3. Provide one thermostat for every 20 sq ft of coil surface.
  - 4. Setpoint shall be adjustable.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Verify existing conditions before starting work.
- B. Verify that systems are ready to receive work.
- C. Beginning of installation means installer accepts existing conditions.
- D. Sequence work to ensure installation of components is complementary to installation of similar components in other systems.
- E. Coordinate installation of system components with installation of mechanical systems equipment such as air handling units and air terminal units.

#### **3.2 INSTALLATION**

- A. Cooperate with other contractors performing work on this project as necessary to achieve a complete and coordinated installation. Each Contractor shall consult the Drawings and Specifications for all trades to determine the nature and extent of others work.
- B. Coordinate with other contractors performing work to provide emergency power to all control devices required to operate on emergency power.
  - 1. Coordinate emergency power to BAS network control panels.
  - 2. Coordinate emergency power to firefighter smoke control panel.
  - 3. Coordinate power wiring for smoke control equipment is installed in metallic conduit.
- C. General Workmanship:
  - 1. Install equipment, piping, and wiring/raceway parallel to building lines wherever possible.
  - 2. Provide sufficient slack and flexible connections to allow for vibration of piping and equipment.
  - 3. Install all equipment in readily accessible locations.
  - 4. All installations shall comply with industry specifications and standards for performance, reliability, and compatibility and be executed in strict adherence to local codes and standard practices.
  - 5. Install all products in accordance with manufacturer's instructions.

## D. Sensors:

1. Mount sensors rigidly and adequately for the environment within which the sensor operates.
2. Provide thermistor type temperature sensors for temperature ranges between minus 30 degrees F to 230 degrees F. Provide RTD type temperature sensors for extended ranges beyond minus 30 degrees F to 230 degrees F.
3. Room temperature sensors shall be installed on concealed junction boxes properly supported by the wall framing. Coordinate installation of room/space sensors with architect and other trades to ensure a neat and orderly installation.
4. All wires attached to sensors shall be air sealed in their raceways or in the wall to stop air transmitted from other areas affecting sensor readings.
5. Sensors used in mixing plenums and hot and cold decks shall be of averaging type. Averaging sensors shall be installed in a serpentine manner vertically across the duct. Each bend shall be supported with a capillary clip.
6. Low-limit sensors used in mixing plenums shall be installed in a serpentine manner horizontally across duct. Each bend shall be supported with a capillary clip. Provide 1 foot of sensing element for each square foot of coil area.
7. Do not install temperature sensors within the vapor plume of a humidifier. If installing a sensor downstream of a humidifier, install it at least 10 feet downstream.
8. Install temperature, humidity, and smoke detectors for both supply air and return air applications a minimum of 10'-0" downstream or upstream of the air handling unit and prior to any branch duct takeoffs.
9. All pipe-mounted temperature sensors shall be installed in wells. Install all liquid temperature sensors with heat-conducting fluid in thermal wells.
10. Install outdoor air temperature sensors on north wall, complete with sun shield where shown on the plans. If not shown, locate sensors in an accessible location, a minimum of 15 feet away from exhaust or relief air locations.
11. Differential air static pressure.
  - a. Supply Duct Static Pressure: Pipe the high-pressure tap to the duct using a pitot tube. Pipe the low-pressure port to a tee in the high-pressure tap tubing of the corresponding building static pressure sensor (if applicable) or to the location of the duct high-pressure tap and leave open to the plenum.
  - b. Return Duct Static Pressure: Pipe the high-pressure tap to the duct using a pitot tube. Pipe the low-pressure port to a tee in the low-pressure tap tubing of the corresponding building static pressure sensor or the plenum.
  - c. Building Static Pressure: Pipe the low-pressure port of the pressure sensor to the static pressure port located on the outside of the building. Pipe the high-pressure port to a location suitable to sense common building pressure or as indicated on the drawings.
    - 1) Panel mount the transducer adjacent to its associated building automation system controller. Provide an independent manometer gauge next to transducer for calibration.
  - d. The piping to the pressure ports on all pressure transducers shall contain a capped test port located adjacent to the transducer.
  - e. All pressure transducers, other than those controlling VAV boxes, shall be located in field device panels, not on the equipment monitored or on ductwork. Mount transducers in a location accessible for service without use of ladders or special equipment.
  - f. All air and water differential pressure sensors shall have gauge tees mounted adjacent to the taps. Water gauges shall also have shutoff valves installed before the tee.
12. Adjust flow switch to meet sensitivity required to ensure minimum flow through the equipment.
13. Verify location and mounting height of thermostats, humidistats, and exposed control sensors with plans and room details before installation. Align with adjacent lighting switches and humidistats.

- a. Install devices to meet ADA requirements unless otherwise noted on the plans.
  14. Mount freeze protection thermostats using flanges and element holders.
    - a. Install thermostat completely across the surface the thermostat serves.
  15. Mount outdoor reset thermostats and outdoor sensors indoors, with sensing elements outdoors with sun shield.
  16. Provide separable sockets for liquids and flanges for air bulb elements.
  17. Provide thermostats in aspirating boxes in areas where flush mounting is required.
  18. Provide guards on thermostats in areas indicated on the drawings.
  19. Calibrate each instrument installed that is not factory calibrated and provided with calibration documentation.
  20. Install shutoff valves in the high and low pressure reference lines connecting to hydronic pressure sensors and switches. Install a shunt valve across the high and low reference pressure ports for servicing. Valves may be ordered as an integral option with the sensor.
- E. Control Valves:
1. Do not install brass valves in open-loop systems.
  2. Install pipe reducers for valves smaller than line size. Position reducers as close to valve as possible but at distance to avoid interference and impact to performance. Install with manufacturer-recommended clearance.
  3. Install flanges or unions to allow valve removal and installation.
  4. Locate valves for easy access and provide separate support of valves that cannot be handled by service personnel without hoisting mechanism.
  5. Valve Orientation:
    - a. Where possible, install globe and ball valves installed in horizontal piping with stems upright and not more than 15 degrees off of vertical, not inverted.
    - b. Install valves in a position to allow full stem movement.
    - c. Where possible, install butterfly valves that are installed in horizontal piping with stems in horizontal position and with low point of disc opening with direction of flow.
  6. Provide valves with position indicators where sequenced with other controls.
  7. Tag valves in accordance with Division 23 Section, "Identification for HVAC Piping and Equipment."
  8. Install a pressure/temperature port on each side of pressure independent control valves (PICVs) which are not factory provided with integral ports.
- F. Control Dampers:
1. Install dampers with extruded aluminum or stainless steel frames and blades in corrosive environments and areas with high humidity.
  2. Install smooth transitions, not exceeding 30 degrees, to dampers smaller than adjacent duct. Install transitions as close to damper as possible but at distance to avoid interference and impact to performance. Consult manufacturer for recommended clearance.
  3. Clearance:
    - a. Locate dampers for easy access and provide separate support of dampers that cannot be handled by service personnel without hoisting mechanism.
    - b. Install dampers with at least 24 inches of clear space on sides of dampers requiring service access.
  4. Service Access:
    - a. Dampers and actuators shall be accessible for visual inspection and service.
    - b. Install access door(s) in duct or equipment located upstream of damper to allow service personnel to hand clean any portion of damper, linkage, and actuator. Comply with requirements in Division 23 Section, "Air Duct Accessories."
  5. Duct openings shall be free of any obstruction or irregularities that might interfere with blade or linkage rotation or actuator mounting.
  6. Install dampers straight and true, level in all planes, and square in all dimensions. Install supplementary structural steel reinforcement for large multiple-section dampers if factory support alone cannot handle loading.

7. Provide mixing dampers of parallel blade construction arranged to mix streams. Where shown on the drawings, provide separate minimum outside air damper section adjacent to return air dampers with separate damper motor.
  8. Provide isolation (two position) dampers of parallel blade construction.
  9. Provide opposed blade damper configuration for all other applications.
  10. Install damper motors on outside of duct in warm areas. Do not install motors in locations at outdoor temperatures.
  11. After installation of low-leakage dampers and seals, caulk between frame and duct or opening to prevent leakage around perimeter of damper.
- G. Operators:
1. Mount and link control damper actuators according to manufacturer's instructions.
    - a. To compress seals when spring-return actuators are used on normally closed dampers, power actuator to approximately 5 degrees open position, manually close the damper, and then tighten the linkage.
    - b. Check operation of damper/actuator combination to confirm that actuator modulates damper smoothly throughout stroke to both open and closed positions.
    - c. Provide all mounting hardware and linkages for actuator installation.
  2. Dampers: Actuators shall be direct-mounted on damper shaft or jackshaft unless shown as a linkage installation. For low-leakage dampers with seals, the actuator shall be mounted with a minimum 5 degree available for tightening the damper seals.
  3. Valves: Actuators shall be connected to valves with adapters approved by the actuator manufacturer.
- H. Control Panels:
1. Install control panels where shown on the drawings and where required to house controllers for the controlled systems and equipment.
  2. Mount control panels adjacent to associated equipment on vibration free walls or free standing angle iron supports. One cabinet may accommodate more than one system in same equipment room. Provide engraved plastic nameplates for instruments and controls inside cabinet and engraved plastic nameplates on cabinet face.
  3. Coordinate 120V power requirements with Division 26 to panels used for the building automation system and transformers for low voltage power to controllers.
- I. Fire Fighter Control Panel:
1. Provide automatic weekly testing of the smoke control system as required by the building code for verification of system operation via BAS programming. Verification test sequence shall include positive confirmation of the following:
    - a. Actuation.
    - b. Testing.
    - c. Manual override.
    - d. Presence of power downstream of all disconnects.
  2. The test sequence shall report abnormal conditions audibly, visually, and by printed report. Email the results to the building operator if BAS is capable. An abnormal condition is any conditions that creates a fault at the fire fighter control panel or does not meet the smoke control sequence of operations.
  3. The test sequence shall operate all devices, equipment, and components used for smoke control.
  4. Execute the test sequence during unoccupied hours, when ambient conditions will not interfere with building operation, or during a time acceptable to the Owner.
  5. Where operation of the test sequence may produce unwanted effects to normal building operation, coordinate with the authority having jurisdiction and Owner to approve exemptions for devices, equipment, and components affected. Submit documentation to the Owner and Engineer as defined in the section titled, "Submittals."
    - a. For any exempted devices, equipment, or components, at a minimum verify the presence of power downstream of all disconnects by a listed control unit.
  6. Coordination with Division 26:

- a. Firefighter smoke control panel shall be powered from a 120 volt, single phase power source from the building standby power system.
  - a. Firefighter smoke control panel shall be provided with an uninterruptible power system (UPS) to allow for continuous operation of all equipment during loss of normal power until stand by power is achieved.
    - 1) Size the UPS to operate for a minimum of 5 minutes.
  - b. Transformers shall be provided as required to convert 120 volt power source to the control signal needed.
- J. Install "hand/off/auto" selector switches to override automatic interlock controls when switch is in "hand" position.
  - K. Provide an insulation standoff on control devices, cables, and other items that do not require flush mounting to ductwork, piping, or equipment.

**3.3 MAINTENANCE**

- A. Refer to Division 01 closeout requirements for additional requirements relating to maintenance service.
- B. Provide service and maintenance of control system for one year from Date of Substantial Completion.
- C. Provide complete service of controls systems, including call backs, and submit written report of each service call.
- D. Smoke control diagrams shall be posted and be kept on file within the Fire Command Center and maintenance room upon completion.

**3.4 STARTUP AND DEMONSTRATION**

- A. Control Dampers and Valves:
  - 1. Stroke and adjust control valves and dampers following manufacturer's recommended procedure, from 100 percent open to 100 percent closed back to 100 percent open.
  - 2. Check and document open and close cycle times for applications with a cycle time of less than 30 seconds.
  - 3. For control valves and dampers equipped with positive position indication, check feedback signal at multiple positions to confirm proper position indication.
  - 4. Verify that all two-position dampers and valves operate properly and that the normal positions are correct.
  - 5. Verify that all modulating dampers and valves are functional, that the start and span are correct, that direction and normal positions are correct, and that they achieve proper closure.
- B. PI Control Valves:
  - 1. Field verify installation and operating differential pressure range of all PI control valves.
  - 2. Verify total system flow to be within plus/minus 10 percent of system design.
  - 3. Individual field adjustments for the PI control valve assembly shall be performed using the PI control valve manufacturer's documented procedures.

**3.5 DAMPER SCHEDULE**

<u>SERVICE</u>	<u>RUSKIN MODEL</u>	<u>MATERIAL</u>
Outside, Exhaust and Relief Air Control, Stairway and Shaft Vents	CD-50	Aluminum
Fire/Smoke Damper for Smoke Control	FSD-60	Galvanized Steel

Smoke Damper for Smoke Control	SD-60	Galvanized Steel
Corrosive Environments	CD-50-CE	Aluminum
Corrosive Environments	CD-36-CE	Stainless Steel
All Other	CD-356	Galvanized Steel

### 3.6 DAMPER OPERATOR VOLTAGE SCHEDULE

<u>SERVICE</u>	<u>VOLTAGE</u>
Interlocked with HVAC fans	120V
Multi-section dampers	120V
Large dampers ( 60 inches in any dimension)	120V
All other operators control wiring	24V

- Note: Coordinate with Division 26 if 120V power is required for operator to achieve appropriate torque requirements for damper actuation.

### 3.7 CONTROL VALVE SCHEDULES

- A. Allowable Valve Type and Size by Control Application:

<u>VALVE TYPE</u>	<u>CONTROL APPLICATION</u>	
	<u>MODULATING</u>	<u>TWO-POSITION</u>
Globe	≤ 4 IN	≤ 2 IN
Characterized Ball	≤ 6 IN	≤ 6 IN
Butterfly	6 IN	≥ 2-1/2 IN

- B. Allowable Valve Body Material by Service Application:

<u>VALVE BODY MATERIAL</u>	<u>SERVICE APPLICATION</u>	
	<u>CLOSED LOOP</u>	<u>OPEN LOOP</u>
Bronze	Allowed	Allowed
Brass	Allowed	Not Allowed
Iron	Allowed	Allowed
Stainless Steel	Allowed	Allowed

- C. Allowable End Connection by System Material:

- Copper Tube:
  - 2-1/2 Inch and smaller: Threaded ends.
- Steel Pipe:
  - 2 Inch and Smaller: Threaded.
  - 2-1/2 Inch and Larger:
    - Flanged.
    - Grooved ends for water systems.

- D. Allowable End Connection by Size Schedule:

<u>VALVE TYPE</u>	<u>END CONNECTION TYPE</u>		
	<u>THREADED</u>	<u>FLANGED</u>	<u>GROOVED</u>
Globe	≤ 2-1/2 IN	≤ 4 IN	N/A
Characterized Ball	≤ 2-1/2 IN	≤ 3 IN	N/A
Butterfly	N/A	≥ 2-1/2 IN	≥ 2-1/2 IN

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 09 14 - REFRIGERANT MONITORING SYSTEMS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Refrigerant Monitoring Systems.

**1.2 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical product data for the refrigerant monitoring system furnished, indicating dimensions, capacities, performance characteristics, electrical characteristics, finishes of materials, and including installation instructions and start-up instructions.
- B. Shop Drawings: Submit shop drawings for the refrigerant monitoring system, containing the following information:
  - 1. Schematic flow diagram of system showing control panel and sensing device(s).
  - 2. Label each control device with setting or adjustable range of control.
  - 3. Indicate all required electrical wiring. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
  - 4. Provide details of faces of control panels, including controls, instruments, and labeling.
  - 5. Include description of sequence of operation.
- C. Maintenance Data: Submit maintenance instructions and spare parts lists. Include this data, product data, and shop drawings in maintenance manuals; in accordance with requirements of Division 01.

**1.3 QUALITY ASSURANCE**

- A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of refrigerant monitoring equipment, of types and sizes required, whose products have been in satisfactory use for a minimum of three years. Manufacturer shall submit a list of 12 similar projects.
- B. Codes and Standards:
  - 1. ASHRAE Compliance: Comply with ASHRAE 15 Safety Standard for Refrigeration Systems.
  - 2. NEMA Compliance: Comply with NEMA standards pertaining to enclosures for refrigerant control systems
  - 3. NFPA Compliance: Comply with NFPA 70 "National Electric Code" where applicable for electric equipment, devices and wiring.

**1.4 DELIVERY STORAGE AND HANDLING**

- A. Provide factory shipping cartons for each piece of equipment, and control device
- B. Maintain cartons through shipping, storage and handling as required to prevent equipment damage, and to eliminate dirt and moisture from equipment.
- C. Store equipment and materials inside and protect from weather.

**1.5 SPARE PARTS**

- A. Provide two sets of spare filters for each type of sensing device furnished.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Critical Environment Technologies
- B. Genesis International, Inc.
- C. Honeywell Analytics.
- D. Macurco Gas Detection.
- E. MSA, Instruments Division.
- F. O-I-Analytical Corporation.
- G. Sentech Corporation.
- H. Specified Controls.
- I. Thermal Gas System.
- J. ToxAlert.
- K. Trane.
- L. YEW, Yokagowa.

**2.2 REFRIGERANT MONITORING SYSTEM**

- A. General: Provide complete refrigerant monitoring system as specified, consisting of control panel, sampling system, and sensing devices as required for a complete installation. Except as otherwise indicated, provide manufacturer's standard control system components as indicated by published product information, designed and constructed as recommended by manufacturer.
- B. System Requirements: Meet the following general requirements:
  - 1. Detect presence of any HCFC or HFC refrigerant regardless of which chiller is furnished. Coordinate with the Contractor the specific requirements for this installation.
  - 2. Indicate, alarm, shut down equipment and communicate with the temperature control system specified in Division 23 Section "Direct Digital Control for HVAC" through an RS-232 or RS-485 port.
  - 3. Locate leak detection monitoring sensors for early warning indication to prevent a major loss of refrigerant without alarm, should a leak occur.
- C. Control Panel and Equipment: Provide control panel with suitable brackets for wall mounting, for each refrigerant monitoring system. Install panel at location shown on the drawings.
  - 1. Fabricate panels of galvanized steel, painted steel, or extruded aluminum alloy, totally enclosed, with hinged doors and keyed lock, NEMA 4 rated.
  - 2. Analyzer: Employ infrared sensor technology to provide sensing down to one part per million (ppm). Analyzer shall be compound specific and calibrated for the refrigerant application. System shall be capable of switching to another refrigerant type by changing one part and recalibration.
  - 3. Alarm Contacts: Provide three adjustable levels of alarm and indicator lights for alarm levels, malfunction, loss of low and zero cycle. Alarm relays shall be rated for 120 Vac at 5 amps.
  - 4. LED Display: Provide local LED display for indication of ppm level.
  - 5. Calibration: Provide auto zero calibration manually at the monitor, automatically at user selected intervals between 15 minutes and 24 hours, or remotely via a dry contact input. Automatically zero by drawing air from an uncontaminated air source. Include a built-in sampling pump.
  - 6. Flow Loss: Continuously sample flow. Indicate a flow loss when flow drops below 500 ml/min.

7. Operating Conditions: Capable of operating in ambient conditions of 0 to 40 degrees C, 0 to 99 percent relative humidity, non-condensing. System shall be insensitive to vibration.
  8. Remote Sample Location: Capable of sampling from locations up to 500 feet from control panel.
  9. Capable of expanding to a minimum of four sampling points with sequential sampling and output signals to allow monitoring from multiple remote sampling locations.
- D. Refrigerant Sensor and Tubing: Provide refrigerant sensor(s) for monitoring refrigerant leaks in the chiller system. Provide application specific refrigerant sensor and particulate filters. Provide refrigerant sensing tubing of 1/4 inch diameter nylon tubing rated for a working pressure of 425 psi and burst pressure of 1,700 psi. Provide tubing with compatible fittings. Tubing shall be Parker Series NR or approved equal.
1. Refrigerant to Be Monitored: R-513A
  2. Accuracy: Sensor shall have accuracy of  $\pm 5$  ppm over range of 0 to 100 ppm and  $\pm 5$  percent of reading between 100 to 1,000 ppm.
  3. Repeatability: Plus or minus 1 percent of full scale.
  4. Detection Level Set Points:
    - a. Detection Level 1: 100 ppm.
    - b. Detection Level 2: 500 ppm.

### **PART 3 - EXECUTION**

#### **3.1 INSPECTION**

- A. Examine areas and conditions under which refrigerant monitoring systems are to be installed.
- B. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

#### **3.2 INSTALLATION OF REFRIGERANT MONITORING SYSTEMS**

- A. General: Install systems and materials in accordance with manufacturer's instructions.
  1. Install electrical components and use electrical products complying with requirements of applicable Division 26 sections of these specifications.
  2. Mount control panel at location indicated on the drawings at convenient height for user interface.
- B. Control Wiring: Install control wiring including conduit in accordance with requirements specified in Division 23 Section "Direct Digital Control for HVAC."
- C. Refrigerant Sensor(s): Install refrigerant sensor(s) at locations indicated on the drawings at height as recommended by the refrigerant monitoring system manufacturer.
- D. Sensor Tubing: Install sensor tubing in accordance with manufacturer's instructions parallel to building columns. Support tubing as required to prevent sagging.

#### **3.3 ADJUSTING AND CLEANING**

- A. Start-Up: Start-up, test, and adjust refrigerant monitoring system in presence of manufacturer's authorized representative. Demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
- B. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint. Replace sensor filters, if contaminated during installation work.
- C. Final Adjustment: After completion of installation, adjust refrigerant monitoring system to meet system requirements.

- D. Final adjustment shall be performed by specially trained personnel in direct employ of manufacturer of refrigerant monitoring system.

### 3.4 TRAINING

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 01 Section "Operating and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**SECTION 23 09 23 - DIRECT-DIGITAL CONTROL FOR HVAC****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. System Description.
- B. Operator Interface.
- C. Controllers.
- D. Electrical Control Power Wiring and Low Voltage Wiring.
- E. Local Area Network.
- F. System Software.
- G. Controller Software.

**1.2 ADMINISTRATIVE REQUIREMENTS**

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.
- B. Coordinate routing of DDC power wiring and conduits requiring a fire-resistive protective assembly or electrical circuit protective system. Fire-resistive protective assembly or electrical circuit protective system shall have a fire-resistance rating of not less than 2 hours and shall be provided where required by NFPA or local building codes. Types of DDC power wiring and conduits requiring a fire-resistive protective assembly include, but are not limited to:
  - 1. Wiring for Emergency Power systems.
  - 2. Smokeproof Enclosure Pressurization systems.
  - 3. Smoke Control systems.
  - 4. Smoke Removal systems.
  - 5. Fire service and Occupant Evacuation Elevator systems.

**1.3 DEFINITIONS**

- A. ASC: Application Specific Controller. Examples include controllers for specific applications (e.g., FCU, VAV box, etc.) that can be configured through any network services software.
- A. ATU: Air Terminal Unit (e.g., VAV boxes, fan-powered boxes, fan coil units).
- B. BAS: Building Automation System.
- C. BTL: BACnet Testing Laboratories. Third party independent testing and listing program for devices which have been tested according to ASHRAE Standard 135.
- D. Control Wiring: Includes conduit, wire and wiring devices to install complete control systems including motor control circuits, interlocks, thermostats, EP and IP switches and like devices. Includes all wiring from Intelligent Devices and Controllers to all sensors and points defined in the input/output summary shown on the drawings or specified herein and required to execute the sequence of operations
- E. DDC: Direct Digital Control.
- F. EMT: Electrical Metallic Tubing
- G. High voltage: 50 volts or higher.
- H. IP: Internet Protocol.

- I. LAN: Local Area Network.
- J. VLAN: Virtual Local Area Network.
- K. Low voltage: Below 50 volts.
- A. NiCS: Niagara Compatibility Statement license.
- L. OSI: Open System Interconnection
- M. PC: Personal Computer.
- N. PICS: Protocol Implementation Conformance Statement.
- O. Point: Point is a generic term used to describe a single item of information in a BAS. Points may be further described as input, output, digital, binary, discrete, analog, modulating, internal, external, virtual or global. Each unique point used by digital controllers, or in a BAS, is typically identified by an address.

#### 1.4 CONTRACTOR RESPONSIBILITIES

- A. Reference the following sections for additional contractor responsibilities and coordination:
  - 1. Division 23 Section "Electrical Coordination for Mechanical Equipment."
  - 2. Division 23 Section "Commissioning for HVAC."
  - 3. Division 23 Section "Instrumentation and Control Devices for HVAC."
- B. Reference Part 3 for additional electrical contractor responsibilities for BAS controls.

#### 1.5 SUBMITTALS

- A. Refer to Division 01 and Division 23 Section "General Mechanical Requirements" for submittal procedures.
- B. General:
  - 1. The drawings and specifications are not intended to show all details. The BAS contractor shall secure satisfactory information before submitting the proposal and include in the proposal a sum sufficient to cover all items of labor and material required for the complete installation for the devices and system described.
  - 1. Inform Engineer in writing of any deviation in the exhibits submitted from the requirements of the drawings, specifications, and sequences of operations.
- C. Product Data:
  - 1. Submit manufacturer technical data for each system component and software module required for a complete installation.
  - 2. Indicate dimensions, weights, and enclosure construction for all BAS distributed controllers.
  - 2. Submit technical data on all new software supplied including description of functions performed by software and location within the system where software shall reside. Include all software licensing agreements.
  - 3. Submit the PICS for each BACnet device used in the BAS.
  - 4. Submit the NiCS for each type of Niagara station in the BAS.
- D. Power and Communication Wiring Transient Protection:
  - 1. Submit catalog data sheets providing evidence that all BAS products offered by the manufacturer are tested and comply with IEEE C62.41.2.
  - 2. Testing shall include power and communication trunk wiring.
  - 3. Compliance with IEEE C62.41.2 shall imply conformance with IEEE C37.90.1 based on the stated position of ANSI and IEEE.
- E. Shop Drawings:

1. Submit a trunk cable schematic showing locations of all programmable control units, controllers, and workstations, with associated network wiring.
  - a. Indicate equipment served by each controller on the diagram.
  - b. Indicate switches, power requirements to each controller, and daisy chained controllers.
3. Submit detailed schematic control drawings for each controlled device and equipment.
  - c. Reference all control components to manufacturer make and model number.
  - d. Include all control and power wiring with termination point (controller and terminal number).
  - e. Include clearly indicated and written sequences of operation referenced to specific control components (e.g., "shall modulate valve V-3").
  - f. Include default position (e.g., N.O., N.C., etc.) for all components where applicable.
  - g. Clearly differentiate between existing components and new components.
  - a. Include detailed wiring diagrams showing methods of connections to VFDs, motor starters, energy meters, and all other devices, and all other field wiring necessary for system installation.
    - b. The use of "typicals" will be allowed where appropriate.
2. Submit detailed drawings for each individual BAS distributed controller.
  - a. Include controller identification.
  - b. Include components included in the controller.
  - c. Include numbering of terminals and communications ports.
  - d. List connected data points, including connected control unit and input device.
  - e. Include type of cable connected to each terminal port.
  - f. Identify specific field devices wired to each terminal including identification of each field device and application.
  - g. Clearly differentiate between existing controllers and new controllers.
  - h. Indicate source (electrical panel ID) of 120V power to each panel to which 120V power is connected.
  - i. Indicate method of connecting controller to equipment supplied by others and to existing communications networks.
  - j. Indicate device instance and network number.
3. Submit floor plans that indicate the following:
  - a. Location of all new BAS distributed controllers and control panels.
  - b. Routing of all new building level network communications wiring not located in mechanical and electrical rooms.
  - c. Routing of wiring to controllers, sensors, and control points not located in mechanical and electrical rooms.
  - d. Location of building system connection to Owner's campus wide data network.
4. Submit methods and materials used to integrate into existing networks.
5. Submit proposed smoke control system testing procedure based on Smoke Control Rational Analysis Report and smoke control drawings. Testing procedures to be approved by life safety consultant and engineer.
6. All control drawings and schematics shall be generated using AutoCAD software or equivalent. All project drawings shall be supplied to the Owner in a format as desired by the Owner upon project completion.
4. Submit system identification nomenclature.
  - a. Nomenclature shall be consistent throughout the network and consistent with any existing networks that are integrated. If not defined, nomenclature shall be similar to the point names shown on the drawings.
  - b. Object name and ID number shall be unique within a control device.
  - c. Control device instance name and ID number shall be unique within the network.
  - d. Network number shall be unique for each unique electrical segment in the BAS.
7. Indicate system graphics indicating monitored systems, data (connected and calculated) and operator notations.

- a. Submit example graphic visualizations and screenshots for the BAS. At a minimum, submit examples for major HVAC equipment components, including chillers, boilers, air handling units, fan coil units, heat pumps, fans, etc.
  - b. Font size and type shall be manufacturer standard.
  - c. Provide graphics demonstration package in a format as desired by the Owner.
8. Indicate description and sequence of operation of operating, user, and application software.
- F. Manufacturer's Instructions: Indicate manufacturer's installation instructions for all manufactured components.
- G. Manufacturer's qualification statement.
- H. Installer's qualification statement.
- I. Project Record Documents: Record actual locations of control components, including control units, thermostats, and sensors.
1. Revise shop drawings to reflect actual installation and operating sequences.
  2. Include submittals data in final "Record Documents" form.
  3. All additions or changes to the BAS during the course of construction shall be reflected upon the drawings and submitted to the Engineer before project close-out.
- J. Testing and Commissioning Reports and Checklists: Submit completed versions of all reports and checklists, along with all trend logs, used to meet the requirements of Part 3, Startup and Demonstration.
- K. Operation and Maintenance Data:
1. Include maintenance data and recommended spare parts list for digital control equipment and control components.
  2. Include trouble-shooting maintenance guides.
  3. Include interconnection wiring diagrams showing complete field installed systems with identified and numbered system components and devices.
  4. Include keyboard illustrations and step-by-step procedures indexed for each operator function.
  5. Include inspection period, cleaning methods, cleaning materials recommended, and calibration tolerances.
  6. Include a maintenance manual which contains the information listed above, product data, shop drawings, final software code for sequences of operation and maintenance data in accordance with requirements of Division 01.
  7. Include logbook for documentation of software updates and patches applied BAS for the time period included in the software licensing agreement.
  8. Provide names, addresses, and telephone numbers of installing contractors and service representatives for equipment and control systems.
- L. Warranty: Submit manufacturer's warranty and ensure forms have been filled out in Owner's name and registered with manufacturer.
- M. Maintenance Materials:
1. Refer to Division 01 for additional provisions.
  2. Extra Stock Materials: Two printer cartridges and cartons of printer paper.

## 1.6 QUALITY ASSURANCE

- A. Perform work in accordance with NFPA 70.
- B. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc., as suitable for the purpose specified and indicated.
- C. BACnet devices used in the BAS shall be BTL listed according to its device profile.

- D. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- E. Installer Qualifications: Company specializing in performing the work of the type specified and with minimum documented experience as follows:
  - 1. All personnel of the BAS Contractor shall have a minimum of three years of experience within their appropriate trades.
  - 2. All subcontractors utilized by the BAS Contractor shall have a minimum of five years experience within their appropriate trades.
- F. Additional BAS Contractor Requirements:
  - 1. Personnel, Coverage and Response Capabilities: The BAS Contractor shall have a fully staffed office with service technicians and systems engineers within a 50 mile radius of the project location.
  - 2. Emergency Service: The BAS Contractor shall have an established 24 hour emergency service organization. A dedicated telephone number shall be provided to the Owner for requesting emergency service. A maximum of four hour, electronic service technician on sight, response time shall be guaranteed by the BAS Contractor.
  - 3. Parts Stocking: The BAS Contractor shall have an independently verifiable inventory of electronic service parts. This electronic service parts inventory must have a worth of at least 100,000 per year over the last five years.
  - 4. Past Projects: The BAS Contractor shall have completed a minimum of twenty five projects within the last five years which are at least equal in dollar value and comparable scope to this project. A list of similar projects, dollar volume, scope, contact name and contact number shall be provided by the BAS Contractor if asked for by the Owner.

## 1.7 WARRANTY

- A. Refer to Division 01 for additional project warranty requirements.
- B. Labor and materials for the BAS specified shall be warranted free from defects in workmanship and material for a period of 1 year after Substantial Completion and system acceptance.
- C. BAS failures during the warranty period shall be adjusted, repaired, or replaced at no additional cost or reduction in service to the Owner.
- D. All work shall have a single warranty date, even when the Owner has received beneficial use due to an early system start-up. If the work specified is split into multiple contracts or a multi-phase contract, then each contract or phase shall have a separate warranty start data and period.
- E. Provide updates to operator workstation software, project-specific software, graphic software, database software, and firmware that resolve Contractor-identified software deficiencies at no charge during warranty period. If available, Owner can purchase in-warranty service agreement to receive upgrades for functional enhancements associated with above-mentioned items. Do not install updates or upgrades without Owner's written authorization.
- F. Provide five year manufacturer's warranty for field programmable micro-processor based units.
- G. Special warranty on instrumentation:
  - 1. All instrumentation shall be covered by manufacturer's transferable one-year "No Fault" warranty. If manufacturer warranty is not available, the BAS installer shall provide the same.

## 1.8 PROTECTION OF SOFTWARE RIGHTS

- A. Prior to delivery of software, the Owner and the party providing the software will enter into a software license agreement with provisions for the following:
  - 1. Limiting use of software to equipment provided under these specifications.
  - 2. Limiting copying.

3. Preserving confidentiality.
  4. Prohibiting transfer to a third party.
- B. Software provider shall provide software updates and patches to the BAS as part of the software licensing agreement as the updates and patches are released. If any security vulnerabilities are discovered by the provider, the provider shall notify the client within five business days.
- C. Ownership of Proprietary Material: Project-specific software and documentation shall become Owner's property upon project completion. This includes, but is not limited to the following:
1. Graphics.
  2. Record drawings.
  3. Database.
  4. Application programming code.
  5. Documentation.

## **PART 2 - PRODUCTS**

### **2.1 MANUFACTURERS**

- A. Corporate Edition Products: The following manufacturers and product lines shall be manufacturer's most current vintage and of open protocol design. Corporate editions shall be based on manufacturer developed software.
1. Automated Logic, WebCtrl.
  2. Delta Controls, enteliBUS.
  3. Johnson Controls, Metasys.
  4. Siemens, Apogee – Desigo CC.
- B. The above list of manufacturers applies to operator workstation software, controller software, the custom application programming language, building controllers, custom application controllers, and application specific controllers. All other products specified under Division 23 Section "Instrumentation and Control Devices for HVAC" need not be manufactured by the above manufacturers.

### **2.2 SYSTEM DESCRIPTION**

- A. General:
1. The BAS shall consist of all necessary hardware and software to perform the control sequences of operation as called for in the Specifications and Drawings. Contractor shall install and commission all necessary devices to ensure a reliable and stable network.
  2. System design is based on a distributed system of fully intelligent, stand-alone controllers, operating in a multi-tasking, multi-user environment on token passing network, with central and remote hardware, software, and interconnecting wire and conduit.
  3. Include computer software and hardware, operator input/output devices, control units, local area networks (LAN), sensors, control devices, actuators.
  4. The BAS shall be capable of integrating multiple devices, sensors, and functions from multiple control vendors into a common front end, including equipment supervision and control, alarm management, energy management, and trend data collection.
  5. The BAS shall be modular in nature, and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, ASC's, and operator devices.
  6. The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices.
- B. Local Area Network:
1. The BAS shall be set up as a physically separate network within the building.
- C. Network Architecture: The BAS network architecture shall be based upon the OSI basic reference model in accordance with ISO 7498.

1. Application/Network Layer:
    - a. BACnet protocol complying with ASHRAE Standard 135.
  2. Physical/Data Link Layer:
    - a. Hard-wired type:
      - 1) Ethernet according to ISO 8802-2 protocol.
      - 2) EIA-485 Twisted Cable Pair according to Master Slave/Token-Passing (MS/TP) protocol.
  3. Communication between operator workstation(s) and building controller(s):
    - a. Ethernet.
  4. Communication between building controller(s) and application specific and custom application controllers:
    - a. MS/TP.
    - b. PTP.
- D. Web Services Enabled Network:
1. The network shall be capable of being accessed remotely over the internet via a virtual link according to Internet Protocol.
  2. System software shall be based on a client/server architecture, designed around the open standards of web technology. The BAS server shall be accessed using a web browser over the BAS network, Owner's LAN, and remotely over the Internet (through the Owner's LAN).
  3. No special software other than a web browser shall be required to access graphics, point displays, and trends, configure trends, configure points and controllers, or to edit programming. Connection shall be browser agnostic.
  4. Software applications shall be designed and optimized for hand-held device interface (e.g., tablets, smart phones, etc.). Interface shall grant visibility and control access, at a minimum, to the following data: Summary, Alarm, Setpoints, Status, Schedule, and Trending.
- E. Network Integration:
1. The BAS network shall be integrated with other automation networks controlled by the Owner. Coordinate with the Owner's information technology (IT) department for networks that shall be integrated.
  2. Provide gateways or other integration devices across networks with different communication protocol to provide a single network visibility and interoperability at the operator workstation. Coordinate communication protocol with each automation system specified.
  3. Interoperable networks shall be capable of sharing all point and point information across networks to a single BAS front end.
  4. Interoperable networks shall be capable of automatically downloading application program changes.
  5. For integrated networks that cannot automatically download application program changes, provide a link to the Controller Manual Download Schedule, as defined in the submittals section of Part 1 on the BAS front end summary page
  6. Integrate the following networks:
    - a. Boiler plant master firing controller.
    - b. Chiller controller.
    - c. Life safety systems.
    - d. Fire alarm control panels.
    - e. Refrigerant monitoring controller.
  7. Uninterruptible Power System (UPS): Provide a UPS to allow for continuous operation of all equipment during loss of normal power until stand by power is achieved.
    - a. Applicable Systems:
      - 1) BAS.
      - 2) Smoke Control System.
    - b. Size the UPS to operate for a minimum of 15 minutes.

- c. Elements of the control system susceptible to power surges shall be protected by conditioners, suppressors or other approved means.
- d. Coordinate the size of the UPS with Division 26.
- 8. Requirements for Smoke Control Networks:
  - a. Network controllers and components used for smoke control operations shall be U.L. 864 – UUKL rated.
  - b. Control wiring used for smoke control operations shall be installed in a fire-resistive cable assembly. Reference Division 26 Section “Low-Voltage Electrical Power Conductors and Cables.”
  - c. Control system shall be capable of communicating with the building’s fire alarm system to fulfill the sequences of operation specified in this section or on the drawings.
  - d. The BAS Contractor shall provide a Fire Fighter’s Smoke Control Panel to manually control the smoke evacuation system. Reference Section 230913 for panel requirements.
- F. Network Interoperability:
  - 1. Provide communication between control units over local area network (LAN).
  - 2. Communication services over the LAN shall result in operator interface and value passing that is transparent to the network architecture as follows:
    - a. Connection of an operator interface device to any one controller on the network shall allow the operator to interface with all other controllers as if that interface were directly connected to the other controllers. Data, status information, reports, system software, custom programs, etc., for all controllers shall be available for viewing and editing from any one controller on the network.
    - b. All database values (e.g., objects, software variables, custom program variables) of any one controller shall be readable by any other controller on the network. This value passing shall be automatically performed by a controller when a reference to an object name not located in that controller is entered into the controller’s database. An operator/installer shall not be required to set up any communication services to perform network value passing.

## 2.3 OPERATOR INTERFACE

- A. General:
  - 1. The Operator Interface shall provide overall BAS supervision and system software interface. Communications from the workstation shall be executed directly to and between the integration level building controllers and field level controllers.
  - 2. The operator interface shall be capable of command entry, information and alarm management, database management, access of all system data, and be independent of hardware technology.
- B. Hardware:
  - 1. Laptop:
    - a. Laptop(s) to be provided by BAS controls manufacturer.
    - b. Laptop shall be general purpose and commercially available, with sufficient memory and processing capability to meet the requirements of the BAS.
    - a. Quantity: 1.
    - c. Minimum RAM: 4.0 Gigabytes.
    - d. Minimum Processing Speed: Intel i3 Dual Core Microprocessor or better running at no less than 3.0 gigahertz.
    - e. Minimum Hard Drive Memory: 500 Gigabyte.
    - f. Drives: External 32X CD/8X DVD drive with USB connection.
    - g. Ports: Minimum of 2 USB 2.0 or faster.
    - h. Display: Minimum 15 inch.
    - i. Network Connection:
      - 1) Suitable for network technology provided.

- 2) Ethernet interface card with minimum speed: 10/100/1000.
- 3) Wireless interface card, dual band.

## 1.2 CONTROLLERS

### C. Building Controllers

1. General:
  - a. Input Power Requirements: 24Vac.
  - b. Manage global strategies by one or more, independent, standalone, microprocessor based controllers.
  - c. Provide sufficient memory to support controller's operating system, database, and programming requirements.
  - d. Share data between networked controllers.
  - e. Controller operating system manages input and output communication signals allowing distributed controllers to share real and virtual object information and allow for central monitoring and alarms.
  - f. Utilize real-time clock for scheduling.
  - g. Continuously check processor status and memory circuits for abnormal operation.
  - h. Monitor and assume predetermined failure mode and generate alarm notification upon detection of abnormal operation.
  - i. Communication with other network devices to be based on assigned protocol.
  - j. Monitor the status of all overrides, and include this information in logs and summaries to inform the operator that automatic control has been inhibited.
2. Communication:
  - a. Perform routing when connected to a network of custom application and application specific controllers.
  - b. Provide service communication port for connection to a portable operator's terminal or hand held device with compatible protocol.
    - 1) Port shall be USB type.
3. Anticipated Environmental Ambient Conditions:
  - a. Outdoors and/or in Wet Ambient Conditions:
    - 1) Mount within NEMA 4X waterproof enclosures.
    - 2) Rated for operation at 40 to 150 degrees F and 95 percent RH, non-condensing.
  - b. Conditioned Space:
    - 1) Mount within NEMA 1 dustproof enclosures.
    - 2) Rated for operation at 32 to 120 degrees F.
4. Local Keypad and Display for each Controller:
  - a. Use for interrogating and editing data.
  - b. System security password prevents unauthorized use.
  - c. If the manufacturer does not normally provide a keypad and display for the controller, provide software and interface cabling needed to use a portable operator terminal for the system.
5. Provisions for Serviceability:
  - a. Diagnostic LEDs for power, communication, and processor.
  - b. Make all wiring connections to field removable, modular terminal strips, or to a termination card connected by a ribbon cable.
6. Memory: In the event of a power loss, maintain all BIOS and programming information for a minimum of 72 hours.
7. Power and Noise Immunity:
  - a. Maintain operation at 90 to 110 percent of nominal voltage rating.
  - b. Perform orderly shutdown below 80 percent of nominal voltage.
  - c. Upon restoration of normal power, the controller shall automatically resume full operation without manual intervention.
  - d. Operation shall be protected against electrical noise of 5 to 120 Hz and from keyed radios up to 5 W. at 3 feet.

8. Surge and Transient Protection:
  - a. Isolation shall be provided at all network terminations, as well as all field point terminations, to suppress induced voltage transients consistent with IEEE Standard C62.41.2.
  - b. Isolation levels shall be sufficiently high as to allow all signal wiring to be run in the same conduit as high voltage wiring where acceptable by electrical code.
- D. Custom Application Controllers
  1. General:
    - a. Input Power Requirements: 24Vac.
    - b. Provide sufficient memory to support controller's operating system, database, and programming requirements.
    - c. Share data between networked, microprocessor based controllers.
    - d. Controller operating system manages input and output communication signals allowing distributed controllers to share real and virtual object information and allowing for central monitoring and alarms.
    - e. Utilize real-time clock for scheduling.
    - f. Continuously check processor status and memory circuits for abnormal operation.
    - g. Monitor and assume predetermined failure mode and generate alarm notification upon detection of abnormal operation.
    - h. Communication with other network devices to be based on assigned protocol.
    - i. Monitor the status of all overrides, and include this information in logs and summaries to inform the operator that automatic control has been inhibited.
  2. Communication:
    - a. Provide service communication port for connection to a portable operator's terminal or hand held device with compatible protocol.
  3. Anticipated Environmental Ambient Conditions:
    - a. Outdoors and/or in Wet Ambient Conditions:
      - 1) Mount within NEMA 4X waterproof enclosures.
      - 2) Rated for operation at 40 to 150 degrees F and 95 percent RH, non-condensing.
    - b. Conditioned Space:
      - 1) Mount within NEMA 1 dustproof enclosures.
      - 2) Rated for operation at 32 to 120 degrees F.
  4. Provisions for Serviceability:
    - a. Diagnostic LEDs for power, communication, and processor.
    - b. Make all wiring connections to field removable, modular terminal strips, or to a termination card connected by a ribbon cable.
  5. Memory: In the event of a power loss, maintain all BIOS and programming information for a minimum of 72 hours.
  6. Power and Noise Immunity:
    - a. Maintain operation at 90 to 110 percent of nominal voltage rating.
    - b. Perform orderly shutdown below 80 percent of nominal voltage.
    - c. Upon restoration of normal power, the Digital Panel shall automatically resume full operation without manual intervention.
    - d. Operation protected against electrical noise of 5 to 120 Hz and from keyed radios up to 5 W. at 3 feet.
  7. Surge and Transient Protection:
    - a. Isolation shall be provided at all network terminations, as well as all field point terminations, to suppress induced voltage transients consistent with IEEE Standard C62.41.2.
    - b. Isolation levels shall be sufficiently high as to allow all signal wiring to be run in the same conduit as high voltage wiring where acceptable by electrical code.
- E. Application Specific Controllers
  1. General:
    - a. Input Power Requirements: 24Vac.

- b. Not fully user programmable, microprocessor based controllers dedicated to control specific equipment.
  - c. Customized for operation within the confines of equipment served.
  - d. Provide sufficient memory to support controller's operating system, database, and programming requirements.
  - e. Communication with other network devices to be based on assigned protocol.
    - 1) Each ASC shall be capable of stand-alone operation and shall continue to provide control functions without being connected to the network.
  - f. Monitor and assume predetermined failure mode and generate alarm notification upon detection of abnormal operation.
2. Communication:
    - a. Provide service communication port for connection to a portable operator's terminal or hand held device with compatible protocol.
  3. Anticipated Environmental Ambient Conditions:
    - a. Outdoors and/or in Wet Ambient Conditions:
      - 1) Mount within NEMA 4X waterproof enclosures.
      - 2) Rated for operation at 40 to 150 degrees F.
    - b. Conditioned Space:
      - 1) Mount within NEMA 1 dustproof enclosures.
      - 2) Rated for operation at 32 to 120 degrees F and 95 percent RH, non-condensing.
  4. Provisions for Serviceability:
    - a. Diagnostic LEDs for power, communication, and processor.
    - b. Make all wiring connections to field removable, modular terminal strips, or to a termination card connected by a ribbon cable.
  5. Memory. In the event of a power loss, maintain all BIOS and programming information for a minimum of 72 hours.
  6. Power and Noise Immunity:
    - a. Maintain operation at 90 to 110 percent of nominal voltage rating.
    - b. Perform orderly shutdown below 80 percent of nominal voltage.
    - c. Upon restoration of normal power, the controller shall automatically resume full operation without manual intervention.
    - d. Operation shall be protected against electrical noise of 5 to 120 Hz and from keyed radios up to 5 W. at 3 feet.
  7. Surge and Transient Protection:
    - a. Isolation shall be provided at all network terminations, as well as all field point terminations, to suppress induced voltage transients consistent with IEEE Standard C62.41.2.
    - b. Isolation levels shall be sufficiently high as to allow all signal wiring to be run in the same conduit as high voltage wiring where acceptable by electrical code.
- F. Input/Output Interface
1. Hardwired inputs and outputs shall tie into the BAS through building, custom application, or application specific controllers.
  2. All Input/Output Points:
    - a. Protect controller from damage resulting from any point short-circuiting or grounding and from voltage up to 24 volts of any duration.
    - b. Provide universal type for building and custom application controllers where input or output is software designated as either binary or analog type with appropriate properties.
    - c. Universal-type inputs or outputs configurable between binary and analog are acceptable.
  3. Binary Inputs:
    - a. Allow monitoring of On/Off signals from remote devices.
    - b. Provide wetting current of 12 mA minimum, compatible with commonly available control devices and protected against the effects of contact bounce and noise.

- c. Sense dry contact closure with power provided only by the controller.
4. Pulse Accumulation Input Objects: Conform to all requirements of binary input objects and accept up to 10 pulses per second.
5. Analog Inputs:
  - a. Allow for monitoring of low voltage 0 to 10 Vdc, 4 to 20 mA current, or resistance signals (thermistor, RTD).
  - b. Compatible with and field configurable to commonly available sensing devices.
6. Binary Outputs:
  - a. Used for On/Off operation or a pulsed low-voltage signal for pulse width modulation control.
  - b. Outputs provided with three position (On/Off/Auto) override switches.
  - c. Status lights for building and custom application controllers to be selectable for normally open or normally closed operation.
7. Analog Outputs:
  - a. Monitoring signal provides a 0 to 10 Vdc or a 4 to 20 mA output signal for end device control.
  - b. Provide status lights and two position (AUTO/MANUAL) switch for building and custom application controllers with manually adjustable potentiometer for manual override on building and custom application controllers.
  - c. Drift to not exceed 0.4 percent of range per year.
8. Tri State Outputs:
  - a. Coordinate two binary outputs to control three point, floating type, electronic actuators without feedback.
  - b. Limit the use of three point, floating devices to the following zone and terminal unit control applications:
    - 1) VAV terminal units.
    - 2) Duct mounted heating coils.
    - 3) Zone dampers.
    - 4) Radiant devices.
  - c. Control algorithms shall run the zone actuator to one end of its stroke once every 24 hours for verification of operator tracking.

## 2.4 ELECTRICAL CONTROL POWER AND LOW VOLTAGE WIRING

- A. Power Wiring: Copper wiring, plenum cable, and raceways shall be as specified in the applicable section of Division 26.
- B. Power and Communication Wiring Transient Protection:
  1. Comply with IEEE C62.41.2.
  2. Communications trunk wiring shall be protected with a transient surge protection device providing the minimal protection required.
  3. Communication circuitry, input/output circuitry, and communication unit shall provide protection against a 1000 volt, 3 amp transient signal, directly applied to the communication or input/output terminations.
    - a. For systems not complying with this requirement, provide equivalent protection external to the automatic temperature control system controller. Protection shall be provided for the individual communications and input/output terminations for each automatic temperature control system controller.
    - b. Submittal documentation shall clearly define how this requirement will be met and how the external protection will not affect the performance of the controllers.
- C. Power Supplies:
  1. Provide UL listed control transformers with Class 2 current limiting type or over-current protection in both primary and secondary circuits for Class 2 service as required by the NEC.
  2. Limit connected loads to 80 percent of rated capacity.
  3. Match DC power supply to current output and voltage requirements.

4. Supplies shall be full wave rectifier type with output ripple of 5.0 mV maximum peak to peak.
  5. Regulation to be 1 percent combined line and load with 100 microsecond response time for 50 percent load changes.
  6. Provide over-voltage and over-current protection to withstand a 150 percent current overload for 3 seconds minimum without trip-out or failure.
  7. Operational Ambient Conditions: 32 to 120 degrees F.
  8. EM/RF meets FCC Class B and VDE 0871 for Class B and MIL-STD 810 for shock and vibration.
  9. Line voltage units UL recognized and CSA approved.
- D. Power Line Filtering:
1. Provide external or internal transient voltage and surge suppression component for all workstations and controllers.
  2. Minimum surge protection attributes:
    - a. Dielectric strength of 1000 volts minimum.
    - b. Response time of 10 nanoseconds or less.
    - c. Transverse mode noise attenuation of 65 dB or greater.
    - d. Common mode noise attenuation of 150 dB or greater at 40 to 100 Hz.
- E. Input/Output Control Wiring
1. Control wiring shall be sized to accommodate the voltage drop associated with the distance between the control device and the controller. Minimum size shall be as specified herein.
  2. In all communication conduits, provide one spare twisted pair to be installed, tagged and labeled at each end.
  3. Control wiring not installed in conduit shall be UL rated for plenum installation.
  4. Ethernet control wiring shall be fiber optic or single pair of solid 24 gauge twisted, shielded copper cable.
  5. RTD wiring shall be three-wire or four-wire twisted, shielded, minimum number 22 gauge.
  6. Other analog inputs shall be a minimum of number 22 gauge, twisted, shielded.
  7. Binary control function wiring shall be a minimum of number 18 gauge.
  8. Analog output control functions shall be a minimum of number 22 gauge, twisted, shielded.
  9. Binary input wiring shall be a minimum of number 22 gauge, twisted, shielded.
  10. Thermistors shall be equipped with the manufacturer's calibrated lead wiring.
  11. 120V control wiring shall be #14 THHN in 3/4 inch conduit. Provide 20% fill extra wire in each conduit.
- F. Splices: Splices in shielded cables shall consist of terminations and the use of shielded cable couplers that maintain the integrity of the shielding.
- G. Conduit and Fittings
1. Conduit for Control Wiring, Control Cable and Transmission Cable: EMT with compression fittings, cold rolled steel, zinc coated or zinc-coated rigid steel with threaded connections.
  2. Outlet Boxes (Dry Location): Sheradized or galvanized drawn steel suited to each application, in general, four inches square or octagon with suitable raised cover.
  3. Outlet Boxes (Exposed to Weather): Threaded hub cast aluminum or iron boxes with gasket device plate.
  4. Pull and Junction Boxes: Size according to number, size, and position of entering raceway as required by National Electrical Codes. Enclosure type shall be suited to location.
- H. Relays
1. Relays other than those associated with digital output cards shall be general purpose, enclosed plug-in type with 8-pin octal plug and protected by a heat and shock resistant duct cover. Number of contacts and operational function shall be as required.
  2. Solid State Relays (SSR):
    - a. Input/output isolation: Greater than 10 E 9 ohms with a breakdown voltage of 1500V root mean square or greater at 60 Hz.
    - b. Contact Life: 10 x 10 E 6 operations or greater.

- c. Ambient Temperature Range: Minus 20 to 140 degrees F.
  - d. Input impedance: Not be less than 500 ohms.
  - e. Relays shall be rated for the application. Operating and release time shall be for 100 milliseconds or less. Transient suppression shall be provided as an integral part of the relay.
3. Contactors:
    - a. Type: Single coil, electrically operated, mechanically held, double-break, silver-to-silver type protected by arcing contacts.
    - b. Positive locking shall be obtained without the use of hooks, latches, or semi permanent magnets.
    - c. The number of contacts and rating shall be selected for the application. Operating and release times shall be 100 milliseconds or less. Contactors shall be equipped with coil transient suppression devices.

## 2.5 SYSTEM SOFTWARE

- A. General:
  1. Provide all necessary system software to form a complete operating system for all operator interface devices.
  2. System software shall integrate with all controller software and allow management of software applications at the operator workstation.
  3. System software display language: English.
- B. Device Profile: BACnet devices shall Conform to the following device profiles as specified in ASHRAE/ANSI 135 BACnet Annex L:
  1. Operator workstation: BACnet Operator Workstation (B-OWS)
  2. Building Controller: BACnet Building Controller (B-C).
  3. Advanced Application Controller: BACnet Advanced Application Controller (B-AAC).
  4. Application Specific Controller: BACnet Application Specific Controller (B-ASC).
- C. Software Programming:
  1. Provide programming for the system and adhere to the sequences of operation provided. Provide actions for all possible situations. All other system programming necessary for the operation of the system shall be provided by the Contractor. Imbed into the control program sufficient comment statements to clearly describe each section of the program. The comment statements shall reflect the language used in the sequences of operation. Provide text-based, graphic-based, and parameter-based programming where appropriate.
- D. Operating System:
  1. Concurrent, multi-tasking capability.
  2. Common Software Applications Supported:
    - a. Microsoft Windows and Microsoft Office Suite.
    - b. Open platform compatible database: Microsoft Access, Oracle Database, IBM Analytics, or other SQL database software. Proprietary databases shall not be acceptable.
  3. Acceptable Operating Systems: Most recent version of operating system.
- E. System Graphics:
  1. Color type, saved in an industry-standard format such as BMP, JPEG, PNG, or GIF.
  2. Allow simultaneous display for comparison and monitoring of system status.
  3. Web based graphics shall require no plug-in (such as HTML and JavaScript) or shall only require widely available no-cost plug-ins (such as Active-X, Java Virtual Machine, and Adobe Flash).
  4. Animate displayed objects by shifting image files of objects based on object status.
  5. Functionality: Provide method for operator with password to perform the following:
    - a. Move between, change size, and change location of graphic displays.
    - b. Modify on-line.

- c. View a summary of the most important data for each controlled zone or piece of equipment.
- d. View a summary of the most important global data for the project, including but not limited to date, day of week, time, outdoor dry bulb temperature, and humidity.
- e. Use point-and-click navigation between graphic screens.
- f. Edit setpoints and other specified parameters.
  - a. Edit equipment names and numbers.
  - b. Edit room names and numbers.
  - g. Indicate areas or equipment in an alarm condition using color or other visual indicator.
  - h. Add, delete, or change dynamic objects consisting of:
    - 1) Analog and binary values.
    - 2) Dynamic text.
    - 3) Static text.
    - 4) Animation files.
  - i. Display graphic file, text, and dynamic object data together on a single graphic. Display all measured and commanded data, setpoints, calculated values, and input and output control points with appropriate engineering units associated with each system schematic.
  - j. Dynamic Data Displays: Dynamic temperature values, humidity values, flow values, and status indication shall be shown in their actual respective locations, and shall automatically update to represent current conditions without operator intervention.
  - k. Dynamic Data Displays shall be capable of including point data from multiple ASC's.
- 6. Include at least one graphic for each of the following:
  - a. Each piece of equipment.
  - b. Occupied zone.
  - c. Hydronic system (chilled water, condenser water, hot water, steam, heat pump, etc.)
  - d. Floor plan displays of the building. Indicate summary conditions for each floor.
  - e. Indicate thermal comfort on floor plan using dynamic colors to represent zone temperature relative to zone setpoint.
- 2. Graphic Tree Structure:
  - f. Structure graphic system tree to allow access to individual graphic screens from a macro to a micro level.
  - g. Allow each level of graphic direct access to the graphic screen above and below the graphic screen in the system tree.
  - h. Allow direct access to the main summary graphic screen/map from any individual graphic screen.
- 7. Sequence of Operation Graphics:
  - a. Display the complete Sequence of Operation or include a link to a separate text file that contains the sequence of operation, as submitted by the Contractor and approved by the Engineer with each system schematic view. The Sequence of Operation text shall be in a separate frame above, below, or to the side of the graphic as appropriate for the graphic size and content.
- 8. Custom Graphics Generation Package:
  - a. Allow operator to create, delete, modify, and save custom graphic files and displays. File format of graphics shall be compatible with BAS software.
  - b. Web-based Graphics: HTML graphics to support web browser compatible formats.
  - c. The BAS Contractor shall provide libraries of pre-engineered screens and symbols depicting standard components with which custom graphics may be built. Standard components include but are not limited to
    - 1) Air handling unit components (e.g., fans, cooling coils, filters, dampers, etc.).
    - 2) Complete mechanical systems (e.g., constant volume-terminal reheat, VAV, etc.).
    - 3) Hydronic system components (e.g., chillers, boilers, pumps, piping, valves, etc.).
    - 4) Electrical symbols.

- d. The graphic development package shall use a mouse or similar pointing device in conjunction with a drawing program to allow the user to perform the following
    - 1) Define symbols.
    - 2) Position and size symbols.
    - 3) Define background screens.
    - 4) Define connecting lines and curves.
    - 5) Locate, orient and size descriptive text.
    - 6) Define and display colors for all elements.
    - 7) Establish correlation between symbols or text and associated system points or other displays.
    - 8) Capture or convert graphics from AutoCAD.
  - e. Graphical displays shall be capable of representing a group of objects. Groups shall be capable of representing any logical grouping of system points or calculated data based upon building function, mechanical system, building layout, or any other logical grouping of points which aids the operator in the analysis of the building.
3. Standard HVAC Graphics Library: Furnish a complete library of standard HVAC equipment graphics and standard symbols for ancillary equipment in a file format compatible with the graphics generation package program. Graphics shall include, but not be limited to, the following:
    - a. HVAC Equipment:
      - 1) Chillers.
      - 2) Boilers.
      - 3) Air Handlers.
      - 4) Terminal HVAC Units.
      - 5) Fan Coil Units.
    - b. Ancillary Equipment:
      - 1) Fans.
      - 2) Pumps.
      - 3) Coils.
      - 4) Valves.
      - 5) Piping.
      - 6) Dampers.
      - 7) Ductwork.
- F. Workstation System Applications:
1. General Application Functions:
    - a. All applications shall be capable of being executed automatically without the need for operator intervention, and shall be flexible enough to allow user customization.
    - b. Allow BAS configuration and future changes or additions by operators with password protection.
    - c. Execute configured processes defined by the user to automatically perform calculations and control routines.
    - d. Process Inputs and Variables: It shall be possible to use any of the following in a configured process:
      - 1) Any system-measured point data or status
      - 2) Any calculated data
      - 3) Any results from other processes
      - 4) Boolean logic operators (and, or)
    - e. Process Triggers: Configured processes may be triggered based on any combination of the following:
      - 1) Time of day
      - 2) Calendar Date
      - 3) Other processes
      - 4) Events (e.g., point alarms)

- f. Data Access: A single process shall be able to incorporate measured or calculated data from any and all other ASC's. In addition, a single process shall be able to issue commands to points in any and all other ASC's on the local network.
2. Network Configuration:
  - a. Allow for configuration of the BAS network.
  - b. Provide alarm when a break in communication between devices is detected.
  - c. Enable the operator to add, delete, or modify the following:
    - 1) Building controllers and ASC's.
    - 2) Points of any type, point parameters, and tuning constants.
  - d. Provide automatic reconfiguration if any station is added or lost.
3. Save and Restore:
  - a. Automatic System Database Save and Restore Functions:
    - 1) Store current database copy of each Building Controller on hard disk or server.
    - 2) Backup database on a user adjustable frequency basis. Default frequency shall be monthly.
    - 3) Automatically update upon change in any system panel.
    - 4) In the event of database loss in any system panel, the first workstation to detect the loss automatically restores the database for that panel unless disabled by the operator.
  - b. Manual System Database Save and Restore Functions by Operator with Password Clearance:
    - 1) Save database from any system panel.
    - 2) Clear a panel database.
    - 3) Initiate a download of a specified database to any system panel.
4. On-line Help:
  - a. Include context-sensitive system to assist operator in operation and editing.
  - b. Include topics available for all applications.
  - c. Include relevant screen data provided for particular screen display.
  - d. Include additional help via hypertext.
5. Security:
  - a. Require user name and password for Operator log-on to view, edit, add, or delete data.
  - b. Include selectable system security for each operator. Support a minimum of five levels of access:
    - 1) Level 1 Read-only data access and display.
    - 2) Level 2 Level 1 scheduling.
    - 3) Level 3 Level 2 operator overrides and commands.
    - 4) Level 4 Level 3 database generation and modification.
    - 5) Level 5 Level 4 Audit trail management.
    - 6) Operators shall be able to perform only those commands available for their respective passwords. Menu selections displayed at any operator device shall be limited to only the items defined as accessible for the user.
    - 7) Support a minimum of 4 passwords at each Building Controller.
  - c. Allow system supervisor to set passwords and security levels for all other operators.
  - d. Allow operator passwords to restrict functions accessible to viewing and/or changing system applications, editor, and object.
  - e. Include automatic, operator log-off results from keyboard or mouse inactivity during user-adjustable, time period.
  - f. Store all system security data in encrypted format.
  - g. Log all user actions and store data for audit with permission access by system administrator only.
    - 1) Include the modified system.
    - 2) Include the value modified.
    - 3) Include the time of modification.
6. System Diagnostics:

- a. Operations Automatically Monitored:
    - 1) Workstations.
    - 2) Printers.
    - 3) Network connections.
    - 4) Building management panels.
    - 5) Controllers.
  - b. Device failure is annunciated to the operator.
7. Alarm Management:
- a. Allow alarm prioritizing to minimize nuisance reporting and to speed operator response to critical alarms.
    - 1) Provide a minimum of three, user definable priority levels.
    - 2) Enable users to manually inhibit alarm reporting for each point.
    - 3) Enable users to manually inhibit nuisance alarm reporting for maintenance or repair work that is scheduled to be performed.
    - 4) Enable user to define conditions under which point changes need to be acknowledged by an operator, and/or logged for analysis at a later date.
    - 5) Allow alarm prioritization to lock out or circumvent other alarms that may be generated as a result of primary alarm.
  - b. Prohibit interference with the ability of the system software to report alarms by either operator activity at the local I/O device, or communications with other system controllers on the network.
  - c. Allow all system objects that are configurable to "alarm in" and "alarm out" of normal state.
  - d. Configurable Objects:
    - 1) Alarm limits.
    - 2) Alarm limit differentials.
    - 3) States.
    - 4) Reactions for each object.
    - 5) Alarm delay.
  - e. Alarm Messages:
    - 1) Descriptor: English language. Acronyms or mnemonics for objects in alarm are not acceptable.
    - 2) Recognizable Features:
      - a) Source.
      - b) Location.
      - c) Nature.
      - d) Time and Date.
      - e) Alarm message box to more fully describe the alarm condition or direct operator response.
      - f) Each Alarm messages shall be assignable to any point in the BAS. Alarm messages shall be assignable to multiple points.
        - a) Notification of an alarm override.
  - f. Configurable Alarm Reactions by Workstation and Time of Day:
    - 1) Logging.
    - 2) Printing.
    - 3) Starting programs.
    - 4) Displaying messages.
    - 5) Phone text message.
    - 6) Email.
    - 7) Providing audible annunciation.
    - 8) Displaying specific system graphics.
8. Custom Trend Logs:
- a. Maintain trend information for minimum 365 days.
  - b. Definable for any data object in the system including interval, start time, and stop time.
    - 1) Resolution: Interval periods shall be adjustable down to one minute.

- 2) Multiple Interval Period: Each trended point shall have the ability to be trended at a different trend interval.
    - c. Trend Data:
      - 1) Sampled and stored on the building controller panel.
      - 2) Auto-Delete Period: Software shall be capable of automatically deleting stored trend data after a user-adjustable period of time. Each trended point shall have the ability to have a different auto-delete interval period.
      - 3) Archivable on hard disk or server.
      - 4) Retrievable for use in reports, spreadsheets and standard database programs.
      - 5) Protected and encrypted format to prevent manipulation or editing of historical data and event logs.
    - d. Trend Graph Display:
      - 1) Group Trend Time Series Plots:
        - a) Provide user-selectable Y-axis points.
        - b) Provide user editable titles, point names, and Y-axis titles.
        - c) Individual trended points shall be able to be grouped into groups of up to four points per plot with up to four plots per page.
      - 2) X-Y Trend Plots:
        - a) User selectable X and Y trend inputs.
        - b) User editable titles, point names, and X and Y-axis titles.
        - c) User selectable time period options:
          - i) 1-day 24-hour period.
          - ii) 1-week 7-day period.
          - iii) 1-month period with appropriate days for the month selected.
          - iv) 1-year period.
          - v) User shall be able to select the beginning and ending period for each X-Y chart, within the time domain of the database being used.
          - vi) User selectable display up to 6 plots per screen in 2 columns.
      - 3) Automatic Scaling: System shall automatically scale the axis on which trends are displayed when multiple points with different trend interval periods are selected for graphical display.
      - 4) Dynamic Update: Trends shall be able to dynamically update at operator-defined intervals.
      - 5) Zoom: Software shall allow zoom-in function for detailed examination of trends.
    - e. Numeric Value Display: Software shall display value of any sample on a trend when picked.
  9. Alarm and Event Log:
    - a. View all system alarms and change of states from any system location.
    - b. List events chronologically.
    - c. List alarm priority.
    - c. Allow operator with proper security to acknowledge and clear alarms. Log operator and time when alarm is acknowledged.
    - d. Archive alarms not cleared by operator to the workstation.
  10. Object, Property Status, and Control:
    - a. Provide a method to view, edit if applicable, the status of any object and property in the system.
    - b. Status Available by the Following Methods:
      - 1) Menu.
      - 2) Graphics.
      - 3) Custom Programs.
  11. Clock Synchronization:
    - a. The real-time clocks in all building control panels and workstations shall be able to automatically synchronize daily from any operator-designated device in the system.

- b. The system shall automatically adjust for daylight savings and standard time, if applicable.
- 12. Reports and Logs:
  - a. Reporting Package:
    - 1) Allow operator to select, modify, or create reports.
    - 2) Definable as to data content, format, interval, and date.
    - 3) Under no conditions shall the operator need to specify the address of hardware controller to obtain system information.
    - 4) Provide ability to obtain real-time logs of all objects available by type or status such as alarm, lockout, normal, etc.
    - 5) Stored on hard disk and readily accessible by standard software applications, including spreadsheets and word processing.
    - 6) Allow printing on operator command or specific time(s).
  - b. Standard Report Format Options:
    - 1) Objects with current values.
    - 2) Global modification values.
    - 3) Current alarms not locked out.
    - 4) Disabled and overridden objects, points and variables.
    - 5) Objects in manual or automatic alarm lockout.
    - 6) Objects in alarm lockout currently in alarm.
    - 7) Objects currently in override status.
    - 8) Objects in Schedules
      - a) Daily.
      - b) Weekly.
      - c) Holiday.
    - 9) Logs:
      - a) Alarm History.
      - b) System messages.
      - c) System events.
      - d) Trends.
  - c. Custom Report Format Options:
    - 1) Daily.
    - 2) Weekly.
    - 3) Monthly.
    - 4) Annual.
    - 5) Time and date stamped.
    - 6) Title.
    - 7) Facility name.
    - 8) Point Groups.
      - a) User-selectable.
      - b) Group may be comprised of specific points, group of equipment objects, group of groups, or for the entire facility without restriction due to the hardware configuration of the BAS.
  - d. Electrical, Fuel, and Weather:
    - 1) Electrical Meter(s):
      - a) Monthly showing daily electrical consumption and peak electrical demand with time and date stamp for each meter.
      - b) Annual summary showing monthly electrical consumption and peak demand with time and date stamp for each meter.
    - 2) Fuel Meter(s):
      - a) Monthly showing daily fuel consumption for each meter.
      - b) Annual summary showing monthly consumption for each meter.
    - 3) Weather:
      - a) Monthly showing minimum, maximum, average outdoor air temperature and heating/cooling degree-days for the month.
- 13. Global Modify:

- a. Allow global modification of all editable data. Similar data shall be grouped into logical objects based on building function, mechanical system, building layout, or any other logical grouping of points.
  - b. Allow each common type of equipment to be excluded or included within the global editing process.
  - c. Display status information on all similar points in one global report.
  - d. Allow modification of the following:
    - 1) Individual data point edited.
    - 2) List of all points within the category.
    - 3) Global change field.
    - 4) Copy feature to assist in downloading the new changes.
    - 5) Verification that all changes were completed.
  - e. Include a change-all feature to change all selections.
  - f. Prevent acceptance of changes until an accept icon is acknowledged.
- G. Workstation Applications Editors:
- 1. Provide editing software for each system application at the PC workstation.
  - 2. Edited applications shall be automatically downloaded and executed at the controller panel.
  - 3. Programming Description: Definition of operator device characteristics, ASC's, individual points, applications and control sequences shall be performed through fill-in-the-blank templates.
  - 4. System Definition/Control Sequence Documentation: All portions of system definition shall be self-documenting to provide hard copy printouts of all configuration and application data.
  - 5. System definition and modification procedures shall not interfere with normal system operation and control.
  - 6. Provide consistent text-based displays of all system point and system applications.
  - 7. Point identification, engineering units, status indication, and application naming conventions shall be the same at all operator devices.
  - 8. Full screen editor for each application shall allow operator to view and change:
    - a. Configuration.
    - b. Name.
    - c. Control parameters.
    - d. Set-points.
    - e. Schedules.
  - 9. Scheduling:
    - d. Allow scheduling down to the zone or room level.
      - a. Monthly calendar indicates schedules, holidays, and exceptions.
      - b. Allows several related objects to be grouped, scheduled, and copied to other objects or dates.
      - c. Start and stop times adjustable from master schedule.
      - e. Schedule expiration.
      - d. Temporary overrides of systems with user adjustable time-out.
      - f. Provide minimum three tiers of priorities for scheduling.
        - 1) Priority 1: Event, temporary, or override.
        - 2) Priority 2: Calendar.
        - 3) Priority 3: Default.
      - g. Higher priority schedules shall overlay with lower priority schedules without interrupting or deleting them. Upon expiration of a higher priority schedule, schedule shall revert to next lower priority.
      - h. Expired priority 1 and priority 2 schedules shall be automatically deleted after execution.
  - 10. Custom Application Programming:
    - a. Create, modify, debug, edit, compile, and download custom application programming during operation and without disruption of all other system applications.
    - b. Programming Features:

- 1) English oriented programming language, allowing for free form programming.
- 2) Alternative language graphically based using appropriate function blocks suitable for all required functions and amenable to customizing or compounding.
- 3) Insert, add, modify, and delete custom programming code that incorporates word processing features such as cut/paste and find/replace.
- 4) Allows the development of independently, executing, program modules designed to enable and disable other modules.
- 5) Debugging/simulation capability that displays intermediate values and/or results including syntax/execution error messages.
- 6) Support for conditional statements (IF/THEN/ELSE/ELSE-F) using compound Boolean (AND, OR, and NOT) and/or relations (EQUAL, LESS THAN, GREATER THAN, NOT EQUAL) comparisons.
- 7) Support for floating-point arithmetic utilizing plus, minus, divide, times, square root operators; including absolute value; minimum/maximum value from a list of values for mathematical functions.
- 8) Language consisting of resettable, predefined, variables representing time of day, day of the week, month of the year, date; and elapsed time in seconds, minutes, hours, and days where the variable values can be used in IF/THEN comparisons, calculations, programming statement logic, etc.
- 9) Language having predefined variables representing status and results of the system software enables, disables, and changes the set points of the controller software.

## 2.6 CONTROLLER SOFTWARE

- A. All applications reside and operate in the system controllers and editing of all applications occurs at the operator workstation.
- B. System Security:
  1. User access secured via user passwords and user names.
  2. Passwords restrict user to the objects, applications, and system functions as assigned by the system manager.
  3. User Log On/Log Off attempts are recorded.
  4. Automatic Log Off occurs following the last keystroke after a user defined delay time.
- C. Object or Object Group Scheduling:
  1. Weekly Schedules Based on Separate, Daily Schedules:
    - a. Include start, stop, optimal stop, and night economizer.
    - b. 10 events maximum per schedule.
    - c. Start/stop times adjustable for each group object.
  2. Exception Schedules:
    - a. Based on any day of the year.
    - b. Defined up to one year in advance.
    - c. Automatically discarded and replaced with standard schedule for that day of the week upon execution.
  3. Holiday or Special Schedules:
    - a. Capability to define up to 99 schedules.
    - b. Repeated annually.
    - c. Length of each period is operator defined.
- D. System Coordination: Provide a standard application for equipment coordination. The application shall provide the operator with a method of grouping together equipment based on function and location. Groups shall be capable of being used for scheduling and other applications.
- E. Alarms:
  1. Binary object is set to alarm based on the operator specified state.
  2. Analog object to have high/low alarm limits.

3. All alarming is capable of being automatically or manually disabled.
4. Alarm Reporting:
  - a. Operator determines action to be taken for alarm event.
  - b. Alarms to be routed to appropriate workstation.
5. Reporting Action Options:
  - a. Start Programs.
  - b. Print.
  - c. Logged.
  - d. Custom messaging.
  - e. Graphical displays.
  - f. Dial out to workstation receivers via system protocol.
- F. Maintenance Management: System monitors equipment status and generates maintenance messages based upon user-designated run-time limits.
- G. Sequencing: Application software based upon specified sequences of operation on the control drawings.
- H. PID Control Characteristics:
  1. Provide proportional-integral algorithms.
  2. Direct or reverse action.
  3. Anti-windup.
  4. Calculated, time-varying, analog value, positions an output or stages a series of outputs.
  5. User selectable controlled variable, set-point, and PI gains.
- I. Staggered Start Application:
  1. Prevents all controlled equipment from simultaneously restarting after power outage.
  2. Order of equipment startup is user selectable.
- J. Anti-Short Cycling:
  1. All binary output objects protected from short-cycling.
  2. Allows minimum on-time and off-time to be selected.
  3. Allows the number of times each piece of equipment may be cycled within any one-hour period.
- K. On-Off Control with Differential:
  1. Algorithm allows binary output to be cycled based on a controlled variable and set-point.
  2. Algorithm to be direct-acting or reverse-acting incorporating an adjustable differential.
- L. Trending: Building controllers shall allow collection and delivery of (time, value) pairs.
- M. Totalization:
  1. Run-Time Totalization:
    - a. Totalize run-times for all binary input objects.
    - b. Provides operator with capability to assign high run-time alarm.
    - c. Generates unique, user-specified messages when the limit is reached.
    - d. Resolution: Adjustable down to one minute.
  2. Pulse Totalization:
    - a. Totalize consumption for user-selected analog and binary pulse input-type objects.
    - b. Configurable for a daily, weekly, or monthly basis.
    - c. Provide calculation and storage accumulations of up to 9,999,999 units (e.g. KWH, gallons, KBTU, tons, etc.).
    - d. Resolution: Adjustable down to one minute.
    - e. Warning Limit: User definable. Generate unique, user-specified messages when the limit is reached.
    - f. The information available from the Pulse Totalization shall include, but not be limited to, the following:
      - 1) Peak Demand, with date and time stamp
      - 2) 24-hour Demand Log
      - 3) Accumulated KWH for day

- 4) Sunday through Saturday KWH usage
  - 5) Sunday through Saturday Demand kW
  - 6) Demand kW annual history for past 12 periods
  - 7) KWH annual history for past 12 periods
3. Event Totalization:
- a. Count user-selected events, such as the number of times a pump or fan system is cycled on and off.
  - b. Provide storage accumulations of up to 9,999,999 events before reset.
  - c. Warning Limit: User definable. Generate unique, user-specified messages when the limit is reached.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION**

- A. Verify existing conditions before starting work.
- B. Verify that systems are ready to receive work.
- C. Beginning of installation means installer accepts existing conditions.
- D. Verify that conditioned power supply is available to the control units and to the operator work station. Verify that field end devices and wiring are installed prior to installation proceeding.
- E. Verify the integrity of control wiring, raceways, control panels, sensors, and control devices prior to reusing for the new work.
- F. Verify wiring insulation is defect free and test wiring for continuity and ground faults.

### **3.2 INSTALLATION**

- A. Install products in accordance with manufacturer's instructions.
- B. Coordination:
  1. Cooperate with other contractors performing work on this project as necessary to achieve a complete and coordinated installation. Each Contractor shall consult the Drawings and Specifications for all trades to determine the nature and extent of others work.
  2. Coordinate with other contractors performing work to provide standby power to all control devices required to operate on standby power.
  3. Coordinate with the Owner to display additional virtual points on individual schematic graphic screens that are not directly associated with that system. Examples may include outdoor air temperature or global alarm conditions.
- B. Web Services Enabled Network:
  4. Provide an IP network data drop for connection of BAS into Owner's IP network. Coordinate final location of IP network data drop with the Owners' IT staff.
  5. If the Owner has no preference or not indicated on the drawings, locate data drop within the main BAS control panel.
  6. Coordinate with the Owner's IT department to implement proper security measures, including secure access to the network data drop and firewalls at all virtual access points to the internet to protect access to the BAS.
- C. General Workmanship:
  1. Install equipment, piping, and wiring/raceway parallel to building lines wherever possible.
  2. Install all equipment in readily accessible locations.
  3. Verify integrity of all wiring to ensure continuity and freedom from shorts and grounds.
  4. All installations shall comply with industry specifications and standards for performance, reliability, and compatibility and be executed in strict adherence to local codes and standard practices.

7. Control wiring routed in wall cavities shall be installed in conduit.
  8. Install control units and other hardware in position on permanent walls where not subject to excessive vibration.
  9. Install software in control units and in operator work station. Implement all features of programs to specified requirements and appropriate to sequence of operation.
- C. Controllers:
1. Install controllers in a locked control panel. Provide common keying for all controller covers.
  2. Provide a separate controller for each piece of controlled equipment, such as an AHU, FCU, VAV box, etc. A controller may control more than one piece of equipment provided that all points associated with the equipment are assigned to the same BAS controller. Global points used for control loop reset are exempt from this requirement.
  3. Select building controllers and custom application controllers to provide the required I/O point capacity required to monitor all of the hardware points listed on the control drawings.
  4. Application specific controllers may be used where factory programming is capable of executing all control functions specified in the sequences of operation. Contractor shall add supplemental controllers, devices, and programming as required to execute the specified control function if the ASC cannot.
- D. Wiring:
1. All control and interlock wiring shall comply with national and local electrical codes.
  5. Properly ground all controllers.
  6. Wire all safety devices through both hand and auto positions of motor starting device to ensure 100 percent safety shut-off.
  2. Provide interlock wiring between devices as indicated on the control drawings.
  3. Provide electrical wiring for relays (including power feed) for temperature and pressure indication.
  4. All NEC Class 1 (line voltage) wiring shall be UL listed in approved raceway according to NEC and Division 26 requirements.
  5. All low-voltage wiring shall meet NEC Class 2 requirements. Low-voltage power circuits shall be sub-fused when required to meet Class 2 current limit.
  7. Conceal all low voltage wiring in finished rooms.
  8. Conceal all low voltage wiring in unfinished rooms below the elevation of the lights. Low voltage wiring above the elevation of the lights may be exposed.
  9. Routing of low voltage wiring above working heights in equipment rooms and above accessible ceilings is acceptable subject to following criteria:
    - a. Wiring shall be plenum rated.
    - b. Do not lay wiring on ceiling tiles.
  6. Where NEC Class 2 (current-limited) wires are in concealed and accessible locations, including ceiling return air plenums, approved cables not in raceway may be used provided that cables are UL listed for the intended applications.
  7. All wiring in mechanical, electrical, service rooms, or where subject to mechanical damage, shall be installed in raceway at levels below 10 feet.
  8. Do not install Class 2 wiring in raceway containing Class 1 wiring. Boxes and panels containing high voltage wiring and equipment may not be used for low-voltage wiring except for the purpose of interfacing the two wires (e.g., relays and transformers).
  9. Where Class 2 wiring is run exposed, wiring shall be run parallel along a surface or perpendicular to it and neatly tied at 10 foot intervals.
  10. Where plenum cables are used without raceway, they shall be supported from or anchored to structural members. Cables shall not be supported by or anchored to ductwork, electrical raceways, piping, or ceiling suspension systems.
  11. All wire-to-device and wire-to-wire connections shall be made at a terminal block or terminal strip.
  12. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals.

13. Maximum allowable voltage for control wiring shall be 120 V. If only higher voltages are available, coordinate with Division 26 to provide step-down transformers.
14. All wiring shall be installed as continuous lengths, with no splices permitted between termination points.
15. Install plenum wiring in sleeves where it passes through floors and walls. Maintain fire rating at all penetrations.
16. Size of raceway and size and type of wire shall be the responsibility of the Contractor, in keeping with the manufacturer's recommendations and NEC requirements, except as noted elsewhere.
17. Include one pull string in each raceway 1 inch and larger.
18. Use coded conductors throughout with conductors of different colors.
19. Control and status relays shall be located in designated enclosures only. These enclosures include packaged equipment control panel enclosures unless they also contain Class 1 starters.
20. Conceal all raceways, except within mechanical, electrical, or service rooms. Install raceway to maintain a minimum clearance of 6 inches from high-temperature equipment (e.g., steam pipes or flues).
21. Secure raceways with raceway clamps fastened to the structure and spaced according to code requirements. Raceways and pull boxes may not be hung on flexible duct strap or tie rods. Raceways may not be run on or attached to ductwork.
22. Install insulated bushing on all raceway ends and openings to enclosures. Seal top end of all vertical raceways.
23. Terminate all control and/or interlock wiring and maintain updated (as-built) wiring diagrams with terminations identified at the job site.
24. Terminate BAS sensor input wiring cable shield by taping back at the field device and connect shield to the grounded control panel chassis or sub-panel.
25. Terminate BAS comm bus cable shield between controllers per manufacturer recommendations.
26. Terminate management level/enterprise level network wiring cable shield by wrapping the drain wire around the foil shield and connecting the ground strip to the drain wire.
27. Flexible metal raceways and liquid-tight, flexible metal raceways shall not exceed 3 feet in length and shall be supported at each end. Flexible metal raceway less than 1/2 inch electrical trade size shall not be used. In areas exposed to moisture, including chiller and boiler rooms, liquid-tight, flexible metal raceways shall be used.
28. Raceway shall be rigidly installed, adequately supported, properly reamed at both ends, and left clean and free of obstructions. Raceway sections shall be joined with couplings (according to code). Terminations shall be made with fittings at boxes, and ends not terminating in boxes shall have bushings installed.

E. Communication Wiring:

1. Adhere to the items listed in the "Wiring" article in Part 3 of this specification in addition to the requirements listed below.
2. All cabling shall be installed in a neat and workmanlike manner. Follow manufacturer's installation recommendations for all communication wiring.
3. Do not exceed 328 feet in Ethernet wiring length between switches or repeaters.
4. Do not install communication wiring in raceway and enclosures containing Class 1 or other Class 2 wiring.
5. Do not install power wiring, in excess of 30 Vac RMS, in conduit with communications wiring. In cases where signal wiring is run in conduit with communication wiring, use separate twisted shielded pairs with the shields grounded in accordance with the manufacturer's wiring practice.
6. Communication conduits shall not be installed closer than six feet from high power transformers or run parallel within six feet of electrical high power cables. Care shall be taken to route the cable as far from interference generating devices as possible.
7. Do not exceed maximum pulling, tension, and bend radius for cable installation, as specified by the cable manufacturer during installation.

8. Verify the integrity of the entire network following the cable installation. Use appropriate test measures for each particular cable.
  9. When a cable enters or exits a building, install a lightning arrestor between the lines and ground. Install the lightning arrestor according to the manufacturer's instructions.
  10. Ground (earth ground) all shields at one point only, to eliminate ground loops.
  11. All runs of communications wiring shall be unspliced length when that length is commercially available.
  12. Terminate shielded cable splices in accessible locations. Harness cables with cable ties.
  13. Make all wire-to-device and wire-to-wire connections at a terminal block or terminal strip.
  14. Label all communications wiring to indicate origination and destination data.
  15. Ground coaxial cable in accordance with NEC regulations.
  16. Install BACnet MS/TP communications wiring in accordance with ASHRAE/ANSI Standard 135
    - a. The network shall use shielded, twisted-pair cable with characteristic impedance between 100 and 120 ohms. Distributed capacitance between conductors shall be less than 17 pF per foot at 76,800 Baud.
    - b. The maximum length of an MS/TP segment shall be 3000 ft with AWG 22 or 24 cable. The use of greater distances and/or different wire gauges shall comply with the electrical specifications of EIA-485.
    - c. The maximum number of nodes per segment shall be 50. Additional nodes may be accommodated by the use of repeaters.
    - d. An MS/TP EIA-485 network shall have no T connections.
- F. Identification of Hardware and Wiring:
1. Label all wiring and cabling, including that within factory-fabricated panels, at each end within 2 inch of termination with the BAS address or termination number.
  2. Permanently label or code each point of field terminal strips to show the instrument or item served.
  3. Identify control panels with minimum 1/2 inch letters on laminated plastic nameplates.
  4. Identify all other control components with permanent labels. Label all plug-in components such that removal of the component does not remove the label.
  5. Identify room sensors related to terminal box or valves with nameplates.
  6. Maintain manufacturers' nameplates and UL or CSA labels visible and legible after equipment is installed.
  7. Identifiers shall match record documents.

### 3.3 STARTUP AND DEMONSTRATION

- A. Start and commission systems. Allow sufficient time for start-up and commissioning prior to placing the BAS in permanent operation.
- B. Contractor shall provide an on-site controls technician or programmer familiar with the project BAS installation and system programming to assist the Commissioning Agent as directed during all phases of system functional testing.
- C. Coordinate with Owner the setup of logins, passwords, and security level access for individuals requiring access to the BAS.
- D. BAS graphics shall be updated with final equipment names, equipment numbers, room names and room numbers to match the final construction documents and any Owner changes made prior to occupancy.
- D. BAS shall be set up and checked by factory trained technicians skilled in the setting and adjustment of the BAS equipment used in this project. Technicians shall be experienced in the type of HVAC systems associated with this project.
- E. Verify that all control wiring is properly connected and free of all shorts and ground faults. Verify that terminations are tight.

- F. Test each control device to ensure that it is operating properly and is calibrated to the appropriate operating requirements. Run each control device through its range of operation and sequence. Verify all normal positions are correct. Adjust and tune PID control constants to achieve proper system operation.
1. As each control input and output is checked, a log shall be completed showing the date, technician's initials, and any corrective action taken or needed.
  2. Demand limiting. The Contractor shall supply a trend data output showing the action of the demand limiting algorithm. The data shall document the action on a minute-by-minute basis over at least a 30-minute period. Included in the trend shall be building kW, demand limiting set point, and the status of sheddable equipment outputs.
  3. Optimum start/stop. The Contractor shall supply a trend data output showing the capability of the algorithm. The change-of-value or change-of-state trends shall include the output status of all optimally started and stopped equipment, as well as temperature sensor inputs of affected areas.
  4. Any tests that fail to demonstrate the operation of the BAS shall be repeated at a later date. The Contractor shall be responsible for any necessary repairs or revisions to the hardware or software to successfully complete all tests.
- G. Test and verify control interfaces to other building systems integrated into the network.
- H. Verify all alarms and interlocks.
1. Check each alarm separately by including an appropriate signal at a value that will trip the alarm.
  2. Interlocks shall be tripped using field contacts to check the logic, as well as to ensure that the fail-safe condition for all actuators is in the proper direction.
  3. Interlock actions shall be tested by simulating alarm conditions to check the initiating value of the variable and interlock action.
  4. Verify fire/smoke and smoke damper functionality. Verify that they respond to the proper fire alarm system general, zone, and/or detector trips.
- I. Document on system equipment schedules the final setting of controller PID constant settings, setpoints, manual reset values, maximum and minimum controller output, and ratio and bias settings in units and terminology specific to the controller. Store documentation with operator workstation.
- J. Demonstrate complete and operating system to Owner.
1. Prior to acceptance, the BAS shall undergo a series of performance tests to verify operation and compliance with this specification. These tests shall occur after the Contractor has completed the installation, started up the system, and performed his/her own tests.
  2. The tests described in this section are to be performed in addition to the tests that the Contractor performs as a necessary part of the installation, start-up, and debugging process.
  3. The Contractor shall demonstrate actual field operation of each control and sensing point for all modes of operation including day, night, occupied, unoccupied, fire/smoke alarm, seasonal changeover, and power failure modes. Any test equipment required to provide the proper operation shall be provided by and operated by the Contractor.
  4. Demonstrate compliance with sequences of operation through all modes of operation.
  5. Demonstrate complete operation of operator interface.
- K. Acceptance:
1. All tests described in this specification shall have been performed to the satisfaction of the Owner prior to the acceptance of the BAS as meeting the requirements of completion. Any tests that cannot be performed due to circumstances beyond the control of the Contractor may be exempt from the completion requirements if stated as such in writing by the Contractor and submitted for approval by the Owner. Such tests shall then be performed as part of the warranty.
  2. The BAS shall not be accepted until all forms and checklists completed as part of the demonstration are submitted and approved.

**3.4 MAINTENANCE SERVICE**

- A. Provide service and maintenance of energy management and control systems for one year from Date of Substantial Completion.

**3.5 TRAINING**

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of sixteen hours on the operation and maintenance of the equipment provided under this section.
- B. Organize the training into sessions or modules for different levels of operators. Owner designated personnel shall be trained based on the level of operator training described below.
- C. Day-to-day Operator Training:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Proficiently operate the BAS.
  - 3. Understand BAS architecture and configuration.
  - 4. Understand BAS components.
  - 5. Understand system operation, including BAS control and optimizing routines (algorithms).
  - 6. Operate the workstation and peripherals.
  - 7. Log on and off the system.
  - 8. Access graphics, point reports, and logs.
  - 9. Adjust and change system set points, time schedules, and holiday schedules.
  - 10. Recognize malfunctions of the system by observation of the printed copy and graphical visual signals.
  - 11. Understand BAS drawings and Operation and Maintenance manual.
  - 12. Understand the job layout and location of control components.
  - 13. Access data from BAS controllers and ASCs.
  - 14. Operate portable operator's terminals.
  - 15. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
- D. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
- E. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- F. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 21 13 - HYDRONIC PIPING****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Hydronic system requirements.
- B. Hydronic piping materials.
- C. Hydronic piping fittings.
- D. Hydronic piping joining materials.

**1.2 ADMINISTRATIVE REQUIREMENTS**

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.
- B. Sequencing: Ensure that utility connections are achieved in an orderly and expeditious manner.

**1.3 SUBMITTALS**

- A. Submit in accordance with conditions of Contract and Division 01 submittal procedures.
- B. Reference Division 23 Section, "Basic Piping Materials and Methods" for additional submittal requirements.
- C. Reports as specified in Part 3 of this Section.

**1.4 QUALITY ASSURANCE**

- A. Comply with Division 23 Section, "Basic Piping Materials and Methods."
- A. Manufacturer Qualifications: Company specializing in manufacturing products of the type specified in this Section, with minimum three years of documented experience.
- B. Installer Qualifications: Company specializing in performing work of the type specified in this Section, with minimum three years of documented experience.

**1.5 DELIVERY STORAGE AND HANDLING**

- A. Comply with Division 23 Section, "Basic Piping Materials and Methods."

**PART 2 - PRODUCTS AND MATERIALS****2.1 HYDRONIC PIPING MATERIALS**

- A. Carbon Steel Pipe:
  - 1. NPS 2 inch and Smaller: ASTM A53 or A106, Type E electric-resistance welded or Type S seamless, Grade B, Schedule 40, black steel, plain ends.
  - 2. NPS 2-1/2 inch through 10 inch: ASTM A53 or A106, Type E electric-resistance welded or Type S seamless, Grade B, Schedule 40, black steel, plain or beveled ends.
  - 3. NPS 12 inch and Larger: ASTM A53 or A106, Type E electric-resistance welded or Type S seamless, Grade B, Schedule STD, black steel, plain or beveled ends.
- B. Copper Tubing:

1. Drawn Temper Tubing: ASTM B306, Type DWV
2. Drawn Temper Tubing: ASTM B88, Type M.
3. Drawn Temper Tubing: ASTM B88, Type L.
4. Annealed Temper Tubing: ASTM B88, Type K.

## 2.2 HYDRONIC PIPING FITTINGS

- A. General: Fittings shall be of wall thickness, pressure rating, and material matching adjoining pipe.
- B. Reference Division 23 Section "Basic Piping Materials and Methods" for basic piping materials and fittings.
- C. Threaded:
  1. All threads shall conform to ASME B1.20.1.
  2. Malleable-Iron: ASME B16.3, standard pattern.
  3. Cast-Iron: ASME B16.4, standard pattern.
  4. Galvanized: ASTM A197, standard pattern.
- D. Flanged:
  1. Cast-Iron Threaded: ASME B16.1, raised ground face, bolt holes spot faced.
  2. Cast-Bronze Flanges: ASME B16.24, raised ground face, bolt holes spot faced.
  1. Galvanized Threaded: ASME B16.5, raised ground face, bolt holes spot faced.
  3. Wrought Cast-Iron, Forged Steel, and Stainless Steel: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connection, and facing:
    - a. Material Group: 1.1.
    - b. End Connections: Butt welding.
    - c. Facings: Raised face.
  4. Gaskets: ASME B16.21, non-metallic, asbestos free, 1/8 inch thick, full-face for cast-iron flanges and raised-face steel flanges, suitable for chemical and thermal conditions of piping system contents.
  5. Flange bolts and nuts: ASME B18.2.1, hex head carbon steel according to ASTM A307, Grade B.
- E. Welded:
  1. Carbon and Galvanized Steel: ASME B16.9, seamless weld conforming to ASTM A234.
- F. Solder-Joint: Wrought-copper, ASME B16.18 or B16.22, streamlined pattern.
- G. Brazed-Joint: Wrought-copper, ASME B16.50, streamlined pattern.

## 2.3 HYDRONIC PIPING JOINING MATERIALS

- A. Reference Division 23 Section "Basic Piping Materials and Methods" for basic joining materials.

## PART 3 - EXECUTION

### 3.1 INSTALLATION GENERAL

- A. Install products in accordance with manufacturer's instructions.
- B. Install piping to ASME B31.9 requirements.
- C. Reference Division 23 Section "Basic Piping Materials and Methods" for general piping installation requirements.
- D. Do not install PVC or non-plenum rated CPVC piping in return air plenums.

**3.2 PIPE APPLICATION SCHEDULE**

- A. Mechanically Joined Hydronic Piping:
  - 1. Contractor may provide mechanically joined hydronic piping systems as an option in lieu of, in whole of, or in part of, the pipe fitting and joining methods for the specific systems indicated in Article "Pipe Applications." Reference Division 23 Section "Mechanically Joined Hydronic Piping Systems."
- B. Heating Hot Water Piping, Above Grade:
  - 1. Acceptable Pipe Materials:
    - a. Carbon steel with threaded fittings for pipes 2 inch and smaller, and flanged or welded fittings for pipes 2-1/2 inch and larger.
    - b. Type L copper with soldered, brazed, or flanged fittings.
  - 2. Fitting Pressure Class: Minimum rating of 125psig.
- C. Chilled Water Piping, Above Grade:
  - 1. Acceptable Pipe Materials:
    - a. Carbon steel with threaded fittings for pipes 2 inch and smaller, and flanged or welded fittings for pipes 2-1/2 inch and larger.
    - b. Type L copper with soldered, brazed, or flanged fittings.
  - 2. Fitting Pressure Class: Minimum rating of 125 psig.
- D. Condenser Water Piping, Above Grade:
  - 1. Acceptable Pipe Materials:
    - a. Carbon steel with threaded fittings for pipes 2 inch and smaller, and flanged or welded fittings for pipes 2-1/2 inch and larger.
    - b. Type L copper with soldered, brazed, or flanged fittings.
  - 2. Fitting Pressure Class: Minimum rating of 125psig.

**3.3 PREPARATION**

- A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- B. Remove scale and dirt on inside and outside before assembly.
- C. Prepare piping connections to equipment using jointing system specified.
- D. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps.

**3.4 PIPING INSTALLATION**

- A. Provide long radius elbows with a minimum centerline radius of 1-1/2 times the pipe diameter. Short radius elbows with a minimum centerline radius of 1 times the pipe diameter may be used only where space does not permit the long radius elbows.
- B. Install piping at a uniform grade of 1 inch in 40 feet upward in the direction of flow.
- C. Make reductions in pipe sizes using eccentric reducer fitting installed with the level side up.
- D. Install branch connections to mains using Tee fittings in main with take-off out the top or side of the main unless otherwise shown on the drawings. Up-feed risers shall have take-off out the top of the main line.
  - 1. Tee-drilling is prohibited as a means for connecting branch taps into any main.
  - 2. Bull-head tees are prohibited. Do not install tee fittings in such a way that the flow through the branch leg equals the sum of the flows through the two main legs.
- E. Anchor piping to ensure proper direction of expansion and contraction. Expansion loops and joints are indicated on the Drawings and specified in Division 23 Section "Expansion Fittings and Loops for HVAC Piping."

- F. Terminate condensate piping outside the building at nearest drain or other location as shown on the plans with air gap.

### 3.5 PIPE HANGERS AND SUPPORTS APPLICATION

- C. Comply with the requirements of Division 23 Section "Hangers and Supports for HVAC Piping and Equipment."
- A. Provide vibration isolation on piping as specified in Division 23 Section "Vibration Isolation for HVAC."
- B. Install hangers with the following minimum rod sizes and maximum spacing:

Nom. Pipe Size - In.	Steel Pipe Max. Span - Ft.	Copper Tube Max. Span - Ft.	Min. Rod Dia. - In.
Up to 3/4	7	5	3/8
1	7	6	3/8
1-1/4	7	7	3/8
1-1/2	9	8	3/8
2	10	8	1/2
2-1/2	11	9	1/2
3	12	10	1/2
4	14	12	5/8 (1/2 for copper)
5	16	13	5/8 (1/2 for copper)
6	17	14	3/4 (5/8 for copper)
8	19	16	7/8 (3/4 for copper)
10	20	18	7/8 (3/4 for copper)
12	23	19	7/8 (3/4 for copper)
14	25		1
16	27		1
18	28		1 1/4
20	30		1-1/4
24	32		1-1/4
30	33		1-1/4

- C. Use copper tube maximum hanger span requirements for PVC and CPVC supports and hangers, unless manufacturer's recommendations specify closer hanger spacing.
- D. Support vertical runs at roof, at each floor, and at maximum 15-foot intervals between floors.
- E. Install a support within one foot of each change of direction.
- F. Space supports not more than five feet apart at valves, strainers, or piping accessories in piping larger than 2 inches.

### 3.6 PIPE JOINT CONSTRUCTION

- A. Reference Division 23 Section, "Basic Piping Materials and Methods" for basic pipe joint construction.
- B. Where more than one pipe material is specified, provide joining fittings that are compatible with piping materials and ensure that the integrity of the system is not jeopardized.
- C. Install non-conductive dielectric connections whenever joining dissimilar metals.

- D. Pipe-to-Valve and Pipe-to-Equipment Connection: Install flanges or unions between piping and valves and equipment for servicing. Do not use direct welded, brazed, or soldered connections unless specifically called for in the manufacturer's installation instructions.

### 3.7 FIELD QUALITY CONTROL

- A. Preparation for Testing:
1. Prepare hydronic piping in accordance with ASME B31.9.
  2. Leave joints, including welds, uninsulated and exposed for examination during the test.
  3. Provide temporary restraints for expansion joints which cannot sustain the reactions due to test pressure. If temporary restraints are not practical, isolate expansion joints from testing.
  4. Isolate equipment that is not to be subjected to the test pressure from the piping. If a valve is used to isolate the equipment, its closure shall be capable of sealing against the test pressure without damage to the valve. Flanged joints at which blinds are inserted to isolate equipment need not be tested.
  5. Install relief valve set at a pressure no more than 1/3 higher than the test pressure, to protect against damage by expansion of liquid or other source of overpressure during the test.
- B. Pressure Testing:
1. Use ambient temperature water as the testing medium, except where there is a risk of damage due to freezing. Another liquid may be used if it is safe for workmen and compatible with the piping system components.
  2. Use vents installed at high points in the system to release trapped air while filling and prevent vacuum while draining the system. Use drains installed at low points for complete removal of the liquid.
  3. Examine system to see that equipment and parts that cannot withstand test pressures are properly isolated. Examine test equipment to ensure that it is tight and that low pressure filling lines are disconnected.
  4. Subject piping system to a hydrostatic test pressure which at every point in the system is 1.5 times the maximum system design pressure but not less than 100 psi. The test pressure shall not exceed the maximum pressure for any vessel, pump, valve, or other component in the system under test. Make a check to verify that the stress due to pressure at the bottom of vertical runs does not exceed either 90 percent of specified minimum yield strength, or 1.7 times the "SE" value in Appendix I of ASME B31.9, Code For Pressure Piping, Building Services Piping.
  5. After the hydrostatic test pressure has been applied for at least 15 minutes, examine piping, joints, and connections for leaks. Eliminate leaks by tightening, repairing, or replacing components as appropriate, and repeat hydrostatic test until there are no leaks.
  6. Provide test reports summarizing the test procedures and results of the tests.
- C. Flushing:
1. After satisfactory pressure test is obtained, flush piping system using a minimum velocity of 4 FPS through all portions of the system.
  2. Make all provisions required to isolate HVAC equipment, coils, control valves, automatic flow control valves, pressure independent control valves, and balance valves during flushing.
  3. Provide temporary valves, connections, and bypasses where required.
  4. System pumps may be used for flushing. Where system pumps are not used, provide temporary pumps with temporary connections.
  5. Continue flushing until discharge water shows no discoloration and strainers are no longer collecting dirt and other foreign materials.
  6. Upon completion of flushing, drain all water from system at low points, and remove, clean, and replace strainers.
  7. Open vents installed at high points in the system to release trapped air while filling and prevent vacuum while draining the system.

**3.8 AD USTING AND CLEANING**

- A. After installation of entire system, fill, clean, and treat systems. Refer to Section "HVAC Water Treatment" for additional requirements.
- B. Cleaning Agent Concentration:
  - 1. Use neutralizer agents on recommendation of system cleaner supplier and approval of Engineer.
- C. Hot Water Heating Systems:
  - 1. Apply heat while circulating, slowly raising temperature to 160 F and maintain for 12 hours minimum.
  - 2. Remove heat and circulate to 100 F or less, drain systems as quickly as possible.
  - 3. Refill with clean water and circulate for 6 hours at design temperatures, then drain.
  - 4. Refill with clean water and repeat until system cleaner is removed.
- D. Chilled Water and Closed Loop Condenser Water Systems:
  - 1. Circulate for 48 hours, then drain systems as quickly as possible.
  - 2. Refill with clean water, circulate for 24 hours, then drain.
  - 3. Refill with clean water and repeat until system cleaner is removed.
- E. Open Loop Systems:
  - 1. Flush open systems with clean water for one hour minimum. Drain completely and refill.
- F. Open vents installed at high points in the system to release trapped air while filling and prevent vacuum while draining the system.
- G. Remove and clean or replace strainer screens.
- H. Inspect, remove sludge, and flush low points with clean water after cleaning process is completed. Include disassembly of components as required.
- I. After cleaning system, but before balancing, remove disposable fine mesh strainers in pump suction diffusers.
- J. Mark calibrated name plates of pump discharge valves after hydronic system balancing has been completed, to permanently indicate final balanced position.
- K. Clean mill scale, grease, and protective coatings from exterior of valves and prepare valves to receive finish painting or insulation.
- L. Inspect valves for leaks after piping systems have been tested and put into service, but before final adjusting and balancing. Adjust or replace packing, as required, on valves with leaks. Replace valve if leak persists.

**3.9 STARTUP**

- A. Fill system and perform initial chemical treatment. For systems with antifreeze or glycol, fill systems with specified percentages. Refer to Division 23 Section "HVAC Water Treatment" for chemical treatment.
- B. Check expansion tanks to determine that they are not air bound and that the system is completely full of water.
- C. Before operating the system perform these steps:
  - 1. Open valves to full open position. Close coil bypass valves.
  - 2. Remove and clean strainers.
  - 3. Check pump for proper direction of correct improper wiring.
  - 4. Set automatic fill valves for required system pressure.
  - 5. Check air vents at high points of systems and determine if all are installed and operating freely (automatic type) or to bleed air completely (manual type).

6. Set temperature controls so all coils are calling for full flow.
7. Check operation of automatic bypass valves.
8. Check and set operating temperatures of boilers, chillers, and cooling towers to design requirements.
9. Lubricate motors and bearings.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 21 13 - BURIED HYDRONIC AND STEAM PIPING****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Buried piping requirements.
- B. Pre-insulated piping system, buried.

**1.2 DEFINITIONS**

- A. Pipe sizes used in this Specification are Nominal Pipe Size (NPS).

**1.3 ADMINISTRATIVE REQUIREMENTS**

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.
- B. Sequencing:
  - 1. Document and mark existing utilities prior to starting excavation.
  - 2. Ensure that utility connections are achieved in an orderly and expeditious manner.

**1.4 SUBMITTALS**

- A. Submit in accordance with conditions of Contract and Division 01 submittal procedures.
- B. Reference Division 23 Section, "Basic Piping Materials and Methods" for additional submittal requirements.
- C. Reports as specified in Part 3 of this Section.

**1.5 QUALITY ASSURANCE**

- A. Comply with Division 23 Section, "Basic Piping Materials and Methods."
- B. Manufacturer Qualifications: Company specializing in manufacturing products of the type specified in this Section, with minimum three years of documented experience.
- C. Installer Qualifications: Company specializing in performing work of the type specified in this Section, with minimum three years of documented experience.
- D. Welder Qualifications: Certify in accordance with ASME BPVC-IX.

**1.6 DELIVERY STORAGE AND HANDLING**

- A. Comply with Division 23 Section, "Basic Piping Materials and Methods."

**PART 2 - PRODUCTS AND MATERIALS****2.1 BURIED HYDRONIC SYSTEM REQUIREMENTS**

- A. Coordinate the material type and pressure class of underground piping with above ground piping systems specified in other Division 23 sections. Provide required transition fittings and adapters where different materials are specified for above ground and underground joined piping systems.
- B. Mechanically Joined Hydronic Piping:

1. Contractor shall not use mechanically joined hydronic piping systems for hydronic piping in lieu of welded, threaded or flanged piping methods.
- C. Piping Materials:
2. Carbon Steel Pipe:
    - a. NPS 2 inch and Smaller: ASTM A53 or A106, Type E electric-resistance welded or Type S seamless, Grade B, Schedule 40 and Schedule 80, black steel, plain ends.
    - b. NPS 2-1/2 inch through 10 inch: ASTM A53 or A106, Type E electric-resistance welded or Type S seamless, Grade B, Schedule 40 and Schedule 80, black steel, plain or beveled ends.
    - c. NPS 12 inch and Larger: ASTM A53 or A106, Type E electric-resistance welded or Type S seamless, Grade B, Schedule STD, black steel, plain or beveled ends.
  2. Copper Tubing:
    - a. Copper Tube Size (CTS): ASTM B88, Type K, drawn.
  3. CPVC Pipe:
    - b. ASTM F441, Schedule 80, plain ends.
  3. HDPE Pipe:
    - a. ASTM F714, SDR 32.5 to 7.3 according to ASTM D3035 or D3350, plain ends.
- D. Fittings:
1. General: Fittings shall be of wall thickness, pressure rating, and material matching adjoining pipe.
  2. Reference Division 23 Section "Basic Piping Materials and Methods" for additional fittings.
  3. Threaded:
    - a. All threads shall conform to ASME B1.20.1.
    - b. Cast-Iron: ASME B16.4, standard pattern.
  4. Flanged:
    - a. Cast-Iron Threaded: ASME B16.1, raised ground face, bolt holes spot faced.
    - b. Cast-Bronze Flanges: ASME B16.24, raised ground face, bolt holes spot faced.
    - c. Wrought Cast-Iron, Forged Steel, and Stainless Steel: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connection, and facing:
      - 1) Material Group: 1.1.
      - 2) End Connections: Butt welding.
      - 3) Facings: Raised face.
    - d. Gaskets: ASME B16.21, non-metallic, asbestos free, 1/8 inch thick, full-face for cast-iron flanges and raised-face steel flanges, suitable for chemical and thermal conditions of piping system contents.
    - e. Flange bolts and nuts: ASME B18.2.1, hex head carbon steel according to ASTM A307, Grade B.
  5. Welded:
    - a. Carbon and Galvanized Steel: ASME B16.9, seamless weld conforming to ASTM A234.
  6. Solder-Joint: Wrought-copper, ASME B16.22, streamlined pattern.
  7. Brazed-Joint: Wrought-copper, ASME B16.50, streamlined pattern.
  8. Socket-Joint:
    - a. PVC: ASTM D2466, Schedule 40 and ASTM D2467, Schedule 80.
    - b. CPVC: ASTM F439, Schedule 80.
  9. Fusion-Joint:
    - a. HDPE: ASTM D2683, socket fusion or ASTM D3261, butt fusion. HDPE resin shall be made to match pipe dimensions and class.
  10. Transition Fittings for plastic to metal piping shall be of the plastic material of the adjoining pipe, one-piece, with a threaded brass or copper insert and schedule 80 solvent cement or fusion end.
- E. Joining Materials:
4. Reference Division 23 Section "Basic Piping Materials and Methods" for basic joining materials.

**2.2 PRE-INSULATED PIPING SYSTEM BURIED**

- A. Manufacturers
1. Insul-Tek Piping Systems, Inc.
  2. ISCO Industries.
  3. Perma-Pipe, Inc.
  4. Rovanco Piping Systems, Inc.
  5. Thermacor Process, L. P.
  6. Tricon Piping Systems, Inc.
  7. Urecon Pre-Insulated Pipe
- B. Conduit Pipe Pre-Insulated System:
1. Description: Factory-fabricated, watertight, drainable, pressure-tested conduit piping system with internal carrier pipe, pipe supports, and insulation.
  2. Carrier Pipe: As specified for the buried hydronic system in Part 3.
  3. Carrier Pipe Support Spacer: Corrugated galvanized steel with a maximum spacing of 10 feet.
    - a. Carrier pipe support shall provide the following minimum clearances:
      - 1) Between carrier pipe insulation and conduit, 1-inch.
      - 2) Between insulation of multiple carrier pipes, 3/16 inch.
      - 3) Between bottom of uninsulated carrier pipe and casing, 1-3/8 inches.
  4. Conduit Pipe:
    - a. Material: ASTM D3350 HDPE, with outside dimensions and wall thickness per ASTM D3035 or D2447.
    - b. Fittings: Factory-fabricated and -insulated elbows and tees compatible with the carrier pipe. Elbows may be bent pipe equal to carrier pipe.
    - c. Joints: Half-shell kits, with pourable or split insulation, casing sleeve, and shrink wrap sleeve.
    - d. Expansion Compensation: Size conduit at offsets with additional clearance required to contain piping expansion.
  5. Accessories:
    - a. Water Shed: Terminal end protector for carrier pipes entering building through floor, 3 inches deep and 2 inches larger than conduit; terminate casing 20 inches above the floor level.
    - b. Guides and Anchors: Steel plate welded to carrier pipes, complete with vent and drainage openings inside casing.
    - c. End Seals: Steel plate welded to carrier pipes, complete with drain and vent openings on vertical centerline.
    - d. Gland Seals: Packed stuffing box and gland follower mounted on steel plate, welded to end of conduit, permitting axial movement of carrier piping, with drain and vent connections on vertical centerline.
- C. Cased Pipe Pre-Insulated System:
1. Description: Factory-fabricated, watertight, drainable, cased piping system with internal carrier pipe and insulation.
  2. Carrier Pipe: As specified for the buried hydronic system in Part 3.
  3. Casing:
    - a. Material: ASTM D3350 HDPE, with minimum wall thickness as specified:
      - 1) Jacket size less than or equal to 12": 100 mils.
      - 2) Jacket sizes 12" to 24": 125 mils.
      - 3) Jacket sizes larger than 24": 150 mils.
    - b. Fittings: Factory-fabricated and -insulated elbows and tees compatible with the carrier pipe. Elbows may be bent pipe equal to carrier pipe.
    - c. Joints: Half-shell kits, with pourable or split insulation, casing sleeve, and shrink wrap sleeve.

- d. Expansion Compensation: Provide expansion cushions external to the system or elastomeric foam insulation blanket internal to the casing, formed to fit over carrier pipe and sized to accommodate the thermal expansion.
4. Accessories:
- a. Water Shed: Terminal end protector for carrier pipes entering building through floor, 3 inches deep and 2 inches larger than conduit; terminate casing 20 inches above the floor level.
  - b. Guides and Anchors: Steel plate welded to carrier pipes, complete with vent and drainage openings inside casing.
  - c. End Seals: Insulated and sealed watertight around casing and carrier pipe.
  - d. Gland Seals: Packed stuffing box and gland follower mounted on steel plate, welded to end of conduit, permitting axial movement of carrier piping, with drain and vent connections on vertical centerline.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION GENERAL**

- A. Install products in accordance with manufacturer's instructions.
- B. Install piping to ASME B31.9 requirements.
- C. Coordinate the location of underground piping systems with other underground utilities.
- D. Do not install underground piping when bedding is wet or frozen.
- B. Reference Division 23 Section "Basic Piping Materials and Methods" for general piping installation requirements.
- E. Provide manholes where access to the underground piping system is needed.

#### **3.2 EARTHWORK**

- A. See Division 31 Section "Earth Moving" for excavation, trenching, and backfilling.
- B. Reference Division 23 Section, "General Mechanical Requirements" for additional excavation, trenching, and backfilling requirements.

#### **3.3 PIPE APPLICATION SCHEDULE**

- A. Condenser Water Piping:
  - 1. Acceptable Pipe Materials:
    - a. Schedule 40 carbon or galvanized steel with threaded fittings for pipes 2 inch and smaller, and welded or flanged fittings for pipes 2-1/2 inch and larger.
    - b. Type K copper with soldered, brazed, or flanged fittings.
    - c. CPVC pipe with socket-joint fittings.
    - d. HDPE pipe with fusion-joint fittings.
    - e. Flanged fittings are only acceptable in direct-bury applications.
  - 2. Fitting Pressure Class: Minimum rating of 150 psig.
  - 2. Acceptable Bury Methods:
    - a. Conduit pipe pre-insulated system.
    - b. Cased pipe pre-insulated system.
  - 3. Insulation Thickness:
    - a. Pre-Insulated Piping Systems: No insulation.

#### **3.4 PREPARATION**

- A. Preparation of foundation for below ground water distribution pipe and fittings

1. Grade trench bottoms to provide a smooth, firm, and stable foundation, free from rock, throughout the length of the pipe.
  2. Remove unstable, soft, and unsuitable materials at the surface upon which pipes are to be laid and backfill with clean sand or pea gravel to indicated invert elevation.
  3. Pipe Beds for Pre-Insulated Piping Systems or Uninsulated direct-buried piping:
    - a. Provide 6 inch thick sand pipe bed underneath and around sides of pipe, up to middle half of the pipe, including fittings. Tamp bed with mechanical tamper to 85 to 95 percent compaction. Provide first layer of sand backfill 6 inches above pipe, tamp backfill with mechanical tamper to 85 to 95 percent compaction.
    - b. For piping with rock trench bottoms, provide sand pipe bed 6 inches underneath and around sides of pipe, including fittings.
    - c. Provide backfill above top of pipe bed as required for field conditions.
- B. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- C. Prepare pipe for grooved mechanical joints as required by coupling manufacturer.
- D. Remove scale and dirt on inside and outside before assembly.
- E. Prepare piping connections to equipment using jointing system specified.
- F. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps.

### 3.5 PIPING INSTALLATIONS

- A. Remove standing water in the bottom of trench.
- B. Do not backfill piping trench until field quality-control testing has been completed and results approved.
- C. Maintain 6 inches clearance from obstructions and provide thrust blocks at every branch connection and change in direction.
- D. Provide long radius elbows with a minimum centerline radius of 1-1/2 times the pipe diameter. Short radius elbows with a minimum centerline radius of 1 times the pipe diameter may be used only where space does not permit the long radius elbows.
- E. Install piping at uniform grade of 1 inch in 40 feet upward in the direction of flow.
- F. Make reductions in pipe sizes using eccentric reducer fitting installed with the level side up.
- G. Install branch connections to mains using Tee fittings in main with take-off out the top or side of the main unless otherwise shown on the drawings. Up-feed risers shall have take-off out the top of the main line.
  1. Tee-drilling is prohibited as a means for connecting branch taps into any main.
  2. Bull-head tees are prohibited. Do not install tee fittings in such a way that the flow through the branch leg equals the sum of the flows through the two main legs.
- H. Secure anchors with concrete thrust blocks. Concrete is specified in Division 03 Section "Cast-in-Place Concrete."
- I. See Division 26 Section "Cathodic Protection" for cathodic devices and connections to piping and conduit systems.

### 3.6 PIPE JOINT CONSTRUCTION

- A. Reference Division 23 Section, "Basic Piping Materials and Methods" for basic pipe joint construction.
- B. Reference Division 23 Section, "Expansion Fittings and Loops for HVAC Piping" for installation of anchors and expansion joints.

- A. Where more than one pipe material is specified, provide joining fittings that are compatible with piping materials and ensure that the integrity of the system is not jeopardized.
- B. Install non-conductive dielectric connections whenever joining dissimilar metals. Reference Section 230510 Basic Piping Materials and Methods.
- C. Pipe-to-Valve and Pipe-to-Equipment Connection: Install flanges or unions between piping and valves and equipment for servicing. Do not use direct welded, brazed, or soldered connections unless specifically called for in the manufacturer's installation instructions.
- D. Fusion Joints: Fuse joints in accordance with ASTM F2620.
- E. Conduit and Cased Piping Joints: Assemble sections and finish joints with pourable or split insulation and exterior jacket sleeve, and apply shrink-wrap seals.

### **3.7 IDENTIFICATION**

- A. Install continuous plastic underground warning tapes during back filling of trenches for underground piping. Locate tapes 6 to 8 inches below finished grade, directly over piping. See Division 31 Section "Earth Moving" for warning-tape materials and devices and their installation.

### **3.8 FIELD QUALITY CONTROL**

- A. Reference Division 23 Section "Hydronic Piping" for additional Field Quality Control requirements for carrier pipe testing and flushing.
- B. Pressure Testing of Conduit Pipe Pre-Insulated System:
  - 1. Seal vents and drains and subject conduit to 15 psig for four hours with no loss of pressure. Repair leaks and retest as required.
- C. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- D. Perform tests and inspections.

### **3.9 ADJUSTING AND CLEANING**

- A. Reference Division 23 Section, "Hydronic Piping" for additional Adjusting and Cleaning requirements.

### **3.10 STARTUP**

- A. Reference Division 23 Section, "Hydronic Piping" for startup requirements.

END OF SECTION

**SECTION 23 21 13 - MECHANICALLY JOINED HYDRONIC PIPING SYSTEMS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Mechanically joined piping system requirements.
- B. Carbon steel grooved piping system.
- C. Copper grooved piping system.
- D. Stainless steel grooved piping system.
- E. Stainless steel press-fit piping system.
- F. Copper press-fit piping system.
- G. Carbon steel plain end piping system.
- H. Carbon steel press fit piping system.

**1.2 ADMINISTRATIVE REQUIREMENTS**

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.
- B. Sequencing: Ensure that utility connections are achieved in an orderly and expeditious manner.

**1.3 SUBMITTALS**

- A. Submit in accordance with conditions of Contract and Division 01 submittal procedures.
- B. Reference Division 23 Section, "Basic Piping Materials and Methods" for additional submittal requirements.
- C. Shop Drawings:
  - 1. Indicate grooved-joint couplings and fittings on drawings and product submittals, and specifically identify with the applicable style or series designation.
  - 2. If an assembly of flexible couplings are used for seismic vibration, thermal expansion, or noise and vibration reduction, submit shop drawings indicating location of assembly, including anchors and guides. Include movement analysis of the assembly, and performance data of the assembly.
- D. Piping Analysis:
  - 1. As a contractor's option, Victaulic can provide piping system design services to accommodate thermal movement, seismic movement, and for the settlement of the piping system. The service includes required grooved piping components detailed in CAD on an overlay of the mechanical contract drawing(s), including anchor load calculations and placement of anchors. A calculation report showing thermal movement and seismic accommodation shall be provided.
    - a. A design stamped by a qualified professional engineer of the manufacturer licensed in the jurisdiction where the project is being constructed is required.
- E. Maintenance Data: Include for each piping specialty and valve in Maintenance Manual specified in Division 01 and Division 23 Section "General Mechanical Requirements."
- F. Reports as specified in Part 3 of this Section. Include the following:
  - 1. Test procedures used.
  - 2. Test results that comply with requirements.

3. Failed test results and corrective action taken to achieve requirements.
- G. Submit a schedule of dissimilar metal joints and adaptor flanges and flange kits. Include joint type material, connection method and proposed flange kits to isolate dissimilar metals. Include minimum and maximum torque requirements for flange connections to valves. Dielectric flange kits are specified in Division 23 section "Basic Piping Materials and Methods".
- H. Submit training certificate of completion for each worker to engineer of record within 30-days of mobilization. Include copy of each worker's training certificate of completion with closeout documents.

#### **1.4 QUALITY ASSURANCE**

- A. Comply with Division 23 Section, "Basic Piping Materials and Methods."
- A. Single Source Responsibility: All components of each mechanically joined piping system used shall be of one manufacturer and conform to local code approval.
- B. Grooving and Joining Tools: Approved by the mechanically joined piping system manufacturer for use with their system and furnished by one manufacturer, though not necessarily the same as the grooved component manufacturer.
- C. Manufacturer Qualifications: Company specializing in manufacturing products of the type specified in this Section, with minimum three years of documented experience and ISO 9001 certification.
  1. Date stamp all castings used for coupling housings, fittings, etc. for quality assurance and traceability.
- D. Installer Qualifications:
  1. Company specializing in performing work of the type specified in this Section, with minimum three years of documented experience.
- E. Obtain installation training from the mechanically joined piping manufacturer for all workers that will be installing or handling the mechanically joined piping components per Part 3 "Field Quality Control". Maintain a copy of each worker's training certificate of completion on site for the duration of the project.
- F. Pipe, fittings, and specialties shall be manufactured in plants located in the United States or certified to meet the specified ASTM, ASME, and ANSI standards.

#### **1.5 COORDINATION**

- A. Reference Division 23 Section "Hydronic Piping" for coordination and additional hydronic piping material and execution requirements.

#### **1.6 DELIVERY STORAGE AND HANDLING**

- B. Comply with Division 23 Section "Basic Piping Materials and Methods."

### **PART 2 - PRODUCTS**

#### **2.1 MECHANICALLY JOINED PIPING SYSTEM REQUIREMENTS**

- C. Antifreeze and Water Treatment:
  1. Refer to Division 23 Section "HVAC Water Treatment" for antifreeze and water treatment products.
- A. Pipe Materials:
  1. Refer to the specific product sections in Part 2 for the acceptable pipe materials.

- B. Fittings:
1. General: Fittings shall be of wall thickness, pressure rating, and material compatible with adjoining pipe as listed and approved by the manufacturer's current literature for the piping system used.
  2. Reference Division 23 Section "Basic Piping Materials and Methods" for additional fittings.
  3. Grooved:
    - a. All grooved joints shall be full-flow type and conform to AWWA C606 and ASTM F1476.
      - 1) Victaulic Advanced Groove System (AGS) pipe ends are an acceptable alternate.
    - b. Body Materials:
      - 1) Ductile Iron: Comply with ASTM A536, Grade 65-45-12 or ASTM A395 Grade 65-45-15.
      - 2) Wrought Steel: Comply with ASTM A234, Grade WPB, 0.375 inch wall.
      - 3) Carbon Steel: Comply with ASTM A53, Grade B or ASTM SA352, Grade LCC.
      - 4) Wrought copper: Comply with ASTM B75 Alloy C12200 or ASTM B152 Alloy C1100.
      - 5) Bronze Sand Cast: Comply with ASTM B16.18 and B584 ally UNS C89836.
      - 6) Stainless Steel: Type 304 or 316, conforming to ASTM A240, A312, A351, A403, A743, or A744, Grade CF8M.
    - c. Coating: Suitable enamel, epoxy, or hot-dipped galvanized according to ASTM A153 to match system requirements.
  4. Strapless Outlet Fittings:
    - a. Pipe Strapless Outlets: 1/2 inch or 3/4 inch NPT outlet for use on 4 inch and larger pipe sizes, rated for 300 psig.
      - 1) Housing: Ductile iron housing conforming to ASTM A536, Grade 65-45-12, painted black.
      - 2) Collar: Hot rolled steel collar conforming to ASTM A569, zinc electroplated to ASTM B633.
      - 3) Bushing: Brass conforming to UNS C37700.
      - 4) Seat/Liner Gasket: Same as Grooved Joint Gasket requirements specified under article "Joining Materials."
    - b. Press-In Branch Connector: 3/4 inch FNPT outlet for use on 1-1/2 inch through 6 inch Schedule 40 carbon steel pipe.
      - 1) Fitting: Carbon steel per ASTM A420 with corrosion resistant coating of zinc/nickel or equal.
      - 2) Thread: Conform to ASME B1.20.1.
      - 3) Sealing Element: EPDM or FKM seal.
      - 4) Working Pressure: 200 psig.
  5. Test Caps: Ductile iron cap according to ASTM A536, Grade 65-45-12, suitable for use on metallic IPS pipe with integral NPT ball valve, maximum test pressure of 250 psi and maximum test temperature of 110 degrees F. Victaulic T-60 test cap or approved equal.
  6. Press-Fit:
    - a. Press-Fit fittings shall comply with ASME B16.51, ASME B31.1 or ASME B31.9 as applicable for the material and project.
    - b. Press-Fit fittings shall comply with ASTM F3226.
    - c. Press-fit fittings shall include self-contained O-ring seals in the end connections.
    - d. Provide leak feature integral to the fitting body to detect unpressed fittings during the pressure testing process.
    - e. Body Materials:
      - 1) Stainless Steel: Type 304 or Type 316, conforming to ASTM A240, A312, A351, A743, or A744, Grade CF8M.
      - 2) Wrought Copper: Comply with ASTM B75 Allow C12200 or ASTM B152 Alloy C11000.
      - 3) Cast Copper: Comply with ASTM B584 Alloy C84400, C87600 or C87710.

- 4) Carbon Steel: Comply with ASTM A420 and have corrosion resistant zinc/nickel or equal coating.
  - f. End Connections:
    - 1) Threaded: All threads shall conform to ASME B1.20.1.
    - 2) Solder-Joint: Wrought-copper, ASME B16.18 or B16.22, streamlined pattern.
    - 3) Flared Ends: Comply with ASME B16.26.
- C. Joining Materials:
1. Reference Division 23 Section "Basic Piping Materials and Methods" for basic joining materials.
  1. Joining Tools: Approved by the mechanically joined piping system manufacturer for use with their system.
  2. Grooved Couplings: Multi-piece housing attached with bolts and nuts with pressure responsive elastomeric gasket, constructed of material specified under Article "Fittings" above and of the following styles.
    - a. Rigid Couplings: Designed with offsetting angle bolt pads to provide a rigid pipe joint to restrict axial or angular movement.
    - b. Flexible Couplings: Designed with flat bolt pads to provide a flexible pipe joint and accommodate a limited amount of linear and/or angular movement.
    - c. Reducing Couplings: Designed to include a direct pipe reduction on pipe run without additional components and includes steel washer to prevent telescoping of smaller pipe inside the larger pipe during a vertical system assembly.
  3. Coupling Bolts: Track-head type and constructed of the one of the following:
    - a. Type 304 or 316 stainless steel conforming to ASTM A193, Grade B8/B8M, Class 2 or ASTM F593 and F594, Group 2, Conditions CW.
    - b. Heat treated carbon steel conforming to ASTM A183 and A449, zinc electroplated to ASTM B633, with a minimum tensile strength of 110,000 psi.
  4. Nuts: Heavy-duty hexagonal type conforming to ASTM A563, Grade B or ASTM A194, Grade 8M.
  5. Washers: Flat type, plated carbon steel conforming to ASTM F436 or Type 304 or 316 stainless steel.
  6. Grooved-Joint Gaskets:
    - a. Molded synthetic rubber (EPDM compound) with central cavity and pressure responsive configuration, integral pipe stop, and complying with ASTM D2000, Grade 2CA615A25B24F17Z.
    - b. Gasket Grade: Type "E" or "EHP" for hydronic applications. Coordinate the appropriate gasket grade with the manufacturer for other applications.
    - c. Identification: Tagged with the appropriate color code to indicate the application.
    - d. Temperature operating range: -30 degrees F to 230 degrees F.
  7. Flange Adapters:
    - a. Cast-Bronze Flanges: ASME B16.24, raised ground face, bolt holes spot faced.
    - b. Wrought Cast-Iron, Forged Steel, and Stainless Steel: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connection, and facing:
      - 1) Material Group: 1.1.
      - 2) Facings: Raised face.
    - c. Gaskets: ASME B16.21, non-metallic, asbestos free, 1/8 inch thick, full-face for cast-iron flanges and raised-face steel flanges, suitable for chemical, thermal, and dielectric conditions of piping system contents.
    - d. Flange bolts and nuts: ASME B18.2.1, hex head carbon steel according to ASTM A307, Grade B.
  8. Pipe Transition Adapters:
    - a. Constructed of material, size, and end connection to join different pipe materials or joining methods.
    - b. Adapter shall be listed according to the manufacturer's literature for the application and joining methods.

- c. Reference Division 23 Section “Basic Piping Materials and Methods” for dielectric fittings.
  - 9. Press Couplings: Single-piece housing with self-contained O-ring seals in the end connections. O-ring seals shall comply with the following:
    - a. EPDM compound conforming to ASME B16.51.
    - b. Type “E” EPDM compound complying with ASTM D2000, Grade 2CA615A25B24F17Z.
    - c. Identification: Tagged with the appropriate color code to indicate the application.
    - d. Temperature operating range: -30 degrees F to 230 degrees F.
  - 10. Press Fit Sealing Elements
    - a. Peroxide cured EPDM or FKM elastomeric seal.
    - b. EPDM rated for 0 to 250 degrees F, FKM rated for 15 to 285 degrees F.
    - c. Uniform in size and width and free from manufactured deformities or indentions.
- D. General Duty Valves and Hydronic Specialties:
  - 1. Acceptable manufacturers listed within this specification may have comparable products which comply with the product specifications referenced in the sections below. These products are acceptable provided they meet the specified requirements and are compatible with the piping system. Reference the Valve and Hydronic Specialties Schedule in Part 3 for examples of acceptable products and design intent. Refer to manufacturer’s current literature for comparable products, sizes, pressure ratings, and connection methods compatible with the piping system. Products identified by model number are based on available size and pressure ranges from that manufacturer. Products offered by manufacturers with extended ranges are acceptable provided they meet the specified requirements.
  - 2. Reference Division 23 Section “General Duty Valves for HVAC Piping” for general duty valve requirements.
  - 3. Reference Division 23 Section “Hydronic Specialties” for hydronic specialty requirements.
- E. Expansion Joints:
  - 1. Reference Division 23 Section “Expansion Fittings and Loops for HVAC” for expansion joint requirements.
  - 2. Select expansion joint and support method in accordance with design conditions and performance data published in manufacturer’s literature using the following types:
    - a. Slip Type: Victaulic Style 150 Mover telescoping slip type or approved equal.
    - b. Standard Expansion Type: Style 155 expansion joint consisting of a series of flexible couplings joined in tandem or approved equal.

## 2.2 CARBON STEEL GROOVED PIPING SYSTEM

- A. Manufacturers:
  - 1. ASC Engineered Solutions.
  - 2. Shurjoint Piping Products.
  - 3. Victaulic.
- B. Carbon Steel Pipe:
  - 1. NPS 10 inch and Smaller: ASTM A53 or A106, Type E electric-resistance welded or Type S seamless, Grade B, Schedule 40, black steel, plain ends.
  - 2. NPS 12 inch and Larger: ASTM A53 or A106, Type E electric-resistance welded or Type S seamless, Grade B, Schedule STD, black steel, plain ends.

## 2.3 COPPER GROOVED PIPING SYSTEM

- A. Manufacturers:
  - 1. ASC Engineered Solutions.
  - 2. Shurjoint Piping Products.
  - 3. Victaulic.

- B. Copper Tubing:
  - 1. Copper Tube Size (CTS), ASTM B88 Type L, hard-drawn.

## **2.4 STAINLESS STEEL GROOVED PIPING SYSTEM**

- A. Manufacturers:
  - 1. ASC Engineered Solutions.
  - 2. Shurjoint Piping Products.
  - 3. Victaulic.
- B. Stainless Steel Pipe:
  - 1. NPS 2 inch and Smaller: ASTM A312, Type 304 or 316, Schedule 10S, plain ends.
  - 2. NPS 2-1/2 inch and larger: ASTM A312, Type 304 or 316, Schedule 10S, plain or beveled ends.

## **2.5 STAINLESS STEEL PRESS-FIT PIPING SYSTEM**

- A. Manufacturers:
  - 1. ASC Engineered Solutions "Gruvlok."
  - 2. Victaulic. Vic-Press.
  - 3. Viega ProPress and MegaPress.
- B. Stainless Steel Pipe:
  - 1. NPS, CTS or IPS 3/4 inch through 2 inch: ASTM A312, Type 304 or 316, Schedule 10S, plain or press fit ends.

## **2.6 COPPER PRESS-FIT PIPING SYSTEM (CTS)**

- A. Manufacturers:
  - 1. ASC Engineered Solutions "Gruvlok."
  - 2. Apollo "Xpress".
  - 3. Mueller Streamline PRS.
  - 4. NIBCO, Inc., Press System.
  - 5. Viega, ProPress.
- B. Copper Tubing:
  - 1. CTS 3/4 inch through 4 inch: ASTM B88 Type L, hard-drawn.

## **2.7 CARBON STEEL PLAIN END PIPING SYSTEM**

- A. Manufacturers:
  - 1. Victaulic, Quick-Vic Installation Ready.
- B. Carbon Steel Pipe:
  - 1. NPS 3/4 inch through 2 inch: ASTM A53 or A106, Schedule 40, plain ends.

## **2.8 CARBON STEEL PRESS FIT PIPING SYSTEM**

- A. Manufacturers:
  - 1. Apollo PowerPress.
  - 2. Mueller Streamline STL.
  - 3. NIBCO BenchPress.
  - 4. Viega, MegaPress
- B. Carbon Steel Pipe:
  - 2. NPS 3/4 inch through 2 inch: ASTM A53 or A106, Schedule 40, press-fit ends.

**PART 3 - EXECUTION****3.1 INSTALLATION GENERAL**

- A. Install products in accordance with manufacturer's instructions.
- B. Install piping to ASME B31.9 requirements.
- C. Reference Division 23 Section "Basic Piping Materials and Methods" for general piping installation requirements.
- D. Reference Division 23 Section "General Duty Valves for HVAC Piping" for general duty valve installation requirements.
- E. Reference Division 23 Section "Hydronic Specialties" for hydronic specialty installation requirements.

**3.2 PIPE APPLICATION SCHEDULE**

- A. Heating Hot Water System:
  - 1. Carbon Steel Grooved: 2 inch and larger.
  - 2. Copper Grooved: 2 inch through 8 inch.
  - 3. Stainless Steel Grooved: 2 inch and larger.
  - 4. Stainless Steel Press-Fit: 3/4 inch through 2 inch.
  - 5. Copper Press-Fit: 3/4 inch through 4 inch.
  - 6. Carbon Steel Plain End: 3/4 inch through 2 inch.
  - 7. Carbon Steel Press Fit End: 3/4 inch through 2 inch.
  - 8. Fitting Pressure Class: Minimum rating of 125psig.
- B. Chilled Water system
  - 1. Carbon Steel Grooved: 2 inch and larger.
  - 2. Copper Grooved: 2 inch through 8 inch.
  - 3. Stainless Steel Grooved: 2 inch and larger.
  - 4. Stainless Steel Press-Fit: 3/4 inch through 2 inch.
  - 5. Copper Press-Fit: 3/4 inch through 4 inch.
  - 6. Carbon Steel Plain End: 3/4 inch through 2 inch.
  - 7. Carbon Steel Press Fit End: 3/4 inch through 2 inch.
  - 8. Fitting Pressure Class: Minimum rating of 125 psig.
- C. Open condenser water system
  - 1. Carbon Steel Grooved: 2 inch and larger.
  - 2. Stainless Steel Grooved: 2 inch and larger.
  - 3. Stainless Steel Press-Fit: 3/4 inch through 2 inch.
  - 4. Carbon Steel Plain End: 3/4 inch through 2 inch.
  - 5. Carbon Steel Press Fit End: 3/4 inch through 2 inch.
  - 6. Fitting Pressure Class: Minimum rating of 125psig.
  - 7. .
- D. Use stainless steel couplings and fittings where design conditions require the use of non-ferrous piping materials for both interior and exterior piping surfaces.

**3.3 PREPARATION**

- A. Remove scale and dirt on inside and outside before assembly.
- B. Verify pipe and tube ends are free from indentations, projections, and roll marks in the area from tube end to groove from proper gasket sealing.
- C. Prepare piping connections to equipment using jointing system specified.

- D. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps.

### 3.4 PIPING INSTALLATIONS

- A. Hydronic piping installations shall be installed subject to Division 23 Section "Hydronic Piping" in addition to those requirements specified in this Section.

### 3.5 PIPE HANGERS AND SUPPORTS APPLICATION

- A. Comply with the requirements of Division 23 Section "Hangers and Supports for HVAC Piping and Equipment."

### 3.6 PIPE JOINT CONSTRUCTION

- A. Reference Division 23 Section "Basic Piping Materials and Methods" for basic pipe joint construction.
- B. Where more than one pipe material is specified, provide joining fittings or pipe transition adapters with appropriate dielectric isolation that are compatible with piping materials and ensure that the integrity of the system is not jeopardized.
- C. Grooved Joints:
  - 1. Ream, debur, and clean tube ends and verify they are free from indentations, projections and roll marks in the area from tube end to groove for proper gasket sealing.
  - 2. Roll and cut groove ends in accordance to manufacturer's current listed standards and according to AWWA C606. Use rolls sets designed and intended for use on the appropriate pipe material when grooving pipe.
    - a. Victaulic Advanced Groove System (AGS) pipe ends are an acceptable alternate. If Victaulic AGS grooved system is used, all couplings, adapters, fittings, and valves shall be compatible with AGS grooved ends.
    - b. Do not use cut groove ends in copper tubing, roll groove only.
    - c. Do not use cut groove ends in stainless steel pipe, roll groove only.
  - 3. Verify tolerances of and maintain grooving tool components for duration of grooving processes. Replace grooving tool components that are found out of tolerance with new as required.
  - 4. Flaring of CTS tube ends to IPS dimensions or to accommodate alternate sized couplings is not allowed.
  - 5. Verify the gasket style and elastomeric material (grade) is suitable for the intended service as specified and in combination with any system chemical additives.
  - 6. Reference latest published manufacturer's product data for additional pressure ratings and application information.
  - 7. Reference the latest published of manufacturer's field installation instructions or other included installation instruction prior to attempting assembly.
  - 8. Install gaskets with lubricant suitable for all piping services. Lubricant shall be by one manufacturer.
- D. Press-Fit Joints:
  - 1. Install press piping system in accordance with manufacturer's recommendations.
  - 2. Ream, debur, and clean tube ends and verify they are free from indentations, projections, burrs and foreign matter.
  - 3. Install permanent inspection mark on tube.
  - 4. Clean tube and fittings of all dirt and oil. Verify O-ring and all press connection components are in place and free of oil, grease or dirt.
  - 5. Push pipe or tube into fittings with twisting action to all the way to the fitting stop or shoulder.
  - 6. Mark tube with permanent marker to indicate proper tube insertion depth.
  - 7. Verify press tool has correct size jaw set for tube size used.

8. Complete one tool cycle with empty jaw to calibrate tool for each time new jaw is inserted into tool.
  9. Squeeze jaw arms to open tool jaws and place jaws around the contour of the fitting. Verify tool is perpendicular to the fitting and depress tool switch.
  10. Squeeze jaw open to remove the tool and observe witness mark.
  11. Verify crimped fitting connection for misalignment of the copper tube, misalignment of the tool or improper insertion of the tube. If any of these conditions are found cut out the joint and provide a new joint.
  12. Maintain minimum distance between joints per the manufacturer's published installation instructions.
  13. Perform pressure test for unpressed fitting detection per manufacturer's installation instruction prior to final pressure test.
- E. Stainless Steel to Copper Systems:
1. Stainless steel 4 inch and smaller to copper 2 inches and smaller:
    - a. Stainless steel reducing tee with 2 inch grooved side outlet.
    - b. Stainless steel rigid coupling, dielectric waterway adapter and CTS rigid coupling.
    - c. Contractors Option (in lieu of above) - 2 inch rigid CTS adapter coupling, 2 inch grooved X copper plain adapter (size as required).
  2. Stainless steel 6 inch and larger to copper 2 inches and smaller:
    - a. Stainless steel tee and welded pipet with 2 inch welded outlet.
    - b. 2 inch schedule 40 stainless steel short nipple with grooved and plain ends. Weld nipple to pipet.
    - c. Stainless steel rigid coupling, dielectric waterway adapter and CTS rigid coupling.
    - d. Contractors Option (in lieu of above) - Stainless steel reducing tee with 2 inch grooved side outlet, 2 inch rigid CTS adapter coupling, 2 inch grooved X copper plain adapter (size as required).
  3. Stainless steel 6 inch and larger to copper 2-1/2 inches to 4 inches:
    - a. Stainless steel tee or reducing tee with grooved side outlet:
    - b. Stainless steel rigid coupling, dielectric waterway adapter and CTS rigid coupling.
    - c. Contractors Option (in lieu of above):
      - 1) Rigid CTS adapter coupling, grooved X copper plain adapter (size as required).
      - 2) Grooved X stainless steel flange adapter nipple (X size as required), bronze flange and dielectric flange kit.
  4. Stainless steel to copper 6 inches to 8 inches:
    - a. Stainless steel tee or reducing tee with grooved side outlet.
    - b. Stainless steel rigid coupling.
    - c. Grooved X stainless steel flange adapter nipple (X size as required).
    - d. Bronze flange and dielectric flange kit.
- F. Dielectric Isolation Requirements: Refer to Division 23 Section "Basic Piping Materials and Methods" for dielectric fittings and their installation requirements. Provide dielectric flanges, flange kits, or dielectric transition couplings for the following joint types:
1. Flange Adapters to Iron, Ductile Iron or Steel Body Valves or Fittings (Except Butterfly Valves): Provide full face gaskets between flanges and adapter flanges. At each bolt, provide steel washers, thermoplastic washers and bolt isolation sleeves or thermoplastic combination washers and bolt sleeves on valve and adapter flanges.
  2. Flange Adapters to Butterfly Valves in Series with Iron, Ductile Iron or Steel Body Valves or Fittings: At each bolt, provide stainless steel washers, thermoplastic washers and bolt isolation sleeves or thermoplastic combination washers and bolt sleeves on adapter flange. Provide stainless steel bolts on butterfly valve flange.
  3. Flange Adapters to Butterfly Valves in Copper Tubing: Install flat washers at each bolt on adapter flange. Provide full face gasket only for butterfly valves without integral liner acting as a gasket.

4. Dielectric Transition Couplings: Provide dielectric transition coupling when connecting copper pipe to butterfly valves. Provide dielectric transition coupling when connecting grooved IPS pipe to CTS pipe.
- G. Couplings:
1. Install rigid couplings unless noted otherwise.
  2. Install flexible couplings at locations required to accommodate expansion and/or vibration isolation.
    - a. Install flexible couplings at pumps.
    - b. Install flexible couplings at expansion joints.
    - c. Install three flexible couplings at mechanical equipment connections for noise and vibration reduction in lieu of flexible connectors if preferred.
  3. Install reducing couplings at reductions in pipe size.
  4. Install press couplings in conjunction with the appropriate press piping system.
- H. Flange Adapters:
1. Install flange adapter washers when flange adapters are used against the following surfaces:
    - a. Rubber.
    - b. Adapting to ANSI/AWWA cast flanges.
    - c. Rubber faced lug valves.
    - d. Serrated flanged surfaces.
  2. Do not install flange adapters for applications that incorporate tie rods for anchoring or on standard grooved-end fittings within 90 degrees of each other.
- I. Miscellaneous Connections:
1. Install test caps for temporary use during piping system testing activities. Test caps shall not be permanently installed in the piping system.
  2. Test caps may be reused within the maximum test pressure and provided the product remains undamaged. Inspect and verify the suitability for service of all test caps prior to installation and use.
  3. Connect test caps to piping system with Victaulic Style 107V or equivalent rigid coupling.
  4. Test cap may be used for filling, testing, or draining purposes by connecting to the NPT outlet of the integral ball valve.
  5. Install blind flanges with separate means to fill, test, or drain system for testing if test caps are not available from manufacturer.

### 3.7 VALVE AND HYDRONIC SPECIALTIES SCHEDULE

- A. Reference Division 23 Section "General Duty Valves for HVAC Piping" for general duty valve applications.
- B. Valve and Hydronic Specialties Schedule: The following schedule references Victaulic model numbers, except where another manufacturer is noted. Manufacturers and model numbers represent examples of acceptable products and design intent.
1. Carbon Steel Grooved Piping System:
 

<u>Valve or Specialty Type</u>	<u>Model/Series Number</u>
Iron Ball Valve	726
Iron Butterfly Valve	761
Iron Swing Check	712
Iron Lift Check	716
Iron Venturi Check	779
Balancing Valve	785 through 789
Coil Kits	799 or 79V
T-Strainer	730
Y-Strainer	732
Suction Diffuser	731
  2. Copper Grooved Piping System:

	<u>Valve or Specialty Type</u>	<u>Model/Series Number</u>
	Brass Butterfly Valve	608N
3.	Stainless Steel Grooved Piping System:	
	<u>Valve or Specialty Type</u>	<u>Model/Series Number</u>
	Stainless Steel Ball Valve	726S
	Stainless Steel Butterfly Valve	461N
	Stainless Steel Swing Check	416 or 712S
4.	Stainless Steel Press-Fit Piping System:	
	<u>Valve or Specialty Type</u>	<u>Model/Series Number</u>
	Stainless Steel Ball Valve	P569
	Stainless Steel Check Valve	Viega 4015.5
5.	Copper Press-Fit Piping System:	
	<u>Valve or Specialty Type</u>	<u>Model/Series Number</u>
	Bronze Ball Valve	Hammond 8303A P2 Milwaukee #BA-400S-P2 Nibco PC585-70-66
	Bronze Gate Valve	Hammond IB640 P2 Milwaukee #105 P2 Nibco PF111
	Bronze Globe Valve	Hammond IB440 P2 Milwaukee 502 P2 Nibco PF211
	Bronze Swing Check	Hammond 509Y P2 Milwaukee 509Y P2 Nibco PF413
6.	Carbon Steel Press-Fit Piping System:	
	<u>Valve or Specialty Type</u>	<u>Model/Series Number</u>
	Carbon Steel Ball Valve	Viega 4870

### 3.8 HYDRONIC SPECIALTIES INSTALLATION

- A. Reference Division 23 Section "Hydronic Piping Specialties" for product requirements.
- B. Strainers:
  1. Provide copper press to connect X screwed NPT adapters for 2 inches and smaller.
  2. Provide press to connect adapter flanges for 2-1/2 inches to 4 inches.
  3. Provide copper grooved adapter flanges for 2-1/2 inches to 8 inches.

### 3.9 EXPANSION JOINT INSTALLATION

- A. Provide expansion joints where indicated. Expansion joints and their installation requirements are specified in Division 23 Section "Expansion Fittings and Loops for HVAC Piping".
  1. Provide with copper press to connect ends or copper press to connect X screwed NPT adapters for 2 inches and smaller.
  2. Provide with copper press to connect ends or press to connect adapter flanges for 2-1/2 inches to 4 inches.
  3. Provide copper grooved adapter flanges for 2-1/2 inches to 8 inches.
- B. As a contractor's option and where field conditions allow, provide expansion joints consisting of an assembly of flexible couplings: Fabricated from a combination of couplings and nipples with rolled groove short type "K" or "L" copper tube nipples and flexible CTS couplings. Install with removable ties to hold joint compressed or expanded during piping fabrication. Provide the same gaskets as specified above for rigid couplings. Provide expansion joints of an assembly of flexible couplings with displacement identical expansion joints as indicated.

**3.10 EQUIPMENT CONNECTIONS**

- A. Grooved flexible style couplings may be used at equipment connections where specified for vibration isolation control only.
- B. Press to connect joints shall not be provided for equipment connections. Provide flanges, unions, di-electric unions or waterway fittings. Flanges, unions, di-electric unions and waterway fittings are specified in Division 23 Section "Basic Piping Materials and Methods."

**3.11 FIELD QUALITY CONTROL**

- A. Reference Division 23 Section "Hydronic Piping" for field quality control requirements in addition to those specified herein.
- B. The mechanically joined piping system manufacturer's factory trained representative shall provide on-site training for contractor's field personnel in the use of grooving and joining tools and installation of mechanically joined piping products.
- C. Installing contractor shall schedule certification training session with the mechanically joined piping component manufacturer, or manufacturer's representative, for all workers that will be installing or handling the mechanically joined piping systems. Training shall cover the proper use of mechanically joining tools and installation of mechanically joined piping products. Mechanically joined piping component manufacturer, or manufacturer's representative shall provide a certificate of completion for each attending worker.
- D. Mechanically joined piping supplier shall provide certification training to Contractor without cost and without additional cost to Owner.
- E. Provide testing procedures as defined in Division 23 Section "Hydronic Piping" and as specified in mechanically joined piping manufacturer's installation instructions.
- F. The mechanically joined manufacturer's factory trained representative shall periodically visit the jobsite and review the installation to verify that the contractor is following best recommended practices in grooved product installation.
- G. Installing contractor shall visually inspect couplings and repair or replace any misaligned couplings and couplings with gaps prior to calling for substantial completion review as defined in Division 23 Section "Common Work Results for HVAC."
- H. Workers performing mechanically joined joints shall initial each joint with a permanent ink marker, such as a "Sharpie". Initials shall be block letters with a minimum height of 1/4".

**3.12 ADJUSTING AND CLEANING**

- A. Reference Division 23 Section "Hydronic Piping" for adjusting and cleaning procedures.

**3.13 STARTUP**

- A. Reference Division 23 Section "Hydronic Piping" for startup procedures.

END OF SECTION

**SECTION 23 21 14 - HYDRONIC SPECIALTIES****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Diaphragm/bladder expansion tanks.
- B. Air vents.
- C. Air separators.
- D. Strainers.
- E. Suction diffusers.
- F. Flexible connectors.
- G. Triple Duty Valves.
- H. Balancing valves.
- I. Relief valves.
- J. Combination Piping Packages (Coil Kits).
- K. Water filtration systems.

**1.2 SUBMITTALS**

- A. Submit in accordance with Division 01 Submittals and Division 23 General Mechanical Requirements.
- B. Product Data: Include rated capacities of selected models, weights (shipping, installed, and operating), furnished specialties and accessories, component sizes, rough-in requirements, service sizes, and finishes.
  - 1. Balancing Valves and Diverting Fittings: Include flow and pressure drop curves based on manufacturer's testing.
- C. Water Filtration System: Include piping layout and assembly drawings of cooling tower basin sweeper systems. Include all dimensions, piping, water jets, couplings, valves, pressure gauges, and other components required to assemble the complete sweeper system inside the cooling tower basin.
- D. Certificates:
  - 1. Inspection certificates for pressure vessels for compliance with ASTM and ANSI manufacturing standards.
  - 2. Welders' certificates complying with the requirements specified in Article, "Quality Assurance."
- E. Manufacturer's installation instructions.
- F. Maintenance Data: Include installation instructions, assembly views, lubrication instructions, and replacement parts list for inclusion in Operating and Maintenance manual.

**1.3 QUALITY ASSURANCE**

- A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.
- B. Comply with ASME B31.9 "Building Services Piping" for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label.

- C. Fabricate and stamp air separators, air and dirt separators, expansion tanks, and buffer tanks to comply with ASME BPVC-VIII-1.
- D. Comply with ASME "Boiler and Pressure Vessel Code", Section IX, "Welding and Brazing Qualification" for qualifications for welding processes and operators.
- E. Comply with AWWA Standards for governing filter media; American Water Works Association, Current Edition.
- F. Hydronic specialties shall be manufactured in plants located in the United States or certified to meet the specified ASTM and ANSI standards.

#### **1.4 DELIVERY STORAGE AND HANDLING**

- A. Accept valves on site in shipping containers with labeling in place. Inspect for damage.
- B. Provide temporary protective coating on cast iron and steel valves.
- C. Provide temporary end caps and closures on piping and fittings. Maintain in place until installation.
- D. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the work, and isolating parts of completed system.

### **PART 2 - PRODUCTS**

#### **2.1 DIAPHRAGM BLADDER EXPANSION TANKS**

- A. Manufacturers:
  - 1. American Wheatley.
  - 2. Amtrol, Inc.
  - 3. Armstrong Fluid Technology.
  - 4. Bell & Gossett; Xylem.
  - 5. Caleffi.
  - 6. Grundfos.
  - 7. John Wood Co.
  - 8. Patterson Pump Co.
  - 9. Taco, Inc.
  - 10. Wessels.
- B. Construction: Closed, welded carbon steel, tested and stamped in accordance with ASME BPVC-VIII-1; with flexible EPDM diaphragm or bladder sealed into tank, cleaned and prime coated; with tapings for installation of accessories.
  - 1. Pressure rating: As scheduled on the drawings.
  - 2. Maximum operating temperature: 240 degrees F.
- C. Accessories: Pressure gauge, air charging fitting, and drain fitting.

#### **2.2 AIR VENTS**

- A. Manufacturers:
  - 1. American Wheatley.
  - 2. Amtrol, Inc.
  - 3. Armstrong International.
  - 4. Bell & Gossett; Xylem.
  - 5. John Wood Company.
  - 6. Nexus Valves.
  - 7. Spirax Sarco.
  - 8. Taco, Inc.

- B. Manual Type: Bronze body and nonferrous internal parts; working pressure as defined by the ANSI fitting class of the system, 225 deg F operating temperature; manually operated with screwdriver or thumbscrew; and having 1/8 inch discharge and inlet connections.
- C. Automatic Type: Designed to vent automatically with float principle; bronze body and nonferrous internal parts; working pressure as defined by the ANSI fitting class of the system, 240 deg F operating temperature; and having 1/4 inch discharge connection and 1/2 inch inlet connection.

### 2.3 AIR SEPARATORS

- A. Air and Dirt Coalescing Medium Type:
  - 1. Manufacturers:
    - a. American Wheatley.
    - b. Armstrong Fluid Technology.
    - c. Bell & Gossett; Xylem.
    - d. Caleffi.
    - e. Spirotherm.
    - f. Taco, Inc.
    - g. Thrush.
    - h. Wessels.
  - 2. Construction: Closed, welded steel; tested and stamped according to ASME BPVC-VIII-1; with the bottom of the vessel extended for dirt separation with the system connection nozzles equidistant from the top and bottom of the vessel, and flanged connection or removable cover for access to the internal media for maintenance or cleaning.
    - a. Pressure rating: As scheduled on the drawings.
    - b. Maximum operating temperature: 270 degrees F.
  - 3. Coalescing Medium: Structured copper or stainless steel medium filling the entire vessel to suppress fluid turbulence and provide air elimination efficiency of 100 percent free air, 100 percent entrained air, and 99.6 percent dissolved air at the installed location.
  - 4. Air Vent: Integral float actuated air vent at the top fitting of tank, threaded to the top of the separator. There shall be no restrictions in the connection from the venting chamber to the vent. Provide side taps with shutoff valve to flush floating dirt or liquids and for quick bleeding of large amounts of air during system fill or refill.
  - 5. Inlet and Outlet Connections: Threaded for 2 inch NPS and smaller; flanged connections for 2-1/2 inch NPS and larger.
  - 6. Blowdown Connection: Bottom connection with threaded shutoff valve.
  - 7. Size: Not to exceed 10 feet per second at the scheduled flow rate.

### 2.4 STRAINERS

- A. Y-Strainers
  - 1. Manufacturers:
    - a. American Wheatley.
    - b. Armstrong International.
    - c. Hoffman Specialty; Xylem.
    - d. Keckley.
    - e. Metraflex Co.
    - f. Mueller Steam Specialties.
    - g. Spirax Sarco.
    - h. Nexus Valve.
    - i. Watts Water Technologies.
  - 2. Pressure Rating: Rated for working pressure as defined by the ANSI fitting class of the system.
  - 3. Size 2 inch and Smaller:
    - a. Body:
      - 1) Bronze, ASTM B62.

- 2) Forged brass ASTM B283.
      - 3) Cast iron ASTM A126 Class B.
      - 4) Type 304 stainless steel ASTM A240.
    - b. Ends: Threaded.
    - c. Cover: Screwed.
    - d. Screen: Type 304 stainless steel with mesh rating based on the Strainer Schedule in Part 3.
  4. Size 2-1/2 inch and Larger:
    - a. Body:
      - 1) Cast iron, ASTM A126 Class B.
      - 2) Carbon steel ASTM A216 Grade WCB.
      - 3) Type 304 stainless steel ASTM A240.
    - b. Ends: Flanged or grooved.
    - c. Cover: Bolted.
    - d. Screen: Type 304 stainless steel with mesh rating based on the Strainer Schedule in Part 3.
- B. Tee Strainers
1. Manufacturers:
    - a. Keckley
    - b. Mueller Steam Specialties.
  2. Pressure Rating: Rated for working pressure as defined by the ANSI fitting class of the system.
  3. Body:
    - a. Carbon steel ASTM A216 or A234.
    - b. Type 304 stainless steel ASTM A240.
  4. Ends: Welded or Flanged.
  5. Cover: Bolted.
  6. Screen: Type 304 stainless steel with mesh rating based on the Strainer Schedule in Part 3.

## 2.5 SUCTION DIFFUSERS

- A. Manufacturers:
1. American Wheatley.
  2. Armstrong Fluid Technology.
  3. Bell & Gossett; Xylem.
  4. Keckley.
  5. PACO; Grundfos Pumps Corp.
  6. Patterson Pump Co.
  7. Taco, Inc.
  8. Victaulic.
- B. Construction: Angle pattern, cast-iron body, threaded connections for 2 inch and smaller, flanged connections for 2-1/2 inch and larger.
1. Pressure Rating: As scheduled on the drawings, minimum working pressure as defined by the ANSI fitting class of the system.
  2. Maximum operating temperature: 300 degrees F.
- C. Accessories:
1. Inlet vanes with length 2-1/2 times pump suction diameter or greater.
  2. Cylinder strainer with 3/16 inch diameter openings with total free area equal to or greater than 5 times cross-sectional area of pump suction, designed to withstand pressure differential equal to pump shutoff head. Provide stainless steel strainer in condenser water system.
  3. Provide disposable screen (5/32 inch mesh) to fit over cylinder strainer for cleaning during startup procedures.

4. Adjustable foot support, designed to carry weight of suction piping.
5. Blowdown tapping in bottom; gauge tapping in side.
6. Permanent magnet located in flow stream, removable for cleaning.

## 2.6 FLEXIBLE CONNECTORS

- A. General: Fabricated from materials suitable for system fluid and that will provide flexible pipe connections.
- B. Metal-Type:
  1. Manufacturers:
    - a. American Wheatley.
    - b. Duraflex.
    - c. Flex-Hose, Inc.
    - d. Flexicraft Industries.
    - e. Flex Pipe USA
    - f. Hyspan Precision Products.
    - g. Mason Industries, Inc.
    - h. Metraflex Co.
    - i. Twin City Hose.
    - j. Unaflex, Inc.
  2. Construction:
    - a. Braided Hose: Flanged or threaded to match equipment connection, corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Include stainless-steel nipples or flanges, welded to hose.
    - b. Bellows: Flanged, stainless-steel bellows with woven, flexible, stainless steel, wire-reinforcing protective jacket.
  3. Pressure Rating: Minimum working pressure as defined by the ANSI fitting class of the system.
  4. Maximum operating temperature: 250 degrees F.
  5. Lateral Movement: Capable of accepting 3/4 inch misalignment.
- C. Rubber-Type:
  1. Manufacturers:
    - a. American Wheatley.
    - b. Duraflex.
    - c. Flex-Hose, Inc.
    - d. Flexicraft Industries.
    - e. Flex Pipe USA.
    - f. General Rubber Corp.
    - g. Griswold Controls.
    - h. Hydronic Components Inc.
    - i. IMI Hydronic Engineering.
    - j. Mason Industries, Inc.
    - k. Mercer Rubber Co.
    - l. Metraflex Co.
    - m. Nexus Valves
    - n. Nutech Hydronic Specialty Products
    - o. Proco Products, Inc.
    - p. Twin City Hose.
    - q. Unaflex, Inc.
  2. Construction:
    - a. Braided Hose: Threaded, CPE or EPDM inner tube, stainless steel braid, stainless steel ferrules, brass or steel end connections.
    - b. Bellows Type: Flanged, fiber-reinforced EPDM rubber body with steel flanges. Do not use control rods.

- 1) Basis of Design: Mason Industries Type SFDEJ twin sphere connection or equal.
3. Pressure Rating: Minimum working pressure as defined by the ANSI fitting class of the system.
4. Maximum operating temperature: 250 degrees F.
5. Lateral Movement: Capable of accepting 3/4 inch misalignment.

## 2.7 TRIPLE DUTY VALVES

- A. Manufacturers:
  1. American Wheatley.
  2. Armstrong Fluid Technology.
  3. Bell & Gossett; Xylem.
  4. Keckley.
  5. PACO; Grundfos Pumps Corp.
  6. Taco, Inc.
  7. Watts Water Technologies.
- B. Construction: Straight or angle pattern, flanged, cast-iron body with bolt-on bonnet, non-slam check valve with spring-loaded bronze disc and seat, stainless steel stem, and calibrated adjustment permitting flow regulation.
  1. Pressure Rating: Minimum working pressure as defined by the ANSI fitting class of the system.
  2. Maximum operating temperature: 300 degrees F.

## 2.8 BALANCING VALVES

- A. Manufacturers:
  1. American Wheatley.
  2. Armstrong Fluid Technology.
  3. Bell & Gossett; Xylem.
  4. Caleffi.
  5. Griswold Controls.
  6. Hays Fluid Controls.
  7. Hydronic Components Inc.
  8. IMI Hydronic Engineering.
  9. Nexus Valve.
  10. Nibco Inc.
  11. Nutech Hydronic Specialty Products
  12. Oventrop.
  13. Pro Hydronic Specialties.
  14. Taco, Inc.
  15. Victaulic Company of America.
- B. Construction: Provide balancing valve with fixed orifice flow balancing, flow measurement, and shut-off capabilities, memory stops, and minimum of two differential pressure metering ports.
  1. Quarter Turn: Provide ball or butterfly quarter turn style for measurement use in variable flow applications.
  2. Full Turn: Provide plug or globe, full or multiple turn style for balancing use in constant flow applications.
  3. Size 2 inch and Smaller: Bronze, forged brass or DZR forged brass body, threaded connections.
  4. Size 2-1/2 inches and Larger: Cast iron, carbon steel, or ductile iron body, with flanged or grooved connections.
  5. Pressure Rating: Minimum working pressure as defined by the ANSI fitting class of the system.
  6. Maximum operating temperature: 250 degrees F.

- C. Accessories: Valve shall include integral pointer and calibrated scale to register degree of valve opening, with position indication readout for repeatable regulation and control.

## 2.9 RELIEF VALVES

- A. Manufacturers:
  - 1. American Wheatley.
  - 2. Armstrong International.
  - 3. Bell & Gossett; Xylem.
  - 4. Caleffi.
  - 5. Keckley.
  - 6. Spence Engineering Company, Inc.
  - 7. Spirax Sarco.
  - 8. Watts Water Technologies.
- B. Safety Relief Valves: Forged brass, bronze, or cast iron, compatible with the piping system, Teflon seat, brass or stainless steel stem, stainless steel springs, EPDM or rubber diaphragm; designed, manufactured, tested, and labeled in accordance with the requirements of Section IV of the ASME Boiler and Pressure Vessel Code.
- C. Combined Pressure/Temperature Relief Valves: Forged brass, bronze, or cast iron, compatible with the piping system, diaphragm operated, with low inlet pressure check valve, inlet strainer removable without system shut-down, and non-corrosive valve seat and stem. Provide with fast fill feature for filling hydronic system. Valve shall be factory-set at operating pressure and have the capability for field adjustment; designed, manufactured, tested, and labeled in accordance with the requirements of Section IV of the ASME Boiler and Pressure Vessel Code.
- D. Pressure Rating: Minimum working pressure as defined by the ANSI fitting class of the system.
- E. Maximum operating temperature: 250 degrees F.
- F. Opening Pressure and Capacity Setpoint: As scheduled on the drawings.

## 2.10 COMBINATION PIPING PACKAGES (COIL KITS)

- A. Combination piping packages are allowed in lieu of individual components specified for hydronic coils and devices containing hydronic coils.
- B. Components shall be same size as piping serving the unit as shown on the drawings. Control valves do not need to be same size as piping subject to the sizing requirements set forth in Division 23 "Instrumentation and Control Devices for HVAC."
- C. Package shall include the components and shall match layouts specified on the Drawings. Each component of the combination piping package shall meet the specifications for the individual components being combined.

## 2.11 WATER FILTRATION SYSTEM

- A. Manufacturers:
  - 1. Griswold Water Systems.
  - 2. Lakos.
  - 3. Puroflux.
- B. Separator Pump Package:
  - 1. Description: Factory assembled and tested, piped, pre-wired filtration unit, including solids separator, pump and motor, piping, piping accessories, valves, gauges, and controls mounted to a steel skid.
    - a. Side Stream Installations: Control of solids in the re-circulated cooling water system shall be accomplished via a side-stream flow of not less than 10% of the full-stream

- system flow. The pump included with the package shall provide sufficient pressure for the re-introduction of side-stream fluid back into system flow.
- b. Separator package: Shall provide for initial pre-straining, followed by direct pumping through a specific centrifugal-action solids-from-liquid separator. Separated solids shall be continuously bled from the separator's collection chamber into the package's integral solids recovery vessel and solids collection bag. Excess liquid shall pass through the bag and return to system flow via piping connected to the package's pump suction line.
2. Components
    - a. Separator: Centrifugal-action design, unishell construction with SA-36, SA-53B or equivalent quality carbon steel or 304 stainless steel, manual and automatic air vents, solids purge outlet at the lowest point of separator accumulation chamber.
    - b. Exterior Coating: Shall be oil-based enamel or acrylic urethane, spray-on coating.
    - c. The separator shall be constructed in accordance with the standards of the American Society of Mechanical Engineers (ASME), Section VIII, Division 1 for pressure vessels. Certification shall be confirmed with the registered "U-stamp" on the body of the separator.
    - d. Solids Collection Vessel: Housing shall be 304 stainless steel with stainless steel basket and coated carbon steel lid with air pressure relief valve. Provide 25- micron fiber felt solids collection bag. Include flow control orifice. Solids capacity shall be minimum 360 cubic inches.
    - e. Inlet and Outlet: Shall be grooved, threaded, or flanged couplings of sizes as indicated on the drawings.
    - f. Purge Outlet: Solids purge outlet shall be threaded, minimum size of 1-1/2 inch.
    - g. Skid Plate: Stainless steel, 3/16-inch minimum thickness, structural steel framework on units with 8-inch and larger connections.
  3. Piping:
    - a. Schedule 80 PVC for piping installed inside cooling tower basin. Water filtration system manufacturer shall design basin sweeper piping layout.
    - b. Schedule 40 coated carbon steel interconnection piping within water filtration unit skid.
  4. Valves: Ball valves on purge line for isolation of solids-handling/purging equipment. Provide inlet/outlet isolation valves to unit.
  5. Pump: End-suction, single stage; TEFC motor; cast iron housing; iron impeller; bronze shaft sleeve; silicon carbide mechanical shaft seal; cast-iron pre-strainer with removable steel basket.
    - a. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."
  6. System Performance Requirements:
    - a. Independent Testing Laboratory: System performance shall be verified by published results from an independent and identified testing laboratory. Standard test protocol of upstream injection, downstream capture, and separator purge recovery is allowed with 50-200 mesh particles to enable effective, repeatable results. Single pass test performance shall not be less than 95% removal. Model tested shall be of same flow-design as specified unit.
    - b. In a single pass through the separator, given solids with a specific gravity of 2.6 and water at 1.0, performance shall be 98% of 74 microns and larger. Additionally, particles finer in size, heavier by specific gravity and some lighter by specific gravity shall also be removed, resulting in an appreciable aggregate removal of particles (up to 75%) as fine as 5 microns.
    - c. In a recirculation system, performance shall be 98 % of solids 40 microns and larger.
    - d. Maximum working pressure and operating temperature: 50 psig and 100 degrees F.
    - e. Purging and Solids Handling: System shall include manual isolation valves for use when servicing the collection bag; motorized ball valve with bronze or forged brass body and stainless steel ball for automatic purge of solids; sight glasses for

- verification of flow through the vessel; annunciator for indicating when the collector bag needs cleaning/replacement; flow control orifice to minimize fluid volume/velocity through the vessel and collector bag.
7. Electrical Controls: UL listed, NEMA 4X enclosure with door disconnect switch, HOA selector switch, motor short circuit/overload protection, transformer, pressure differential switch indicating internal bag cleaning/replacement, adjustable solid state purge timer, pump run indication status light, single point power connection, power requirement per schedule.
- C. Maintenance:
1. The separator shall feature the following access capabilities for either inspection or the removal of unusual solids/debris:
    - a. A hand-hole port at the collection chamber for all units with connections 4-inches and larger.
    - b. A 1/2-inch inspection port, located at the lowest point of the upper chamber.
    - c. A grooved coupling in the upper body to provide full access.

### **PART 3 - EXECUTION**

#### **3.1 HYDRONIC SPECIALTY APPLICATIONS**

- A. Reference Division 23 Section "General Duty Valves for HVAC Piping" for general duty valve applications.
- B. Air Vents:
1. Manual Type: High points in the system outside of mechanical rooms, at heat transfer coils, and elsewhere as required for system air venting.
  2. Automatic Type: Air separator outlets, expansion tank connections, high points in outlet piping of boilers and hot water heat exchangers, and elsewhere as required for system air venting within a mechanical room.
- C. Strainers: Inlet of each pressure reducing valve, pump, and elsewhere as indicated. Do not install strainers on the inlet of pumps serving open loop condenser water systems. Provide strainers in open loop condenser water system where shown on the drawings.
- D. Suction Diffusers: Install on the pump suction inlet. Do not include strainer in suction diffusers installed on pumps serving open condenser water systems, such as cooling towers. Provide strainers in open loop condenser water system where shown on the drawings.
- E. Flexible Connectors:
1. Metal Type: Inlet and discharge connections to pumps (unless otherwise indicated) and other vibration producing equipment.
  2. Rubber Type: Inlet and discharge connections to pumps (unless otherwise indicated) and other vibration producing equipment.
  3. Omit flexible connectors if replaced by series of three grooved couplings on projects where grooved pipe is used.
- F. Triple Duty Valves: Contractor has option to provide triple duty valve in the pump discharge line if lieu of balance and check valves. Shutoff valve is still required even if triple duty valve is used.
- G. Balancing Valves:
1. Constant Volume Pumping Systems: Where shown on the drawings and elsewhere as required to facilitate system balancing.
  2. Variable Volume Pumping Systems: Where shown on the drawings, sized for the smaller of the pipe size or to have a minimum pressure drop of 1 psig at the design flow rate.
- H. Relief Valves: Where located on the plans and at pressure tanks, hot water generators, low pressure side of reducing valves, heat exchangers, and expansion tanks. Install elsewhere as required by ASME Boiler and Pressure Vessel Code.

- I. Pressure Reducing Valves: Hot water generators, and elsewhere as required to regulate system pressure.

### 3.2 STRAINER SCHEDULE

- A. Acceptable strainer types based on fluid and pipe size:
  1. Hydronic in Pipes Smaller than 4 inch: Y-Type.
  2. Hydronic in Pipes Larger than 4 inch: Y-Type, T-Type, Basket.
- B. Acceptable strainer types based on orientation:
  1. Horizontal: Y-Type, T-Type, Basket.
  2. Vertical: Y-Type, T-Type.
- C. Screen Mesh Rating Based on Application:
  1. General Piping:
    - a. Pipe size 4 inch and smaller: 0.062 inches (12 mesh).
    - b. Pipe size larger than 4 inch: 0.125 inch (6 mesh).
  2. Upstream of automatic flow control valves: 0.0331 inch (20 mesh).
  3. Upstream of brazed plate heat exchangers: 0.0331 inch (20 mesh).
  4. Upstream of plate and frame heat exchangers: 0.0787 inch (10 mesh).

### 3.3 INSTALLATION

- A. Install specialties in accordance with manufacturer's instructions.
- B. Reference Division 23 Section "Basic Piping Materials and Methods" for general piping installation requirements.
- C. Expansion Tanks:
  1. Diaphragm/Bladder Tanks:
    - a. Install diaphragm/bladder-type expansion tanks on floor or support from structure as indicated on the drawings. Vent and purge air from hydronic system, charge tank with proper air charge to suit system design requirements.
    - b. Support tank as detailed on the Drawings. In the absence of details, provide support from the floor or structure above, sufficient for the weight of the tank, piping connections, and fittings, plus weight of water assuming a full tank of water. Do not overload building components and structural members.
    - c. Support vertical tanks with steel legs or base; support horizontal tanks with steel saddles.
- D. Air Vents:
  1. Where large air quantities can accumulate, provide enlarged air collection standpipes.
  2. Install manual air vents in piping mains with a tee fitting, 1/2 inch ball valve, threaded nipple, and cap.
  3. For automatic air vents in ceiling spaces or other concealed locations, provide vent tubing to nearest drain.
- E. Air Separators:
  1. Install with shutoff valves on the inlet and outlet piping.
  2. Install air outlet piping to compression expansion tank with 1/4 inch per foot (2 percent) upward slope towards tank.
  3. Install automatic air vent at air outlet and run piping to floor drain.
  4. Install in-line air separators with drain valve on units 2 inch and larger.
  5. Install combination air and dirt separator blowdown piping with gate valve; extend to nearest drain.
  6. Install air and air/dirt separators on floor or support from structure as indicated on the drawings.

7. Support tank as detailed on the Drawings. In the absence of details, provide support from the floor or structure above, sufficient for the weight of the tank, piping connections, and fittings, plus weight of water assuming a full tank of water. Do not overload building components and structural members.
- F. Strainers:
1. Provide valved drain and hose connection on strainer blowdown connection for strainers 2 inch and larger.
- G. Suction Diffusers:
1. Adjust foot support to carry weight of suction diffuser. Install nipple and ball valve in blowdown connection.
- H. Triple Duty Valves:
1. Install triple duty valves with stem in upward position. Allow clearance above stem for check mechanism removal.
- I. Relief Valves:
1. Adjust relief valve setpoint as noted on the drawings.
  2. Pipe relief valve outlet to nearest floor drain.
  3. Where one line vents several relief valves, make cross sectional area equal to sum of individual vent areas.
- J. Water Filtration System:
1. Install water filtration system per manufacturer installation instructions. Provide support for unit as scheduled on the drawings.
  2. Install piping between water filtration system and cooling tower per water filtration system manufacturer recommendations.

### 3.4 STARTUP

- A. Reference Division 23 Section Hydronic Piping for general startup requirements.
- B. Start up and commissioning of water filtration unit shall be performed by a factory authorized representative.
- C. Start up and commissioning of glycol makeup unit shall be performed by a factory authorized representative.
- D. Remove temporary strainer after cleaning system.

### 3.5 TRAINING

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain water filtration equipment and/or glycol makeup equipment.
- B. Training for Owner's personnel shall include but not be limited to:
  1. Overview of the system and /or equipment as it relates to the facility as a whole.
  2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
- C. Review manufacturer's safety data sheets for handling of chemicals.
- D. Review data in maintenance manuals, especially data on recommended parts inventory and supply sources and on availability of parts and service. Refer to Division 1 and Division 23 Section "General Mechanical Requirements."
- E. Schedule at least four hours of training with Owner, through Architect, with at least seven days' advance notice.
- F. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time,

attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.

END OF SECTION

**SECTION 23 21 23 - HYDRONIC PUMPS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A.
- B. Vertical in-line, split-coupled inline pumps.

**1.2 SUBMITTALS**

- A. See Section 01 30 00 - Administrative Requirements for submittal procedures.
- B. Product Data: Provide certified pump curves showing performance characteristics with pump and system operating point plotted. Include NPSH curve when applicable. Include electrical characteristics and connection requirements.
- C. Millwright's Certificate: Certify that base mounted pumps have been aligned.
- D. Manufacturer's Installation Instructions: Indicate hanging and support requirements and recommendations.
- E. Alignment Report: Provide alignment and grout reports for alignment work specified in Part 3. Submit pictures of grouted base with the alignment report.
- F. Operation and Maintenance Data: Include installation instructions, assembly views, lubrication instructions, and replacement parts list.
- G. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
  - 1. Extra Pump Seals: for each type and size of pump.
  - 2. Extra Cartridges for Side-Stream Filters: One set for each filter.

**1.3 QUALITY ASSURANCE**

- A. Manufacturer Qualifications: Company specializing in manufacture, assembly, and field performance of pumps, with minimum three years of documented experience.
- B. UL Compliance: Fabricate and label pumps to comply with UL 778, "Motor-Operated Water Pumps," for construction requirements.
- C. Product Options: Drawings indicate size, profiles and connections requirements of pumps and are based on the specific types and models indicated. Other manufacturers' pumps with equal performance characteristics may be considered. Refer to Division 1 Section "Substitutions."
- D. Regulatory Requirements: Fabricate and test pumps to comply with HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation," and HI 1.6, "Centrifugal Pump Tests."
- E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.

**1.4 DELIVERY STORAGE AND HANDLING**

- A. Manufacturer's Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anticorrosion compound after assembly and testing. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.
- B. Store pumps in dry location.

- C. Retain protective covers for flanges and protective coatings during storage.
- D. Protect bearings and couplings against damage from sand, grit, and other foreign matter.
- E. Comply with pump manufacturer's written rigging instructions.

## 1.5 WARRANTY

- A. Warranty on Pumps: Provide written warranty, signed by manufacturer, agreeing to replace/repair, within warranty period, pumps with inadequate or defective materials and workmanship, including leakage, breakage, improper assembly, or failure to perform as required; provided manufacturer's instructions for handling, installing, protecting, and maintaining units have been adhered to during warranty period. Replacement includes both parts and labor for removal and reinstallation.
  - 1. Warranty Period: One year from date of substantial completion.

## PART 2 - PART 2 PRODUCTS

### 2.1 HVAC PUMPS - GENERAL

- A. Provide pumps that operate at specified system fluid temperatures without vapor binding and cavitation, are non-overloading in parallel or individual operation, and operate within 25 percent of midpoint of published maximum efficiency curve.
- B. Minimum Quality Standard: .
- C. Base Mounted Pumps: Aligned by qualified millwright.
- D. Products Requiring Electrical Connection: Listed and classified by UL or testing agency acceptable to Authority Having Jurisdiction as suitable for the purpose specified and indicated.
- E. Pumps and Circulators: Factory-assembled and factory-tested. Fabricate casings to allow removal and replacement of impellers without necessity of disconnecting piping. Type, sizes, and capacities shall be as indicated.
- F. Preparation for Shipping: After assembly and testing, clean flanges and exposed machined metal surfaces and treat with an anticorrosion compound. Protect flanges, pipe openings, and nozzles.
- G. Motors: Conform to NEMA Standard MG-1, general purpose, continuous duty, Design B, except Design C where required for high starting torque; single, multiple, or variable speed with type of enclosure and electrical characteristics as indicated; have built-in thermal-overload protection, and grease-lubricated ball bearings. Select motors that are non-overloading within the full range of the pump performance curve. Refer to Section "Common Motor Requirements for HVAC Equipment" for additional requirements.
  - 1. Efficiency: Motors shall have a minimum efficiency meeting the requirements of the Energy Policy Act of 1992 as defined in NEMA MG-1 when tested in accordance with IEEE Standard 112, Test Method B.
    - a. Motor Frame: NEMA Standard 48 or 54; use pump manufacturer's standard.
- H. Apply factory finish paint to assembled, tested units prior to shipping.

### 2.2 VERTICAL IN-LINE SPLIT-COUPLED PUMPS

- A. Type: Pumps shall be centrifugal, close-coupled, single-stage, bronze-fitted, radially split case design, with mechanical seals, and rated for 175 psig working pressure and 225 deg F continuous water temperature.

- B. Motor: Direct-mounted to pump casing; with lifting and supporting lugs in top of motor enclosure.
- C. Casing: Cast iron, with threaded companion flanges for piping connections smaller than 2-1/2 inches, and threaded gauge tapings at inlet and outlet connections.
- D. Impeller: Statically and dynamically balanced, closed, overhung, single-suction, cast bronze, conforming to ASTM B 584, and keyed to shaft.
- E. Shaft: Ground and polished carbon steel shaft, screw or nut and bronze sleeve and integral thrust bearing. Provide flinger on motor shaft between motor and seals to prevent liquid that leaks past pump seals from entering the motor bearings.
- F. Seal: Carbon rotating against a stationary ceramic seat, 225 degrees F maximum continuous operating temperature. Provide 316 stainless steel gland plate. Provide factory installed flush line and manual vent.
- G. Coupling: Provide rigid spacer type of high tensile aluminum alloy. Coupling shall be designed to be easily removed on site to reveal a space between the pump and motor shafts sufficient to remove all mechanical seal components for servicing and to be replaced without disturbing the pump or motor.
- H. Lower Seal Chamber throttle bushing shall be provided to ensure seals maintain positive cooling and lubrication.
- I. Accessories: Provide a 50 micron cartridge filter and sight flow indicator suitable for the system working pressure in the flush line. Provide new filter after system is flushed and tested. Alternatively provide a maintenance free sediment separator in the flush line with sight flow indicator. Verify differential pressure is adequate for effective operation.
- J. Motor: Designed for vertical in-line, split coupled operation Provide a high tensile aluminum split coupler to connect the pump and motor shaft with sufficient gap to allow seal replacement without removing motor or dismantling pump.
- K. Manufacturers:
  - 1. American Marsh Pumps.
  - 2. Armstrong Fluid Technology, Inc.
  - 3. Aurora Pumps.
  - 4. Bell & Gossett, ITT.
  - 5. Goulds Water Technology.
  - 6. Grundfos Pumps Corp.
  - 7. Paco Pumps.
  - 8. Patterson Pump Co.
  - 9. Peerless Pump.
  - 10. Taco, Inc.
  - 11. Thrush Company, Inc.
  - 12. Weinman
  - 13. Wilo.

### **PART 3 - EXECUTION**

#### **3.1 PREPARATION**

- A. Verify that electric power is available and of the correct characteristics.

#### **3.2 INSTALLATION**

- A. Install in accordance with manufacturer's instructions.

- B. Provide access space around pumps for service. Provide no less than minimum space recommended by manufacturer.
- C. Decrease from line size with long radius reducing elbows or eccentric reducers installed flat on top. Support piping adjacent to pump such that no weight is carried on pump casings. For Vertical In-line or base-mounted pumps, provide supports under elbows on pump suction and discharge line sizes 4 inches and over.
- D. Provide line sized shut-off valve and strainer on pump suction, and line sized soft seat check valve and balancing valve on pump discharge. A separate strainer is not required if a suction diffuser with strainer is provided.
- E. Provide air cock and drain connection on horizontal pump casings.
- F. Provide drains for bases and seals, piped to and discharging into floor drains.
- G. Install flexible connectors on the suction and discharge side of each pump mounted on housekeeping pad. Install flexible connectors between the pump casing and the discharge valves, and upstream of the pump suction diffuser.
- H. Provide vibration isolation for pumps as specified in Section "Vibration Isolation for HVAC".
- I. Install a combination pressure gauge with tubing connected to the suction and discharge of each pump at the integral pressure gauge tapplings provided as well as a tap upstream of the suction diffuser and strainer.
- J. Install temperature and pressure gauge connector plugs in suction and discharge piping around pump. Temperature and pressure gauge connector plugs are specified in Section "Meters and Gauges."
- K. Check, align, and certify alignment of base-mounted pumps prior to start-up. Comply with pump and coupling manufacturer's written instruction.
- L. Install floor mounted pumps on concrete housekeeping base, with anchor bolts, set and level, and grout in place. Refer to the drawings and Section "Vibration Isolation for HVAC" to determine where concrete inertia bases are required.
  - 1. Adjust alignment of pump and motor shafts for angular and parallel alignment by one of the two methods specified in the Hydraulic Institute "Centrifugal Pumps - Instructions for Installation, Operation and Maintenance."
  - 2. For pumps with flexible couplings requiring alignment and grouting per manufacturer's inspection, operation and maintenance (IOM) plan, measure alignment when pump is set and again after pump has been started. Misalignment shall be no greater than 5 thousandths angular and 3 thousandths parallel. Submit reports of alignment results in accordance with Submittals paragraph.
  - 3. After alignment is correct, tighten the foundation bolts evenly, but not too firmly. Fill the base plate completely with non-shrink, nonmetallic grout, with metal blocks and shims or wedges in place. After grout has cured, fully tighten foundation bolts.
- M. Lubricate pumps before start-up.

### 3.3 STARTUP

- A. Final Checks Before Start-Up: Perform the following preventative maintenance operations and checks before start-up:
  - 1. Lubricate oil-lubricated bearings.
  - 2. Remove grease-lubricated bearing covers and flush the bearings with kerosene and thoroughly clean. Fill with new lubricant in accordance with the manufacturer's recommendations.

3. Disconnect coupling and check motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
  4. Check that pump is free to rotate by hand. For pumps handling hot liquids, pump shall be free to rotate with the pump hot and cold. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.
  5. Clean strainers.
  6. Check piping connections for tightness.
- B. Starting procedure for pumps with shutoff power not exceeding the safe motor power:
1. Prime the pump, opening the suction valve, closing the drains, and prepare the pump for operation.
  2. Open the valve in the cooling water supply to the bearings, where applicable.
  3. Open the cooling water supply valve if the stuffing boxes are water-cooled.
  4. Open the sealing liquid supply valve if the pump is so fitted.
  5. Open the warm-up valve of a pump handling hot liquids if the pump is not normally kept at operating temperature.
  6. Open the recirculating line valve if the pump should not be operated against dead shutoff.
  7. Start the motor.
  8. Open the discharge valve slowly.
  9. Observe the leakage from the stuffing boxes and adjust the sealing liquid valve for proper flow to ensure the lubrication of the packing. Do not tighten the gland immediately, but let the packing run in before reducing the leakage through the stuffing boxes.
  10. Check the general mechanical operation of the pump and motor.
  11. Close the recirculating line valve once there is sufficient flow through the pump to prevent overheating.
- C. If the pump is to be started against a closed check valve with the discharge valve open, the steps are the same, except that the discharge valve is opened some time before the motor is started.
- D. Retouch any marred or scratched surfaces of factory-finished surfaces, using finish materials furnished by manufacturer.
- E. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for detailed requirements for testing, adjusting, and balancing hydronic systems.

### 3.4 TRAINING

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
1. Overview of the system and/or equipment as it relates to the facility as a whole.
  2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**SECTION 23 25 00 - HVAC WATER TREATMENT****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Chemicals and test equipment.
- B. Chemical feeding equipment.

**1.2 SUBMITTALS**

- A. Submit in accordance with conditions of Contract and Division 01 submittal procedures.
- B. Product Data: Submit product cutsheets, materials, accessories, chemicals, and equipment, including electrical characteristics and connection requirements, rated capacities, water-pressure drops, shipping, installed, and operating weights for the water treatment system.
- C. Shop Drawings: Indicate system schematic, equipment locations, controls schematics, and electrical characteristics. Detail equipment assemblies indicating dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 1. Wiring Diagrams: Detail power and control wiring and differentiate between manufacturer-installed and field-installed wiring.
- D. Manufacturer's Installation Instructions: Indicate placement of equipment in systems, piping configuration, and connection requirements.
- E. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.
- F. Manufacturer's Field Reports: Indicate start-up of treatment systems when completed and operating properly. Indicate analysis of system water after cleaning and after treatment to confirm compliance with performance requirements.
- G. Certificate: Submit certificate of compliance from Authority Having Jurisdiction indicating approval of chemicals and their proposed disposal.
- H. Project Record Documents: Record actual locations of equipment and piping, including sampling points and location of chemical injectors.
- I. Operation and Maintenance Data: Include data on chemical feed pumps, agitators, and other equipment including spare parts lists, procedures, and treatment programs. Include step by step instructions on test procedures including target concentrations. Include in maintenance manuals specified in Division 1.
- J. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
  - 1. Sufficient chemicals for treatment and testing during required maintenance period.
- K. Warranty and maintenance agreement.

**1.3 QUALITY ASSURANCE**

- A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience. Company shall have local representatives with water analysis laboratories and full time service personnel.
- B. Installer Qualifications: An experienced installer who is an authorized representative of the chemical treatment manufacturer for both installation and maintenance of chemical treatment equipment required for this Project.

- C. Comply with ASHRAE Guideline 12, Managing the Risk of Legionellosis Associated with Building Water Systems and ASHRAE Standard 188, Legionellosis: Risk Management for Building Water Systems.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- E. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

#### **1.4 WARRANTY**

- A. Warranty: Submit written warranty, signed by Manufacturer and countersigned by Installer and Contractor, agreeing to adjust or replace system or portions thereof, as required to achieve required performances, during 1-year period following final start-up for continued operation of condenser water system.
- B. Agreement to Maintain: Prior to time of final acceptance, manufacturer of water treatment system shall submit 4 copies of "Agreement for Continued Service and Maintenance" for water treatment system for Owner's possible acceptance. Offer terms and conditions for furnishing chemicals and providing continued testing and servicing, and including replacement of materials and equipment, for one-year with option for renewal of Agreement by Owner.

#### **1.5 SPARE PARTS**

- A. Chemicals, Water Treatment: Furnish 6 month supply of chemicals recommended by water treatment system manufacturer for treating water to meet specified water quality.
  - 1. Ascertain from water piping system Installer, what materials are used for pump seals. Provide only chemicals that are compatible with these materials.

### **PART 2 - PRODUCTS**

#### **2.1 MANUFACTURERS**

- A. General: The following manufacturers of water treatment systems are acceptable. Manufacturers shall provide chemical feed equipment that meet the requirements specified herein.
  - 1. AmSolv Total Water Management
  - 2. Aquanomics
  - 3. Kurita
  - 4. MAC Water Technologies
  - 5. Nalco, an Ecolab Company.
  - 6. Suez Water Technologies.
  - 7. Water Treatment Vendor that is listed under Association of Water Technologies (ATW) with a Certified Water Technician (CWT).

#### **2.2 CHEMICALS AND TEST EQUIPMENT**

- A. General: Furnish chemicals of type and quantity as recommended by water-treatment system manufacturer that are compatible with piping system components and connected equipment.
- B. System Cleaner:
  - 1. Liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products.
  - 2. For closed systems, provide nonoxidizing biocide treatment if needed to meet biological parameters from water test performed after system is cleaned..

- C. Closed System Treatment (Water):
  - 1. Sequestering agent to reduce deposits and adjust Ph.
  - 2. Corrosion inhibitors.
  - 3. Conductivity enhancers.
- D. Condenser Water System Treatment (Cooling Towers):
  - 1. Sequestering agent to inhibit scaling.
  - 2. Corrosion inhibitor.
  - 3. Biocide chlorine release agents or microbiocide.
- E. Test Equipment:
  - 1. Manufacturer recommended equipment and chemicals, in a carrying case, for testing pH, total dissolved solids, sodium sulfite for dissolved oxygen, biocount, chloride, and total alkalinity and for calcium hardness field tests.
  - 2. Corrosion Test Coupon Assembly: Constructed of corrosion material, complete with piping, valves, and mild steel and copper coupons. Locate copper coupon downstream from mild steel coupon in the test coupon assembly.
    - a. Two station rack for closed-loop systems.
    - b. Four station rack for open condenser water systems.

### 2.3 CHEMICAL FEEDING EQUIPMENT

- A. Bypass (Pot) Feeder: Cast iron or steel, for introducing chemicals into system; with funnel shutoff valve on top, air-release valve on top, drain valve on bottom, and recirculating shutoff valves on sides.
  - 1. Capacity: 5 gal. for working pressure of 175 psig.
- B. Solution Metering Pump:
  - 1. Positive displacement, diaphragm or piston pump, simplex, self-priming, with adjustable flow rate, thermoplastic construction, continuous-duty fully enclosed electric motor and drive, and built-in relief valve, foot valve/strainer, ceramic sinker, suction and discharge tubing, and injection valve assembly. Rated for intended chemical with 25 percent safety factor for design pressure and temperature.
  - 2. Electrical Characteristics:
    - a. 120 volts, single phase, 60 Hz.
    - b. Cord and Plug: Provide unit with 6 foot cord and plug for connection to electric wiring system including grounding connector.
- C. Solution Tanks:
  - 1. 50 gallon capacity, chemical-resistant reservoir fabricated from high-density opaque polyethylene, self-supporting, 1 gallon graduated markings; factory-installed floating suction assembly, molded fiberglass cover with recess for mounting pump, agitator, and liquid level switch.
- D. Agitator:
  - 1. Direct drive, 1750 rpm, totally enclosed, continuous-duty electric motor, 1/2 inch diameter coated Type 316 stainless steel shaft and propeller, mounted on tank with angle adjustment and stainless steel clamp.
  - 2. Electrical Characteristics:
    - a. 120 volts, single phase, 60 Hz.
    - b. Cord and Plug: Provide unit with 6 foot cord and plug for connection to electric wiring system including grounding connector.
- E. Liquid-Level Switch:
  - 1. Polypropylene housing, integrally mounted PVC air trap, receptacles for connection to metering pump, and low-level alarm.
- F. Conductivity Controller:

1. Packaged monitor controller with solid state circuiting, five percent accuracy, linear dial adjustment, built-in calibration switch, on-off switch and light, control function light, output to control circuit and recorder.
- G. Water Meter:
1. Displacement type cold water meter, rotating-disc or turbine type, bronze or cast-iron body rated for 125 psig, with sealed, tamper-proof magnetic drive or impulse contact register, single pole, double throw dry contact switch, and at least six-digit totalizer.
  2. Electrical Characteristics:
    - a. 120 volts, single phase, 60 Hz.
- H. Solenoid Valve or Motorized Ball Valves:
1. Solenoid valve shall be forged brass body globe pattern, fail closed, general purpose solenoid enclosure, and continuous duty coil.
  2. Motorized ball valve shall be forged brass body with stainless steel ball, fail closed, with general purpose actuator.
  3. Electrical Characteristics:
    - a. 120 volts, single phase, 60 Hz.
- I. Timers:
1. Electronic timers, infinitely adjustable over full range, 150 second and five minute range, mounted together in cabinet with hands-off-automatic switches and status lights.
- J. Chemical Tubing: Schedule 40, PVC with solvent-cement joints; or polypropylene tubing with heat fusion.
- K. Plastic Ball Valves: Rigid PVC or CPVC body, integral union ends, and polytetrafluoroethylene seats and seals.
- L. Plastic-Body Strainer: Rigid PVC or CPVC with cleanable stainless-steel strainer element.
- M. Condenser Water System Treatment Controller (Cooling Towers)
1. Provide automatic electronic solid-state control system for inhibitor feed, blowdown and biocide feeds. Inhibitor application shall be meter activated, blowdown shall be conductivity activated, and biocide shall be meter fed with blowdown locked out to ensure biocide retention time.
  2. Control system shall incorporate solid state integrated circuits and digital LED displays, in NEMA-12 steel enclosure. Provide gasketed and lockable door.
  3. Base dissolved solids control on conductivity and include:
    - a. LED digital readout display (micro-ohm/cm).
    - b. Temperature compensated sensor probe adaptable to sample stream manifold.
    - c. High, low, normal conductance indicator lights (LED).
    - d. High or low conductance alarm light (flash or steady switch), trip points field adjustable. Flash or steady switch shall have silence position.
    - e. Illuminated legend shall indicate "ALARM" whenever alarm condition exists.
    - f. Hand-off-automatic switch for solenoid bleed valve.
    - g. Illuminated legend shall indicate "BLEED" when valve is operated.
    - h. Adjustable hysteresis or dead-band (internal).
  4. Base inhibitor feed control on make-up volume and include:
    - a. Solid state counter (1-15 field selectable).
    - b. Solid state timer (adjustable 1/4 to 5 minutes).
    - c. Test switch.
    - d. Hand-off-automatic switch for chemical pump.
    - e. Illuminated legend shall indicate when pump is activated.
    - f. Solid state lock-out timer (adj. 1/4 to 3 hours) and indicator light. Lock-out timer shall deactivate the pump and activate alarm circuits.
    - g. Panel totalizer (amount of makeup), electro-mechanical type.
  5. Biocide programmer to include:
    - a. 24 hour timer with 14 day skip feature to permit activation any hour of the day.

- b. Precision solid state bleed lock-out timer (0-9 hours) and biocide pump timer (0 - 2-1/4 hours), clock controlled.
- c. Solid state alternator to enable the use of two different formulations.
- d. Digital display of the time of day (24 hours).
- e. LED display of day of week (14 days).
- f. Fast and slow clock set controls (internal).
- g. Battery back-up so clock is not disturbed by power outages, quartz timekeeping accuracy.
- h. Hand-off-automatic switches for biocide pumps.
- i. Illuminated legend shall indicate "BIOCIDE A" or "BIOCIDE B" when pump is activated.

### **PART 3 - EXECUTION**

#### **3.1 PERFORMANCE REQUIREMENTS**

- A. Provide a water treatment system sized and equipped to treat raw make-up water available at project site.
- B. Maintain water quality for HVAC systems that controls corrosion and build-up of scale and biological growth for maximum efficiency of installed equipment without posing a hazard to operating personnel or the environment.
- C. Base chemical treatment performance requirements on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.
- D. Coordinate the use of oxidizing agents supplemented with non-oxidizers sequentially to ensure organisms do not become immune to treatment per ASHRAE Guideline 12-2000.
- E. Except as otherwise indicated, provide water treatment system manufacturer's standard materials and components as indicated by published product information, and as recommended by manufacturer for application indicated.
- F. Comply with applicable codes for addition of non-potable chemicals to building mechanical systems and to public sewage systems.
- G. Perform work in accordance with local health department regulations.

#### **3.2 PREPARATION**

- A. Perform an analysis of supply water to determine the type and quantities of chemical treatment needed to maintain the water quality as specified.
- B. Systems shall be operational, filled, started, and vented prior to cleaning. Use water meter to record capacity in each system.
- C. Place terminal control valves in open position during cleaning.
- D. Verify that electric power is available and of the correct characteristics.

#### **3.3 INSTALLATION**

- A. Install in accordance with manufacturer's instructions.
- B. Install treatment equipment level and plumb.
- C. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

- D. Install piping adjacent to equipment to allow service and maintenance.
- E. Electrical Coordination:
  - 1. Coordinate applicable electrical requirements in Division 26 sections for connecting and grounding electrical equipment.
  - 2. Coordinate electrical connectors and terminals are tightened according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

### 3.4 CLOSED SYSTEM TREATMENT

- A. Provide one bypass feeder on each system. Install isolating and drain valves and necessary piping. Install around balancing valve downstream of circulating pumps unless indicated otherwise.
- B. Introduce closed system treatment through bypass feeder when required or indicated by test.
- C. Provide 3/4 inch water coupon rack around circulating pumps with space for 2 test specimens.

### 3.5 CONDENSER WATER SYSTEMS (COOLING TOWERS)

- A. Passivate galvanized steel material in cooling towers for minimum of six weeks prior to full operation. Coordinate pH level concentrations with cooling tower manufacturer. Schedule this process to ensure work is done prior to cooling tower activation.
- B. Provide solution pumps to feed sequestering agent and corrosion inhibitor from solution tank into condenser water supply to tower. Provide agitator as required.
- C. Provide conductivity controller to sample condenser water and operate solenoid bleed valve and solution pumps.
- D. Provide solution pump to feed diluted acid from solution tank into condenser water supply to tower.
- E. Introduce oxidizing and nonoxidizing biocides to tower by intermittent slug feed.
- F. Provide water meter in make-up water line to tower, to activate solution pumps for preset time when condenser water pumps are running.
- G. Provide liquid level switch in each solution tank to deactivate solution pump and agitator and sound local alarm bell.
- H. Provide 3/4 inch water coupon rack around circulating pumps with space for 2 test specimens.

### 3.6 FIELD QUALITY CONTROL

- A. Engage a factory-authorized service representative to perform startup service.
  - 1. Inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.
  - 2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational before introducing chemicals for water-treatment system.
  - 3. Place HVAC water-treatment system into operation and calibrate controls during the preliminary phase of HVAC systems' startup procedures.
- B. Test chemical feed piping as follows:
  - 1. Do not enclose, cover, or put piping into operation until it is tested and satisfactory test results are achieved.
  - 2. Test for leaks and defects. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.

3. Leave uncovered and unconcealed new, altered, extended, and replaced water piping until it has been tested and approved. Expose work that has been covered or concealed before it has been tested and approved.
  4. Cap and subject piping to static water pressure of 50 psig (345 kPa) above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow test pressure to stand for four hours. Leaks and loss in test pressure constitute defects.
  5. Repair leaks and defects with new materials and retest piping until satisfactory results are obtained.
  6. Prepare test reports, including required corrective action.
- C. Fluid Testing:
1. Coordinate with the testing requirements specified in Division 23 Section "Hydronic Piping"

### 3.7 AD USTING

- A. Sample boiler water at one-week intervals after boiler startup for a period of five weeks, and prepare certified test report for each required water performance characteristic. Where applicable, comply with ASTM D 3370 and the following standards:
1. Silica: ASTM D 859.
  2. Steam System: ASTM D 1066.
  3. Acidity and Alkalinity: ASTM D 1067.
  4. Iron: ASTM D 1068.
  5. Water Hardness: ASTM D 1126.
- B. Occupancy Adjustments: Within 12 months of Substantial Completion, perform two separate water analyses to prove that automatic chemical feed systems are maintaining water quality within performance requirements specified in this Section. Perform analyses at least 60 days apart. Submit written reports of water analysis.

### 3.8 CLOSEOUT ACTIVITIES

- A. Training: Train Owner's personnel on operation and maintenance of chemical treatment system.
- B. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC water-treatment systems and equipment.
- C. Provide overview of the system and /or equipment as it relates to the facility as a whole.
- D. Review operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
- E. Review manufacturer's safety data sheets for handling of chemicals.
- F. Review data in maintenance manuals, especially data on recommended parts inventory and supply sources and on availability of parts and service. Refer to Division 1 and Division 23 Section "General Mechanical Requirements."
- G. Provide minimum of two hours of training with Owner with at least seven days advance notice.
- H. Have operation and maintenance data prepared and available for review during training.
- I. Conduct training using actual equipment after treated system has been put into full operation.
- J. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- K. Submit certificate of compliance from Authority Having Jurisdiction indicating approval of installation.

**3.9 MAINTENANCE**

- A. Provide a separate maintenance contract for specified maintenance service.
- B. Perform maintenance work using competent and qualified personnel under the supervision and in the direct employ of the equipment manufacturer or original installer.
- C. Maintenance service shall not be assigned or transferred to any agent or subcontractor without prior written consent of Owner.
- D. Provide monthly technical service visits to perform field inspections and make water analysis on-site. Detail findings in writing on proper practices, chemical treating requirements, and corrective actions needed. Submit two copies of field service report after each visit.
- E. Provide laboratory and technical assistance services during this maintenance period.
- F. Analyses and reports of all chemical items concerning safety and compliance with government regulations.
- G. Provide on-site inspections of equipment during scheduled or emergency shutdown to properly evaluate success of water treatment program, and make recommendations in writing based upon these inspections.

END OF SECTION

**SECTION 23 31 13 - METAL DUCTS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Metal ductwork.
- B. Duct liner.
- C. Duct sealants.
- D. Duct hangers and supports.
- E. Wire rope hanging system.
- F. Manufactured ductwork and fittings.
- G. Factory-fabricated grease exhaust ductwork.

**1.2 DEFINITIONS**

- A. Sealing Requirements Definitions: For the purposes of duct systems sealing requirements specified in this Section, the following definitions apply:
  - 1. Seams: A seam is defined as joining of two longitudinally (in the direction of airflow) oriented edges of duct surface material occurring between two joints. All other duct surface connections made on the perimeter are deemed to be joints.
  - 2. Joints: Joints include girth joints; branch and subbranch intersections; so-called duct collar tap-ins; fitting subsections; louver and air terminal connections to ducts; access door and access panel frames and jambs; duct, plenum, and casing abutments to building structures.

**1.3 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The duct system design, as indicated, has been used to select and size air moving and distribution equipment and other components of the air system. Changes or alterations to the layout or configuration of the duct system must be specifically approved in writing. Accompany requests for layout modifications with calculations showing that the proposed layout will provide the original design results without increasing the system total pressure.

**1.4 SUBMITTALS**

- A. Product data including details of construction relative to materials, dimensions of individual components, profiles, and finishes for the following items:
  - 1. Duct Liner.
  - 2. Sealing Materials.
  - 3. Fire-Stopping Materials.
- B. Shop drawings from duct fabrication shop, drawn to a scale not smaller than 1/4 inch equals 1 foot, on drawing sheets same size as the Contract Drawings, detailing:
  - 1. Fabrication, assembly, and installation details, including plans, elevations, sections, details of components, and attachments to other work.
  - 2. Duct layout, indicating pressure classifications, duct gauge and sizes in plan view. For exhaust ducts systems, indicate the classification of the materials handled as defined in this Section.
  - 3. Fittings.
  - 4. Reinforcing details and spacing.

5. Seam and joint construction details.
  6. Penetrations through fire-rated and other partitions.
  7. Terminal heating and cooling unit, coil, humidifier and duct silencer installations.
  8. Locations of fire and fire/smoke dampers and associated duct access doors.
  9. Locations of cleanout and access doors in grease exhaust ducts.
  10. Location of manual balancing dampers.
  11. Duct smoke detector locations. Refer to electrical drawings for general locations and coordinate locations with the electrical contractor.
  12. Hangers and supports, including methods for building attachment, vibration isolation, and duct attachment.
- C. Coordination drawings for ductwork installation in accordance with Division 23 Section "General Mechanical Requirements." In addition to the requirements specified in "General Mechanical Requirements" show the following:
1. Coordination with ceiling suspension members.
  2. Spatial coordination with other systems installed in the same space with the duct systems.
  3. Coordination of ceiling- and wall-mounted access doors and panels required to provide access to dampers and other operating devices.
  4. Coordination with ceiling-mounted lighting fixtures and air outlets and inlets.
- D. Leak test report for ducts specified to be leak tested in Part 3. Indicate pressure tests performed. Include date, section tested, test pressure, and leakage rate, following SMACNA (LEAK).
- E. Leak Test certificate for all smoke control duct joints and fittings in compliance with the locally adopted IMC.
- F. Leak Test certificate for all grease duct joints and fittings in compliance with the locally adopted IMC.
- G. Record drawings including duct systems routing, fittings details, reinforcing, support, and installed accessories and devices, in accordance with Division 23 Section "General Mechanical Requirements" and Division 1.
- H. Welding certificates including welding procedures specifications, welding procedures qualifications test records, and welders' qualifications test records complying with requirements specified in "Quality Assurance" below.

## 1.5 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.
- B. Installer Qualifications: Company specializing in performing the type of work specified in this section, with minimum three years of documented experience.
- C. Qualify welding processes and welding operators in accordance with AWS D1.1 "Structural Welding Code - Steel" for hangers and supports and AWS D9.1 "Sheet Metal Welding Code."
- D. Qualify each welder in accordance with AWS qualification tests for welding processes involved. Certify that their qualification is current.
- E. NFPA Compliance: Comply with the following NFPA Standards:
1. NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems," except as indicated otherwise.
  2. NFPA 90B, "Standard for the Installation of Warm Air Heating and Air Conditioning Systems.
  3. NFPA 96, "Standard for the Installation of Equipment for the Removal of Smoke and Grease-Laden Vapors for Commercial Cooking Equipment," Chapter 3, "Duct System," for kitchen hood duct systems, except as indicated otherwise.

- F. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Provide ductwork systems in conformance with "HVAC Duct Construction Standards – Metal and Flexible," latest edition.
- G. Underwriter's Laboratories (UL): Comply with the UL standards listed within this section. Provide mastic and tapes that are listed and labeled in accordance with UL 181A and marked according to type.
- H. National Air Duct Cleaners Association, Inc. (NADCA): Clean ductwork systems in accordance with the standard Assessment, Cleaning and Restoration of HVAC Systems (ACR 2002).

## 1.6 PROTECTION AND REPLACEMENT

- A. Protect ductwork during shipping and storage from dirt, debris and moisture damage. Provide plastic covers over ends of ductwork during shipping, storage and installation.
- B. Replace duct liner that is damaged and cannot be repaired satisfactorily, including insulation with vapor barrier damage and insulation that has been exposed to moisture during shipping, storage, or installation. Drying the insulation is not acceptable. Dry surfaces prior to installing new duct liner.

## 1.7 FIELD CONDITIONS

- A. Do not install duct sealants when temperatures are less than those recommended by sealant manufacturers.
- B. Maintain temperatures within acceptable range during and after installation of duct sealants.

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 DUCT ASSEMBLIES

- A. Ducts: Galvanized steel, unless otherwise indicated. Provide sheet metal in thickness indicated (minimum 26 gauge), packaged and marked as specified in ASTM A700.
- B. Supply Air Ducts (constant volume or single zone VAV systems): 3 inches w.g pressure class, galvanized steel.
- C. Primary Supply Air Ducts (upstream of terminal boxes in multizone VAV systems): 4 inches water gauge.
- D. Secondary Supply Air Ducts (downstream of terminal boxes in multizone VAV systems): 2 inches water gauge
- E. Return and Relief: 2 inch w.g. pressure class, galvanized steel.
- F. General Exhaust: 2 inch w.g. pressure class, galvanized steel.
- G. Smoke Control Exhaust and Makeup Ducts: 3 inch w.g. pressure class, galvanized steel.
- H. Wet Area Exhaust Ducts, where noted on the drawings:
  - 1. Type 304, stainless steel, minimum 24 gauge. Provide continuously welded seams on top or sides of duct and flanged joints with watertight EPDM gaskets.
  - 2. Aluminum, minimum 24 gauge, with longitudinal seams and laps arranged on top of duct. Seal joints with silicone sealant to provide watertight joint.
- I. Type II (Cooking) Hood Exhaust Duct: 2 inch w.g. pressure class, rigid metallic material complying with SMACNA and Mechanical code.
  - 1. Galvanized Steel.
  - 2. Stainless Steel.
  - 3. Aluminum.

4. Seal ducts with welds, gaskets, mastics, liquid sealants or tapes.
- J. Dishwasher Hood Exhaust Ducts: 2 inch w.g. pressure class.
1. Type 304, stainless steel, minimum 18 gauge, with finish to match kitchen equipment and range hood. Provide continuously welded seams on top or sides of duct and flanged joints with watertight EPDM gaskets.
  2. Aluminum, with longitudinal seams and laps arranged on top of duct. Seal joints with silicone sealant to provide watertight joint.
- K. Type I (Grease) Hood Exhaust Ducts: 2 inch w.g. pressure class, comply with NFPA 96.
1. Concealed: Carbon-steel sheet, minimum 16 gauge.
  2. Exposed:
    - a. Interior to the Building: Type 304, stainless steel, minimum 18 gauge, with finish to match kitchen equipment and range hood.
    - b. Exterior to the Building:
      - 1) Type 304, stainless steel, minimum 18 gauge.
      - 2) Carbon-steel sheet, minimum 16 gauge, coated with an exterior rated, high temperature corrosion resistant paint.
  3. Weld and flange seams and joints.
  4. At Contractor's option, a UL listed concentric ductwork package may be used in lieu of the welded carbon or stainless steel duct for connecting hood to exhaust fan. Provide manufacturers UL listing number and verification certificate as a part of the shop drawing submittal. Install duct package in strict conformance with manufacturer's instructions and recommendations.
- L. Dryer Vent Ducts: 2 inch w.g. pressure class, rigid, smooth wall, aluminum or stainless steel duct, minimum 26 gauge.
- M. Outside Air Intake: 2 inch w.g. pressure class, galvanized steel.
- N. Combustion Air: 2 inch w.g. pressure class, galvanized steel, aluminum or stainless steel.
- O. Transfer Air and Sound Boots: 1/2 inch wg pressure class, galvanized steel.
- P. Natatorium, Hydrotherapy, Swimming Pool or Pool Equipment Ductwork: 2 inch w.g. pressure class.
1. Aboveground: Minimum 22 gauge aluminum sheet material.
  2. Underground: Polyvinyl Chloride up to 24" in diameter or fiber reinforced plastic (FRP). Refer to Section "Nonmetal Ducts".
- Q. Exterior Ductwork: Ductwork installed exterior to the building without weather-proof jacket or cladding shall be minimum #18 gauge with longitudinal and transverse joints welded or sealed airtight as specified under Paragraph "Seam and Joint Sealing".
- R. Duct Liner Application: Provide duct liner on the following interior air ducts and where specified on the drawings.
1. Supply Ductwork:
    - a. Exposed to public view rectangular ductwork.
    - b. Exposed to public view round ductwork.
    - c. First 15 feet of ductwork downstream of equipment outlets.
  2. Return Ductwork.
    - a. Exposed to public rectangular ductwork.
    - b. Exposed to public round ductwork.
    - c. Return air transfer ductwork and boots.

## 2.2 MATERIALS

- A. Sheet Metal, General: Provide sheet metal in thickness indicated (minimum 26 gauge), packaged and marked as specified in ASTM A 700.

- B. Galvanized Steel for Ducts: Hot-dipped galvanized steel sheet, ASTM A653/A653M FS Type B, lock-forming quality with G90/Z275 coating.. Provide mill phosphatized or galvanized finish for surfaces of ducts exposed to view that is to be field painted. Provide bright galvanized finish for ductwork that is exposed to view and not field painted.
- C. Carbon Steel for Ducts: ASTM A1008/A1008M, Designation CS (commercial steel), cold-rolled, with oiled, exposed matte finish.
- D. Aluminum for Ducts: ASTM B209 (ASTM B209M); aluminum sheet, alloy 3003-H14. Aluminum Connectors and Bar Stock: Alloy 6061-T651 or of equivalent strength, with standard, one-side bright finish where ducts are exposed to view, and mill finish for concealed ducts.
- E. Stainless Steel for Ducts: ASTM A 480, Type 316, with No. 4 finish on exposed surface for ducts exposed to view; Type 304, sheet form, with No. 1 finish for concealed ducts.
- F. PVC-Coated Galvanized Steel: UL-181 Class 1 Listing. Hot-dipped galvanized steel sheet, ASTM A653/A653M FS Type B, lock-forming quality with G90/Z275 coating. Provide with factory-applied, 4-mil, PVC coating on exterior of ducts and fittings for underground applications, and the interior of ducts and fittings for fume-handing applications and 2-mil PVC coating on the reverse side of the ducts and fittings.
- G. Duct Liner
  - 1. General:
    - a. Comply with NFPA Standard 90A and North American Insulation Manufacturers Association (NAIMA) Standard AHC-101.
    - b. Liner shall have a flame spread rating of not more than 25 without evidence of continued progressive combustion and a smoke developed rating of no higher than 50, when tested in accordance with ASTM E84 or UL 723.
    - c. Duct sizes on mechanical plans indicate clear inside airflow dimensions. Sheet metal sizes for ductwork with duct liner shall be increased accordingly to account for liner thickness.
  - 2. Fiberglass: ASTM C1071, Type I or II, glass fibers firmly bonded together with a thermosetting resin with surface exposed to airstream coated to prevent erosion of glass fibers. Liner surface shall serve as a barrier against infiltration of dust and dirt, shall meet ASTM C 1338 for fungi resistance and shall be cleanable using duct cleaning methods and equipment outlined by NAIMA Duct Cleaning Guide. Duct liner shall be rated for air velocity of 6,000 fpm.
    - a. Rectangular fiberglass duct liner shall be Certainteed ToughGard T, JohnsManville Linacoustic RC, Knauf Atmosphere, Owens Corning QuietR or approved equal.
      - 1) Thickness and Density:
        - a) 1 inch, 1-1/2 pounds per cubic foot.
    - b. Round fiberglass duct liner shall be Certainteed ToughGard UltraRound, JohnsManville Spiracoustic Plus, Owens Corning QuietZone Spiral, or approved equal.
      - 1) Thickness and Density:
        - a) 1 inch, 4 pound per cubic foot.
    - c. Thermal Performance: Meet minimum "K-Factor" equal to 0.28 (Btu·in/h·sq ft·F) or better, at a mean temperature of 75°F and rated in installed condition in accordance with ASTM C518 and/or ASTM C177.
    - d. Noise Reduction Coefficient (NRC): Meet the following minimum NRC in accordance with ASTM C423 Type A Mounting:
      - 1) 1 Inch Thick: NRC 0.65.
    - e. Liner Adhesive: Comply with NFPA Standard 90A /UL 181 classified with flame spread/smoke development less than 25/50 and ASTM C 916. Adhesive shall be a minimum 35% solid content, water-based, non-oxidizing and have a service temperature of -20 to 200 F. Water-based adhesive shall be one of the following:
      - 1) Design Polymerics DP 2502.
      - 2) Duro Dyne WIT.

- 3) Foster 85-60.
  - 4) Childers CP-127.
  - 5) Johns Manville SuperSeal.
  - 6) Hardcast Coil-Tack.
- f. Mechanical Fasteners: Galvanized steel, suitable for adhesive attachment, mechanical attachment, or welding attachment to duct.
- 1) Fastener Pin Length: As required for thickness of insulation, and without projecting more than 1/8 inch into the airstream.
  - 2) Adhesive For Attachment of Mechanical Fasteners: Comply with the "Fire Hazard Classification" of duct liner system.
- H. Joint Sealers and Sealants: Non-hardening, water resistant, mildew and mold resistant.
1. Type: Heavy mastic or liquid used alone or with tape, suitable for joint configuration and compatible with substrates, and recommended by manufacturer for pressure class of ducts.
  2. Surface Burning Characteristics: Sealants shall be ASTM E84 or UL 723 listed with a flame spread index not more than 25 and a smoke-developed index not more than 50.
  3. For Use with Flexible Ducts: UL labeled.
  4. The term sealant used here is not limited to materials of adhesive or mastic nature, but also includes tapes and combinations of open weave fabric strips and mastics. Duct tape shall not be used as a sealant on any ducts.
  5. Joint and Seam Tape: 2 inches wide, glass-fiber-reinforced fabric.
  6. Tape Sealing System: Woven-fiber tape impregnated with a gypsum mineral compound and a modified acrylic/silicone activator to react exothermically with the tape to form a hard, durable, airtight seal.
  7. Solvent-Based Joint and Seam Sealant: One-part, non-sag, solvent-release-curing, polymerized butyl sealant complying with FS TT-S-001657, Type I; formulated with a minimum of 65 percent solids. Approved products: Design Polymerics DP 1090, Duro Dyne SGD, Fosters 32-14, or approved equal.
  8. Water-Based Joint and Seam Sealant: Non-Fibrated, UL 181 listed, rated to minimum SMACNA Pressure Class of  $\square$ 10 inches w.g and SMACNA Seal Class A. Sealant shall have a minimum service temperature range of 20 to 200 F and be freeze/thaw stable through 5 cycles. Approved products: Childers CP-146, Design Polymerics DP 1010, Ductmate Proseal, Duro Dyne Duroseal EDS-RS, Fosters 32-18, Hardcast Iron-Grip 601, Red Devil D-Seal and United McGill United Duct Seal WB.
  9. Water-Based Joint and Seam Sealant: Fiber reinforced, UL 181 listed, rated to minimum SMACNA Pressure Class of  $\square$ 10 inches w.g and SMACNA Seal Class A. Sealant shall have a minimum service temperature range of 20 to 200 F and be freeze/thaw stable through 5 cycles. Approved products: Childers CP-146, Design Polymerics DP 1030, Ductmate Fiberseal, Duro Dyne Duroseal EDS-RF, Fosters 32-17, Hardcast CCWI-181, Red Devil F-Seal 181 or United McGill Uni-Mastic.
  10. Flanged Joint Mastics: One-part, acid-curing, silicone elastomeric joint sealants, complying with ASTM C 920, Type S, Grade NS, Class 25, Use O.
  11. Flanged Gasket Tapes: Butyl gasket shall be UL 181 classified. Gasket size shall be minimum 5/8 inch x 3/16 inch and have nominal 100 percent solid content. It shall be non-oxidizing, non-skinning and have a service temperature of -25 to 180 F. Approved Products: Design Polymerics DP 1040, Ductmate 440, and Hardcast 1104.
- I. Fire Stopping
1. Fire-Resistant Sealant: Two-part, foamed-in-place, fire-stopping silicone sealant formulated for use in a through-penetration fire-stop system for filling openings around duct penetrations through walls and floors, having fire-resistance ratings indicated as established by testing identical assemblies per ASTM E 814 by Underwriters Laboratory, Inc. or other testing and inspecting agency acceptable to authorities having jurisdiction.
  2. Fire-Resistant Sealant: One-part elastomeric sealant formulated for use in a through-penetration fire-stop system for filling openings around duct penetrations through walls and floors, having fire-resistance ratings indicated as established by testing identical

assemblies per ASTM E 814 by Underwriters Laboratory, Inc. or other testing and inspecting agency acceptable to authorities having jurisdiction.

3. Products: Subject to compliance with requirements, provide one of the following:
    - a. "3M Fire Stop Foam"; 3M Corp.
    - b. "SPECSEAL Pensil 200 Silicone Foam"; Specify Technology, Inc.
    - c. 3M Fire Stop Sealant"; 3M Corp.
    - d. "3M Fire Barrier Caulk CP-25"; Electrical Products Div./3M.
    - e. "Fyre Putty"; Standard Oil Engineered Materials Co.
    - f. "FS-ONE", Hilti, Inc.
- J. Hangers and Supports
1. Hanger Rod: ASTM A36/A36M; steel, galvanized; threaded both ends, threaded one end, or continuously threaded.
  2. Hanger Fasteners: Attach hangers to structure using appropriate fasteners, as follows:
    - a. Concrete Wedge Expansion Anchors: Complying with ICC-ES AC193.
    - b. Masonry Wedge Expansion Anchors: Complying with ICC-ES AC01.
    - c. Concrete Screw Type Anchors: Complying with ICC-ES AC193.
    - d. Masonry Screw Type Anchors: Complying with ICC-ES AC106.
    - e. Concrete Adhesive Type Anchors: Complying with ICC-ES AC308.
  3. Building Attachments: Concrete inserts, powder actuated fasteners, or structural steel fasteners appropriate for building materials. Do not use powder actuated concrete fasteners for lightweight aggregate concrete or for slabs less than 4 inches thick.
  4. Hangers: Galvanized sheet steel, or round, uncoated steel, threaded rod.
    - a. Hangers Installed In Corrosive Atmospheres: Electro-galvanized, all-thread rod or hot-dipped-galvanized rods with threads painted after installation.
    - b. Straps and Rod Sizes: Conform with SMACNA HVAC Duct Construction Standards, 2005 Edition, for sheet steel width and gauge and steel rod diameters.
  5. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
  6. Trapeze and Riser Supports: Steel shapes conforming to ASTM A 36.
    - a. Where galvanized steel ducts are installed, provide hot-dipped-galvanized steel shapes and plates.
    - b. For stainless steel ducts, provide stainless steel support materials.
    - c. For aluminum ducts, provide aluminum support materials, except where materials are electrolytically separated from ductwork.
  7. Pre-engineered roof duct supports:
    - a. Manufacturers:
      - 1) Cooper B-Line, Inc.
      - 2) Elite Components.
      - 3) ERICO/Caddy.
      - 4) Ferguson/FNW.
      - 5) Miro.
      - 6) PHD Manufacturing.
      - 7) PHP Systems/Design.
      - 8) Roof Top Blox.
      - 9) Unistrut, a brand of Atkore International Inc.
      - 10) Zsi Foster.
    - b. General: Pre-engineered devices with embedded duct support fixtures as specified.
    - c. Pedestals: Steel pedestals with thermoplastic or rubber base with the following dimensions:
      - 1) Up to 12 inch strut length support: 18 inch x 18 inch.
      - 2) Up to 16 inch strut length support: 24 inch x 18 inch.
      - 3) Up to 24 inch strut length support: 30 inch x 18 inch.
      - 4) Thickness: Minimum 3/16 inch thick.
    - d. Block Bases: Closed-cell polyethylene blocks with the following dimensions.
      - 1) Length: Nominal 10 inch, 12 inch, 16 inch, or 24 inch

- 2) Width: Nominal 4 inches.
- e. Attachment/Support Fixtures: As recommended by manufacturer, with straps or crossbar over top of duct to prevent movement.
- f. Mounting Height: Provide minimum clearance of 6 inches under supported component to top of roofing.
- g. Pre-Engineered Duct Support Rails:
  - 1) Manufacturers:
    - a) AES Industries.
    - b) Custom Curb, Inc.
    - c) Pate Company.
    - d) Thybar.
  - 2) Construction:
    - a) Base plate designed to be attached to building structure, with fully mitered raised cant and step to match roof insulation thickness.
    - b) Welded, minimum 18 gauge galvanized steel shell, internally reinforced to load bearing factors of equipment being supported.
    - c) Factory installed treated wood nailer.
    - d) 4 inch, minimum 18 gauge nailer jacket with counterflashing where equipment will not fully cover the support.
- 8. Wire Rope Hanging Systems:
  - a. General: Wire rope hanger system shall have a minimum 5 to 1 safety factor based upon the applied working load being supported.
  - b. Source Limitations: Furnish associated fittings, accessories, and hardware produced by a single manufacturer.
  - c. Wire Rope: Zinc coated or galvanized steel, with wire thread type as required to support the applied working load being supported. Provide same size wire for all applications based on worst case loading.
  - d. Cable Lock: Cast zinc housing with steel spring with wedge grip, selected to meet the vertical load applied to the hanging system and wire thread. Do not exceed the working load limit.
  - e. Accessories: Hanger attachments and structural attachments shall be compatible with wire rope hanger system and shall be by the same manufacturer as the wire rope hanger system.
  - f. Manufacturers:
    - 1) ASC Engineered Solutions.
    - 2) Ductmate Industries, Inc; Clutcher Cable Hanging System.
    - 3) Duro Dyne.
    - 4) Gripple.
- K. Reinforcement Shapes and Plates: Unless otherwise indicated, provide galvanized steel reinforcing where installed on galvanized sheet metal ducts. For aluminum and stainless steel ducts provide reinforcing of compatible materials.
- L. Tie Rods: Same material as the duct, 1/4-inch minimum diameter for 36-inch length or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

### 2.3 DUCTWORK FABRICATION

- A. Fabricate and support duct in accordance with latest edition of SMACNA (DCS).
- B. Provide duct material, gauges, reinforcing, and sealing for operating pressures indicated.
  - 1. Fabricate rectangular ductwork of minimum 26 gauge sheet metal.
  - 2. Fabricate ducts in lengths appropriate to reinforcement and rigidity class required for pressure classification.
- C. Provide materials that are free from visual imperfections such as pitting, seam marks, roller marks, stains, and discolorations.

- D. Field Painted Ductwork: Provide mill phosphatized finish on exposed surfaces of rectangular ductwork and duct fittings to be field painted.
- E. Exterior Ductwork: Ductwork installed exterior to the building without weather-proof jacket or cladding shall be minimum #18 gauge with longitudinal and transverse joints welded or sealed airtight as specified under Paragraph "Seam and Joint Sealing".
1. Lined Ductwork: Where exterior ductwork is specified on the drawings to be provided with interior lining for thermal or sound performance requirements, seal the longitudinal and transverse joints with sealant rated for exterior exposure.
- F. Cross breaking or Cross Beading: Cross break or bead duct sides that are 19 inches and larger and are 20 gauge or less, with more than 10 sq. ft. of unbraced panel area, as indicated in SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figure 2-9, unless they are lined or are externally insulated.
- G. Fabricate elbows, transitions, offsets, branch connections, and other duct construction in accordance with SMACNA "HVAC Metal Duct Construction Standard," 2005 Edition, Figures 4-1 through 4-8. Unless otherwise noted on drawings, provide prefabricated 45 degree, high efficiency, rectangular/round branch duct takeoff fittings with manual balancing damper, 3/8 inch square shaft, U-bolt, nylon bushings, locking quadrant, and 2 inch insulation build-out for branch duct connections and take-offs to individual diffusers, registers and grilles. 45 degree, high efficiency, rectangular/round branch duct takeoff fittings shall be Flexmaster STO with model BO3 damper or equal.
- H. Provide radius elbows, turns, and offsets with a minimum centerline radius of 1-1/2 times the duct width. Where space does not permit full radius elbows, provide short radius elbows with a minimum of two continuous splitter vanes. Vanes shall be the entire length of the bend. The use of square throat, radius heel elbows is prohibited. Remove and replace all installed elbows of this type with an approved elbow at no additional cost to the owner.
- I. Provide mitered elbows where space does not permit radius elbows, where shown on the drawings, or at the option of the contractor with the engineer's approval. The contractor shall obtain approval to substitute mitered elbows in lieu of radius elbows prior to fitting fabrication. Mitered elbows less than 45 degrees shall not require turning vanes. Mitered elbows 45-degrees and greater shall have single thickness turning vanes of same material and gauge as ductwork, rigidly fastened with guide strips in ductwork. Vanes for mitered elbows shall be provided in all supply and exhaust ductwork and in return and outside air ductwork that has an air velocity exceeding 1000 fpm. Do not install vanes in grease ductwork. Refer to Section "Ductwork Accessories" for turning vane construction and mounting.
- J. Provide full radius elbows for ductwork installed in noise critical spaces. Refer to Section "Basic Mechanical Materials and Methods" for noise critical spaces. Where space does not permit the installation of radius elbows, provide mitered elbows with sound attenuating, acoustical turning vanes. Refer to Section "Ductwork Accessories" for acoustical turning vanes.
- K. Increase duct sizes gradually, not exceeding 15 degrees divergence wherever possible; maximum 30 degrees divergence upstream of equipment and 45 degrees convergence downstream.
- L. Where ducts are connected to exterior wall louvers and duct outlet is smaller than louver frame, provide blank-out panels sealing louver area around duct. Use same material as duct, painted black on exterior side; seal to louver frame and duct.
- M. Round and Flat Oval Duct Fabrication
1. General: "Basic Round Diameter" as used in this article is the diameter of the size of round duct that has a circumference equal to the perimeter of a given sized of flat oval duct. Except where interrupted by fittings, provide round and flat oval ducts in lengths not less than 12 feet.
    - a. Fabricate round and flat oval ductwork of minimum 26 gauge sheet metal.

- N. Round Ducts: Fabricate round supply ducts using seam types identified in SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figure 3-2, RL-1, RL-4, or RL-5 except where diameters exceed 72 inches. Seam Types RL-2 or RL-3 may be used for ducts smaller than 72 inches in diameter if spot-welded on 1-inch intervals. Fabricate ducts having diameters greater than 72 inches with longitudinal butt-welded seams. Comply with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Table 3-5 through 3-13 for galvanized steel gauges. For round duct with static pressure classification of 2 inches water gauge or lower, round supply ducts may be fabricated using snaplock seam types identified in SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figure 3-2, RL-6A, RL-6B, RL-7 or RL-8.
- O. Flat Oval Ducts: Fabricate flat oval supply ducts with standard spiral lockseams (without intermediate ribs) or with butt-welded longitudinal seams in gauges listed in SMACNA "HVAC Duct Construction Standards," 2005 Edition, Table 3-15.
- P. Round and Flat Oval Fittings Fabrication
1. 90-Degree Tees and Laterals and Conical Tees: Fabricate to conform to SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figures 3-5, 3-6 and 3-7 and with metal thickness specified for longitudinal seam straight duct.
  2. Diverging-Flow Fittings: Fabricate with a reduced entrance to branch taps with no excess material projecting from the body onto branch tap entrance.
  3. Elbows: Unless elbow construction type is indicated, provide elbows meeting the following requirements:
    - a. Fabricate in die-formed, gored, pleated, or mitered construction. Fabricate the bend radius of die-formed, gored, and pleated elbows 1.5 times the elbow diameter.
      - 1) Elbows in Round Duct: Provide full radius elbows.
      - 2) Elbows in Flat Oval Duct: Provide full radius elbows. Where space limits the installation of full radius elbows, short radius elbows with a minimum of two continuous splitter vanes shall be installed. Vane length shall be the entire length of the bend or 36 inches whichever is greater.
      - 3) The use of square throat, radius heel elbows is prohibited. Remove and replace all installed elbows of this type with an approved elbow at no additional cost to the owner.
      - 4) Provide full radius elbows for ductwork installed in noise critical spaces or where shown on the drawings. Refer to Section "Basic Mechanical Materials and Methods" for noise critical spaces.
    - b. Mitered Elbows: Fabricate mitered elbows with welded construction in gauges specified below.
      - 1) Mitered Elbows Radius and Number of Pieces: Unless otherwise indicated, construct elbow to comply with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Table 3-1.
      - 2) Round Mitered Elbows: Solid welded and with metal thickness listed below for pressure classes from minus 2 inches to plus 2 inches:
        - a) 3 to 26 inches: 24 gauge.
        - b) 27 to 36 inches: 22 gauge.
        - c) 37 to 50 inches: 20 gauge.
        - d) 52 to 60 inches: 18 gauge.
        - e) 62 to 84 inches: 16 gauge.
      - 3) Round Mitered Elbows: Solid welded and with metal thickness listed below for pressure classes from 2 inches to 10 inches:
        - a) 3 to 14 inches: 24 gauge.
        - b) 15 to 26 inches: 22 gauge.
        - c) 27 to 50 inches: 20 gauge.
        - d) 52 to 60 inches: 18 gauge.
        - e) 62 to 84 inches: 16 gauge.
      - 4) Flat Oval Mitered Elbows: Solid welded and with the same metal thickness as longitudinal seam flat oval duct.

- 5) 90-Degree, 2-Piece, Mitered Elbows: Use only for supply systems, or exhaust systems for material handling classes A and B; and only where space restrictions do not permit the use of 1.5 bend radius elbows. Fabricate with a single-thickness turning vane.
  - c. Round Elbows - 8 Inches and Smaller: Die-formed elbows for 45- and 90-degree elbows and pleated elbows for 30, 45, 60, and 90 degrees only. Fabricate nonstandard bend angle configurations or 1/2-inch-diameter (e.g. 3-1/2- and 4-1/2-inch) elbows with gored construction.
  - d. Round Elbows - 9 Through 14 Inches: Gored or pleated elbows for 30, 45, 60, and 90 degrees, except where space restrictions require a mitered elbow. Fabricate nonstandard bend angle configurations or 1/2-inch-diameter (e.g. 9-1/2- and 10-1/2-inch) elbows with gored construction.
  - e. Round Elbows - Larger Than 14 Inches and All Flat Oval Elbows: Gored elbows, except where space restrictions require a mitered elbow.
  - f. Die-Formed Elbows for Sizes Through 8 Inches and All Pressures: 20 gauge with 2-piece welded construction.
  - g. Round Gored Elbows Gauges: Same as for non-elbow fittings specified above.
  - h. Flat Oval Elbows Gauges: Same as longitudinal seam flat oval duct.
  - i. Pleated Elbows Sizes Through 14 Inches and Pressures Through 10 Inches: 26 gauge.
- Q. Shop Application of Liner in Rectangular Ducts
- 1. Adhere a single layer of indicated thickness of duct liner with 90 percent coverage of adhesive at liner contact surface area. Multiple layers of insulation to achieve indicated thickness is prohibited.
  - 2. Apply a coat of adhesive to liner facing in direction of airflow not receiving metal nosing.
  - 3. Butt transverse joints without gaps and coat joint with adhesive.
  - 4. Fold and compress liner in corners of rectangular ducts or cut and fit to assure butted edge overlapping.
  - 5. Longitudinal joints in rectangular ducts shall not occur except at corners of ducts, unless the size of the duct and standard liner product dimensions make longitudinal joints necessary.
    - a. Apply an adhesive coating on longitudinal seams in ducts exceeding 2,500 FPM air velocity.
  - 6. Secure liner with mechanical fasteners 4 inches from corners and at intervals not exceeding 12 inches transversely around perimeter; at 3 inches from transverse joints and at intervals not exceeding 18 inches longitudinally.
  - 7. Secure transversely oriented liner edges facing the airstream with metal nosings that are either channel or "Z" profile or are integrally formed from the duct wall at the following locations:
    - a. Fan discharge.
    - b. Intervals of lined duct preceding unlined duct.
    - c. Upstream edges of transverse joints in ducts where duct velocity is greater than 2,500 FPM.
  - 8. Terminate liner with duct buildouts installed in ducts to attach dampers, turning vane assemblies, and other devices. Fabricated buildouts (metal hat sections) or other buildout means are optional; when used, secure buildouts to the duct wall with bolts, screws, rivets, or welds. Terminate liner at fire dampers at connection to fire damper sleeve through fire separation.

## 2.4 MANUFACTURED DUCTWORK AND FITTINGS

- A. General: At the Contractor's option, factory-manufactured ductwork can be provided instead of fabricated ductwork for round and oval ductwork. The round duct system shall consist of fittings that are factory fitted with a sealing gasket and spiral duct which, when installed according to the

manufacturer's instructions, will seal the duct joints without the use of duct sealer. The oval duct system shall be sealed with duct sealer as specified.

1. Ducts shall be calibrated to manufacturer's published dimensional tolerance standard.
2. All duct 14" diameter and larger shall be corrugated for added strength and rigidity.
3. Spiral seam slippage shall be prevented by means of a flat seam and a mechanically formed indentation evenly spaced along the spiral seam.
4. Ducts shall be constructed using spiral lock seam sheet metal construction.
5. Ductwork to be installed in exposed locations shall have the surface prepared in the factory for field painting.

B. Duct Construction

1. Unless otherwise noted, all duct and fittings shall be constructed from galvanized steel in accordance with SMACNA's Duct Construction Standards for +10" water gauge pressure with minimum wall thickness as shown in the following tables.
2. Duct shall be calibrated to manufacturer's published dimensional tolerance standard.
3. Ducts shall be constructed using spiral lock seam sheet metal construction.
4. Ductwork to be installed in exposed locations shall be factory-prepared for field painting, i.e. mill-phosphatized.

Single Wall Round Duct:

Diameter (Inches)	Galvanized Spiral Duct (ga)	Galvanized Fittings (ga)
3-14	28	24
15-24	26	24
26-42	24	22
42-60	22	20

Oval Duct:

Major Axis (Inches)	Galvanized Spiral Duct (ga)	Galvanized Fittings (ga)
3-24	24	20
25-38	22	20
37-48	22	18
49-60	20	18
61-70	20	16
71 and large	18	16

5. .

C. Fittings:

1. All fitting ends for round duct and transitions and divided flow fittings smaller than 24" diameter that convert oval duct to round duct shall come factory equipped with a double lipped, U-profile, EPDM rubber gasket. Gasket shall be manufactured to gauge and flexibility so as to ensure that system will meet all of the performance criteria set forth in the manufacturer's literature. Gasket shall be classified by Underwriter's Laboratories to conform to ASTM E84-91a and NFPA 90A flame spread and smoke developed ratings of 25/50.
2. All fittings shall be calibrated to manufacturer's published dimensional tolerance standard and associated spiral duct.
3. All fitting ends from 5" to 60" diameter shall have rolled over edges for added strength and rigidity.
4. All elbows from 5" to 12" diameter shall be 2 piece die stamped and continuously stitch welded. All elbows 14" diameter and larger shall be standing seam gorelock construction and internally sealed.

5. The radius of all 90° and 45° elbows shall be 1.5 times the elbow diameter, unless otherwise noted on the contract documents to be 1.0. The radius of all 15°, 30° and 60° elbows shall be minimum 1.0 times the elbow diameter.
  6. All fittings that are of either spot welded or button punched construction shall be internally sealed. When contract documents require divided flow fittings, only full body fittings will be accepted. The use of duct taps is unacceptable except for retrofit installations.
  7. All volume dampers shall be Lindab Safe type DRU, DSU or DTU or equal by an acceptable manufacturer. Damper shall be fitting sized to slip into spiral duct. Damper shall have the following features:
    - a. Locking quadrant with blade position indicator.
    - b. 2" sheet metal insulation stand-off.
    - c. Integral shaft/blade assembly.
    - d. Shaft mounted, load bearing bushings.
    - e. Gasketed shaft penetrations to minimize leakage.
- D. Manufacturers:
1. Hercules Industries.
  2. Hranec Corporation.
  3. Lewis & Lambert.
  4. Lindab Safe.
  5. Linx Industries, Inc.
  6. Semco.

## 2.5 CONCENTRIC DUCT FOR GREASE EXHAUST

- A. General: At Contractors option, in lieu of welded carbon or stainless steel grease exhaust duct, a pre-fabricated concentric duct package may be used subject to local code authority approval. Provide fire rating and clearance to combustibles listing as applicable for the installation.
- B. Code Compliance: Material and installation shall comply with UL 1978, UL 2221, ASTM E814, and NFPA 96. Zero clearance applications shall also comply with BOCA ER 96-37 or ICBO ER 5301 Zero Clearance to Combustibles Report.
- C. Product Description:
1. Grease duct shall be factory prefabricated, double wall type, listed for venting of grease laden air from Type 1 kitchen hoods serving commercial cooking appliances.
  2. Material and installation shall be rated for continuous operation at 500 F and intermittent operation at 2000 F.
  3. All grease duct system components shall be by manufacturer to maintain approval agency ratings including supports, guides, fittings, cleanouts, and expansion joints.
  4. Grease duct system shall meet ASTM E119 2-hour fire resistance rating and 3-hour fire engulfment rating and ASTM E814 3-hour Fire Stop Test.
  5. Grease duct system shall be SBCCI tested as an alternate to a 2-hour fire rated shaft and SBCCI classified as a 2-hour fire rated enclosure.
  6. The grease duct system shall be constructed of inner and outer walls with ceramic fiber insulation between the walls.
  7. The inner wall shall be constructed of stainless steel, minimum 0.035 inch thickness.
  8. The outer wall shall be constructed of aluminized steel or Type 430, Type 304, or 316 stainless steel, minimum 0.024 inch thickness. Provide aluminized steel if duct is exposed and will be field painted.
  9. The insulation shall be minimum 3-inch up to 24 inch duct diameter and 4-inch for greater than 24 inch duct diameter thickness soluble ceramic fiber.
  10. The grease duct assembly shall be rated for zero clearance to combustibles.
- D. Manufacturers:
1. Ampco.
  2. CaptiveAire

3. DuraVent Commercial.
4. Enervex.
5. Metal-Fab G.
6. Schebler Chimney Systems.
7. Security Chimneys.
8. Selkirk ZeroClear.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION**

- A. Install, support, and seal ducts in accordance with SMACNA (DCS).
- B. Install products in accordance with manufacturer's instructions.
- C. Install ducts with the fewest possible joints.
- D. Seal duct joints with the appropriate sealing material.
- E. Use fabricated fittings for all changes in directions, changes in size and shape, and connections.
- F. Install couplings tight to duct wall surface with projections into duct at connections kept to a minimum.
- G. Locate ducts, except as otherwise indicated, vertically and horizontally, parallel and perpendicular to building lines; avoid diagonal runs. Install duct systems in shortest route that does not obstruct useable space or block access for servicing building and its equipment.
- H. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
- I. Provide clearance of 1 inch where furring is shown for enclosure or concealment of ducts, plus allowance for insulation thickness, if any.
- J. Install insulated ducts with 1-inch clearance outside of insulation.
- K. Conceal ducts from view in finished and occupied spaces by locating in mechanical shafts, hollow wall construction, or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as specifically shown.
- L. Coordinate layout with suspended ceiling and lighting layouts and similar finished work.
- M. Exposed Ductwork: Exposed ductwork shall be free of defects, dents or blemished surfaces to provide a smooth, finished appearance. Any damaged material shall be replaced with new material. Ductwork that is to be field painted shall have surfaces wiped clean of lubricant, dirt, or fil prior to priming and painting. Apply primer and paint of type as recommended by paint manufacturer for duct material and finish.
- N. Electrical Equipment Spaces: Route ductwork to avoid passing through transformer vaults and electrical equipment spaces and enclosures.
- O. Non-Fire-Rated Partition Penetrations: Where ducts pass interior partitions and exterior walls, and are exposed to view, conceal space between construction opening and duct or duct insulation with sheet metal flanges of same gauge as duct. Overlap opening on 4 sides by at least 1-1/2 inches.
- P. Acoustical Barrier Penetrations: Where a duct passes through a wall, ceiling or floor slab of a noise critical space, provide a clear annular space of 1-inch between the duct and the structure. Refer to Section "Common Work Results for HVAC" for noise critical spaces. The Contractor shall check the clearance and, if clearance is acceptable, shall install the duct and pack the voids full depth with mineral fiber batt insulation. Contractor shall caulk both ends with a non-aging, non-hardening sealant backed by a polyethylene foam rod or permanently flexible firestop

material. Where there is insufficient clearance space, Contractor shall place a short stub duct in the wall, pack and caulk around it and then attach the inlet and outlet ducts to each end.

- Q. Cover ducts openings during construction with duct caps or three-mil plastic to protect inside of (installed and delivered) ductwork from exposure to dust, dirt, paint and moisture. Do not use duct tape on ducts that will be exposed or painted.
- R. Duct Liner Installation
1. Fiberglass Duct Liner:
    - a. Attach fiberglass duct liner using fasteners that do not damage the liner when applied as recommended by the manufacturer, that do not cause leakage in the duct, and will indefinitely sustain a 50-pound tensile dead load test perpendicular to the duct wall.
  2. Flexible Elastomeric Duct Liner:
    - a. Install liner in accordance with the manufacturer's installation instructions or ASTM C 1710.
    - b. Attach flexible elastomeric duct liner to clean, oil-free sheet metal surfaces with adhesive as recommended by the liner manufacturer.
    - c. Seal all longitudinal seams and end joints with manufacturer's recommended adhesive and install compression joints in accordance with manufacturer's instructions to eliminate any openings in insulation that would allow passage of air to duct surface being insulated.
- S. Kitchen Hood Exhaust
1. Provide for thermal expansion of ductwork through 2,000°F temperature range.
  2. Install without dips or traps that may collect residues, except where traps have continuous or automatic residue removal.
  3. Horizontal Ducts:
    - a. Provide at least one opening that is minimum size of 20 inches by 20 inches for personnel entry. Where an opening of this size is not possible, provide access openings at each change in direction and at 12-foot intervals. Locate openings on sides of duct 1-1/2 inches minimum from bottom, and fit with grease-tight covers of same material as duct. Support systems for ducts 24 inch and larger in any dimension shall be designed for the weight of the duct plus 800 pounds at any point in the duct system.
    - b. Slope horizontal ductwork serving a Type I hood back toward the hood or local grease reservoir a minimum of 1/4 inch per foot. Horizontal ducts that exceed 75 feet in length shall be sloped not less than 1 inch per foot.
  4. Vertical Ducts:
    - a. For ducts larger than 24 inches by 24 inches, provide a 20 inch by 20 inch access opening for personnel entry at the top of the vertical riser.
    - b. For ducts smaller than 24 inches by 24 inches, provide an access opening at each floor level in a location that is accessible and not higher than 12 feet above finished floor.
    - c. Supports for ducts large enough for personnel entry shall be designed for the weight of the duct plus 800 lbs at any point in the duct system.
  5. Provide transition at connection to fan with opening size equal to or greater than the venturi opening of the fan inlet. Provide gasket at flanged connection to fan rated for 1500 F and grease applications.
  6. Do not penetrate fire-rated assemblies without providing shaft, field-applied or factory-built enclosure.
- T. Dishwasher Exhaust Duct Installations
1. Install dishwasher exhaust duct systems in accordance with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figure 10-2.
  2. Slope horizontal ductwork back towards dishwasher hood a minimum of 1/4" per foot. Where distance does not allow continuous slope in ductwork, provide low point drains with the following:

- a. Drip leg with 3/4 inch plenum rated drain tubing routed to discharge at code approved location.
  - b. Pigtail trap or U-trap sized for system pressure.
- U. Dryer Vent Ducts
  1. Install dryer vent exhaust ducts in accordance with dryer manufacturer's installation instructions.
  2. Install dryer vent ducts without kinks. Install duct joints with overlap, with the male end extending in the direction of airflow. Make connections with metal clamps adjustable using phillips/hex head screws. Do not penetrate duct with sheet metal screws.
  3. Connect individual dryer vents into main header using lateral, 45 degree tees to minimize pressure drop.
  4. Install vertical risers with a means for cleanout.
  5. Install a backdraft damper at termination of the dryer vent duct.
- V. Natatorium, Hydrotherapy, Swimming Pool, Pool Equipment Ductwork
  1. Seal above ground ductwork with silicone sealant to provide watertight joint.
  2. Slope above ground horizontal exhaust ductwork down towards air devices at a minimum of 1/4 inch per foot. Where distance does not allow continuous slope in ductwork, provide low point drains with the following:
    - a. Drip leg with 3/4 inch plenum rated drain tubing routed to discharge at code approved location.
    - b. Pigtail trap or U-trap sized for system pressure.
- W. Provide openings in ductwork where required to accommodate thermometers and controllers. Provide pilot tube openings where required for testing of systems, complete with metal can with spring device or screw to ensure against air leakage. Where openings are provided in insulated ductwork, install insulation material inside a metal ring.
- X. Locate ducts with sufficient space around equipment to allow normal operating and maintenance activities.
- Y. Use crimp joints with or without bead for joining round duct sizes 8 inch and smaller with crimp in direction of air flow.
- Z. Seam and Joint Sealing
  1. General: Seal duct seams and joints as follows:
    - a. All transverse joints, longitudinal seams, and duct wall penetrations shall be sealed to meet SMACNA Seal Class A.
    - b. Seal class shall apply to all supply, return, outdoor air, and exhaust ductwork, regardless if the duct is positively or negatively pressurized. Transfer air ducts and sound boots do not need to be sealed.
  2. Seal externally insulated ducts prior to insulation installation.
  3. Ductwork installed exterior to the building without weather-proof jacket or cladding shall have longitudinal and transverse joints welded or sealed airtight with weatherproof heavy liquid sealant applied according to manufacturer's instructions.
    - a. Lined Ductwork: Where exterior ductwork is specified on the drawings to be provided with interior lining for thermal or sound performance requirements, seal the longitudinal and transverse joints with sealant rated for exterior exposure.
    - b. Duct Sealing:
      - 1) Seal air distribution system from the inside using automated aerosolized sealant injection.
      - 2) Repair all injection and test holes in existing ductwork sealed tight as per SMACNA standards.
- AA. Hanging and Supporting
  1. Install rigid round, rectangular, and flat oval metal duct with support systems per SMACNA standards.

2. The use of wire rope hanging systems is an acceptable alternate hanging method when installed in strict accordance with manufacturer's instructions. Wire rope hanger spacing shall not exceed 8 feet. Supported load shall not exceed manufacturer's recommended load rating.
    - a. Where approved by local code authority, the loop system may be swaged directly on to a seismic approved bracket or appropriate end fixing.
  3. Support horizontal ducts within 2 feet of each elbow and within 4 feet of each branch intersection.
  4. Support vertical ducts at a maximum interval of 16 feet and at each floor.
  5. Upper attachments to structures shall have an allowable load not exceeding 1/4 of the failure (proof test) load but are not limited to the specific methods indicated. Hangers and supports shall be fastened to building joists or beams. Do not attach hangers and supports to the above floor slab or roof with sheet metal screws.
  6. Install concrete insert prior to placing concrete.
  7. Install powder actuated concrete fasteners after concrete is placed and completely cured.
  8. Provide double nuts and lock washers on threaded rod supports.
  9. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
  10. Installation of Pre-Engineered Roof Duct Supports:
    - a. Install pre-engineered roof duct supports to rest on the roofing membrane without attachment to the roof structure or penetration through the roofing assembly.
    - b. Install pre-engineered roof duct supports anchored to the roof structure.
      - 1) Install supports to meet the specified design criteria.
        - a) Building Design Risk Category: III.
        - b) Design Wind Speed: 169mph.
      - 2) Coordinate with the pre-engineered roof duct support manufacturer to anchor the duct supports directly to the roof structure in accordance with the manufacturer's installation instructions or provide intermediate duct supports engineered to meet the design criteria.
      - 3) Submit design and installation requirements as a Deferred Submittal.
      - 4) Pre-Engineered Duct Support Rails: Provide rigid backing material (e.g., insulation, wood, etc.) to maintain cant slope. Install supports to maintain continuous insulation on roof.
- BB. Penetrations
1. Fire Barrier Penetrations: Where ducts pass through fire-rated walls, partitions, ceilings, and floors, maintain the fire-rated integrity.
  2. Exterior Wall Penetrations: Seal duct penetrations through exterior wall constructions with sleeves, packing, and sealant. Refer to Division 23 Section "Basic Piping Materials and Methods" for additional information.
  3. Underground Exterior Wall Penetrations: Seal duct penetrations through underground exterior walls with sleeves, packing, and sealant. Refer to Division 23 Section "Basic Piping Materials and Methods" for additional information.
  4. Elevated Floor Penetrations of Waterproof Membrane, Interior Penetrations of No-Fire Rated Walls and Concrete Slab on Grade Penetrations: Seal ducts that pass through waterproof floors, non-fire rated walls, partitions and ceilings or concrete slab on grade. Refer to Division 23 Section "Basic Piping Materials and Methods" for special sealers and materials.
- CC. Connections
1. Equipment Connections: Connect equipment with flexible connectors in accordance with Division 23 Section "Air Duct Accessories."
  2. Branch Connections: Comply with SMACNA "HVAC Duct Construction Standards".
  3. Outlet and Inlet Connections: Comply with SMACNA "HVAC Duct Construction Standards". Where a 90-degree elbow is required at the connection to air devices, provide

a rigid duct elbow or, at Contractor's option, a flexible elbow assembly as specified in Division 23 Section "Air Duct Accessories."

4. Fan Connections: Comply with SMACNA "HVAC Duct Construction Standards".

### 3.2 FIELD QUALITY CONTROL

- A. Remake leaking joints as required and apply sealants to achieve specified maximum allowable leakage.
- B. General Duct Systems: Perform leakage tests on the duct systems listed below in accordance with ASHRAE and SMACNA standards.
  1. Disassemble, reassemble, and seal segments of the systems as required to accommodate leakage testing, and as required for compliance with test requirements.
  2. Conduct tests at static pressures equal to the maximum design pressure of the system or the section being tested. If pressure classifications are not indicated, test entire system at the maximum system design pressure. Do not pressurize systems above the maximum design operating pressure. Give 7 days' advanced notice for testing. Submit a letter report to the Owner and Engineer summarizing the test procedures followed, systems tested and the results of the leakage tests.
  3. Determine leakage from entire system or section of the system by relating leakage to the surface area of the test section.
  4. Maximum Allowable Leakage: As described in ASHRAE 2005 Handbook, "Fundamentals" Volume, Chapter 35, Table 9 and Figure 13. Comply with requirements for leakage classification 3 for round and flat oval ducts, leakage classification 12 for rectangular ducts in pressure classifications less than and equal to 2 inches water gauge (both positive and negative pressures), and leakage classification 6 for pressure classifications greater than 2 inches water gauge and less than and equal to 10 inches water gauge.
  5. Remake leaking joints as required and apply sealants to achieve specified maximum allowable leakage.
  6. Leakage Test: Perform volumetric measurements and adjust air systems as described in Testing, Adjusting and Balancing chapter of ASHRAE "HVAC Applications" Volume, Duct Design chapter of ASHRAE "Fundamentals" Volume, and Division 23 Section "Testing, Adjusting and Balancing for HVAC."
- C. Ductwork with Pressure Rating > 3" W.C.: Ducts and plenums shall be leak tested in accordance with SMACNA HVAC Air Duct Leakage Test Manual to prove they meet leakage classification less than or equal to 6. Submit test reports to the Engineer of Record demonstrating that at least 25 percent of the installed duct area has been tested and pass this test.
- D. Grease Duct Leakage Test: All portions of grease duct systems shall be tested for leakage in accordance with Chapter 5, Section 506 of the locally adopted IMC. Leakage tests shall be by light or other equivalent test methods as approved by the local code official to verify that all joints are liquid tight. Tests shall be performed in the presence of the local code official. Any joints found defective shall be repaired and retested until satisfactory results are obtained. The contractor shall submit a copy of the grease duct leakage test report to the Architect and Engineer complete with the approval signature of the local code official.
- E. Smoke Control Duct Leakage Test: All portions of smoke control duct systems shall be tested for leakage in accordance with Chapter 5, Section 513 of the locally adopted IMC. Ducts shall be leak tested to 1.5 times the maximum design pressure. Measured leakage shall not exceed 5 percent of design air flow. Test shall be as approved by the local code official to verify that all joints are liquid tight. Tests shall be performed in the presence of the local code official. Any joints found defective shall be repaired and retested until satisfactory results are obtained. The contractor shall submit a copy of the smoke control duct leakage test report to the Architect and Engineer complete with the approval signature of the local code official.

**3.3 ADJUSTING STARTUP**

- A. Adjust volume control devices as required by the testing and balancing procedures to achieve required air flow. Refer to Division 23 Section "Testing, Adjusting and Balancing for HVAC" for requirements and procedures for adjusting and balancing air systems.
- B. Remove temporary protection devices over ductwork prior to starting equipment and turning the system over to the owner.
- C. If permanent HVAC equipment is used during the construction period, provide temporary filters at all openings in the ductwork and at inside equipment to protect the system from dust, dirt, paint, and moisture. Replace and maintain filters when needed, but not less than every month. On the day of substantial completion, clean the duct system and provide a new set of filters in the HVAC unit.
  - 1. Refer to Division 23 Section "Particulate Air Filtration" for filter requirements.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 33 00 - AIR DUCT ACCESSORIES****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Turning vanes.
- B. Backdraft dampers.
- C. Combination fire and smoke dampers.
- D. Duct access doors.
- E. Duct hardware.
- F. Fire dampers.
- G. Flexible duct connectors.
- H. Smoke dampers.
- I. Volume control dampers.
- J. Duct opening closure film.
- K. Cable operated damper systems.
- L. Fire rated duct wrap.
- M. Flexible ductwork.
- N. Flexible elbow assembly.
- O. Duct silencers.

**1.2 SUBMITTALS**

- A. Product Data: Provide for each type of ductwork accessory the following:
  - 1. Electrical characteristics.
  - 2. Connection requirements.
  - 3. Dimensions.
  - 4. Capacities.
  - 5. Pressure drops,
  - 6. Leakage rates.
  - 7. Materials of construction.
- B. Shop Drawings: Indicate for shop fabricated assemblies the following:
  - 1. Interfacing requirements with ductwork.
  - 2. Method of fastening or support.
  - 3. Methods of assembly of components.
- C. Performance Data: Submit performance data for duct silencers including insertion loss performance in octave bands from 63 Hz to 8,000 Hz and pressure drop at specified airflow.
- D. Project Record Drawings: Record actual locations of access doors and test holes.
- E. Maintenance Data: Submit manufacturer's maintenance data including parts lists for each type of duct accessory. Include this data, product data, and shop drawings in maintenance manual.

**1.3 QUALITY ASSURANCE**

- A. Manufacturer's Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.
- B. SMACNA Compliance: Comply with applicable portions of SMACNA (DCS) "HVAC Duct Construction Standards Metal and Flexible".
- C. UL Compliance:
  - 1. Fire Dampers: Construct, test, and label fire dampers in accordance with current edition of UL Standard 555 Standard for Fire Dampers.
  - 2. Smoke Dampers: Construct, test, and label smoke dampers in accordance with current edition of UL Standard 555S Standard for Smoke Dampers.
  - 3. Flexible Ductwork: Construct flexible ductwork in compliance with UL Standard 181 Factory-Made Air Ducts and Connections.
  - 4. Duct Tape: Label in accordance with UL Standard 181B and marked 181B-FX.
  - 5. Duct Clamps: Label in accordance with UL Standard 181B and marked 181B-C.
  - 6. Fire Rated Duct Wrap: Meet the fire protection requirements defined by UL Standard 1479 Fire Tests of Through-Penetration Firestops.
  - 7. Grease Exhaust Duct Wrap: Meet the fire protection requirements defined by UL Standard 1479 Fire Tests of Through-Penetration Firestops.
- D. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated
- E. NFPA Compliance:
  - 1. Comply with applicable provisions of NFPA 90A Standard for the Installation of Air-Conditioning and Ventilating Systems and NFPA 90B Standard for the Installation of Warm Air Heating and Air-Conditioning Systems pertaining to installation of ductwork accessories.
  - 2. Comply with NFPA 96 Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations for fire-rated grease exhaust ducts.
- F. ASTM Compliance: Products shall have flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by ASTM E 84 "Standard Test Method for Surface Burning Characteristics of Building Materials" (NFPA 255) method.
  - 1. Duct silencers shall be tested for performance in accordance with ASTM E477 "Test Method for Measuring Acoustical and Airflow Performance of Duct Liner Materials and Prefabricated Silencers."
  - 2. Grease exhaust duct wrap shall be tested for performance in accordance with ASTM E 2336 "Standard Test Methods for Fire Resistive Grease Duct Enclosure Systems" and ASTM E814 "Standard Test Methods of Fire Resistance of Through-Penetration Fire Stops".
  - 3. Fire rated duct wrap shall be tested in accordance with ASTM E814 "Standard Test Methods of Fire Resistance of Through-Penetration Fire Stops".

**1.4 DELIVERY STORAGE AND HANDLING**

- A. Protect ductwork accessories during shipping and storage from dirt, debris and moisture damage.
- B. Protect dampers from damage to operating linkages and blades.

**1.5 SPARE PARTS**

- A. Extra Fusible Links: One link for every 10 installed of each type, size and temperature range. Obtain receipt.

**PART 2 - PRODUCTS****2.1 TURNING VANES**

- A. Manufacturer:
1. Aero Dyne Co.
  2. Anemostat Products Div.; Dynamics Corp. of America.
  3. Ductmate Industries.
  4. Duro Dyne Corp.
  5. Elgen Manufacturing Co., Inc.
  6. Hart & Cooley Mfg. Co.
  7. Register & Grille Mfg. Co., Inc
  8. Sheet Metal Connectors, Inc.
- B. Manufactured Turning Vanes: Provide turning vanes and runners fabricated from galvanized sheet metal, lock-forming quality, ASTM A 653, minimum Coating Designation G 60, of the same gauge thickness or greater as the ductwork in which they are installed.
1. Vanes shall be rigidly fastened with guide strips to minimize noise and vibration.
  2. Vanes in ductwork over 30" deep shall be installed in multiple sections with vanes not over 30" long and shall be rigidly fastened.
  3. Turning vanes shall be constructed per SMACNA Duct Construction Standards Metal and Flexible – 2005 Edition, Figure 4-3 and set into side strips suitable for mounting in ductwork.
- C. Acoustical Turning Vanes: Provide acoustical turning vanes constructed of airfoil shaped aluminum extrusion with perforated faces and fiberglass fill in systems serving noise critical spaces. Refer to Section "Common Work Results for HVAC" for noise critical spaces.

**2.2 BACKDRAFT DAMPERS**

- A. Manufacturers:
1. Air Balance, Inc.
  2. Arrow United Industries.
  3. Cesco
  4. Greenheck
  5. Louvers & Dampers, Inc.
  6. Nailor Industries, Inc.
  7. Pottorff
  8. Ruskin Mfg. Co.
  9. TAMCO
  10. Vent Products
- B. Backdraft Dampers: Provide dampers with parallel blades, counterbalanced and factory-set to open at indicated static pressure. Provide adjustment device to permit setting for varying differential static pressure
1. Construct frames of minimum 16 gauge galvanized steel or 10 gauge aluminum.
  2. Construct blades of minimum 16 gauge aluminum.
  3. Provide minimum 1/2" diameter, corrosion-resistant bearings and 1/2" diameter, galvanized or stainless steel axles.
  4. Mechanically lock blade edge seals into blade edge. Provide neoprene seals for round dampers and silicone or vinyl seals for rectangular dampers.

**2.3 COMBINATION FIRE AND SMOKE DAMPERS**

- A. Manufacturers:
1. Air Balance, Inc.
  2. Cesco Products.
  3. Greenheck

4. Louvers & Dampers, Inc.
  5. Nailor Industries, Inc.
  6. Pottorff
  7. Prefco Products, Inc.
  8. Ruskin Mfg. Co.
- B. General: Provide combination fire and smoke dampers at locations indicated on the drawings. Damper ratings shall be as required to maintain the fire and/or smoke ratings noted on the architectural drawings. Provide duct access door for inspection and service to each fire and smoke damper and fusible link as required. Provide sleeves of length as required to meet the installed location. Damper assemblies shall be provided as a single unit from the manufacturer.
- C. Fabricate dampers in accordance with NFPA 90A, UL555 (current edition) classified fire damper of rating required for location installed, UL555S (current edition) classified smoke damper for leakage class II and rated for dual directional airflow.
- D. Fire/smoke dampers shall be rated for closure in ducts up to minimum velocity of 2,000 fpm and static pressure of 4" w.g.
- E. Multiple Blade Dampers:
1. Frame: Minimum 16-ga galvanized steel. Construct casings of 16 gauge stainless steel where installed in corrosive or moisture laden airstreams or where noted on the drawings.
  2. Blades: Minimum 22 gauge thickness with airfoil or longitudinal grooved shape for airflow velocities up to 2,000 fpm and airfoil shape for airflow velocities greater than 2,000 fpm.
  3. Bearings: Self-lubricating, turning in extruded hole in the frame.
  4. Linkage: Plated steel axles, linkage concealed in frame, 1/2" actuator shaft.
  5. Seals: Flexible, stainless steel jamb seals, silicone rubber blade seals with galvanized steel mechanical locked in to the blade edge and stainless steel spring loaded leakage seals in sides of casing. Provide stainless steel spring loaded leakage seals in sides of casing, and the following additional features:
    - a. Open-closed indication switch.
    - b. Temperature Limited Override.
    - c. Test Switch.
    - d. .
- F. Operators:
1. UL listed and labeled.
  2. Spring return open/fail closed operation.
  3. Two-position or modulating as required for the installation.
  4. Electric type suitable for 120 Volts, single phase, 60 Hz.
  5. Factory installed on dampers.
  6. All operators shall open in between 7 and 15 seconds and close in between 7 and 15 seconds after alarm or smoke detection has occurred.
  7. Rated for a minimum of 20,000 cycles of operation.
  8. Provide automatic reset of damper upon cessation of detector (test or actual smoke detection), and normalization of duct air temperature.
- G. Electro Thermal Link: Provide resettable temperature device rated at 160 to 165 degrees F (71 to 74 degrees C) unless otherwise indicated.
- H. Smoke Activation:
1. Provide terminal block for connection to the building fire alarm system.
- I. Accessories:
- a. Open-closed indication switch.
  - b. Temperature Limited Override.
  - c. Test Switch.
  - d. Integral end switch.

**2.4 DUCT ACCESS DOORS**

- A. Manufacturers:
1. Air Balance Inc.
  2. Ductmate Industries.
  3. Duro Dyne Corp.
  4. Greenheck.
  5. Register & Grille Mfg. Co., Inc.
  6. Ruskin Mfg. Co.
  7. Ventifabrics, Inc.
  8. Vent Products.
  9. Zurn Industries, Inc.; Air Systems Div.
- B. Provide, where indicated on the drawings or where specified in Part 3 of this section, duct access doors of size allowable by duct dimensions with, unless otherwise noted on the drawings, minimum size of 10" by 10" and maximum size of 24" by 24". Fabricate in accordance with SMACNA (DCS) and as indicated. Label access doors for fire and smoke dampers as specified in Part 3.
- C. Fabrication: Rigid and close-fitting of galvanized steel with sealing gaskets and quick fastening locking devices. Construct of same or greater gauge as ductwork served. For insulated ductwork, install minimum 1 inch thick insulation with sheet metal cover. Provide flush frames for uninsulated ductwork, extended frames for externally insulated duct.
1. 12 inches square or less: Provide one size hinged, other side with one handle-type latch for doors 12" high and smaller, 2 handle-type latches for larger doors. Provide removable section of duct where duct size is too small for a 10" by 10" access door.
  2. Larger than 12 inches square: Provide two hinges and two handle-type latches.

**2.5 DUCT HARDWARE**

- A. Manufacturers:
1. Ductmate Industries.
  2. Elgen Manufacturing Co., Inc.
  3. Ventfabrics, Inc.
  4. Young Regulator Co.
- B. Test Holes: Provide in ductwork at fan inlet and outlet, and elsewhere as indicated.
1. Temporary Test Holes: Cut or drill in ducts as required. Cap with neat patches, neoprene plugs, threaded plugs, or threaded or twist-on metal caps.
  2. Permanent Test Holes: Factory fabricated, air tight flanged fittings with screw cap. Provide extended neck fittings to clear insulation.
- C. Quadrant Locks: Provide for each damper, quadrant lock device on one end of shaft; and end bearing plate on other end for damper lengths over 12". Provide extended quadrant locks and end extended bearing plates for externally insulated ductwork.

**2.6 FIRE DAMPERS**

- A. Manufacturers:
1. Air Balance, Inc.
  2. Cesco Products.
  3. Greenheck
  4. Louvers & Dampers, Inc.
  5. Nailor Industries, Inc.
  6. Pottorff
  7. Prefco Products, Inc.
  8. Ruskin Mfg. Co.

- B. General: Provide fire dampers at locations indicated on the drawings. Damper ratings shall be as required to maintain the fire ratings noted on the architectural drawings. Provide duct access door for inspection and service to each fire damper and fusible link as required. Provide sleeves of length as required to meet the installed location.
- C. Fabricate in accordance with NFPA 90A and UL 555 and as indicated.
- D. Fire dampers shall be dynamic-rated for closure under pressure.
- E. Provide positive lock in closed position.
- F. Ceiling Radiation Dampers
  - 1. General: Conform to UL 555C or tested in accordance with UL 263.
  - 2. Casing: Galvanized steel frame in gauges as required to maintain applicable UL classification.
  - 3. Damper Blades: Galvanized steel with UL classified thermal insulation as required to meet UL criteria and fire and smoke ratings noted on the architectural drawings.
  - 4. Fusible link: Integral to device, rated at 165 degrees F.
  - 5. Accessories: Provide as required for the installation:
    - a. Volume Controller: Manually adjustable volume controller integral to the assembly used to regulate airflow through the damper for testing and balancing.
    - b. Boot Fitting: Factory provided elbow, end or straight type. Include field provided collar, flanged recess, or ceramic thermal blanket.
    - c. Box Fitting: Factory provided 26 gauge with field provided collar, flanged recess, or ceramic thermal blanket.
- G. Horizontal Dampers: Minimum 22 gauge galvanized steel frame, stainless steel closure spring, and lightweight, heat retardant non-asbestos fabric blanket. Construct casings of 20 gauge stainless steel where installed in corrosive or moisture laden airstreams or where noted on the drawings.
- H. Curtain Type Dampers: Galvanized steel with interlocking blades. Provide stainless steel closure springs and latches for horizontal installations. Configure with blades out of air stream. Construct frames of 20-gauge stainless steel where installed in corrosive or moisture laden airstreams or where noted on the drawings.
- I. Multiple Blade Dampers: Minimum 16 gauge, galvanized steel frame and blades, oil-impregnated bronze or stainless steel sleeve bearings and plated steel axles, 1/8 by 1/2 inch plated steel concealed linkage, stainless steel closure spring, blade stops, and lock. Construct frames of 20-gauge stainless steel where installed in corrosive or moisture laden airstreams or where noted on the drawings
- J. Fusible links: UL 33 rated at 160 to 165 degrees F unless otherwise indicated.
- K. Accessories:
  - 1. Open-closed indication switch.

## 2.7 FLEXIBLE DUCT CONNECTORS

- A. Manufacturers:
  - 1. Carlisle HVAC Products.
  - 2. Ductmate Industries.
  - 3. Duro Dyne Corp.
  - 4. Elgen Manufacturing Co., Inc.
  - 5. Ventfabrics, Inc.
- B. Fabricate in accordance with SMACNA (DCS) and as indicated. Flexible connectors shall have flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by ASTM E 84 (NFPA 255) method.

- C. Flexible Duct Connections: Fabric crimped into metal edging strip. Provide metal compatible with connected ducts. Factory fabricated. Flame-retardant or noncombustible fabrics compliant with NFPA 701.
  - 1. Indoor Fabric: UL listed fire-retardant neoprene coated woven glass fiber fabric compliant with NFPA 90A.
    - a. Minimum Weight: 26 oz./sq. yd.
    - b. Minimum Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
    - c. Service Temperature: Minus 40 to plus 200 deg F.
  - 2. Outdoor Fabric: UL listed fire-retardant woven glass fiber fabric coated with weatherproof, synthetic rubber resistant to UV rays and ozone compliant with NFPA 90A.
    - a. Minimum Weight: 24 oz./sq. yd.
    - b. Minimum Tensile Strength: 225 lbf/inch in the warp and 300 lbf/inch in the filling.
    - c. Service Temperature: Minus 40 to plus 250 deg F.
  - 3. Metal: Factory fabricated with a fabric strip minimum 3-1/2 inches wide attached to two strips of minimum 24 gauge galvanized sheet steel or 0.032-inch- thick aluminum.
- D. Maximum Installed Length: 14 inch.
- E. Coatings and Adhesives: Comply with UL 181, Class 1.

## 2.8 SMOKE DAMPERS

- A. Manufacturers: Subject to compliance with requirements, provide fire and smoke dampers of one of the following:
  - 1. Air Balance, Inc.
  - 2. Cesco Products.
  - 3. Greenheck
  - 4. Louvers & Dampers, Inc.
  - 5. Nailor Industries, Inc.
  - 6. Pottorff
  - 7. Prefco Products, Inc.
  - 8. Ruskin Mfg. Co.
- B. General: Provide smoke dampers at locations indicated on the drawings. Damper ratings shall be as required to maintain the smoke ratings noted on the architectural drawings. Provide duct access door for inspection and service to each smoke damper as required. Provide sleeves of length as required to meet the installed location. Damper assemblies shall be provided as a single unit from the manufacturer.
- C. Fabricate in accordance with NFPA 90A and UL 555S, and as indicated.
- D. Dampers:
  - 1. UL555S (current edition) leakage class II, rated for dual directional airflow.
  - 2. Rated for a minimum velocity of 2,000 fpm and pressure of 4" w.g.
  - 3. Blades: Minimum 22 gauge thickness with airfoil or longitudinal grooved shape for airflow velocities up to 2,000 fpm and airfoil shape for airflow velocities greater than 2,000 fpm.
- E. Casings:
  - 1. Minimum 16-ga galvanized steel.
  - 2. Minimum 16 gauge stainless steel where installed in corrosive or moisture laden airstreams or where noted on the drawings.
- F. Bearings: Self-lubricating, turning in extruded hole in the frame.
- G. Seals:
  - 1. Jamb seals made of flexible, stainless steel.
  - 2. Blade edge seals: silicone rubber mechanically locked in to the blade edge.
  - 3. Stainless steel spring loaded leakage seals in sides of casing,
- H. Linkage: Concealed in the frame.

- I. Smoke Activation:
  - 1. Provide terminal block for connection to the building fire alarm system.
- J. Operators:
  - 1. UL listed and labeled.
  - 2. Spring return, fail closed.
  - 3. Electric type 120 Volts, single phase, 60 Hz.
  - 4. Factory installed on dampers.
  - 5. Designed to close and/or open damper between 7 and 15 seconds after alarm or smoke detection has occurred.
  - 6. Two-position or modulating as required for the installation.
  - 7. Rated for a minimum of 20,000 cycles of operation.
  - 8. Operator mounted outside or inside air stream.
  - 9. Automatic reset of damper upon cessation of detector (test or actual smoke detection), and normalization of duct air temperature.
- K. Accessories:
  - a. Blade Material: Match casing material.
  - b. Open closed indication switches.
  - c. Test switch.
  - d. Provide with integral end switch.

## 2.9 VOLUME CONTROL DAMPERS

- A. Manufacturers:
  - 1. Air Balance, Inc.
  - 2. Arrow United Industries
  - 3. Cesco
  - 4. Greenheck
  - 5. Louvers & Dampers, Inc.
  - 6. Nailor Industries, Inc.
  - 7. Pottorff
  - 8. Rossi Air Flow
  - 9. Ruskin Mfg. Co.
  - 10. TAMCO
  - 11. Vent Products
- B. Fabricate dampers in accordance with SMACNA (DCS) and as indicated. Construct using galvanized steel for standard air systems, aluminum for wet or natatorium environments and stainless steel for corrosive environments.
- C. Single Blade Dampers:
  - 1. Fabricate for duct sizes up to 12 x 36 inch.
  - 2. Blade: 20 gauge, 0.04 inch, minimum.
- D. Multi-Blade Damper: Fabricate of parallel or opposed blade pattern with maximum blade sizes 8 by 72 inch. Assemble center and edge crimped blades in prime coated or galvanized channel frame with suitable hardware.
  - 1. Blade: 18 gauge, 0.0478 inch, minimum.
- E. Bearings: Corrosion resistant, molded synthetic.
- F. Axles: Positively lock into the damper blade.
- G. Blade Seals: Where used for shutoff duty, provide Neoprene seals for round dampers and silicone for rectangular dampers.
- H. Quadrants:
  - 1. Provide locking, indicating quadrant regulators.

2. On insulated ducts, provide extended shafts and mount regulator on standoff bracket, base or adapter.
3. Where rod lengths exceed 48 inches, provide regulator at both ends.

#### **2.10 DUCT OPENING CLOSURE FILM**

- A. Mold-resistant, self-adhesive film to keep debris out of ducts during construction.
- B. Thickness: 2 mils.
- C. High tack water-based adhesive.
- D. UV stable.
- E. Elongation Before Break: 325 percent, minimum.

#### **2.11 CABLE OPERATED DAMPER SYSTEMS**

- A. Manufacturer:
  1. DuroDyne, DuroZone.
  2. Metropolitan Air Technology, Inc. (Reference model number for round damper is RT-250 and for rectangular damper is RT-200).
  3. Young Regulator Co. (Reference model number is 270).
- B. General: Where access to dampers through a hard ceiling is required, provide a concealed, remote cable-operated, butterfly-type volume damper assembly with external worm gear operator.
- C. Damper assembly shall include duct casing with rolled bead stiffeners, reinforced blade, self-lubricating bearing, and remote operator mounting plate.
- D. Adjustable through the diffuser frame with standard 1/4 inch nut-driver or flat screwdriver.
- E. Cable assembly shall attach to damper as a single piece with no linkage adjustment required.
- F. Positive, direct, two-way damper control with no sleeves, springs or screw adjustments to come loose after installation.
- G. Cable length as required to span the distance from the damper to the remote operator location.
- H. Where approved by Architect, a ceiling cup with cover plate can be used for access to cable operator.

#### **2.12 FIRE RATED DUCT WRAP**

- A. Manufacturers:
  1. 3M.
  2. Pyroscat
  3. Thermal Ceramics
  4. Unifrax Corporation
- B. Grease Exhaust Ducts:
  1. Reference manufacturer and model number is Unifrax FyreWrap Elite 1.5.
  2. Minimum two-hour rated duct wrap insulation for Type I hood grease exhaust duct applications.
  3. Two layers of 1-1/2 inch thick.
  4. Density: Minimum 6 lb. per cubic foot.
  5. Zero clearance to combustibles.
  6. Flexible wrap enclosure rated for minimum 2000 F.
  7. Material: Non-mineral wool, passive, low bio-persistent fiber totally encapsulated with aluminum foil reinforced with scrim. UL Listed in accordance with ASTM E2336.

8. Attachments:
    - a. Ducts smaller than 24" by 24" in size, provide stainless steel bands at insulation seams and on maximum 12 inch centers to hold the outer layer of the blanket enclosure in place.
    - b. Ducts larger than 24" by 24" in size, provide pins to hold the outer layer in place.
  9. Insulation shall be tested for intended use in accordance with all applicable codes and shall be approved by the local code official.
  10. Provide factory-built access doors by same manufacturer as fabricated for use specifically with the insulation system.
- C. Dryer Vent Exhaust Ducts in Plenums:
1. Reference manufacturer and model number is Unifrax FyreWrap DPS.
  2. One-hour rated duct wrap insulation specifically designed as a means to separate dryer vent exhaust ducts from an air plenum by preventing flame propagation and smoke development in the plenum area.
  3. This system may be used as an alternative to a gypsum enclosure where allowed by the AHJ.
  4. 1-1/2 inch thick wrap.
  5. Density: Minimum 6 lb. per cubic foot.
  6. Zero clearance to combustibles.
  7. Flexible wrap enclosure rated for minimum 2000 F.
  8. Material: Non-mineral wool, passive, low bio-persistent fiber totally encapsulated on all sides with aluminum foil reinforced with scrim. UL Listed in accordance with ISO 6944 and UL 1479, and as acceptable to the Authority Having Jurisdiction.
- D. General for HVAC Ducts:
1. Reference Manufacturer and Model Number is Unifrax FyreWrap Elite 1.5.
  2. Provide duct wrap insulation for HVAC ducts required to be in rated enclosure construction where dampers are restricted.
  3. One, two or three hour-rating as required for the installation.
  4. 1-1/2 inch thick wrap.
  5. Density: Minimum 6 lb. per cubic foot.
  6. Zero clearance to combustibles.
  7. Flexible wrap enclosure rated for minimum 2000 F.
  8. Applied in one or more layers to achieve the hourly rating requirement.
  9. Material: Non-mineral wool, passive, low bio-persistent fiber totally encapsulated on all sides with aluminum foil reinforced with scrim. UL Listed in accordance with ISO 6944 and UL 1479, and as acceptable to the Authority Having Jurisdiction.
- E. Access Doors:
1. Manufacturer and/or model number:
    - a. Ductmate Ultimate.
    - b. FlameGard.
    - c. Thermal Ceramics FastDoor XL.
    - d. Or Equal.
  2. Duct access door to be tested and listed in accordance with UL1978.
  3. Gaskets: Liquid tight and minimum 1500F rated.
  4. Duct access to be provided with 2-hour and zero clearance insulation cover tested and UL Listed per ASTM E2336 by same manufacturer and as fabricated for use specifically with the insulation system.

## 2.13 FLEXIBLE DUCTWORK

- A. Manufacturers:
1. ATCO Rubber Products.
  2. Flexmaster.
  3. JPL (J.P. Lamborn Co)

4. Thermaflex.
- B. Construction: Provide flexible ductwork conforming to UL 181-Class I, NFPA 90A and NFPA 90B and as follows. Duct types of manufacturers are indicated for reference in regard to required quality of construction and materials.
- C. Insulated Flexible Ductwork: Provide duct fabric of ply-vinyl film, polyethylene film or multiple layers of aluminum laminate supported by helically wound spring steel wire. Wrap fabric with fiberglass insulation and provide fire retardant polyethylene or reinforced metalized protective vapor barrier as specified herein.
1. Duct pressure class up to and including 6" w.g.
    - a. Fire retardant polyethylene vapor barrier
      - 1) ATCO 80 Series
      - 2) Flexmaster Type 5B
      - 3) JPL Type PR Series
      - 4) Thermaflex Type G-KM
    - b. Reinforced metalized vapor barrier
      - 1) ATCO 30 Series
      - 2) Flexmaster Type 5M
      - 3) JPL Type MHP Series
      - 4) Thermaflex Type M-KE
  2. High pressure (duct pressure class over 6" w.g.)
    - a. Fire retardant polyethylene vapor barrier
      - 1) Flexmaster Type 3B
    - b. Reinforced metalized vapor barrier
      - 1) ATCO OmniAir 1200
      - 2) JPL Type FHP-25
      - 3) Flexmaster Type 3M
      - 4) Thermaflex Type M-KC
  3. Flexible ductwork shall have CPE liner with steel wire helix mechanically locked or permanently bonded to the liner.
  4. Provide acoustical, fiberglass insulated duct with minimum R-value of R-6.0.

#### **2.14 FLEXIBLE ELBOW ASSEMBLY**

- A. Manufacturers:
1. Build Right Products, FlexRight Elbow.
  2. Flexible Technologies, Inc., FlexFlow Elbow.
  3. Titus, FlexRight.
- B. General: At Contractors option, in lieu of rigid sheet metal elbows at connections to air inlets and outlets in concealed spaces, provide flexible elbow assembly to air devices requiring a 90 degree elbow connection.
- C. Flexible elbow assembly shall be constructed of durable composite material and UL listed for use in return air plenums with a turning radius of not less than 3 inches.

#### **2.15 DUCT SILENCERS**

- A. Manufacturer: Subject to compliance with requirements, provide duct silencers of one of the following:
1. BRD Noise and Vibration Control
  2. Commercial Acoustics, Div. of Metal Form Manufacturing
  3. Dynasonics
  4. Industrial Acoustics (IAC)
  5. Price Industries
  6. Ruskin Company

7. SEMCO Inc.
  8. United Sheet Metal
  9. VAW Systems Ltd.
  10. Vibro-Acoustics
- B. Description: Duct section with sheet metal outer casing, sound absorbing fill material, and inner casing of perforated sheet metal; incorporating interior baffles of similar construction. Fabricate in accordance with SMACNA (DCS).
- C. General Requirements:
1. Casing, sealants, adhesives, accessory materials, and packing materials to comply with ASTM E84.
  2. Airstream surfaces installed in a return air plenum to comply with requirements in ASHRAE Std 62.1.
  3. Factory-fabricated, field-installed products.
  4. Provide internal support rods at locations as required to provide uniform support and to prevent the fan airflow from twisting the internal core.
  5. Provide end connections compatible with the location being installed.
- D. Geometry: Provide the following geometries as specified on the drawings.
1. Circular straight with center bodies or pods.
  2. Circular elbows with splitters or baffles.
  3. Rectangular straight with splitters or baffles.
  4. Rectangular elbows with splitters or baffles.
  5. Specialty or custom geometry.
- E. Configuration:
1. Rectangular: Provide lined splitters with radiused nose and contour tails.
  2. Tubular: Provide inner casing and liner and the option specified below as required to meet the scheduled silencer on the drawings:
    - a. Without center body.
    - b. With absorptive aerodynamically shaped center body with nose cone and truncated tail cone.
    - c. With absorptive splitters with radiused nose and contoured tails.
- F. Materials:
1. Outer Casing: Minimum 22 gauge thick galvanized steel stiffened as required. Provide seams of the following:
    - a. Mastic filled lock formed.
    - b. Welded.
  2. Inner casing and splitters: Minimum 22 gauge thick perforated galvanized steel.
  3. Sound absorbing media: Media shall be incombustible, mildew resistant and vermin proof.
    - a. Acoustic quality, glass fiber insulation packed to minimum 5 percent compression.
    - b. Acoustic quality mineral wool.
  4. Fill Liner: Bonded glass fiber matting or mylar film designed to protect media from erosion.

### **PART 3 - EXECUTION**

#### **3.1 INSPECTION**

- A. Examine areas and conditions under which ductwork accessories will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

**3.2 INSTALLATION OF DUCTWORK ACCESSORIES**

- A. Install ductwork accessories in accordance with manufacturer's installation instructions, with applicable portions of details of construction as shown in SMACNA standards, and in accordance with recognized industry practices to ensure that products serve intended function.
- B. Provide turning vanes, of same gauge as ductwork, rigidly fastened with guide strips in ductwork having an offset of 45 degrees or more. Provide vanes in all supply and exhaust ductwork and in return and outside air ductwork that has an air velocity exceeding 1000 fpm. Do not install vanes in grease or dryer exhaust ductwork.
- C. Install backdraft dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.
- D. Provide combination fire and smoke dampers, fire dampers, and smoke dampers at locations indicated, where ducts and outlets pass through fire rated components, and where required by Authorities Having Jurisdiction.
1. Install with required perimeter mounting angles, sleeves, breakaway duct connections, corrosion resistant springs, bearings, bushings and hinges.
  2. Coordinate all smoke and fire/smoke damper installation, wiring, and checkout to ensure that the dampers function properly and that they respond to the proper fire alarm system signal.
  3. Install ceiling radiation dampers per manufacturer's instructions. Support damper assembly from structure.
  4. Demonstrate re-setting of fire and fire/smoke dampers to Owner's representative.
- E. Provide duct access doors to maintain and/or clean components internal to ductwork including, but not limited to, coils, airflow stations, motorized and backdraft dampers, humidifiers, etc, Install access doors to open against system air pressure, with latches operable from either side, except outside only where duct is too small for person to enter.
1. Provide duct access door(s) as scheduled below, at each fire and smoke damper within 12 inches of the device to allow for testing and maintenance. Label each door (with minimum 1" lettering) indicating which damper type is served. Door shall be capable of being fully opened or provide removable door.
 

DUCT ACCESS DOOR SCHEDULE		
Duct Width/Depth	Door Size	Quantity
10" TO 12"	10 X 10	1
14" TO 18"	12 X 12	1
20" TO 36"	14 X 14	1
38" TO 54"	18 X 18	1
56" TO 72"	18 X 18	2 (1 EACH END)
74" TO 96"	20 X 20	2 (1 EACH END)
  2. Provide duct access doors for cleaning kitchen exhaust ducts in accordance with NFPA 96. Review locations prior to fabrication.
- F. Provide flexible duct connections wherever ductwork connects to vibrating equipment and when transitioning between two different metallic duct materials (e.g., aluminum to galvanized steel). Make airtight joint. Provide adequate joint flexibility to allow for thermal, axial, transverse, and torsional movement, and also capable of absorbing vibration of connected equipment.
1. At fans and motorized equipment associated with ducts, provide flexible duct connections immediately adjacent to the equipment.
  2. At equipment supported by vibration isolators, provide flexible duct connections immediately adjacent to the equipment.
- G. Provide volume control dampers at branch takeoffs from main ducts. Unless otherwise noted on drawings, provide prefabricated 45 degree, high efficiency, rectangular/round branch duct takeoff fittings with manual volume control damper and locking quadrant for branch duct connections and take-offs to individual diffusers, registers and grilles.

- H. Install constant airflow regulators square and free from racking. Do not compress or stretch damper frame into duct or opening. Handle damper using frame or sleeve.
- I. Provide cable operated volume dampers with remote operators where access to dampers through a hard ceiling is required.
  - 1. Support cable assembly to avoid bends and kinks in cable.
- J. Install grease exhaust and fire rated duct wrap in accordance with manufacturer's instructions to provide the fire rating of the material as tested per UL requirements. Joints at insulation seams, banding, pins, and fire stop systems shall be installed as per manufacturers UL Listing and manufacturers published installation instructions. Overlap seams, install stainless steel bands and/or pins to secure wrap to duct and fill annular spaces in floor and wall penetrations with UL rated forming materials and/or putty to maintain the integrity of the system.
- K. Install flexible ductwork in accordance with manufacturer's instructions. At a minimum, install two wraps of duct tape around the inner core connection and a metallic or non-metallic clamp over the tape and two wraps of duct tape or a clamp over the outer jacket.
  - 1. Flexible ductwork runs shall not exceed 5 feet in length. Utilize the minimum length of duct to make the connections.
  - 2. Install flexible ductwork straight as possible avoiding tight turns with a maximum of one 90 degree bend in any length. Install flexible ductwork fully extended minimizing compression.
  - 3. Provide continuous length with no intermediate joints.
  - 4. Support flexible ductwork from structure and not from ceiling tile, light fixtures or air terminals. Support for maximum sag of 1/2-inch per foot.
  - 5. Avoid incidental contact with metal fixtures, water lines, pipes, or conduit.
  - 6. Support straps/saddles shall be minimum 1-1/4" wide. Use of wire hanging systems shall utilize strap and connect wire to strap.
    - a. Factory installed suspension systems are acceptable
  - 7. Do not crimp flexible ductwork against joist or truss members, pipes, conduits, etc.
  - 8. Install flexible ductwork with bend radius at the center line equal to or greater than one duct diameter.
    - a. Support bends approximately one duct diameter on both sides of bends.
  - 9. Connect flexible ductwork to sheet metal ductwork and air devices with at least 1" overlap.
- L. Provide rigid duct elbow or flexible elbow assembly where a 90 degree elbow is required at connection to air devices.
- M. Install duct silencers at locations indicated on the drawings with straight sections of upstream and downstream ductwork as recommended by the manufacturer.
  - 1. If the silencer is installed in a location exposed to water or weather, the fill shall be completely encapsulated in mylar bagging. The mylar bagging shall not degrade the acoustical performance of the silencer.
- N. Coordinate with other work, including ductwork, as necessary to interface installation of ductwork accessories properly with other work.

### 3.3 FIELD QUALITY CONTROL

- A. Operate installed ductwork accessories to demonstrate compliance with requirements. Test for air leakage while system is operating. Repair or replace faulty accessories, as required to obtain proper operation and leakproof performance.
- B. After start-up, final corrections and balancing of systems, test duct silencers by taking octave band sound measurements over full audio frequency range in areas adjacent to mechanical equipment rooms, duct and pipe shafts, and other critical locations, as directed. Refer to Division 23 Section "Testing, Adjusting and Balancing of HVAC" for additional requirements.
  - 1. Provide one-third octave band measurements of artificial sound sources in areas indicated as having critical requirements.
  - 2. Submit complete report of test results including sound curves.

**3.4 ADJUSTING AND CLEANING**

- A. Adjusting: Adjust ductwork accessories for proper settings, install fusible links in fire dampers and adjust for proper action.
- B. Label access doors in accordance with Division-23 section "Identification for HVAC Piping and Equipment".
- C. Final positioning of manual dampers is specified in Division-23 section "Testing, Adjusting, and Balancing for HVAC".
- D. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 34 23 - HVAC POWER VENTILATORS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Roof ventilators.
- B. Upblast roof exhausters.
- C. Roof intake fans.
- D. Inline centrifugal fans.
- E. Kitchen hood exhausters.
- F. Utility vent set.

**1.2 SUBMITTALS**

- A. General: Submit data in accordance with Conditions of Contract and Division 1 Specification Sections.
- B. Product Data: Provide data on fans and accessories including fan curves with specified operating point clearly plotted, power, RPM, sound power levels at rated capacity, and electrical characteristics and connection requirements. Include the following:
  - 1. For fans with factory-furnished starters or variable frequency drives, include short circuit current ratings.
  - 2. Materials gages and finishes, including color charts.
  - 3. Dampers, including housings, linkages, and operators.
- C. Shop Drawings: Shop drawings from manufacturer detailing equipment assemblies and indicating dimensions, weights, required clearances, components, and location and size of field connections.
- D. Wiring Diagrams: Wiring diagrams that detail power, signal, and control wiring. Differentiate between manufacturer-installed wiring and field-installed wiring.
- E. Maintenance Data: Include instructions for lubrication, motor and drive replacement and spare parts list.
- F. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
  - 1. Extra Fan Belts: One set for each individual fan.

**1.3 QUALITY ASSURANCE**

- A. AMCA Compliance: Provide products that meet AMCA certified performance and sound ratings and are licensed to use the AMCA Seal.
- B. UL Compliance: Fans and fan motors shall be designed, manufactured, and tested in accordance with UL 705 "Power Ventilators."
- C. Kitchen Hood Exhaust Fans: Kitchen hood exhaust fans and components shall comply with requirements of UL 762 "Outline of Investigation for Power Roof Ventilators for Restaurant Exhaust Appliances and NFPA 96 "Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations".
- D. Nationally Recognized Testing Laboratory and NEMA Compliance (NRTL): Fans and components shall be NRTL listed and labeled. The term "NRTL" shall be as defined in OSHA Regulation 1910.7.

- E. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.
- F. Electrical Component Standard: Components and installation shall comply with NFPA 70 "National Electrical Code."

#### 1.4 DELIVERY STORAGE AND HANDLING

- A. Protect motors, shafts, and bearings from weather and construction dust.

#### 1.5 FIELD CONDITIONS

- A. Permanent fans may not be used for ventilation during construction.

### PART 2 - PRODUCTS AND MATERIALS

#### 2.1 POWER VENTILATORS - GENERAL

- A. General: Provide fans that are factory fabricated and assembled, factory tested, and factory finished; with indicated capacities and characteristics.
- B. Statically and Dynamically Balanced: Fans and shafts shall be statically and dynamically balanced and designed for continuous operation at the maximum rated fan speed and motor horsepower.
  - 1. Fan Shaft: Turned, ground, and polished steel designed to operate at no more than 70 percent of the first critical speed at the top of the speed range of the fan's class.
- C. Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings in accordance with AMCA Standard 210 "Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating".
- D. Sound Ratings: Comply with AMCA 301 "Certified Ratings Program Product Rating Manual for Fan Sound Performance". Test fans in accordance with AMCA Standard 300 "Reverberant Room Method for Sound Testing of Fans".
- E. Fabrication: Comply with AMCA 99.
- F. Belt Drives: Factory mounted, with final alignment and belt adjustment made after installation.
  - 1. Service Factor: 1.4.
- G. Belts: Oil-resistant, non-sparking, and non-static.
  - 1. Fans used for smoke control applications shall have 1.5 times the number of belts required for the design duty with a minimum of two belts.
- H. Motors: Refer to Section "Common Motor Requirements for HVAC Equipment" for requirements.
- I. Motor and Fan Wheel Pulleys: Adjustable pitch for use with motors through 15 HP; fixed pitch for use with motors larger than 15 HP. Select pulley so that pitch adjustment is at the middle of the adjustment range at fan design conditions.
  - 1. Belt Guards: Provide steel belt guards for motors mounted on the outside of the fan cabinet.
- J. Hazardous Duty: Provide fans with spark resistant construction and explosion proof motor where specified in the schedule.
- K. Factory Finish: The following finishes are required:
  - 1. Sheet Metal Parts: Prime coating prior to final assembly.
  - 2. Exterior Surfaces: Baked-enamel finish coat after assembly.

**2.2 ROOF VENTILATORS**

- A. Manufacturers:
1. Accurex.
  2. Acme Engrg. & Mfg. Corp.
  3. CaptiveAire
  4. Carnes Company, Inc.
  5. Cook (Loren) Co.
  6. Greenheck Fan Corp.
  7. Hartzell Fan, Inc.
  8. PennBarry.
  9. Twin City Fan Company.
- B. Fan Unit: Belt-driven or direct-drive as indicated, centrifugal or axial fan, consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.
- C. Housing: Heavy-gage, removable, spun-aluminum, dome top and outlet baffle; square, one-piece, aluminum base with venturi inlet cone.
- D. Roof Curbs: Refer to Section "Hangers and Supports for HVAC" for pre-engineered roof equipment supports .
- E. Fan Wheel: Aluminum hub and wheel.
- F. Belt-Driven Drive Assembly: Resiliently mounted to the housing, with the following features:
1. Pulleys: Cast-iron, adjustable-pitch.
  2. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
  3. Fan Shaft: Turned, ground, and polished steel drive shaft keyed to wheel hub.
  4. For centrifugal fans, fan and motor shall be isolated from exhaust air stream.
- G. Accessories: Provide the following items as indicated:
1. Disconnect Switch: Nonfusible type, with thermal overload protection mounted inside fan housing, factory-wired through an internal aluminum conduit.
  2. Bird Screens: Maximum 1/2-inch mesh, 16-gage, aluminum or brass wire.
  3. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base, fan set to close when fan stops.
  4. Dampers: Motor-operated, parallel-blade, volume control dampers mounted in curb base.
    - a. Blades: Die-formed sheet aluminum.
    - b. Frame: Extruded aluminum, with waterproof, felt blade seals.
    - c. Linkage: Nonferrous metals, connecting blades to counter weight or operator.
    - d. Operators: Manufacturer's standard electric actuator.
    - e. Operators: Manufacturer's standard pneumatic actuator.

**2.3 UPBLAST ROOF EXHAUSTERS**

- A. Manufacturers:
1. Accurex.
  2. Acme Engrg. & Mfg. Corp.
  3. CaptiveAire
  4. Carnes Company, Inc.
  5. Cook (Loren) Co.
  6. Greenheck Fan Corp.
  7. Hartzell Fan, Inc.
  8. PennBarry.
  9. Twin City Fan Company
- B. General Description: Belt-driven or direct-drive as indicated, consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.

- C. Fan Wheel:
  - 1. Type: Non-overloading centrifugal, propeller or axial blades as scheduled
  - 2. Material: Aluminum ,
- D. Housing:
  - 1. Construct of heavy-gage aluminum including curb cap, windband and motor compartment..
  - 2. Rigid internal support structure.
  - 3. One-piece fabricated or fully welded curb-cap to windband for leak proof construction.
  - 4. Wind Band and Base: Reinforced and braced aluminum, containing aluminum butterfly dampers and rain trough, motor and drive assembly, and fan wheel.
    - a. Dampers Rods: Steel with bronze or nylon bearings.
  - 5. Provide breather tube for fresh air motor cooling and wiring.
- E. Shafts and Bearings:
  - 1. Fan Shaft:
    - a. Ground and polished steel with anti-corrosive coating.
    - b. First critical speed at least 25 percent over maximum cataloged operating speed.
  - 2. Bearings
    - a. Permanently sealed or pillow block type.
    - b. Minimum L10 life in excess of 50,000 hours.
- F. Drive Assembly: Resiliently mounted to the housing, with the following features:
  - 1. Belts, pulleys, and keys oversized for a minimum of 150 percent of driven horsepower.
  - 2. Belts: Static free and oil resistant.
  - 3. Pulleys: Cast-iron, adjustable-pitch, keyed and securely attached to the wheel and motor shafts..
- G. Roof Curbs: Refer to Section "Hangers and Supports for HVAC" for pre-engineered roof equipment supports.
- H. Drain Trough: Provides single point drainage for water or other residue.
- I. Accessories: Provide the following items as indicated:
  - 1. Disconnect Switch: Nonfusible type, with thermal overload protection mounted inside fan housing, factory-wired through an internal aluminum conduit.
  - 2. Bird Screens: Maximum 1/2-inch mesh, 16-gage aluminum or brass wire.
  - 3. Dampers: Counter-balanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
  - 4. Dampers: Motor-operated, parallel-blade, volume control dampers mounted in curb base.
    - a. Blades: Die-formed sheet aluminum.
    - b. Frame: Extruded aluminum, with waterproof, felt blade bumpers.
    - c. Linkage: Nonferrous metals.
    - d. Operators: Manufacturer's standard electric actuator.
    - e. Operators: Manufacturer's standard pneumatic actuator.

## 2.4 ROOF INTAKE FANS

- A. Manufacturers:
  - 1. Acme Engrg. & Mfg. Corp.
  - 2. Carnes Company, Inc.
  - 3. Cook (Loren) Co.
  - 4. Greenheck Fan Corp.
  - 5. Hartzell Fan, Inc.
  - 6. PennBarry.
  - 7. Twin City Fan Company
- B. Fan Unit: Adjustable belt or direct-driven centrifugal fan with resiliently-mounted induction motor.
- C. Housing: Provide housing of one of the following:

1. Galvanized steel, four sided, hood style housing.
  2. Heavy gauge extruded aluminum, louvered penthouse.
  3. Powder-coated steel weatherproof cabinet with side intake hood, and removable service panels.
- D. Sheaves: Constructed of cast iron or heavy gauge steel, bored to fit shafts and keyed; variable and adjustable pitch motor sheaves selected so required rpm is obtained with sheaves set at mid-position; fan shaft with self-aligning prelubricated ball bearings.
- E. Filters: Provide washable aluminum filters of thickness and MERV rating as scheduled.
- F. Roof Curbs: Refer to Section "Hangers and Supports for HVAC" for pre-engineered roof equipment supports.
- G. Accessories: Provide the following items as indicated:
1. Disconnect Switch: Nonfusible type, with thermal overload protection mounted inside fan housing, factory-wired through an internal aluminum conduit.
  2. Bird Screens: Maximum 1/2-inch mesh, 16-gage aluminum or brass wire.
  3. Dampers: Counter-balanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
  4. Dampers: Motor-operated, parallel-blade, volume control dampers mounted in curb base.
    - a. Blades: Die-formed sheet aluminum.
    - b. Frame: Extruded aluminum, with waterproof, felt blade bumpers.
    - c. Linkage: Nonferrous metals.
    - d. Operators: Manufacturer's standard electric actuator.
  5. Curb Extensions: Aluminum or galvanized steel as required to raise the inlet above the roof surface to avoid entry of snow.

## 2.5 INLINE CENTRIFUGAL FANS

- A. Manufacturers:
1. Acme Engrg. & Mfg. Corp.
  2. CaptiveAire
  3. Carnes Company, Inc.
  4. Cook (Loren) Co.
  5. Greenheck Fan Corp.
  6. PennBarry.
  7. Twin City Fan Company
- B. Fan Unit: Inline, belt or direct driven, centrifugal fans consisting of housing, wheel, outlet guide vanes, fan shaft, bearings, drive assembly, motor and disconnect switch, mounting brackets, and accessories.
- C. Housing: Galvanized steel or split, spun-aluminum housing, with straightening vanes, inlet and outlet flanges, and support bracket adaptable to floor, side wall, or ceiling mounting.
- D. Wheel: Aluminum, forward curved, backward inclined or airfoil blades welded to aluminum hub.
- E. Direct-Drive Units: Motor encased in housing out of air stream, factory-wired to disconnect located on outside of fan housing.
- F. Belt-Drive Units: Motor mounted on adjustable base, with adjustable sheaves, enclosure around belts within fan housing, and lubricating tubes from fan bearings extended to outside of fan housing. Provide self-aligning pre-lubricated ball bearings.
- G. Accessories: Provide the following accessories as indicated:
1. Volume Control Damper: Manual operated with quadrant lock, located in fan outlet.
  2. Companion Flanges: For inlet and outlet duct connections.
  3. Fan Guards: Expanded metal in removable frame.

4. Speed Control: Variable speed switch with on-off control and speed control for 100 to 50 percent of fan air delivery.

## 2.6 KITCHEN HOOD UPBLAST EXHAUSTERS

- A. Manufacturers:
  1. Accurex.
  2. CaptiveAire
  3. Carnes Company, Inc.
  4. Cook (Loren) Co.
  5. Greenheck Fan Corp.
  6. PennBarry.
  7. Twin City Fan Company
- B. Fan Unit: Belt-driven or direct-drive as indicated, centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.
- C. Housing:
  1. Construct of heavy-gage, removable, spun-aluminum including curb cap, windband and motor compartment.
  2. Rigid internal support structure.
  3. One-piece fabricated or fully welded curb-cap base to windband for leak proof construction.
  4. Construct drive frame assembly of heavy gauge steel, mounted on vibration isolators.
  5. Provide breather tube for fresh air motor cooling and wiring.
- D. Fan Wheel: Aluminum hub and blades.
- E. Shafts and Bearings:
  1. Fan Shaft:
    - a. Ground and polished steel with anti-corrosive coating.
    - b. First critical speed at least 25 percent over maximum cataloged operating speed.
  2. Bearings
    - a. Permanently sealed or pillow block type.
    - b. Minimum L10 life in excess of 50,000 hours.
- F. Drive Assembly: Resiliently mounted to the housing, with the following features:
  1. Belts, pulleys, and keys oversized for a minimum of 150 percent of driven horsepower.
  2. Belts: Static free and oil resistant.
  3. Pulleys: Cast-iron, adjustable-pitch, keyed and securely attached to the wheel and motor shafts..
- G. Grease Exhaust: Exhaust fans serving Type I kitchen exhaust hoods shall discharge a minimum of 40" above the roof surface, shall have hinged access, shall have access opening on curvature of outer housing for blade inspection and cleaning, and shall be installed in accordance with NFPA 96 and local codes.
- H. Roof Curbs: Refer to Section "Hangers and Supports for HVAC" for pre-engineered roof equipment supports
- I. Drain Trough: Grease drain trough shall be filled with replaceable, absorbent material or replaceable cup with absorbent material and cap which absorbs grease and rejects water.
- J. Accessories: Provide the following items as indicated:
  1. Disconnect Switch: Nonfusible type, with thermal overload protection mounted inside fan housing, factory-wired through an internal aluminum conduit.
  2. Clean Out Port: Removable grease repellent compression rubber plug allows access for cleaning wheel through windband.
  3. Roof Curb Extension: Vented curb extension where required for compliance with minimum clearances required by NFPA 96.
  4. Hinge Kit:

- a. Aluminum hinges.
  - b. Hinges and restraint cables mounted to base (sleeve).
  - c. Allows fan to tilt away for access to wheel and ductwork for inspection and cleaning.
5. Heat Baffle: Prevents heat from radiating into motor compartment.

## 2.7 UTILITY VENT SET

- A. Manufacturers:
1. Accurex.
  2. Acme Engrg. & Mfg. Corp.
  3. Bayley Fan Group.
  4. CaptiveAire
  5. Carnes Company, Inc.
  6. Chicago Blower Corp.
  7. Cook (Loren) Co.
  8. Greenheck Fan Corp.
  9. Hartzell Fan, Inc.
  10. PennBarry.
  11. Trane Co.
  12. Twin City Fan Company
- B. Fan Unit: Belt-or direct-drive, centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, and accessories.
- C. Housings: Fabricated of heavy-gage galvanized steel or aluminum material with side sheets fastened to scroll sheets by means of welding or deep lock seam.
1. Inlet: Round duct collar.
  2. Discharge: Slip-joint duct connection.
  3. Housings Discharge Arrangement: Adjustable to 8 standard positions.
- D. Fan Wheels: Single-width, single-inlet, welded to cast-iron or cast-steel hub and spun steel inlet cone, with hub keyed to the shaft.
1. Blade Materials: Steel or aluminum.
  2. Blade Type: Forward-curved, backward-curved or airfoil, die-formed.
- E. Shafts and Bearings:
1. Fan Shaft:
    - a. Ground and polished steel with anti-corrosive coating.
    - b. First critical speed at least 25 percent over maximum cataloged operating speed.
  2. Bearings
    - a. Permanently sealed or pillow block type.
    - b. Minimum L10 life in excess of 50,000 hours.
- F. Drive Assembly: Resiliently mounted to the housing, with the following features:
1. Belts, pulleys, and keys oversized for a minimum of 150 percent of driven horsepower.
  2. Belts: Static free and oil resistant.
  3. Pulleys: Cast-iron, adjustable-pitch, keyed and securely attached to the wheel and motor shafts..
- G. Grease Exhaust: Exhaust fans serving Type I kitchen exhaust hoods shall discharge a minimum of 40" above the roof surface, shall have access opening on curvature of outer housing for blade inspection and cleaning, and shall be installed in accordance with NFPA 96 and local codes.
1. Drain Connection: Provide drain connection with grease drain trough filled with replaceable, absorbent material or replaceable cup with absorbent material and cap which absorbs grease and rejects water.
- H. Accessories: Provide the following accessories where indicated:
1. Backdraft Dampers: Gravity-actuated with counterweight and interlocking aluminum blades and felt edges in steel frame installed on fan discharge.

2. Access Doors: Gasketed doors with latch-type handles.
3. Scroll Dampers: Single-blade damper installed at fan scroll top with adjustable linkage.
4. Spark-Resistant Construction: AMCA construction option A, B, or C as indicated.
5. Inlet Screens: Removable, heavy wire mesh.
6. Drain Connections: 3/4-inch, threaded coupling drain connection installed at lowest point of housing.
7. Weather Hoods: Weather-resistant with stamped vents over motor and drive compartment.

### **PART 3 - EXECUTION**

#### **3.1 SEQUENCING AND SCHEDULING**

- A. Coordinate the size and location of structural steel support members.

#### **3.2 INSTALLATION**

- A. Install fans level and plumb, in accordance with manufacturer's written instructions.
- B. Secure roof-mounted fans to pre-engineered roof equipment supports in accordance with the requirements specified in Section "Hangers and Supports for HVAC Piping and Equipment."
- C. Install vibration isolation for equipment as specified in Division 23 Section "Vibration Isolation for HVAC Piping and Equipment."
- D. Arrange installation to provide access space around fans for service and maintenance.

#### **3.3 ADJUSTING CLEANING AND PROTECTING**

- A. Adjust damper linkages for proper damper operation.
- B. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel and cabinet.

#### **3.4 STARTUP**

- A. Final Checks Before Start-Up: Perform the following operations and checks before start-up:
  1. Remove shipping blocking and bracing.
  2. Verify fan assembly is secure on mountings and supporting devices and that connections for ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
  3. Perform cleaning and adjusting specified in this Section.
  4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
  5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
  6. Verify manual and automatic volume control and that fire and smoke dampers in connected ductwork systems are in the full-open position.
  7. Disable automatic temperature control operators.
- B. Starting procedures for fans:
  1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
    - a. Replace fan and motor pulleys as required to achieve design conditions.
  2. Measure and record motor electrical values for voltage and amperage.
  3. Shut unit down and reconnect automatic temperature control operators.

4. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for air-handling-system testing, adjusting, and balancing.

### **3.5 DEMONSTRATION**

- A. Demonstration Services: Train Owner's maintenance personnel on the following:
  1. Procedures and schedules related to start-up and shutdown, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
  2. Familiarization with contents of Operating and Maintenance Manuals specified in Division 1 Section "Closeout Procedures" and Division 23 Section "General Mechanical Requirements."
- B. Schedule training with at least 7 days' advance notice.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 34 33 - AIR CURTAINS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Service window air curtains.
- B. Air curtains.
  - 1. Hot-water heating coils.

**1.2 SUBMITTALS**

- A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each unit.
- B. Shop Drawings: For air curtain units.
  - 1. Include plans, elevations, sections, and attachment details.
  - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 3. Include diagrams for power, signal, and control wiring.
- C. Samples for Initial Selection: For units with factory-applied color finishes.
- D. Operation and Maintenance Data: Manufacturer's printed instructions for operating and maintaining air curtain components.
- E. Warranty Documentation: Submit manufacturer's warranty and ensure that forms have been completed in Owner's name and registered with manufacturer.

**1.3 COORDINATION DRAWINGS**

- A. Submit plans and details drawn to scale and coordinated with penetrations of walls.

**1.4 QUALITY ASSURANCE**

- A. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of air curtains that are similar to those indicated for this Project in material, design, and extent.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of air curtains and are based on the specific product indicated. Alternate manufacturers shall meet the design intent shown on the drawings. Refer to Division 1 Section "Product Requirements."
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. Comply with AMCA 220, "Test Methods for Air Curtain Units," for airflow, outlet velocity, and power consumption.
- E. Comply with AHRI 410, "Forced-Circulation Air-Cooling and Air-Heating Coils," for components, construction, and rating.
  - 1. Certify coils according to AHRI 410.

**1.5 WARRANTY**

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of air curtains that fail in materials or workmanship within specified warranty period.
  - 1. Warranty Period (Water or Steam Heating Units): Two years.

## 1.6 EXTRA MATERIALS

- A. Furnish extra materials described below, before construction begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Furnish one set of filters and fan belts for each unit.

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 AIR CURTAINS

- A. Manufacturers:
  - 1. Berner International Corp.
  - 2. Mars Air Products.
  - 3. Powered Aire, Inc.
- B. Frame: Minimum 16-gauge galvanized steel or aluminized steel base frame with welded construction.
- C. Housing Panel and Finish: Provide finish as scheduled on the plans.
  - 1. Galvanized steel.
  - 2. Aluminum.
  - 3. Stainless steel.
  - 4. Molded, high impact polyethylene.
- D. Mounting Brackets: Steel, for mounting as scheduled.
- E. Air Adjustment: Provide one of the following options to reduce air volume and outlet velocity to meet the installation requirements:
  - 1. Multi-speed motors with minimum of 3 speed adjustments.
  - 2. Intake louvers that are an integral part of the housing, mechanically field adjustable and capable of reducing air-outlet velocity by up to 60 percent.
- F. Discharge Nozzle: Integral part of the housing, containing adjustable air-directional vanes with 40-degree sweep front to back.
- G. Fans: Galvanized steel, painted steel, or aluminum, centrifugal, forward curved, double width, double inlet; statically and dynamically balanced.
  - 1. Fan Drives:
    - a. Direct drive.
    - b. Belt drive, equipped with belt guards and adjustable sheaves and pulleys for adjusting air-outlet velocity.
- H. Motors: Comply with Section "Common Motor Requirements for HVAC Equipment".
  - 1. Single speed, multispeed or variable speed.
  - 2. Resiliently mounted, continuous duty.
  - 3. Totally enclosed, air over.
  - 4. Explosion proof in hazard locations
  - 5. Integral thermal-overload protection.
  - 6. Bearings: Permanently sealed, lifetime, prelubricated, ball bearings.
  - 7. Disconnect: Internal power cord with plug and receptacle.
- I. Hot Water Heating Coils
  - 1. Description: Factory mounted, drainable coil.

2. Piping Connections: Threaded.
  3. Tubes: Copper, complying with ASTM B 75.
    - a. Tube Diameter: 0.625 inch.
  4. Fins: Maximum fin spacing 14 fins per inch.
    - a. Aluminum.
    - b. Copper.
  5. Fin and Tube Joint:
    - a. Mechanical bond.
    - b. Silver brazed.
  6. Headers:
    - a. Seamless copper tube with brazed joints.
    - b. Fabricated steel with brazed joints.
  7. Frames: Minimum 16 gauge galvanized-steel channel frame.
  8. Ratings: According to ASHRAE 33.
  9. Working-Pressure Ratings: 200 psig, 325 deg F.
  10. Source Quality Control: Test to 300 psig and to 200 psig underwater.
- J. Filters
1. Disposable Panel Filters: Factory-fabricated, viscous-coated, flat-panel-type, disposable air filters with glass-fiber media sprayed with nonflammable adhesive in cardboard or galvanized-steel frame.
  2. Washable Panel Filters: Removable, aluminum media, minimum 0.5" thick, aluminum or steel filter frame.
  3. Mounting Frames: Welded, galvanized steel with gaskets and fasteners and suitable for bolting together into built-up filter banks.
- K. Accessories: Provide the following accessories where required to meet the specified conditions on the drawings.
1. Built-In Thermostat: Line voltage, factory installed and wired to the junction box on air curtain.
  2. Field Installed Thermostat: Line voltage, factory furnished thermostat to be field wired to the junction box on the air curtain.
  3. Automatic Door Switch: Provide automatic door switch in door area to activate air curtain when door opens and to deactivate air curtain when door closes.
    - a. Provide plunger type at dock doors and back of house doors.
    - b. Provide magnetic type at public entrance doors.
  4. Time-Delay Relay: Factory installed and adjustable to allow air curtain to operate from 0.5 seconds to 10 hours.
  5. Motor-Control Panel: Complete with motor starter, 115-V ac transformer with primary and secondary fuses, and terminal strip.
    - a. Provide NEMA 250, Type 1 enclosure.
  6. Mounting Brackets: Provide mounting brackets and other mounting accessories as required to permit installation and functioning of air curtain to meet project installation.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION**

- A. Examine areas and conditions where air curtains will be installed for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine roughing-in for piping systems to verify actual locations of piping connections before air-curtain installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2 COORDINATION**

- A. Coordinate layout and installation of air curtains and suspension system components with other construction, including light fixtures, fire-suppression-system components, and partition assemblies.
- B. Coordinate installation of wall penetrations and louvers.

**3.3 INSTALLATION**

- A. Install products in accordance with manufacturer's instructions.
- B. Install air curtains with clearance for equipment service and maintenance.
- C. Comply with requirements for hangers and supports specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment."

**3.4 CONNECTIONS**

- A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to air curtain to allow service and maintenance.
- C.
- D. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."
- E. Connect wiring according to Division 26 Section "Common Work Results for Electrical."

**3.5 FIELD QUALITY CONTROL**

- A. Perform the following field tests and inspections and prepare test reports:
  - 1. After installing air curtains completely, perform visual and mechanical check of individual components.
  - 2. After electrical circuitry has been energized, start unit to confirm motor rotation and unit operation. Certify compliance with test parameters.
  - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- B. Repair or replace malfunctioning units and retest as specified above.

**3.6 ADJUSTING**

- A. Adjust belt tension.
- B. Adjust motor and fan speed to achieve specified airflow.
- C. Adjust discharge louver and dampers to regulate airflow.
- D. Adjust air-directional vanes.

**3.7 DEMONSTRATION**

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air curtains on the following:
  - 1. Procedures and schedules related to start-up and shutdown, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
  - 2. Familiarization with contents of Operating and Maintenance Manuals specified in Division 1 Section "Project Closeout" and Division 23 Section "General Mechanical Requirements."

- B. Schedule training with at least 7 days' advance notice.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 36 00 - AIR TERMINAL UNITS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Variable Air Volume Terminal Units
  - 1. Reheat

**1.2 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical product data, including performance data for each size and type of air terminal furnished; certified sound power data for each unit; schedule showing drawing designation, room location, number furnished, model number, size, and accessories furnished.
- B. Shop Drawings: Submit manufacturer's assembly-type shop drawings indicating dimensions, weight loadings, required clearances, methods of assembly of components and electrical characteristics and connection requirements.
- C. Certificates: Certify that coils are tested and rated in accordance with AHRI 410.
- D. Wiring Diagrams: Submit ladder-type wiring diagrams for electric power and control components, clearly indicating required field electrical connections.
- E. Nameplate Data: Nameplate data shall be submitted in a timely manner so as to allow proper coordination with the Electrical Contractor. Submittals that do not have nameplate data will be rejected.
- F. Manufacturer's Installation Instructions: Indicate support and hanging details, installation instructions, recommendations, and service clearances required.
- G. Project Record Documents: Record actual locations of units and locations of access doors required for access of valving.
- H. Operation and Maintenance Data: Include manufacturer's descriptive literature, operating instructions, maintenance and repair data, and parts lists. Include this data, product data, shop drawings, and maintenance data in maintenance manual; in accordance with requirements of Division 1.

**1.3 QUALITY ASSURANCE**

- A. ADC Compliance: Provide air terminals that have been tested and rated in accordance with ADC standards, and bear ADC Seal.
- B. AHRI Compliance:
  - 1. Provide air terminals that have been tested and rated in accordance with AHRI 880 "Performance Rating of Air Terminals" and bear AHRI certification seal.
  - 2. Provide air terminals that meet the scheduled sound performance in compliance with AHRI 885 "Procedure for Estimating Occupied Space Sound Levels in the Application of Air Terminals and Air Outlets".
- C. UL/ETL Compliance: Air terminal units shall be UL or ETL listed as a complete assembly. All electrical components shall be UL listed and installed in accordance with the National Electric Code.
- D. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.

- E. Product Listing Organization Qualifications: An organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

#### 1.4 SPARE PARTS

- A. If HVAC equipment is used during construction, the contractor is fully responsible for it's cleaning just before substantial completion prior to testing and balancing.

### PART 2 - PRODUCTS

#### 2.1 VARIABLE AND CONSTANT AIR VOLUME TERMINAL UNITS

- A. Manufacturers:
  - 1. Carnes Co.
  - 2. Carrier Corp.; Sub. of United Technologies Corp.
  - 3. Environmental Technologies, Inc.
  - 4. Greenheck
  - 5. Johnson Controls, Inc.
  - 6. Krueger Mfg. Co.
  - 7. Metalaire.
  - 8. Nailor Industries, Inc.
  - 9. Price Industries.
  - 10. Tempmaster Corp.
  - 11. Titus Products Div.; Philips Industries, Inc.
  - 12. Trane (The) Co.
- B. Construction
  - 1. Casings: Construct of galvanized sheet metal of minimum 22 gauge thickness or die-cast aluminum of minimum 20 gauge thickness.
    - a. Assembled with longitudinal lock seam construction.
    - b. Construct casings such that when subjected to 0.5-in w.g. pressure for low pressure units, and 3.0-in w.g. pressure for high pressure units, total leakage does not exceed 2% of specified air flow capacity with outlets sealed and inlets wide open.
  - 2. Air Inlet Collar: Provide round, suitable for standard flexible duct sizes or rectangular where needed to meet airflow requirements.
  - 3. Unit Discharge: Rectangular, with slip-and-drive connections.
  - 4. Acceptable Liners:
    - a. Linings: Line inside surfaces of casings with fiberglass, lining material to provide acoustic performance, thermal insulation, and to prevent condensation on outside surfaces of casing. Provide minimum thickness of 1/2". Secure lining to prevent delamination, sagging, or settling.
  - 5. Access: Provide removable panels in casings to permit access to air dampers, fans and other parts requiring service, adjusting, or maintenance.
    - a. Provide airtight gasket and quarter-turn latches.
  - 6. Provide hanger brackets for attachment of supports.
- C. Sound Attenuator
  - 1. Provide if required to meet scheduled acoustical performance requirements.
  - 2. Construction to consist of a continuous extension of the casing and liner as required to achieve required attenuation.
  - 3. At 2000 fpm inlet velocity, the additional differential pressure drop with attenuator not to exceed 0.2 inch wg.
  - 4. All sound data shall be compiled in an independent ADC certified laboratory and in accordance with the latest version of AHRI 880. All units shall be AHRI certified and bear the AHRI certification label.

- D. Primary Air Damper Assembly
1. Heavy-gauge, galvanized steel or extruded aluminum construction with solid steel, nickel-plated shaft pivoting on HDPE, self-lubricating bearings.
  2. Provide integral position indicator or alternative method for indicating damper position over full range of 90 degrees.
  3. Incorporate low leak damper blades for tight airflow shutoff.
    - a. Air Leakage Past Closed Damper: Maximum two percent of unit maximum airflow at 3 inch wg inlet static pressure, tested in accordance with ASHRAE Std 130.
- E. Hot Water Heating Coil:
1. Seamless copper tubes, mechanically expanded into aluminum or aluminum-plated fins.
  2. Include low-leakage access door for coil inspection and cleaning.
  3. Coil leak tested to minimum 200 psig.
  4. Base performance data on tests run in accordance with AHRI 410.
- F. Electrical Requirements:
1. Single-point power connection.
  2. Equipment wiring to comply with requirements of NFPA 70.
  3. All electrical components shall be UL or ETL listed or recognized and installed in accordance with the National Electrical Code.
  4. All electrical components shall be mounted in a control box.
  5. The entire assembly shall be UL or ETL listed (cETL in Canada) and so labeled.
- G. Control Transformers: Factory supplied and mounted for electric and electronic control applications.
- H. Controls: Provide controls accurate to 1.5 degrees F and adjustable from 65 degrees F to 85 degrees F. Provide air flow measurement station at terminal unit inlet. Provide control type as indicated below.
1. DDC (Direct Digital Control): Provide direct digital controls, compatible with direct digital control system specified in other Division 23 sections.
    - a. The unit level controller to include the following:
      - 1) 24 VAC power terminal or RJ-12 Power connection.
      - 2) Port for thermostat connection.
      - 3) Service Port for diagnostic equipment.
      - 4) Damper actuator.
      - 5) LED indication for troubleshooting.
      - 6) Heating output signal(s).
      - 7) Cooling output signal(s).
      - 8) Supply air temperature sensor input.
      - 9) Contact closure input.
      - 10) BACNET communication capability.
    - b. Include a factory-installed, unit-mounted direct-digital controller.
    - c. Bi-directional Damper Actuator: 24 volt, powered closed, spring return open.
    - d. Microprocessor-Based Controller: Air volume controller, pressure-independent with electronic airflow transducers, factory-calibrated maximum and minimum CFM's.
      - 1) Occupied and unoccupied operating mode.
      - 2) Remote reset of temperature or CFM set points.
      - 3) Proportional, plus integral control of room temperature.
      - 4) Monitoring and adjusting with portable terminal.
      - 5) Time-proportional reheat coil control.
    - e. Room Sensor:
      - 1) Compatible with temperature controls specified.
      - 2) Wall-mounted, system powered, with temperature set-point adjustment including connection access for portable operator terminal.
  2. Airflow Sensor: Differential pressure airflow device measuring total, static, and wake pressures.
    - a. Sensor Requirements:

- 1) Plastic parts shall be fire-resistant, complying with UL 94.
  - 2) Control tubing shall be protected by grommets at the wall of the air flow sensor's housing.
  - 3) Furnished with multiple total and static pressure sensing ports and a center averaging chamber that amplifies the sensed air flow signal.
  - 4) Provide sensor with a pressure transducer to interface with the building control system.
- b. Signal accuracy: Provide accuracy within 5 percent throughout the terminal unit operating range.
- I. Identification: Provide label on each unit indicating Plan Number, cfm range, cfm factory-setting, and calibration curve (if required).

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Verify that conditions are suitable for installation.
- B. Verify that field measurements are as indicated on drawings.

#### **3.2 INSTALLATION**

- A. Install products in accordance with manufacturer's instructions.
- B. Install the inlets of air terminal units and air flow sensors a minimum of three duct diameters from elbows, transitions, and duct takeoffs.
- C. Provide ceiling access doors or locate units above easily removable ceiling components.

#### **3.3 ADJUSTING**

- A. Adjust damper linkages for proper damper operation.
- B. Reset volume with damper operator attached to assembly allowing flow range modulation from 100 percent of design flow to scheduled minimum flow.

#### **3.4 FIELD QUALITY CONTROL**

- A. Upon completion of installation and prior to initial operation, test and demonstrate that air terminals, duct connections to air terminals, and water coils are leak-tight.
  1. Leak Test:
    - a. Repair or replace air terminals and duct connections as required to eliminate leaks, and retest to demonstrate compliance.
    - b. Repair water leaks and retest until no leaks exist.
  2. Operational Test:
    - a. After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
    - b. Test and adjust controls and safeties.
    - c. Replace damaged and malfunctioning controls and other equipment.

#### **3.5 CLEANING**

- A. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel and cabinet.
- B. Install new filters.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 37 13 - DIFFUSERS REGISTERS AND GRILLES****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Ceiling air diffusers.
- B. Registers and grilles.
- C. Linear slot diffusers.

**1.2 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical product data for air outlets and inlets including the following:
  - 1. Schedule of air outlets and inlets indicating drawing designation, room location, number furnished, model number, size, and accessories furnished.
  - 2. Data sheet for each type of air outlet and inlet, and accessory furnished; indicating construction, finish, and mounting details. Indicate selections on product data.
  - 3. Performance data for each type of air outlet and inlet furnished, including aspiration ability, temperature and velocity traverses; throw and drop; and noise criteria ratings at specified airflows.
- B. Shop Drawings: Submit manufacturer's assembly-type shop drawing for each type of air outlet and inlet, indicating materials and methods of assembly of components.
- C. Maintenance Data: Submit maintenance data, including cleaning instructions for finishes, and spare parts lists. Include this data, product data, and shop drawings in maintenance manuals; in accordance with requirements of Division 1.
- D. Coordination Drawings: Reflected ceiling plans and wall elevations drawn to scale to show locations and coordination of diffusers, registers, and grilles with other items installed in ceilings and walls.
- E. Color Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for diffusers, registers, and grilles with factory-applied color finishes.
- F. Samples for Verification: Provide samples of diffusers, registers, and grilles, in manufacturer's standard sizes, showing the full range of colors. Prepare Samples from the same material to be used for the Work.

**1.3 QUALITY ASSURANCE**

- A. Test and rate air outlets and inlets in accordance with ASHRAE 70 "Method of Testing the Performance of Air Outlets and Inlets".
- B. Test and rate air outlets and inlets in certified laboratories under requirements of ADC 1062 "Certification, Rating and Test Manual".
- C. Provide air outlets and inlets bearing ADC Certified Rating Seal.
- D. Test and rate sound data for air outlets and inlets in accordance with AHRI 885 "Procedure for Estimating Occupied Space Sound Levels in the Application of Air Terminals and Air Outlets (with Addendum 1)".
- E. Install air outlets and inlets in accordance with NFPA 90A "Standard for the Installation of Air Conditioning and Ventilating Systems".

**1.4 SPARE PARTS**

- A. Furnish to Owner, with receipt, 3 operating keys for each type of air outlet and inlet that require them.

**PART 2 - PRODUCTS****2.1 CEILING AIR DIFFUSERS**

- A. Manufacturers
  - 1. Carnes Co.
  - 2. Greenheck.
  - 3. Krueger Mfg. Co.
  - 4. Metalaire; Metal Industries, Inc.
  - 5. Nailor Industries, Inc.
  - 6. Price Industries, Inc.
  - 7. Titus HVAC
  - 8. Tuttle & Bailey; Div. of Air Systems Components, Inc.
- B. General: Except as otherwise indicated, provide manufacturer's standard ceiling air diffusers where shown; of size, shape, capacity and type indicated; constructed of materials and components as indicated, and provided with accessories as required for a complete installation.
- C. Performance: Provide ceiling air diffusers that have, as minimum, temperature and velocity traverses, throw and drop, and noise criteria ratings for each size device as listed in manufacturer's current data.
- D. Ceiling Compatibility: Provide diffusers with border styles that are compatible with adjacent ceiling systems, and that are specifically manufactured to fit into ceiling module with accurate fit and adequate support. Refer to general construction drawings and specifications for types of ceiling systems which will contain each type of ceiling air diffuser.
- E. Types: Provide ceiling air diffusers of type, capacity, and with accessories and finishes as scheduled on the drawings.

**2.2 REGISTERS AND GRILLES**

- A. Manufacturers
  - 1. Carnes Co.
  - 2. Greenheck.
  - 3. Krueger Mfg. Co.
  - 4. Metalaire; Metal Industries, Inc.
  - 5. Nailor Industries, Inc.
  - 6. Price Industries, Inc.
  - 7. Titus HVAC
  - 8. Tuttle & Bailey; Div. of Air Systems Components, Inc.
- B. General: Except as otherwise indicated, provide manufacturer's standard registers and grilles where shown; of size, shape, capacity and type indicated; constructed of materials and components as indicated, and provided with accessories as required for a complete installation.
- C. Performance: Provide registers and grilles that have, as minimum, temperature and velocity traverses, throw and drop, and noise criteria ratings for each size device and listed in manufacturer's current data.
- D. Ceiling Compatibility: Provide registers and grilles with border styles that are compatible with adjacent ceiling systems, and that are specifically manufactured to fit into ceiling module with

accurate fit and adequate support. Refer to general construction drawings and specifications for types of ceiling systems which will contain each type of register and grille.

- E. Wall Compatibility: Provide registers and grilles with border styles that are compatible with adjacent wall systems, and that are specifically manufactured to fit into wall construction with accurate fit and adequate support. Refer to general construction drawings and specifications for types of wall construction which will contain each type of wall register and grille.
- F. Types: Provide registers and grilles of type, capacity, and with accessories and finishes as scheduled on the drawings.

## 2.3 LINEAR SLOT DIFFUSERS

- A. Manufacturers
  1. Carnes Co.
  2. Greenheck.
  3. Krueger Mfg. Co.
  4. Metalaire; Metal Industries, Inc.
  5. Nailor Industries, Inc.
  6. Price Industries, Inc.
  7. Titus HVAC
  8. Tuttle & Bailey; Div. of Air Systems Components, Inc.
- B. General: Except as otherwise indicated, provide manufacturer's standard linear slot diffusers where shown; of size, shape, capacity and type indicated; constructed of materials and components as indicated, and provided with accessories as required for a complete installation.
- C. Performance: Provide linear slot diffusers that have, as minimum, temperature and velocity traverses, throw and drop, and noise criteria ratings for each size device as listed in manufacturer's current data.
- D. Compatibility: Provide linear slot diffusers with border styles that are compatible with adjacent ceiling or wall systems, and that are specifically manufactured to fit into ceiling or wall with accurate fit and adequate support. Refer to general construction drawings and specifications for types of ceiling and wall systems which will contain each type of linear slot diffuser.
- E. Linear Slot Diffusers: Slot diffusers shall be standard one-piece lengths up to 6-feet and shall be furnished in multiple sections greater than 6-feet.
  1. Provide straight and curved sections as required to accommodate layout shown on the drawings.
  2. Multiple sections shall be joined together end-to-end with alignment pins to form a continuous slot appearance. All alignment components shall be provided by the manufacturer.
  3. Where specified on the drawings, plenums shall be manufactured by the slot diffuser manufacturer. Plenums shall be internally insulated, by the manufacturer, with minimum ¼" thick, closed-cell insulation. Insulation shall not be made of fibrous material.
- F. Types: Provide linear slot diffusers of type, capacity, and with accessories and finishes as scheduled on the drawings.

## PART 3 - EXECUTION

### 3.1 INSPECTION

- A. Examine areas and conditions under which air outlets and inlets are to be installed for compliance with installation tolerances and conditions that would affect the performance of the equipment. Do not proceed with work until unsatisfactory conditions have been corrected.

**3.2 INSTALLATION**

- A. General: Install air outlets and inlets in accordance with manufacturer's written instructions, design drawings, referenced standards, and in accordance with recognized industry practices to ensure that products serve intended function.
- B. Coordinate with other work, including ductwork and duct accessories, to interface installation of air outlets and inlets with other work.
- C. Where a 90-degree elbow is required at the connection to air devices, provide a rigid duct elbow or, at Contractor's option, a flexible elbow assembly as specified in Division 23 section "Air Duct Accessories".
- D. Locate ceiling air diffusers, registers, and grilles, as indicated on general construction "Reflected Ceiling Plans". Unless otherwise indicated, locate units in center of acoustical ceiling module.
- E. Linear Slot Diffuser Installation:
  - 1. For installations in a hard ceiling, install diffuser prior to installation of drywall. Use manufacturer's hard ceiling clips for mounting to ceiling framing. Screws through face of diffuser are not acceptable.

**3.3 ADJUSTING**

- A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before beginning air balance.

**3.4 CLEANING**

- A. After installation of diffusers, registers, and grilles, inspect exposed finish. Clean exposed surfaces to remove dirt and smudges. Replace any air device that has damaged finishes.

END OF SECTION

**SECTION 23 51 00 - BREECHINGS CHIMNEYS AND STACKS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Special gas vents.

**1.2 DEFINITIONS**

- A. Breeching: The conduit conveying flue gas from the appliance to the chimney.
- B. Chimney: A structure containing one or more vertical or nearly vertical passageways for conveying flue gases to the outside atmosphere.
- C. Stack: A primarily vertical, round, vent.
- D. Vent: A flue-gas conveying system intended for use with certain gas-, liquid-, or solid fuel-fired appliances that do not produce flue gas outlet temperatures higher than a value specified in the listing vent standards.
- E. Category I Appliance: An appliance that operates with a non-positive vent static pressure and with a vent gas temperature that avoids excessive condensate production in the vent.
- F. Category II Appliances: An appliance that operates with a non-positive vent static pressure and with a vent gas temperature that may cause excessive condensate production in the vent.
- G. Category III Appliances: An appliance that operates with a positive vent static pressure and with a vent gas temperature that avoids excessive condensate production in the vent.
- H. Category IV Appliances: An appliance that operates with a positive vent static pressure and with a vent gas temperature that may cause excessive condensate production in the vent.

**1.3 SUBMITTALS**

- A. Product Data: Submit product data including materials, dimensions, weights, required clearances, and accessories.
- B. Shop Drawings:
  - 1. Indicate general construction, dimensions, weights, support, and layout of breeching, chimneys, and stacks.
  - 2. Submit layout drawings indicating plan view, elevations, and details.
  - 3. Submit detail assemblies and indicate method of field assembly, components, hangers and seismic restraints, and location and size of each field connection.
- C. Manufacturer's Instructions: Include installation instructions and indicated assembly, support details, and connection requirements.
- D. Manufacturer's Certificates: Submit certificates of compliance with specified reference standards.
- E. Welders Certificates: Include welder certification of compliance with ASME BPVC-IX.
- F. Wind and Seismic Certificates: Submit complete engineering report certifying that stacks meet the design wind and seismic loads.

**1.4 QUALITY ASSURANCE**

- A. Comply with the following Codes and Standards:
  - 1. NFPA 211 "Standard for Chimneys, Fireplaces, Vents and Solid Fuel Burning Appliances."
  - 2. NFPA 54 "National Fuel Gas Code" for natural gas and propane burning appliances.

3. NFPA 31 "Standard for the Installation of Oil-Burning Equipment" for fuel oil appliances.
4. UL: Comply with applicable portions of UL safety standards; provide products which have been UL listed and labeled.
5. SMACNA: Comply with SMACNA's "HVAC Duct Construction Standards" for fabricated breeching and smokepipe and with SMACNA's "Guide for Steel Stack Design and Construction" for steel stacks.
6. AWS: All welders and procedures shall be certified in accordance with AWS D1.1, "Structural Welding Code-Steel," for hangers and supports and in accordance with AWS Standard D9.1, "Sheet Metal Welding Code" for duct joining and seam welding.
7. ASHRAE: Comply with the ASHRAE Systems and Equipment Handbook for Chimney, Gas Vent, and Fireplace Systems material requirements and design criteria.

## 1.5 DELIVERY STORAGE AND HANDLING

- A. Delivery: Handle breeching and stack components carefully to prevent damage, denting and scoring. Do not install damaged components; replace with new.

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 SPECIAL GAS VENTS

- A. Manufacturers
  1. General:
    - a. AMPCO.
    - b. DuraVent Commercial.
    - c. Enervex Inc.
    - d. Heat-Fab Inc.
    - e. Metal-Fab, Inc.
    - f. Nova-Flex Group.
    - g. ProTech Systems Inc.
    - h. Schebler Chimney Systems.
    - i. Security Chimneys.
    - j. Selkirk Metalbestos.
- B. General: UL 1738 listed, rated for 1.25 inch w.c. positive or negative flue pressure complying with NFPA 211 and suitable for condensing-gas appliances.
- C. Single-wall Vents: Rated for 480 degrees F continuously, with shell constructed of ASTM A949, Type AL29-4C, ASTM A276 Type 316L, or ASTM A268 Type 444 stainless steel.
- D. Double-wall Vents: Rated for 550 degrees F continuously, with inner and outer jacket separated by at least a 1/2 inch annular space. Construct inner shell of ASTM A949, Type AL29-4C, ASTM A276 Type 316, or ASTM A268 Type 444 stainless steel listed for condensing appliances. Construct outer jacket of aluminized coated steel or Type 304, 316, or AL29-4C stainless steel.
- E. Accessories, UL labeled: Provide tees, adjustable and variable lengths, elbows, increasers, draft hood connectors, terminations, dampers, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners, fabricated from similar materials and designs as vent pipe straight sections, all listed for same assembly. Provide discharge assembly termination compatible with manufacturer system to protect against and/or drain rainfall.
- F. Appliance Adapter: Provide appliance adapter to connect double wall special gas vent to flue outlet of appliance and secure with hose clamp.
  - a. Enervex Inc. SR.
  - b. Heat-Fab Model 9401RHM.
  - c. Selkirk Metalbestos 3CV-AA .

**2.2 GUYING AND BRACING**

- A. Cable: Galvanized, stranded wire of the following thickness:
  - 1. Minimum Size: 1/4 inch in diameter
  - 2. For ID Sizes 4 to 15 inches: 5/16 inch in diameter.
  - 3. For ID Sizes 18 to 24 inches: 3/8 inch in diameter.
  - 4. For ID Sizes 27 to 30 inches: 7/16 inch in diameter.
  - 5. For ID Sizes 33 to 36 inches: 1/2 inch in diameter.
  - 6. For ID Sizes 39 to 48 inches: 9/16 inch in diameter.
  - 7. For ID Sizes 51 to 60 inches: 5/8 inch in diameter.
- B. Pipe: 1-1/4 inch diameter, galvanized steel.
- C. Angle Iron: Galvanized steel 2 by 2 by 1/4 inch.

**PART 3 - EXECUTION****3.1 EXAMINATION**

- A. Examine areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of work. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2 APPLICATION SCHEDULE**

- A. Category IV Appliances:
  - 1. Special gas vents, single wall for appliances with flue gases up to 480 degrees F continuously, double wall for flue gases up to 550 degrees F continuously.

**3.3 INSTALLATION GENERAL**

- A. Install in accordance with manufacturer's instructions.
- B. Maintain minimum clearances from combustibles specified in third party listing.
- C. Align connections accurately with internal surfaces smooth.
- D. Seal joints between sections of positive pressure vents in accordance with manufacturer's installation instructions, and using only sealants recommended by manufacturer.
- E. Support breechings from building structure, rigidly with suitable ties, braces, hangers, and anchors to hold to shape and prevent buckling. Support vertical breechings, chimneys, and stacks at 12 foot spacing, to adjacent structural surfaces, or at floor penetrations. Refer to SMACNA (DCS) for equivalent duct support configuration and size. Reference Division 23 Section "Hangers and Supports for HVAC" for supports.
- F. Install guy wires and/or braces where maximum unsupported lengths of stacks are exceeded.
- G. Install concrete inserts for support of breechings, chimneys, and stacks in coordination with formwork.
- H. Pitch breechings with positive slope up from fuel-fired equipment to chimney or stack, minimum 1/4 inch per foot or per manufacturer's recommendations, whichever is more stringent. Provide flat bottom transitions where required to maintain continuous slope. Provide condensate drain connection at low points with 3/4" plenum rated drain tubing with pigtail trap sized for system pressure. Pipe drain line to nearest open site drain and terminate with air gap. Provide pH neutralizer in drain line in accessible location.
- I. All connections to common breechings shall be 45 degree lateral tees.

- J. Install firestopping to preserve fire resistance rating of partitions and other elements.
- K. Coordinate installation of dampers and draft control devices. Locate dampers as close to draft hood collar as possible.
- L. Install slip joints permitting removal of appliance without removal or dismantling of breeching, breeching insulation, chimneys, or stacks.

### **3.4 INSTALLATION OF SPECIAL GAS VENTS**

- A. Connect special gas vents to appliance adapters.
- B. Insulate single wall special vents serving instantaneous gas water heaters.
  - 1. Insulate single wall special gas vents for instantaneous gas water heaters. Refer to Division 23 specification section "HVAC Insulation" for insulation thickness, material and installation methods.

### **3.5 FIELD QUALITY CONTROL**

- A. Temporary Closure: At ends of breechings and chimneys that are not completed or connected to equipment, provide temporary closure that will prevent entrance of dust and debris until installations are completed.
- B. Touch-up or refinish sections or accessories that are scratched or marred during shipping and handling, or require touch-up after welding.

### **3.6 AD USTING AND CLEANING**

- A. Clean breechings internally during installation, to remove dust and debris. Clean external surfaces to remove welding slag and mill film. Grind welds smooth.

END OF SECTION

**SECTION 23 51 13 - DRAFT CONTROL DEVICES****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Vent exhaust fan system.
- B. Combustion-air fan system.
- C. Draft and/or combustion air system controller
- D. Vent dampers.
- E. Dryer vent fans.
- F. Dryer vent system controller.

**1.2 SUBMITTALS**

- A. Product Data:
  - 1. Provide data on fans including materials of construction, fan curves with specified operating point clearly plotted, power, RPM, sound power levels for both fan inlet and outlet at rated capacity, and electrical characteristics and connection requirements.
  - 2. Provide data on dampers including materials of construction and airflow performance.
  - 3. Provide data for each controller including performance characteristics, electrical characteristics, finishes of materials, installation instructions and start-up instructions.
- B. Shop Drawings: Show fabrication and installation details for products. Include plans, elevations, sections, details, and attachments to other work. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, hangers and seismic restraints, and location and size of each field connection.
  - 1. Wiring diagrams detailing power and control wiring and differentiating clearly between manufacturer-installed wiring and field-installed wiring..
- C. Operation and Maintenance Data: Include manufacturer's descriptive literature, operating instructions, fan lubrication procedures, spare parts list, and maintenance and repair data.
- D. Warranties: Special warranties specified in this Section.

**1.3 QUALITY ASSURANCE**

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. Mechanical draft system shall be guaranteed to operate to provide a constant draft that does not fluctuate more than +/- 0.01 inch W.C. under stable load conditions.
- C. Venting system shall comply with NFPA 54 "National Fuel Gas Code" to satisfy Factory Mutual (FM) Global Insurance requirements.
- D. Draft ventilators shall meet UL Standard 378 "Standard for Draft Equipment".
- E. Draft vent controllers shall contain features in compliance with UL Standard 378 "Standard for Draft Equipment".

**1.4 WARRANTY**

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of draft control system that fail in materials or workmanship within specified warranty period.
  - 1. Failures include failure of the fan due to corrosion.
  - 2. Warranty Period: Two years from date of Substantial Completion.
- B. Vent Exhaust Fan System Warranty: Provide a ten year warranty against corrosion perforation from the date of substantial completion. The warranty shall include 100 percent coverage of a contractor's response within a 24 hour Owner request.

**PART 2 - PRODUCTS****2.1 VENT EXHAUST FAN SYSTEM**

- A. Manufacturers:
  - 1. Enervex.
  - 2. Tjernlund Products Inc.
  - 3. US Draft.
- B. General: Provide demand controlled exhaust system, consisting of fans, motors, controls, and ductwork, designed to maintain negative pressure throughout the entire chimney or stack.
- C. Fan:
  - 1. Performance Requirements:
    - a. Capable of handling flue gases up to 550 degrees F continuously measured at the flue exit point.
  - 2. Construction:
    - a. Backward inclined centrifugal or axial type of inline design, statically and dynamically balanced with integral and non-removable weights.
    - b. The drive unit consisting of the impeller and motor shall be serviceable without having to remove the entire fan assembly from the vent system.
    - c. Spark resistant construction per AMCA 99-0401, Type B.
    - d. Housing: Minimum 0.063 inch thick, cast-aluminum or stainless-steel.
    - e. Wheel: Cast-aluminum, stainless-steel, or other non-ferrous material to eliminate the possibility of sparks and the potential of igniting unburned fuel and/or explosive gases.
- D. Motor:
  - 1. Type: Permanent split capacity, surface mounted permanent magnet, or electronically commutated type with an IP55 rating and Class F insulation.
  - 2. Construction: Totally enclosed out of the airstream, with pre-lubricated and sealed ball bearings. Bearings shall be rated for a minimum of 320 degrees F.
  - 3. Rating: Variable-speed duty, minimum Class F insulation
- E. Vent System:
  - 1. Reference Division 23 Section "Breechings, Chimneys, and Stacks" for additional system requirements.
- F. Variable Frequency Drive:
  - 1. Factory programmed as part of the mechanical draft system.
  - 2. Not be part of the draft vent system controller PID loop.
  - 3. Include safe torque-off function.
  - 4. Include sensorless vector control for permanent magnet and induction motor control.
  - 5. Reference Division 23 Section "Variable Frequency Drives for HVAC" for additional requirements.

**2.2 COMBUSTION-AIR FAN SYSTEM**

- A. Manufacturers:
  - 1. Enervex.
  - 2. Field Controls L.L.C.; the Venting Solutions Company.
  - 3. Tjernlund Products Inc.
  - 4. US Draft.
- B. General: Provide demand controlled combustion air system, consisting of fans, motors, controls, and ductwork, designed to maintain positive pressure to the appliance(s).
- C. Fan:
  - 1. Construction:
    - a. High efficiency, backward inclined centrifugal or tube-axial type, statically and dynamically balanced.
    - b. Spark resistant construction per AMCA 99-0401, Type B.
    - c. Housing: Galvanized steel or cast aluminum.
    - d. Wheel: Cast-aluminum, stainless-steel, or other non-ferrous material.
    - e. Assembly: Propeller and motor assembly shall be totally enclosed within the fan casing.
  - 2. Motor:
    - a. Type: Permanent split capacity, surface mounted permanent magnet, or electronically commutated with IP 55 rating.
    - b. Construction: Totally enclosed, fan-cooled, shaded-pole motor direct-mounted to the fan with pre-lubricated and sealed ball bearings; stainless-steel shaft.
    - a. Rating: Variable-speed duty, minimum Class F insulation
- D. Combustion Air System:
  - 1. Reference Division 23 Section "Breechings, Chimneys, and Stacks" for additional system requirements.
- E. Variable Frequency Drive:
  - 1. Factory programmed as part of the mechanical vent system.
  - 2. Not be part of the controller PID loop.
  - 3. Include safe torque-off function.
  - 4. Include sensorless vector control for permanent magnet and induction motor control.
  - 5. Reference Division 23 Section "Variable Frequency Drives for HVAC" for additional requirements.

**2.3 DRAFT AND OR COMBUSTION AIR SYSTEM CONTROLLER**

- A. Type: Proportional, Integral, Derivative (PID).
- B. Control:
  - 1. Capable of controlling both the appliance exhaust and combustion air systems simultaneously via a single unit and maintain pre-set adjustable system pressures via independent PID control loops.
  - 2. Capable of controlling multiple fans in lead-lag operation, parallel operation, and allow for redundancy in the event of fan failure.
  - 3. Capable of controlling pressure to within plus or minus 0.01" WC of the pressure setpoints.
  - 4. Capable of reaching and maintaining pressure set point within 20 seconds of appliance operation. Controller shall shut off appliances if set point is not maintained.
- C. Pressure transducer: Bi-directional type.
- D. Sensors:
  - 1. Provide a pressure sensor with probe and tubing for the vent flue pipe.
  - 2. Provide a pressure sensor with probe and tubing for the combustion air pipe or in the room as indicated on the drawings.

- E. Design for 120 VAC electrical service.
- F. Communication: Modbus RTU or BACnet.
  - 1. Provide alarm annunciation through fault codes and an LCD display.
  - 2. Perform programmable operation to include intermittent versus continuous fan operation, purge times, sensor sensitivity, alarm limits and displays, manual overrides, and low/high limit fan speeds.
- G. Safety Features:
  - 1. Interlocks to prevent burner operation during emergencies when mechanical or electrical problems occur.
  - 2. Interlocks to ensure proper combustion pressurization setpoint prior to appliance operation.
  - 3. Integrated operating priority option: Allow one or more appliances to operate during electrical or mechanical failure of the fan, provided the draft requirement can be met and safe operation assured.
- H. Enclosure: Minimum NEMA 1.

## 2.4 VENT DAMPERS

- A. Manufacturers:
  - 1. Enervex.
  - 2. Field Controls L.L.C.; the Venting Solutions Company.
  - 3. Johnson Controls, Inc.; Controls Group.
  - 4. US Draft.
- B. Damper Construction: Stainless-steel damper blade, shaft, and vent pipe with metal, pre-lubricated bearings.
  - 1. 24-V ac motor sized to power damper open and closed in approximately 15 seconds in each direction. Power shall be off when damper is at rest.
  - 2. Integrate damper control with vent exhaust fan system.
  - 3. Comply with ANSI Z21.66 or UL 378.
- C. Controls:
  - 1. 115-to 24-V control transformer.
  - 2. Keyed wiring harness.
  - 3. Damper end-switch to prove damper is open.
  - 4. Interlock with equipment to permit burner operation when damper is open.
  - 5. Hold-open switch for troubleshooting equipment controls.

## 2.5 DRYER VENT FANS

- A. Manufacturers:
  - 1. Enervex.
  - 2. LaundryFab, a division of US Draft.
  - 3. Tjernlund Products Inc.
- B. General Description: Direct-drive, variable speed motors, mechanical fans consisting of fan wheel and housing, factory-mounted motor, and accessories. Fans shall be listed in accordance with UL 705. Assembly shall be rated for operating temperatures up to 350 degrees F.
- C. Housings: Steel with corrosion resistant finish or cast aluminum, with duct connections designed to minimize lint collection.
  - 1. Designed to allow the entire impeller and motor assembly to be removed as a unit.
  - 2. Provide a service door for cleaning and service.
- D. Wheels: Cast-aluminum, statically and dynamically balanced.
- E. Motor: Totally enclosed, fan-cooled, variable speed, pre-lubricated and sealed ball bearings, Class B insulated.

- F. Variable frequency drive shall be as specified in Division 23 Section "Variable Frequency Drives for HVAC".

## 2.6 DRYER VENT SYSTEM CONTROLLER

- A. Manufacturers:
  - 1. Enervex.
  - 2. LaundryFab, a division of US Draft.
  - 3. Tjernlund Products Inc.
- B. General Description: System shall be furnished complete including ventilator fan, variable frequency drive, system controller and sensors.
- C. Modulating Fan Controller:
  - 1. Micro-processor based controller designed to maintain a constant pressure for increased efficiency and proper operation of the dryer vent system. Features included with the controller shall comply with UL 378, Standard for Draft Equipment and UL 508, Standard for Industrial Controls.
  - 2. Enclosure: NEMA 1 or 12 rated, suitable for indoor installations.
  - 3. Features:
    - a. Potentiometer to set the required duct pressure.
    - b. LCD display: Display both the pressure set point and actual duct pressure.
    - c. LED diodes or other means to verify ventilator operation, cycling, and alarm.
    - d. Provide safety shut-off with visual alarm to shut down dryer on insufficient duct pressure or fan failure.
    - e. Interlocks for appliances.
    - f. Terminal strip for interfacing with a building automation system.
  - 4. Accessories:
    - a. Duct probe with tubing and pressure transducer.

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Install products in accordance with manufacturer's instructions.
- B. Install listed components in a manner conforming to the listing.
- C. Install support plates prior to installing inducer fan or dampers.
- D. Install draft inducer fans in single-wall vent section that is designed to couple with other vent materials.
- E. Secure draft inducer fans to appliances, breechings, or stacks with hardware compatible with connected materials.
- F. Install draft inducer fans with clearances for service and maintenance.
- G. Locate flue pressure sensor in vent flue pipe according to the manufacturer installation instructions.
- H. Locate combustion air pressure sensor in the combustion air pipe according to the manufacturer installation instructions. Sensor shall be located in the room with appliances and have flexible tubing extended outside for reference to neutral.
- I. Secure barometric dampers to breechings with hardware compatible with connected materials.
- J. Locate barometric and motorized vent dampers as close to draft hood collar as possible.
- K. Secure barometric and motorized vent dampers to appliances, breechings, or chimneys with hardware compatible with connected materials.

- L. Install PVC intake duct that is sized according to manufacturer's written instructions.
- M. Dryer Vent System Controller:
  - 1. Locate the duct pressure probe in the dryer vent duct according to the manufacturer installation instructions.
  - 2. Wire the pressure transducer to the modulating fan controller.

### 3.2 CONNECTIONS

- A. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems".
- B. Connect wiring according to Division 26 Section "Common Work Results for Electrical".

### 3.3 STARTUP

- A. Engage a factory-authorized service representative to perform startup service.
- B. Complete installation and startup checks according to manufacturer's written instructions.
- C. Electrical: Verify that electrical wiring installation complies with manufacturer's submittal and installation requirements of Division 26 Sections. Do not proceed with startup of fans or equipment served until wiring installation is acceptable to equipment installer.
- D. Remove and replace malfunctioning components and recheck.
- E. Startup: Contractor shall startup and demonstrate operation of system as follows:
  - 1. Start system according to manufacturer's instructions.
  - 2. Operate and adjust controls and safeties.
  - 3. Operate system including accessories and controls, to demonstrate compliance with requirements.

### 3.4 ADJUSTING

- A. Set field-adjustable switches and controls as indicated.

### 3.5 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain draft control devices. Refer to Division 1 and Division 23 Section "General Mechanical Requirements".

### 3.6 TRAINING

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time,

attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.

- D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 52 16 - CONDENSING BOILERS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Manufactured units.
- B. Boiler construction.
- C. Boiler trim.
- D. Fuel burning system.
- E. Factory installed controls.

**1.2 ADMINISTRATIVE REQUIREMENTS**

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.
- B. Sequencing: Ensure that utility connections are achieved in an orderly and expeditious manner.
- C. Water Sample: Conduct a water sample test prior to boiler installation to coordinate the chemical treatment requirements with the water treatment supplier.

**1.3 SUBMITTALS**

- A. General: Submit the following in accordance with the Conditions of the Contract and Division 1 Specification Sections.
- B. Product data including rated capacities of selected models, weights (shipping, installed, and operating), furnished specialties, and accessories; and installation and startup instructions. For boilers with factory-mounted starters, provide short circuit current rating.
- C. Shop drawings detailing fabrication and installation of equipment assemblies. Indicate dimensions, weights, loadings, required clearances, method of field assembly, components, and location and size of each field connection.
  - 1. Wiring diagrams detailing power and control wiring and differentiating clearly between manufacturer-installed wiring and field-installed wiring.
  - 2. AGA design certificates, for information.
- D. Manufacturer's field reports, indicating work supervised and performed and related observations, for information.
  - 1. Indicate compliance with specified performance and efficiency.
  - 2. Provide results of the following combustion tests:
    - a. Boiler firing rate.
    - b. Over fire draft.
    - c. Gas flow rate.
    - d. Heat input.
    - e. Burner manifold gas pressure.
    - f. Percent carbon monoxide.
    - g. Percent oxides of nitrogen.
    - h. Percent oxygen.
    - i. Percent excess air.
    - j. Flue gas temperature at outlet.
    - k. Ambient temperature.
    - l. Net stack temperature.

- m. Percent stack loss.
  - n. Percent combustion efficiency.
  - o. Heat output.
- E. Operation and Maintenance Data: Include manufacturer's descriptive literature, operating instructions, cleaning procedures, replacement parts list, and maintenance and repair data.
- F. Warranty: Submit manufacturer warranty and ensure forms have been completed in Owner's name and registered with manufacturer.
- G. Software: Copy of software provided under this section.

#### **1.4 QUALITY ASSURANCE**

- A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.
- B. NFPA Compliance:
- 1. Comply with NFPA 70 "National Electrical Code" for components and installation.
  - 2. Comply with NFPA 31 "Standard for the Installation of Oil Burning Equipment" for boilers with fuel oil burners.
  - 3. Comply with NFPA 54 "National Fuel Gas Code" for boilers with natural gas burners.
  - 4. Comply with NFPA 58 "Liquefied Petroleum Gas Code" for boilers with propane burners.
- C. Listing and Labeling: Provide products specified in this Section that are listed and labeled.
- 1. The Terms "Listed" and "Labeled": As defined in the "National Electrical Code," Article 100.
  - 2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.
- D. AGA Compliance: Design certified by AGA, tests and ratings according to AGA requirements.
- E. AHRI Compliance: Comply with AHRI 1500 "Performance Rating of Commercial Space Heating Boilers".
- F. ASME Compliance: Fabricate and stamp boilers according to ASME Boiler and Pressure Vessel Code, Section IV, "Heating Boilers." Provide control and safety devices in compliance with locally adopted edition of ASME CSD-1.

#### **1.5 DELIVERY STORAGE AND HANDLING**

- A. Protect boilers from damage by leaving factory inspection openings and shipping packaging in place until final installation.

#### **1.6 WARRANTY**

- A. Refer to Division 01 for additional warranty requirements.
- B. Provide a five year warranty to include coverage for heat exchanger.

### **PART 2 - PRODUCTS**

#### **2.1 MANUFACTURERS**

- A. Variable Primary Flow System Condensing Boilers.
- 1. Aerco.
  - 2. Camus Hydronics.
  - 3. Cleaver Brooks
  - 4. Fulton.

5. Lochinvar.
6. Raypak
7. RBI.
8. Viessmann.

## 2.2 MANUFACTURED UNITS

- A. Factory assembled, factory fire-tested, self-contained, readily transported unit ready for automatic operation except for connection of water, fuel, electrical, and vent services.
- B. Unit: Metal membrane wall, water or fire tube, condensing boiler on integral structural steel frame base with integral fuel burning system, firing controls, boiler trim, insulation, and removable jacket, suitable for indoor application.
- C. Performance Characteristics: Refer to the schedule on the drawings for capacity, efficiency and electrical characteristics.

## 2.3 BOILER CONSTRUCTION

- A. Conform to the minimum requirements of ASME BPVC-IV and ANSI Z21.13 for construction of boilers.
- B. Assembly to bear the ASME "H" stamp and comply with the efficiency requirements of the latest edition of ASHRAE Std 90.1.
- C. Required Directory Listings:
  1. AHRI Directory of Certified Product Performance - Air-Conditioning, Heating, and Refrigeration Institute (AHRI); current edition at [www.ahrinet.org](http://www.ahrinet.org).
  2. NBBI Manufacturer and Repair Directory - The National Board of Boiler and Pressure Vessel Inspectors (NBBI); current edition at [www.nationalboard.org](http://www.nationalboard.org).
- D. Heat Exchanger: Construct with materials that are impervious to corrosion where subject to contact with corrosive condensables.
- E. Provide adequate tappings, observation ports, removable panels, and access doors for entry, cleaning, and inspection.
- F. Insulate casing with insulation material, protected and covered by heavy-gage metal jacket.
- G. Factory apply boiler base and other components, that are subject to corrosion, with durable, acrylic, powder coated or painted.

## 2.4 BOILER TRIM

- A. ASME rated pressure relief valve.
- B. Flow switch.
- C. Electronic Low Water Cut-off: Complete with test light and manual reset button to automatically prevent firing operation whenever boiler water falls below safe level.
- D. Temperature and pressure gage.
- E. Pressure Switches:
  1. High gas pressure.
  2. Low gas pressure.
  3. Air pressure.
- F. Manual reset high limit.
- G. Boiler Pump (where required by boiler design):

1. Primary pump, factory supplied and sized for field installation to ensure minimum, continuous circulation through boiler.
2. Where pump is not provided by boiler manufacturer, provide pump in accordance with boiler manufacturer's recommendations.

## 2.5 FUEL BURNING SYSTEM

- A. Provide forced draft automatic burner or pulse combustion, integral to boiler, designed to burn natural gas and maintain fuel-air ratios automatically.
  1. Blower Design: Statically and dynamically balanced to supply combustion air; direct connected to motor.
  2. Forced Draft Design: Mixes combustion air and gas to achieve minimum 90 percent combustion efficiency.
  3. Pulse Combustion Design: Self-aspirating, not requiring blower for combustion.
  4. Combustion Air Filter: Protects fuel burning system from debris.
- B. Gas Train: Plug valve, safety gas valve, gas-air ratio control valve, and pressure regulator controls air and gas mixture.
- C. Emission of Oxides of Nitrogen Requirements: Comply with local authorities having jurisdiction requirements for nitrous oxide emissions for natural gas fired systems, as applicable.
- D. Intakes: Combustion air intake capable of accepting free mechanical room air or direct outside air through a sealed intake pipe

## 2.6 FACTORY INSTALLED CONTROLS

- A. Option for internal or external (0-10) VDC control.
- B. Temperature Controls:
  1. Automatic reset type to control fuel burning system on-off and modulating firing rate to maintain temperature.
  2. Manual reset type to control fuel burning system to prevent boiler water temperature from exceeding safe system water temperature.
  3. Low-fire start time delay relay.
  4. Flue gas temperature and supply water temperature compensation to prevent boiler over-firing.
- C. Electronic PI setpoint/modulation control system.
- D. Microprocessor-based, fuel/air mixing controls
- E. Controller: Provide a master firing control processor. Processor shall be capable of all boiler operation and efficient staging. The master firing control shall be equipped with open protocol communication according to the drawings and specifications. The processor shall be compatible with the existing or specified control system.
- F. Boiler pump time delay.

## 2.7 SOURCE QUALITY CONTROL

- A. Test and inspect boilers according to ASME Boiler and Pressure Vessel Code, Section IV for low-pressure boilers and Section I for high-pressure boilers.
- B. Provide factory tests to check construction, controls, and operation of unit.
- C. Manufacturer to conduct boiler inspection prior to shipment; submit copy of inspection report to Architect.

**2.8 ACCESSORIES**

- A. Exhaust mufflers (as applicable).
- B. Air supply mufflers (as applicable).
- C. Flow Switch: Furnish field-mounted differential pressure sensor or thermal dispersion flow switch (paddle-type flow switch not allowed).

**PART 3 - EXECUTION****3.1 COORDINATION**

- A. Coordinate layout and installation of boilers with related work.
- B. Furnish copy of manufacturer's wiring diagram submittal to electrical Installer.
- C. Coordinate size and location of concrete housekeeping pads.

**3.2 INSTALLATION**

- A. Install boilers level and plumb, according to manufacturer's written instructions, rough-in drawings, and referenced standards.
- B. Install according to NFPA 54.
- C. Support boilers on concrete pad constructed in accordance with Division 23 section "Common Work Results for HVAC". Cast anchor bolt inserts into pad.
- D. Provide spring vibration isolation mounts where recommended by manufacturer for pulse combustion boilers.
- E. Assemble units and parts shipped loose or disassembled.
- F. Install electrical devices furnished with boiler but not specified to be factory mounted.

**3.3 CONNECTIONS**

- A. Install piping adjacent to boiler to allow service and maintenance.
- B. Connect air intake and exhaust piping to boiler, size as recommended by manufacturer. Provide intake piping material per manufacturer's recommendations unless otherwise noted on the drawings. Refer to Division 23 Section "Breechings, Chimneys, and Stacks" for flue exhaust piping. Pitch toward boiler minimum of 2 percent or as indicated. Provide termination as indicated.
- C. Connect gas piping to boiler according to requirements of Division 22 Section "Natural Gas Systems." Provide union with sufficient clearance for burner removal and service.
  - 1. Install pressure relief lines from the gas train devices to discharge outside of the building. Relief lines shall be black steel pipe with malleable iron fittings one pipe size larger than the relief outlet of the device. Provide turn down with 40 mesh insect screen at discharge. Provide individual relief lines for each gas train device.
  - 2. Install pressure regulators required in the main gas piping a minimum of 10 feet from the burner connections.
- D. Connect hot water piping to supply and return boiler tapings, according to requirements of Division 23 section "Hydronic Piping." Provide shutoff valve and union or flange at each connection.
- E. Connect condensate piping to boiler connection and/or flue stack according to manufacturer's requirements. Install Schedule 40 CPVC pipe and fittings from boiler to nearest floor drain or as

indicated with PH neutralizer. Provide clear plastic tubing between boiler module connection and manifold connection.

- F. Pipe relief valves to nearest floor drain.

### **3.4 CLEANING AND TOUCH-UP PAINTING**

- A. Flush and clean boilers upon completion of installation, in accordance with manufacturer's start-up instructions.
- B. Just prior to substantial completion clean unit's exposed surfaces.
- C. Retouch any marred or scratched surfaces of factory-finished surfaces, using finish materials furnished by manufacturer.

### **3.5 STARTUP**

- A. Arrange with National Board of Boiler and Pressure Vessel Inspectors and/or local authority having jurisdiction for inspection of boiler piping and for certification of completed boiler units.
- B. Provide services of a factory-authorized service representative to provide startup service.
- C. Verify that electrical wiring installation complies with manufacturer's submittal and installation requirements of Division 26 Sections. Do not proceed with boiler startup until wiring installation is acceptable to equipment installer.
- D. Start boilers according to manufacturer's instructions.
- E. Adjust burner for maximum burning efficiency.
- F. Operate and adjust controls and safeties.
- G. Retouch any marred or scratched surfaces of factory-finished surfaces, using finish materials furnished by manufacturer.

### **3.6 DEMONSTRATION**

- A. Provide services of a factory-authorized service representative to demonstrate the operation of the boiler, burner and controls.
- B. Operate boiler, including accessories and controls, to demonstrate compliance with requirements.

### **3.7 TRAINING**

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section. The contractor shall account for all shifts.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 53 23 - BOILER ACCESSORIES****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. Extent of boiler accessories work required by this section is indicated on drawings and schedules, and by requirements of this section.
- B. Types of boiler accessories specified in this section include the following:
  - 1. Safety and relief valves.. Water relief valves.
- C. Refer to other Division-23 sections for boilers, piping, specialties, concrete pads, etc., required for installation of boiler accessories; not work of this section.

**1.2 QUALITY ASSURANCE**

- A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of boiler accessories, of types and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years.
- B. Codes and Standards:
  - 1. ASME Compliance: Construct and install boiler accessories in accordance with ASME "Boiler and Pressure Vessel Code". Install boiler accessories in accordance with ASME B31.1 "Power Piping", or ASME B31.9 "Building Services Piping", as applicable.

**1.3 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical product data, including rated capacities of selected model clearly indicated, weights (shipping, installed, and operating where applicable), furnished specialties and accessories; and installation and start-up instructions.
- B. Shop Drawings: Submit manufacturer's assembly-type shop drawings indicating dimensions, weight loadings, required clearances, and methods of assembly of components.
- C. Wiring Diagrams: Submit ladder-type wiring diagrams for electrically operated boiler accessories. Clearly differentiate between portions of wiring that are factory-installed and portions to be field installed.
- D. Maintenance Data: Submit maintenance data and parts lists for each boiler accessory, including "troubleshooting" maintenance guide. Include this data and product data in maintenance manual; in accordance with requirements of Division 1.

**PART 2 - PRODUCTS AND MATERIALS****2.1 SAFETY AND RELIEF VALVES**

- A. Water Relief Valves: Provide water relief valves as indicated, of size and capacity as selected by Installer for proper relieving capacity, constructed in accordance with ASME Boiler and Pressure Vessel Code.
  - 1. Pressure Relief Valves: Construct of bronze body, metallic disc, metal seat, with non-mechanically guided stem. Set valve to relieve at 10 PSI above operating pressure.
  - 2. Manufacturers: Subject to compliance with requirements, provide water relief valves of one of the following:
    - a. Amtrol, Inc.
    - b. Bell & Gossett ITT.

- c. Spirax Sarco Co.
- d. Watts Regulator Co.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION OF BOILER ACCESSORIES**

- A. Install boiler accessories as indicated, in accordance with manufacturer's installation instructions, and with recognized industry practices, to ensure that boiler accessories comply with requirements and serve intended purposes. Comply with requirements of state and local boiler codes, applicable portions of ASME Boiler and Pressure Vessel Code, and applicable portions of ANSI B31.1 or ASME B31.9.
- B. Coordinate with other work as necessary to interface installation of boiler accessories with other components of heat generation systems.

#### **3.2 SAFETY AND RELIEF VALVES**

- A. Water Relief Valves: Install as indicated on top of boilers. Pipe discharge to floor drain.

#### **3.3 FIELD QUALITY CONTROL**

- A. Flush and clean boiler accessories upon completion of installation, and in accordance with manufacturer's installation instructions.
- B. Hydrostatically test, if required, assemble boiler accessories and piping in accordance with applicable sections of ASME Boiler and Pressure Vessel Code.

END OF SECTION

**SECTION 23 64 16 - CENTRIFUGAL WATER CHILLERS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Chiller Package.
- B. Charge of refrigerant and oil.
- C. Controls and control connections.
- D. Chilled water connections.
- E. Condenser water connections.
- F. Variable frequency drives.
- G. Starters.
- H. Electrical power connections.

**1.2 SUBMITTALS**

- A. Reference Division 01 for general submittal procedures.
- B. Product Data: Provide rated capacities, minimum and maximum chilled water flows, weights (shipping, installed, and operating), specialties and accessories and electrical requirements. Submit manufacturer's ladder type wiring diagrams for interlock and control wiring. Clearly differentiate between portions of wiring that are factory-installed and portions to be field installed. Provide short circuit current rating of factory mounted starter or variable frequency drive.
- C. Shop Drawings: Indicate components, assembly, dimensions, weights and loadings, required clearances, and location and size of field connections. Indicate equipment, piping and connections, valves, strainers, and thermostatic valves required for complete system.
- D. Manufacturer's Certificate: Certify that components of package not furnished by manufacturer have been selected in accordance with manufacturer's requirements.
- E. Test Reports: Indicate energy input versus cooling load output from 0 to 100 percent of full load at specified and minimum condenser water temperature.
- F. Manufacturer's Instructions: Submit manufacturer's complete installation instructions.
- G. Sustainable Design Documentation: Submit manufacturer's product data on refrigerant used, showing compliance with specified requirements.
- H. Operation and Maintenance Data: Include start-up instructions, maintenance data, parts lists, controls, and accessories. Include trouble- shooting guide.
- I. Warranty: Submit manufacturer's warranty and ensure forms have been filled out in Owner's name and registered with manufacturer.
- J. Submit certification of compliance with ASME, UL, AND ASHRAE fabrication requirements specified in "Reference Standards" above.
- K. Submit certification of compliance with performance verification requirements specified in "Reference Standards" above.
- L. Submit field quality control reports specified in PART 3 of this Section.
- M. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
  - 1. Reference Division 01 for additional provisions.

2. Extra Refrigerant: One container.
3. Extra Lubricating Oil: One container.

### 1.3 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum five years documented experience.
- B. Provide certification of inspection in compliance with the requirements of Authority Having Jurisdiction.
- C. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.
- D. Machine Experience: At time of submission of bid or proposal, chiller model proposed must have acquired minimum of 2 years experience on each of 10 field installations, each machine having acquired minimum of 2,400 operating hours.
- E. UL Compliance: Fabricate centrifugal chillers to comply with UL 1995 "Standard for Safety Heating and Cooling Equipment".

### 1.4 DELIVERY STORAGE AND HANDLING

- A. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.
- B. Handle chillers and components properly to prevent damage, breaking, denting and scoring. Do not install damaged reciprocating chillers or components; replace with new. Comply with manufacturer's rigging and installation instructions for unloading chillers, and transporting them to final location.
- C. Store chiller and components in clean dry space. Protect from weather, dirt, fumes, water, construction debris, and physical damage. Storage temperatures for unit controls are not to exceed 185 deg. F.

### 1.5 WARRANTY

- A. Reference Division 01 for additional warranty requirements.
- B. Manufacturer's Special Warranty on Compressor and Electric Motor: Written parts and labor warranty, signed by manufacturer agreeing to repair or replace compressor and/or compressor motor, including replacement of refrigerant.
  1. Warranty Period: Manufacturer's standard, but not less than five years after date of Substantial Completion.
- C. Manufacturer's Special Warranty on Compressor Bearings: Written parts and labor warranty, signed by manufacturer agreeing to repair or replace compressor bearings and related damage including replacement of refrigerant, and including tear down for bearing inspection in the fifth year of operation.
  1. Warranty Period: Manufacturer's standard, but not less than five years after date of Substantial Completion.
- D. General Warranty: Special warranty specified in this Article shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Carrier.
- B. Daikin Applied.
- C. Dunham Bush.
- D. Trane.
- E. York.

**2.2 CHILLERS**

- A. Chillers: Factory assembled and tested, packaged, water cooled, hermetic or open type centrifugal chillers consisting of centrifugal compressors, compressor motors, condenser, evaporator, refrigeration accessories, instrument and control panel including gauges and indicating lights, auxiliary components and accessories, and motor starters. Provide with standard factory-finish.
- B. Rating: Comply with AHRI 550/590 "Performance Rating of Water-Chilling and Heat Pump Water-Heating Packages Using the Vapor Compression Cycle".
- C. Safety: Comply with UL 1995 "Heating and Cooling Equipment".
- D. Comply with ASME BPVC-VIII-1 "Boiler and Pressure Vessel Code, Section VIII, Division 1 - Rules for Construction of Pressure Vessels" for construction and testing of centrifugal chillers.
- E. Comply with ASHRAE Std 15 "Safety Standard for Refrigeration Systems" for safe construction and operation of centrifugal chillers.

**2.3 COMPRESSORS**

- A. Compressor Casing: Fine grain cast iron, horizontally or vertically split with machined passages and leak tested to minimum 150 psig, with gasketed sealed casing joints and refrigerant sight glass.
- B. Impellers: Single or multi-stage, in-line design, fully shrouded, statically and dynamically balanced, cast high strength aluminum alloy, tested to 20 percent over operating speed, designed and assembled for no critical speeds within operating range, mounted on heat treated forged or rolled steel shaft, nonferrous, labyrinth seals between stages.
- C. Guide Vanes: Modulating radial blade dampers on each stage, with externally mounted electric operator, suitable for capacity reduction to 10 percent of specified load without hot gas bypass when supplied with design entering water quantity and temperature.
- D. Bearings: Steel or aluminum journal bearings, pressure lubricated.
- E. Gear Box: Double helical design, symmetrical and center supported by spherically seated, self aligning bearing, arranged for inspection without disassembly.
  - 1. Provide speed increasing transmissions for variable speed chillers to not exceed 10,000 rpm compressor speed.
- F. Motor: Hermetically sealed or open type, designed for single or variable speed as defined on the Drawings, low slip, squirrel cage, induction type. Full load operation of the motor shall not exceed nameplate rating. Rotor shaft shall be heat treated carbon steel and designed such that the first critical speed is well above the operating speed. Provide for removal of the stator for service or replacement without breaking the main refrigerant piping connections.

- G. Lubrication: Provide forced circulation type lubrication system with positive displacement submerged oil pump, with oil cooler if required for proper performance, pressure regulator, replaceable oil filters, thermostatically controlled oil heater, and motor controls. System shall provide positive pressure lubrication of journals, bearings and seals (if any), during start-up, operation, and coast-down of chiller, including power interruptions. Interlock to start before chiller motor and run after motor is shut down. On units with two compressors provide redundant oil pump. Provide sight glass or electronic sensors for monitoring oil level.
- H. Refrigerant: Factory pre-charge unit with refrigerant.

## 2.4 EVAPORATOR

- A. Provide evaporator of shell and tube type, seamless or welded steel, seamless copper tubes with integral individually replaceable fins, rolled or silver brazed into tube sheets. Position intermediate tube support sheets along length of shell to avoid contact and relative motion between adjacent tubes. Tubes shall be removable from either end of the heat exchanger without affecting the strength and durability of the tube sheets and without causing leakage in adjacent tubes.
- B. Hydronic Piping Connections: Integral to the water heads with flanged or grooved connections.
- C. Test and, where applicable, stamp refrigerant side for 150 psig working pressure and water side for working pressure as scheduled on the drawings, in accordance with ASME BPVC-VIII-1.
- D. Provide marine type water boxes, machine welded to heat exchanger with tapped drain and vent connections, and flanged or mechanical joint connections arranged to permit inspection of tubes from either end without disturbing refrigerant and removable without disturbing water piping. Tube cleaning shall be within space shown on the drawings.
- E. Provide thermometer wells or thermistors for temperature controller and low temperature cutout. Provide suitable tappings for control sensors and gauges.
- F. Design and construct evaporator to prevent liquid refrigerant from entering the compressor.
- G. Provide carbon rupture disc or relief valve on shell in accordance with ASHRAE Std 15.
- H. Provide pressure limiting devices in accordance with ASHRAE Std 15.
- I. Construction and materials to comply with ASME BPVC-VIII-1 or ASHRAE Std 15 as applicable to chiller manufacturer and chiller model.

## 2.5 CONDENSERS

- A. Provide condensers of shell and tube type, seamless or welded steel construction with fabricated steel heads, seamless copper tubes with integral fins, rolled or silver brazed into tube sheets. Position intermediate tube support sheets along shell length to avoid contact and relative motion between adjacent tubes. Tubes shall be removable from either end of the heat exchanger without affecting the strength and durability of the tube sheets and without causing leakage in adjacent tubes.
- B. Hydronic Pipe Connections: Integral to the water heads with flanged or grooved connections.
- C. Test and, where applicable, stamp refrigerant side for 150 psig working pressure and water side for working pressure as scheduled on the drawings; in accordance with ASME BPVC-VIII-1.
- D. Provide marine type water boxes, machine welded to heat exchanger with tapped drain and vent connections, and flanged or mechanical joint connections arranged to permit inspection of tubes from either end without disturbing refrigerant and removable without disturbing water piping. Tube cleaning shall be within space shown on the drawings.
- E. Provide carbon rupture disc or relief valve on shell in accordance with ASHRAE Std 15.
- F. Provide pressure limiting devices in accordance with ASHRAE Std 15.

- G. Provide baffles to ensure even distribution of incoming gas and to concentrate non-condensable gases.
- H. Construction and materials to comply with ASME BPVC-VIII-1.

## 2.6 PURGE SYSTEM

- A. Provide purge system on positive pressure units, incorporating a low temperature refrigeration system to automatically remove non-condensable gases, water and air, and for condensing, separating, and returning refrigerant to the system.
- B. Provide all necessary devices to automatically isolate purge system from chiller.
- C. System discharge shall be maximum 0.60 pound of refrigerant per pound of air discharged.

## 2.7 INSULATION

- A. Insulate evaporators and other cold surfaces to prevent condensation, with ambient humidity of 75 percent and dry-bulb temperature of 90 deg. F, no air movement.
- B. Insulate condensers used for free cooling, heat recovery or heat pump operation with minimum 1" thick insulation.
- C. Provide manufacturer's standard insulation material.

## 2.8 CONTROLS

- A. Disconnect Switch: As indicated on the drawings.
- B. Flow Switch: Furnish field-mounted differential pressure sensor or thermal dispersion flow switch (paddle-type flow switch not allowed)
- C. Refrigerant Flow Control Devices:
  - 1. Provide refrigerant flow control devices between evaporator and condensers (and elsewhere as required) to regulate refrigerant flow at volume and pressure required to maintain evaporator liquid refrigerant at level sufficient to keep cooler heat transfer tubes adequately wetted through full range of chiller operation.
  - 2. Design devices to permit chiller operation at scheduled conditions, and to allow condenser entering water temperature to decrease to minimum permissible temperature or 1 deg. F above return chilled water temperature.
- D. Capacity Control:
  - 1. Designed and fabricated to regulate evaporator leaving water temperature. Design for capacity modulation, from full load to scheduled minimum load capacity under normal operating conditions, without overshooting and without hunting at scheduled throttling range.
- E. Safeties and diagnostics:
  - 1. Provide electronic overloads and indicating light, current fault protection and indication light, power failure indication light, high temperature protection and indication light, transient voltage protection insensitive to input phase sequence, phase loss protection, diagnostic test switches, and hinged access doors with key lock.
- F. Provide microprocessor-based control panel, factory-mounted and wired, containing solid state, fully automatic operating and safety controls. Provide proportional integral derivative (PID) control strategies. Provide operator interface that accesses chiller information and control adjustments at the face of the control panel.
- G. Provide communications port to communicate with the building management system with BACNet or LONWorks compatible interface for chiller monitoring, control and data gathering. Coordinate with the building controls contractor the exact building management system requirements.

- H. Provide electrical interlock to prevent chiller operation when chilled water pump(s) and/or condenser water pump(s) are not operating.
- I. Provide the following manufacturer's standard safety controls, including the following minimum functions, so that operating any one will shut down machine and require manual reset:
  - 1. Low evaporator refrigerant temperature.
  - 2. High condenser refrigerant pressure.
  - 3. Low oil pressure.
  - 4. Low refrigerant (evaporator) pressure.
  - 5. High compressor discharge temperature.
  - 6. Low evaporator leaving water temperature (freeze-stat).
  - 7. High motor temperature.
  - 8. High bearing temperature.
  - 9. High oil temperature.
  - 10. Compressor motor overcurrent or over voltage.
  - 11. Power interruption.
- J. Include anti-recycle timer, factory wired to control panel, limiting compressor motor restarts at time intervals as recommended by manufacturer.
- K. Provide the manufacturer's standard safety controls arranged so that operating any one will shut down machine and automatically reset.
- L. Provide a diagnostic module capable of indicating all lockout conditions specified above, plus recording the elapsed time (pre-alarm to alarm), the operating conditions of the compressor motor (amperes), refrigerant temperatures and pressures, and chilled and condenser water temperatures (entering and leaving) at the time of lockout.
- M. Provide the following devices on control panel:
  - 1. Manual Switches:
    - a. Machine off-auto switch.
    - b. Oil pump switch (manual or automatic).
    - c. Purge pump switch (manual-off-auto).
    - d. Machine selector switch to allow load, unload, hold or automatic operation.
  - 2. Manual Set Point Adjustments:
    - a. Leaving chilled water temperature.
    - b. Current demand limit.
  - 3. Status Lights:
    - a. Chilled water flow proven.
    - b. Cooling required.
    - c. Unit running.
    - d. Unit loading.
    - e. Unit unloading.
    - f. Manual reset required.
    - g. Remote chilled water set point active.
    - h. Remote current water set point active.
  - 4. Setpoint and Temperature Display:
    - a. Chilled water set point.
    - b. Current limit set point.
    - c. Entering evaporator water temperature.
    - d. Leaving evaporator water temperature.
    - e. Entering condenser water temperature.
    - f. Leaving condenser water temperature.
  - 5. Dial Type Pressure Gauges:
    - a. Evaporator refrigerant pressure.
    - b. Condenser refrigerant pressure.
    - c. Low oil pressure (oil sump).
    - d. High oil pressure (oil supply).

- N. Provide the following operating controls:
1. Solid state, chilled water temperature controller that controls electronic guide vane operator or compressor speed. Locate temperature sensor in entering chilled water.
  2. Adjustable thirty minute off timer prevents compressor from short cycling.
  3. Demand limit device to manually set maximum current infinitely between 40 percent and 100 percent of full load amperes.
  4. Automatic start that determines demand for chilled water from proof of chilled water flow and temperature differential between chilled water set point and supply temperature.
  5. Solenoid valve between heat recovery condenser and receiver to limit refrigerant level in condenser.
  6. Provide controls to ensure that compressor will start only under unloaded condition.
  7. Provide sequencing controls to ensure lubrication of compressor motor bearings and seals (if any). Sequence as follows:
    - a. Run lubrication system oil so that compressor motor bearing is lubricated before start-up,
    - b. Start compressor motor,
    - c. Provide lubrication during coast-down after compressor motor shut-down.
  8. Provide modular electronic or solid state controls.
  9. Design controls to automatically restart compressor after power failure interruptions, provided minimum time between starts has been complied with.

## 2.9 SOUND

- A. For water-cooled indoor chillers, sound pressure and/or power level ratings shall comply with AHRI Standard 575 "Method of Measuring Machinery Sound within Equipment Space".
- B. Maximum Permissible Sound Pressure Level (SPL): Use 0.0002 microbar as reference. SPL measurements shall be taken in multiple directions that uniformly cover 360 degrees. Measurements shall be taken at a distance from the unit as specified in the applicable AHRI Standard. Unit shall be operating at full load under standard AHRI ambient and water temperature conditions and within the installation parameters set forth by the applicable AHRI Standard.
- C. Do not exceed the maximum permissible dB level in any of the following octave bands:

Sound, dB	63Hz	125Hz	250Hz	.5kHz	1kHz	2kHz	4kHz	8kHz	LwA
Pressure	--	--	--	--	--	--	--	--	--
Power	--	--	--	--	--	--	--	--	--

## 2.10 VIBRATION ISOLATION

- A. Provide devices of type and size recommended by chiller manufacturer and as required in Division 23 Section "Vibration Isolation for HVAC."

## 2.11 VARIABLE FREQUENCY DRIVE (VFD) UNIT MOUNTED

- A. Furnish chiller with factory-mounted, liquid-cooled variable frequency drive (VFD) shipped completely factory-assembled, wired, and tested.
- B. Specifically design VFD to interface with the centrifugal water chiller controls and allow for the operating ranges and specific characteristics of the chiller. VFD control logic is to optimize chiller efficiency by coordinating compressor motor speed and compressor inlet guide vane position to maintain the chilled water setpoint while avoiding surge. If surge is detected, VFD surge avoidance logic shall adjust chiller operation to move away from and avoid surge at similar conditions in the future.
- C. VFD Efficiency: 97 percent or better at full speed and full load.
- D. Fundamental Displacement Power Factor: Minimum of 0.96.

- E. Provide voltage and current regulated, solid state, microprocessor-based pulse-width modulated (PWM) VFD. Output power devices to be IGBT transistors.
- F. Provide liquid-cooled heatsink to cool the power semi-conductor and capacitor.
- G. Provide cleanable shell and tube heat exchanger with water-cooled design. Do not provide plate and frame heat exchanger.
- H. Furnish VFD in a NEMA Type 1 metal enclosure having a minimum short circuit withstand rating of 65,000 amps per UL 508. Include three phase input lugs plus a grounding lug for electrical connections, output motor connection via factory-installed bus bars and all components properly segregated and completely enclosed in a single, metal enclosure.
  - 1. Enclosure to include a pad lockable, door-mounted circuit breaker with shunt trip and AIC rating of 65,000 amps.
  - 2. Entire chiller package to be listed by Underwriter's Laboratories Inc.
- I. VFD to be tested according to UL 508 and listed by a Nationally Recognized Testing Laboratory (NRTL) as designated by OSHA.
- J. Comply with recommendations stated in IEEE 519 "Recommended Practice and Requirements for Harmonic Control in Electric Power Systems".
  - 1. Include integrated active rectification control system to limit total demand distortion (TDD) in current at the VFD to less than or equal to 5 percent as measured at the VFD input. If active filters are used to meet this requirement, then the losses associated with the filter are to be included in the chiller performance on the selection.
- K. Fundamental Displacement Power Factor: Minimum of 0.96.
- L. Voltage Input: Nominal 480 volts, three phase, 60 hertz AC, plus or minus 10 percent of nominal voltage.
- M. Line Frequency: 38 to 60 hertz.
- N. VFD to include the following:
  - 1. All control circuit voltages physically and electrically isolated from power circuit voltage.
  - 2. 150 percent instantaneous torque available for improved surge control.
  - 3. Soft start, adjustable linear acceleration, coast-to-stop.
  - 4. Adjustable current limiting and UL approved electronic motor overload protection.
  - 5. Insensitivity to incoming power phase sequence.
  - 6. VFD and motor protection from the following faults:
    - a. Output line-to-line short circuit.
    - b. Line-to-ground short circuit.
    - c. Phase loss at VFD input.
    - d. Phase reversal/imbalance.
    - e. Over-voltage.
    - f. Under-voltage.
    - g. Over-temperature.
- O. Include the following VFD status indicators available to facilitate startup and maintenance:
  - 1. Output speed in hertz and rpm.
  - 2. Input line voltage.
  - 3. Input line kW.
  - 4. Output/load amps.
  - 5. Average current in percent RLA.
  - 6. Load power factor.
  - 7. Fault.
  - 8. VFD transistor temperature.
- P. Service Conditions (at full output power; no external venting or heat exchangers required):
  - 1. Operating Ambient Temperature: Between 32 degrees F and 104 degrees F.
  - 2. Room Ambient Relative Humidity: Up to 95 percent.

3. Elevation: Up to 3,300 feet. For every 300 feet above 3,300 feet, decrease the rated output current by one percent.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Examine areas to receive chillers for compliance with installation tolerances and other conditions affecting performance and maintenance of chillers.
- B. Examine proposed route of moving chillers into place and verify that it is free of interference.
- C. Verify piping roughing-in locations.
- D. Verify branch circuit wiring suitability. Do not proceed with installation until unsatisfactory conditions have been corrected.

#### **3.2 INSTALLATION**

- A. Install in accordance with manufacturer's installation instructions.
- B. Install chillers plumb and level, and anchor. Support units using the vibration control devices. Vibration control devices are specified in Division 23 Section "Vibration Isolation for HVAC Piping and Equipment."
- C. Coordinate the size and location of concrete equipment pads. Cast anchor bolt inserts into pad.
- D. Install vibration isolators according to isolator manufacturer's written instructions.
- E. Install chiller accessories which have been shipped loose or unassembled for shipment purposes.
- F. Maintain manufacturer's recommended clearances for servicing and maintenance.
- G. Piping installation requirements are specified in other sections of Division 23. The Drawings indicate the general arrangement of piping, fittings, and specialties.
- H. Install piping adjacent to machine to allow servicing and maintenance.
- I. Provide flanged or grooved evaporator connections to chilled water piping with accessories as indicated in the details on the drawings.
- J. Furnish and install necessary auxiliary water piping for oil cooling units and purge condensers.
- K. Insulate evaporator and cold surfaces that are not factory insulated.
- L. Insulate condensers used for free cooling, heat recovery or heat pump operation that are not factory insulated.
- M. Provide flanged or grooved condenser connections to condenser water piping with accessories as indicated in the details on the drawings. Arrange piping to allow removal of condenser heads.
- N. Arrange piping for easy dismantling to permit tube cleaning.
- O. Provide piping from chiller rupture disc to outdoors. Size as recommended by manufacturer.
- P. Provide drain piping as indicated from rupture disc or relief valve to suitable drain.

#### **3.3 ELECTRICAL CONNECTIONS**

- A. Refer to Division 26 Sections for wiring devices, wires and cables, and electrical installation requirements.
- B. Install and connect proof of flow device switches.

- C. Provide for connection of electrical wiring between starter and chiller control panel, oil pump, and purge unit.
- D. Ground equipment.
  - 1. Tighten electrical connectors and terminals, including grounding connections, according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

### **3.4 MANUFACTURER S FIELD SERVICES**

- A. Provide services of a factory-authorized service representative to supervise field assembly of components and installation of chillers, including piping, electrical and control connections, and to report results in writing.
- B. Supply initial charge of refrigerant and oil if not completely factory charged.
- C. Demonstrate system operation and verify specified performance.
- D. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.

### **3.5 CLEANING**

- A. Clean finishes to remove dust and dirt.
- B. Touch up scratches in unfinished surfaces to restore corrosion resistance.
- C. Touch up scratches in finished surfaces to restore finish.

### **3.6 STARTUP**

- A. Provide services of factory trained representative for minimum of one day to leak test, refrigerant pressure test, evacuate, dehydrate, charge, start-up, and calibrate controls.
- B. Start-up Service:
  - 1. Evacuate, dehydrate, vacuum pump and charge with specified refrigerant, and leak test in accordance with manufacturer's instructions, if not factory charged.
  - 2. Perform lubrication service, including filling of reservoirs, and confirming that lubricant is of quantity and type recommended by manufacturer.
  - 3. Do not place chillers in sustained operation prior to initial balancing of mechanical systems for interface with chillers.

### **3.7 TRAINING**

- A. Train operating personnel in operation and maintenance of units.
- B. Provide the services of the manufacturer's field representative to conduct training.
- C. At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of eight hours on the operation and maintenance of the equipment provided under this section.
- D. Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."

- E. Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- F. Schedule training with Owner with at least 7 days' advance notice.

**3.8 MAINTENANCE**

- A. Provide a separate maintenance contract for specified maintenance service.
- B. Furnish service and maintenance of complete assembly for one year from Date of Substantial Completion.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 65 00 - COOLING TOWERS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Cooling Tower:
  - 1. Induced-draft, propeller fan, crossflow.
- B. Controls:
  - 1. Interlock wiring specified as factory-installed is work of this Section

**1.2 SUBMITTALS**

- A. Product Data: Submit manufacturer's technical product data, including rated capacities; pressure drop, fan performance data, weights (shipping, installed, and operating), installation and start-up instructions, and rating curves with selected points clearly indicated. Provide short circuit current rating of factory mounted starter or variable frequency drive.
- B. Shop Drawings: Submit assembly-type shop drawings indicating dimensions, weight loadings, required clearances, and methods of assembly of all components.
- C. Wiring Diagrams: Submit manufacturer's electrical requirements for power supply wiring to cooling towers. Submit manufacturer's ladder-type wiring diagrams for interlock and control wiring. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
- D. Maintenance Data: Submit maintenance data and parts list for each cooling tower, control, and accessory; including "trouble- shooting" maintenance guide. Include this data, product data, shop drawings, and wiring diagrams, in operation and maintenance manual; in accordance with requirements of Division 1.
- E. Certifications: Submit required certifications and written tests results for required testing.
- F. Warranty: Submit manufacturer's warranty and ensure forms have been filled out in Owner's name and registered with manufacturer.

**1.3 QUALITY ASSURANCE**

- A. CTI Certification:
  - 1. CTI ATC-105 Acceptance Test Code for Water Cooling Towers: Provide manufacturer's certification of tower cooling capacity in compliance with CTI ATC-105 -, based on factory-performance tests, and provide performance curve plotting Leaving-Water Temperature (LWT) against Wet-Bulb Temperature (WBT).
  - 2. CTI ATC-128 Test Code for Measurement of Sound from Water Cooling Towers: Provide manufacturers certification of tower sound output in accordance with CTI ATC-128.
- B. Certify tower wind resistance to withstand pressure indicated, in any direction.
- C. Certify earthquake resistance against loading as indicated.

**1.4 REGULATORY REQUIREMENTS**

- A. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.

**1.5 DELIVERY STORAGE AND HANDLING**

- A. Factory assemble entire unit. For shipping, disassemble into as large as practical sub-assemblies so that minimum amount of field work is required for re-assembly.
- B. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.

**1.6 WARRANTY**

- A. One-year warranty after start-up, or eighteen months from date of shipment, whichever occurs first. Warranty to include coverage for defects in material and workmanship.
- B. Provide a five year warranty on fan assembly including fan, drive and motor.
- C. The entire tower, including structure, casing, basins, decking, fan(s), motor(s), and all mechanical drive components (including belts, if used) shall be warranted against failure due to defects in materials and workmanship for a period of five (5) years from the date of shipment to the job.
- D. Factory applied and polyurethane liner shall be warranted against failure due to defects in materials and workmanship for a period of ten (10) years from the date of shipment to the job

**1.7 SPARE PARTS**

- A. General: Furnish to Owner, with receipt, the following spare parts:
  - 1. One spare set of matched fan belts for each belt driven fan.
  - 2. Three spare spray nozzles for each tower cell.
  - 3. One spare gasket for each gasketed access and inspection opening.
  - 4. One valve seat for mechanical water make-up valve.

**PART 2 - PRODUCTS****2.1 MANUFACTURERS**

- A. Baltimore Aircoil Co., Inc.
- B. Evapco Inc.
- C. Marley (The) Cooling Tower Co.

**2.2 MANUFACTURED UNITS**

- A. Fabricate cooling towers using manufacturer's standard design, materials, and construction in accordance with published product information, except as otherwise indicated.

**2.3 STRUCTURAL SYSTEM**

- A. Design structural system for the following live loading in addition to tower dead-loads and operating-loads:
  - 1. Wind Loading: 30 psf on exposed vertical surfaces.
  - 2. Shipping and Hoisting Load: 2g horizontal and 3g vertical.
  - 3. Live Load: Fan deck and hot water basin cover shall be designed for 50 psf live load or 200 lb. concentrated load.
  - 4. Fabricate structural system including assembly of collecting basin and steel casings by one of the following methods:
    - a. Bolt connections with fasteners having equal or better corrosion-resistance than materials fastened; seal joints to make watertight enclosure.
    - b. Weld connections and weld metal seams continuously to make watertight.
- B. Rigging supports:

1. Provide rigging supports on structure for final rigging.

## 2.4 COMPONENTS

- A. Pan and Casing:
  1. Collecting basin and sump:
    - a. Provide the following materials and types of units, designed and installed to support water and to ensure water tightness:
      - 1) Provide stainless steel.
      - 2) Provide integral type collecting basin and sump with lift-out strainer with openings smaller than nozzle orifices.
    - b. Provide the following connections at locations where shown on the drawings:
      - 1) Drain, overflow and water make-up.
      - 2) Bottom outlet.
      - 3) Bottom equalizer connection.
      - 4) Flume box with all hardware, gaskets flume and cover plate.
      - 5) Side bypass.
  2. Casings, Frame and Fan Deck:
    - a. Provide the following materials fabricated and installed by manufacturer to make tower watertight:
      - 1) Provide stainless steel.
- B. Fans:
  1. Fans and Drives:
    - a. Fans and drives shall be installed by manufacturer.
    - b. Fan: Select fan to meet specified sound ratings.
      - 1) Cast-aluminum propeller-fan of adjustable-pitch type.
    - c. Drive:
      - 1) V-belt drive: Designed for minimum 150 percent motor nameplate power. Fabricate fan and motor sheave(s) from corrosion-resistant materials to minimize maintenance and ensure maximum drive and powerband operating life. Provide bearings with minimum L-10 life of 80,000 hours per ABMA STD 11. Belt tension must be easily adjusted in the field.
    - d. Driveshaft:
      - 1) Composite steel epoxy coated for corrosion resistance.
      - 2) Type 304 stainless steel.
      - 3)
    - e. Hub Connection:
      - 1) Stainless steel.
  2. Fan bearings:
    - a. Provide the following types installed by manufacturer.
      - 1) Provide self-aligning ball bearings; include external extended grease lines, and fittings.
- C. Motor:
  1. .
  2. Motor Type: Provide totally enclosed, air over, energy efficient type motor.
  3. Motors driven by variable frequency drives shall be inverter duty type, rated for use with variable frequency drives.
  4. Motors: Refer to Section "Common Motor Requirements for HVAC Equipment" for additional requirements.
- D. Fan Guard:
  1. Welded steel rod and wire guard, hot dipped galvanized after fabrication.
- E. Safety:
  1. Handrails:

- a. Provide galvanized steel pipe rails of required height above tower. Include knee and toe rails of required diameter and heights.
  2. Ladders:
    - a. Provide galvanized steel or aluminum ladder, to top of cooling tower working surface.
- F. Distribution Section:
  1. Provide gravity flow type water distribution system installed by manufacturer to ensure even distribution of water over wetted-surface-fill.
  2. Provide the following materials designed and installed by manufacturer for the water distribution system.
    - a. Distribution basin: Open basin constructed of Stainless steel.
    - b. Piping: Schedule 40 PVC pipe header and removable schedule 40 PVC pipe branches.
    - c. Nozzles: Provide removable plastic, brass, or ceramic nozzles.
    - d. Provide weir dams or metering nozzles to provide at least 50 percent turndown capability.
    - e. Pressure Drop: Maximum pressure drop of 5 psi.
  3. Basin Covers:
    - a. Provide basin covers materials, removable and with handles, installed by manufacturer to prevent debris from entering the basin and to inhibit algae growth by eliminating sunlight:
    - b. Provide series 300 stainless steel.
  4. Inlet Connection:
    - a. Inlet connections on each distribution basin arranged for flanged pipe connection.
    - b. Single bottominlet connection with internal self-balancing distribution piping provided by manufacturer.
  5. Flow Control Valves
    - a. Provide butterfly valves for balancing flow to each distribution basin, and for shut-off during servicing
- G. Fill:
  1. Provide the following materials fabricated into wave-formed configurations installed by manufacturer to assure break-up of water into droplets:
    - a. Provide vertical sheets of polyvinyl chloride plastic having flame spread rating of 5 per ASTM E 84.
- H. Drift Eliminators:
  1. Provide the following materials fabricated by manufacturer into three-pass configuration to limit drift-loss to indicated maximum percentage of circulating-water flow-rate:
    - a. Provide polyvinyl chloride plastic, having flame spread rating of 5 per ASTM E 84.
- I. Inlet Screens:
  1. Provide the following materials, mounted in removable frames by manufacturer:
    - a. Provide PVC screens in series 300 stainless steel frames.
- J. Sound Attenuators:
  1. Provide the following materials, factory-fabricated and mounted by manufacturer at intake and discharge of tower, lined with waterproof sound-absorbent non-combustible material held in place by manufacturer's standard method except as otherwise indicated:
    - a. Line attenuators with glass fiber.
    - b. Secure lining with galvanized steel retainers.
    - c. Secure lining with series 300 stainless steel retainers.
- K. Service Access: Provide access doors, ladders and platforms for service of the cooling tower components.
  1. Access Doors: Provide hinged access doors on each cased face for entry into the cold-water basin. Include an internal walkway for inspection and maintenance.

2. Access Door Platform: Provide an external galvanized steel access platform at the access door of the unit(s). Provide an aluminum ladder and 1-1/4 inch (32 mm) galvanized steel pipe safety railing is included with the platform.
  3. Fan Deck Ladder with Handrails: Provide an aluminum ladder with steel safety cage and safety gate for access to the fan deck. 1-1/4 inch galvanized steel pipe handrail shall be provided around the perimeter of the cooling tower cells. The handrails shall be provided with knee and toe rails and shall conform to OSHA requirements applicable at the time of shipment.
  4. Internal Service Platform: Provide an internal platform in the plenum section to provide for inspection and maintenance of internal components and drive system.
  5. Louver Face External Platforms: Provide platforms and ladders for access to the hot water basins for inspection of spray water distribution.
- L. Water Level Control:
1. Liquid Level Switch:
    - a. Electric Probe Type:
      - 1) Stainless steel construction with minimum wire lead length required to adjust probe height for appropriate water level control.
      - 2) Provide individual probes to meet the required control points specified on the drawings.
- M. Vibration Cutout Switch:
1. Provide switch to de-energize fan motors if excessive vibration occurs due to fan imbalance.
  2. Provide enclosure NEMA rated for installation location.
  3. Provide vibration detection with sensitivity applicable to protect the proper operation of the fan system.
- N. Coatings:
1. Apply phosphatized pretreatment on zinc coated surfaces which have not been mill-phosphatized or polymer-coated. Apply gasoline-soluble rust preventative compound on ferrous parts which cannot be galvanized, including shafts and machined parts.
  2. Finish components with zinc-coated metal surfaces by one of the following methods:
    - a. Coat abraded areas and welded areas with galvanizing repair paint. Finish-paint exposed surfaces with zinc chromated paint.
    - b. Provide 2-1/4 oz. (per sq. ft. of sheet) zinc coating on basin and sump, after fabrication, by hot-dip galvanizing process. Coat abraded areas and welded areas of work with galvanizing repair paint.
    - c. Apply to metal surfaces not galvanized, zinc-rich paint which has been tested and accepted by UL as being equivalent to hot-dipped galvanized steel.
- O. Maximum Permissible Sound Pressure Level:
1. Use 0.0002 microbar as reference. Measure at 50' in several directions, uniformly covering 360 degrees. Do not exceed maximum permissible dB level, each of the following octave bands:

63 Hz	109	dB
125 Hz	110	dB
250 Hz	109	dB
500 Hz	103	dB
1000 Hz	99	dB
2000 Hz	94	dB
4000 Hz	90	dB
8000 Hz	87	dB

## 2.5 ACCESSORIES

- A. Electric Immersion Heaters: In pan suitable to maintain temperature of water in pan at 40 degrees F when outside temperature is 0 degrees F and wind velocity is 15 mph; immersion thermostat and float control operate heaters on low temperature when the pan is filled.
- B. Time Delay Relay: Limits fan motor starts to not more than six per hour.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine cooling towers before installation. Reject cooling towers that are damaged.
- B. Examine areas to receive equipment for compliance with requirements for installation tolerances and other conditions affecting unit performance.
- C. Final locations of equipment on the Drawings are approximate, unless dimensioned. Determine exact locations before roughing-in piping and electrical work.
- D. Examine proposed route of moving equipment into place and verify that it is free of interferences.
- E. Verify piping rough-in locations.
- F. Verify branch circuit wiring suitability.
- G. Do not proceed with installation until unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION

- A. General: Install cooling towers where indicated, in accordance with equipment manufacturer's written instructions and with recognized industry practices, to ensure that cooling towers comply with requirements and serve intended purposes.
- B. Access: Provide access and service space around and over cooling towers as indicated, but in no case less than that recommended by manufacturer.
- C. Support: Install grade-mounted units on structural steel mechanical equipment stand. Anchor cooling tower to stand with removable fasteners. Coordinate tower structure with tower manufacturer and structural engineer. Account for tower cell location, spacing, etc.
  - 1. Mechanical equipment stand is specified in Division 5; not work of this Section.
- D. Placement: Install vibration isolators according to isolator manufacturer's recommendations. Refer to Division 23 Section "Vibration Isolation for HVAC" for vibration isolation requirements.
  - 1. Install gaskets or sealants between cooling tower cells.
  - 2. Level units to tolerance of 1/8" in 10'-0", in both directions.

### 3.3 CONNECTIONS

- A. Condenser Water Piping: Refer to Division 23 section "Hydronic Piping".

1. Provide flanged or union connections to cooling tower, with flexible pipe connections if tower is mounted on vibration isolators.
  2. Pitch lines so water will drain into sump.
  3. Connect inlets to cooling tower with shutoff valve, and balancing valve (if 2 or more inlets).
  4. Connect outlets with shutoff valves.
- B. Make-up and Water Piping: Refer to Division 22 section "Water Distribution Piping and Specialties".
1. Provide flanged or union connections to cooling tower, with flexible pipe connections if tower is mounted on vibration isolators.
  2. Pitch lines so water will drain into sump.
  3. Connect to automatic fill valve with 3-valve bypass, and backflow preventer.
- C. Drain Piping: Refer to Division 22 section "Sanitary Drainage and Vent Piping and Specialties".
1. Connect drain, overflow, and bleed lines to cooling tower as indicated, full size of connection on cooling tower.
- D. Refer to Division 26 Sections for wiring devices, wires and cables, and electrical installation requirements.

### 3.4 FIELD QUALITY CONTROL

- A. Provide the services of the manufacturer's field representative to inspect tower after installation and submit report prior to start-up, verifying installation is in accordance with specifications and manufacturer's recommendations.
- B. Test for capacity under actual operating conditions in accordance with CTI ATC-105 and verify specified performance.
- C. All seams on the tower and tower basin shall be properly sealed to avoid leaks. Contractor shall coordinate with manufacturer to correct any leaks prior to commencing water treatment.

### 3.5 CLEANING AND TOUCHUP

- A. Cleaning:
1. Clean inside of cooling tower thoroughly before filling for start-up.
  2. Clean factory-finished surfaces.
- B. Touchup:
1. Coated Surfaces: Repair any marred or scratched surfaces with manufacturer's touch-up paint or coating.

### 3.6 SYSTEM STARTUP

- A. Start-up tower in presence of Owner's operating personnel.
- B. Start-up: Comply with manufacturer's instructions for filling and start-up of operation, but not less than the following:
1. Verify lubrication of rotating parts; lubricate as needed.
  2. Verify fan rotation direction.
  3. Verify that motor amperage is in accordance with manufacturer's data.
  4. Balance condenser water flow to each tower, and to each inlet for multiple inlet towers.
  5. Adjust water level control for proper operating level.
  6. Adjust bleed valve for percentage of circulated water volume recommended by tower Water Treatment Consultant.
  7. Balance equalizer lines between multiple towers (if any).
  8. Adjust temperature controls and verify operation.
  9. Ensure chemical treatment system is installed, tested and operational prior to filling cooling tower.

**3.7 TRAINING**

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**SECTION 23 72 00 - AIR-TO-AIR ENERGY RECOVERY EQUIPMENT****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Heat wheels.

**1.2 SUBMITTALS**

- A. Product Data: Include rated capacities, furnished specialties, and accessories. Provide short circuit current rating of units with factory mounted starter or variable frequency drive.
- B. Shop Drawings:
  - 1. Include plans, elevations, sections, details, and attachments to other Work.
  - 2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.
  - 3. Wiring Diagrams: Power, signal, and control wiring.
- C. Manufacturer's Instructions: Indicate assembly, support details, connection requirements, and include start-up instructions.
- D. Operation and Maintenance Data: Submit maintenance data and parts list for each unit, including "trouble-shooting" maintenance guide, servicing guide and preventative maintenance schedule and procedures. Include this data in maintenance manual; in accordance with requirements of Division 1.
- E. Warranty: Submit manufacturer's warranty and ensure forms are completed in Owner's name and registered with manufacturer.
- F. Field quality-control test reports.

**1.3 QUALITY ASSURANCE**

- A. Source Limitations: Obtain air-to-air energy recovery units through one source from a single manufacturer.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of air-to-air energy recovery units and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100.
- D. AHRI Compliance: Capacity ratings for air-to-air energy recovery equipment shall comply with AHRI 1060 "Performance Rating of Air-to-Air Heat Exchangers for Energy Recovery Ventilation Equipment".
- E. ASHRAE Compliance: Capacity ratings for energy recovery devices shall comply with ASHRAE 84 "Method of Testing Air-to-Air Heat Exchangers".
- F. NRCA Compliance: Roof curbs for roof-mounted equipment shall be constructed according to recommendations of NRCA.

#### 1.4 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 23 Section "Common Work Results for HVAC".

#### 1.5 SPARE PARTS

- A. Furnish spare parts described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Filters: Furnish one set of each type of filter specified.
  - 2. Fan Belts: Furnish set of belts for each belt-driven fan in energy recovery units.
  - 3. Wheel Belts: Furnish set of belts for each heat wheel.

### PART 2 - - PRODUCTS

#### 2.1 HEAT WHEELS

- A. Manufacturers:
  - 1. Airxchange
  - 2. Aldes North America.
  - 3. FlaktGroup SEMCO.
  - 4. Heatex, Inc.
  - 5. Novel Aire Technologies
  - 6. Thermotech Enterprises, Inc.
  - 7. Xetex
- B. Cabinet: Galvanized steel with manufacturer's standard paint coating. Include the following:
  - 1. Internally insulated.
  - 2. Casing seals on periphery of rotor, and on duct divider, with 1-inch duct flanges for connection of supply and exhaust ducts.
  - 3. Support removable rotor on grease-lubricated ball bearings with extended grease fittings, or permanently lubricated ball bearings. Mount horizontal wheels on tapered roller bearing.
- C. Wheel: Provide enthalpy type for both sensible and latent heat recovery designed to ensure laminar flow.
  - 1. Construct wheel media of corrugated aluminum, glass-fiber or polymer material , with non-toxic, noncorrosive silica-gel or molecular sieve desiccant coating permanently bonded to the media.
  - 2. Provide wheel structure of stainless steel framework for supporting segments that are removable for servicing,
  - 3. Construct media for passing maximum 800 micrometer solids and maximum 0.04 percent cross contamination by volume of exhaust air.
  - 4. Energy recovery device shall transfer moisture entirely in the vapor phase, so unit shall not require a condensation pan. Drive rotor with belt around outside of rotor.
- D. Drive: Fractional horsepower motor and gear reducer.
  - 1. Provide adjustable variable-frequency controller for speed adjustment where scheduled. .
- E. Frost Protection: Provide heat or wheel speed control to eliminate frost accumulation where scheduled.
- F. Controls:
  - 1. For constant speed wheel, provide starting relay, factory mounted and wired, and manual motor starter for field wiring.
  - 2. For variable speed wheel, provide control panel factory mounted and wired to motor, with airstream thermostat and adjustable variable-frequency controller for field wiring; with pilot-light indication of rotor rotation and provisions for setting maximum and minimum speed.

- G. Rotation Detection: Provide electronic control module, electromagnetic sensor, and iron shuttle factory wired and mounted, with alarm bell for field wiring and mounting.

### **PART 3 - - EXECUTION**

#### **3.1 INSTALLATION**

- A. Install products in accordance with manufacturer's instructions.
- B. Install heat wheels so supply and exhaust airstreams flow in opposite directions and rotation is from exhaust side to purge section to supply side.
  - 1. Install access doors in both supply and exhaust ducts, both upstream and downstream, for access to wheel surfaces, drive motor, and seals.
  - 2. Install removable panels or access doors between supply and exhaust ducts on building side for bypass during startup.
  - 3. Access doors and panels are specified in Division 23 Section "Air Duct Accessories."
- C. Install units with clearances for service and maintenance.
- D. Install new filters at completion of equipment installation and before testing, adjusting, and balancing.

#### **3.2 CONNECTIONS**

- A. Piping installation requirements are specified in other Division 23 sections. Drawings indicate general arrangement of piping, fittings, and specialties.
  - 1. Install piping adjacent to machine to allow service and maintenance.
  - 2. Condensate Drain Piping: Route condensate drain to nearest roof drain or to location shown on the drawings. Provide trap at connection to drain pan with depth as noted on the drawings and install cleanouts at changes in direction (refer to manufacturer's recommendations for any additional requirements). Size condensate drain piping in accordance with local code and as shown on the drawings.
  - 3. Connect condensate drain piping to the unit with appropriate trap. Verify that the piping material and installation is in accordance with Division 22 requirements.
- B. Duct and fan installation requirements are specified in other Division 23 sections. Drawings indicate general arrangement of ducts, fittings, and specialties. Provide flexible duct connectors where ducts are connected to units with fans.
- C. Ground equipment according to Division 26.
- D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

#### **3.3 FIELD QUALITY CONTROL**

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.
  - 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
  - 2. Adjust seals and purge.
  - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
  - 4. Set initial temperature and humidity set points.
  - 5. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

- B. Remove malfunctioning units, replace with new units, and retest as specified above.

### 3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units.

### 3.5 TRAINING

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

**APPENDIX**

GEOTECHNICAL REPORT DATED AUGUST 16, 2024 (from Geotechnical Engineering Testing, Inc.)  
AVAILABLE UPON REQUEST

END OF SECTION

**SECTION 23 73 13 - CENTRAL STATION AIR HANDLING UNITS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Casing construction.
- B. Fan section.
- C. Coil section.
- D. Filter and air cleaner section.
- E. Damper section.
- F. Total energy recovery wheel section.
- G. Access section.
- H. Electrical.
- I. Roof mounting curb.

**1.2 DEFINITIONS**

- A. Low Pressure: Greater than 1 inch w.c. and less than or equal to 4 inches w.c. internal positive or negative pressure.
- B. Medium Pressure: Greater than 4 inches w.c. and less than 10 inches w.c. internal positive or negative pressure.
- C. High Pressure: Greater than or equal to 10 inches w.c. internal positive or negative pressure.

**1.3 ADMINISTRATIVE REQUIREMENTS**

- A. Coordination: Coordinate the installation with size, location and installation of service utilities.
- B. Coordinate the work with other trades for installation of roof mounted air handling units on roof curbs.
- C. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.
- D. Sequencing: Ensure that utility connections are achieved in an orderly and expeditious manner.

**1.4 SUBMITTALS**

- A. Product Data:
  - 1. Published Literature: Indicate dimensions, weights, capacities, ratings, gages and finishes of materials, and electrical characteristics and connection requirements.
  - 2. Filters: Data for filter media, filter performance data, filter assembly, and filter frames.
  - 3. Fans: Performance and fan curves with specified operating point clearly plotted, power, RPM.
  - 4. Sound Power Level Data: Certified fan outlet, inlet, and casing radiation at rated capacity. For variable speed fans, provide sound ratings at 100, 80 and 60 percent of maximum rpm.
  - 5. Electrical Requirements: Power supply wiring including wiring diagrams for interlock and control wiring, clearly indicating factory-installed and field-installed wiring.
  - 6. Certified coil performance ratings with system operating conditions indicated.
  - 7. Motor ratings and electrical characteristics plus motor and fan accessories.

8. Provide short circuit current rating of units with factory mounted starter or variable frequency drive.
  9. Dampers, including housings, linkages, and operators.
  10. Total pressure drop for the unit with itemized pressure drop per module. At a minimum, provide line items for the following:
    - a. External static pressure loss.
    - b. Unit inlet and outlet opening losses.
    - c. Internal filter, coil, and casing losses.
    - d. Pressure drop per module.
- B. Sustainable Design Documentation: Submit manufacturer's product data on refrigerant used, showing compliance with specified requirements.
- C. Shop Drawings: Indicate assembly, unit dimensions, weight loading, required clearances, construction details, field connection details, and electrical characteristics and connection requirements.
- D. Specimen Warranty: Submit sample of manufacturer's warranty.
- E. Executed Warranty: Submit documentation of final executed warranty completed in Owner's name and registered with manufacturer.
- F. Manufacturer's Instructions: Include installation instructions.
- G. Maintenance Data: Include instructions for lubrication, filter replacement, motor and drive replacement, spare parts lists, and wiring diagrams.
- H. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
  1. Extra Fan Belts: One set for each unit.
  2. Extra Filters: One set for each unit.
- I. Product certificates signed by manufacturers of central-station air-handling units certifying that their products comply with specified requirements.

## 1.5 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.
- B. AHRI Certification: Comply with the following for the applicable components,
  1. Factory test central-station air-handling units and their components in accordance with the applicable portions of AHRI 430 "Performance Rating of Central-Station Air-Handling Units". Units shall be listed and bear the label of the Air-Conditioning and Refrigeration Institute.
  2. AHRI 260 "Sound Rating of Ducted Air Moving and Conditioning Equipment".
  3. AHRI 410 "Standard for Forced-Circulation Air-Cooling and Air-Heating Coils".
  4. AHRI 640 (I-P) "Performance Rating Of Commercial and Industrial Humidifiers".
  5. AHRI 1060 I-P "Performance Rating of Air-to-Air Heat Exchangers for Energy Recovery Ventilation Equipment".
- C. AMCA Compliance: Comply with the following standards for rating and testing of the applicable components specified herein.
  1. AMCA 210 "Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating".
  2. AMCA 300 "Reverberant Room Method for Sound Testing of Fans".
  3. AMCA 301 "Methods for Calculating Fan Sound Ratings from Laboratory Test Data".
  4. AMCA 500-D "Laboratory Methods of Testing Dampers for Rating".
  5. AMCA 500-L "Laboratory Methods of Testing Louvers for Rating".
  6. AMCA 611 "Certified Ratings Program for Airflow Measurement Stations".

- D. NFPA Compliance: Central-station air-handling units and components shall be designed, fabricated, and installed in compliance with NFPA Standard 90A "Standard for the Installation of Air Conditioning and Ventilating Systems."
- E. UL Compliance: Electric coils, along with the complete central-station air-handling unit, shall be listed and labeled by Underwriters' Laboratories. Comply with the following for the applicable components.
  - 1. UL 508 "Industrial Control Equipment".
  - 2. UL 795 "Commercial-Industrial Gas Heating Equipment".
  - 3. UL 1598 "Luminaires".
  - 4. UL 1812 "Ducted Heat Recovery Ventilators".
  - 5. UL 1995 "Heating and Cooling Equipment".
- F. Nationally Recognized Tested Laboratory and NEMA Compliance (NRTL): Electric coils, along with the complete central-station air-handling unit shall be listed and labeled by a NRTL. The term "NRTL" shall be as defined in OSHA Regulation 1910.7.

## 1.6 DELIVERY STORAGE AND HANDLING

- A. Accept products on site in factory-fabricated protective containers, with factory-installed shipping skids and lifting lugs. Follow manufacturer's written instructions for rigging. Inspect for damage. Replace damaged units or components.
- B. Store in clean dry place off the ground and protect from weather, physical damage, and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish. Replace any sections that experience internal water damage due to lack of protection.
- C. Do not operate units until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

## 1.7 SPARE PARTS

- A. General: Furnish to Owner, with receipt, the following spare parts for each air-handling unit.
  - 1. If HVAC equipment is used during the construction period, Contractor shall provide one set of filters (if system is designed to include pre-filters and after-filters, provide only pre-filters) when the unit is started and replace filters when needed, but not less than every month. On the day of substantial completion, the Contractor shall clean the unit and provide a new set of filters at each location in the unit.
  - 2. Furnish one additional complete set of belts for each central-station air-handling unit.
  - 3. Furnish one additional gasket for each sectional joint of each central-station air-handling unit.

## PART 2 - PRODUCTS AND MATERIALS

### 2.1 MANUFACTURERS

- A. Aaon, Inc.
- B. Airtherm Mfg. Co.
- C. Air Zone Industries, Inc.
- D. Carrier Air Conditioning.
- E. Daikin Applied.
- F. Dunham-Bush, Inc.
- G. Johnson Controls Inc./ York International Corporation.

- H. VTS Group.

## 2.2 MANUFACTURED UNITS

- A. General Description: Factory assembled, consisting of fans, motor and drive assembly, coils, plenums, filters, and drip pans.
- B. Types: Central-station air-handling units included in this project are of the following types:
  - 1. Draw-through.
- C. Motor: Refer to Division 23 Section "Common Motor Requirements for HVAC Equipment."
  - 1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so that the driven load will not require the motor to operate in the service factor range.
- D. Electrical Components: Refer to Division 26 Sections.

## 2.3 CASING CONSTRUCTION

- A. Full Perimeter Base Rail:
  - 1. Construct of galvanized steel.
  - 2. Provide base rail of sufficient height to raise unit for external trapping of condensate drain pans.
- B. Casing:
  - 1. Construct of one piece, insulated, double wall panels.
  - 2. Provide mid-span, no through metal, internal thermal break.
  - 3. Construct outer panels of galvanized steel and inner panels of galvanized steel.
  - 4. Casing Air Pressure Performance Requirements:
    - a. Able to withstand up to 10 inches w.g. positive or negative static pressure.
  - 5. Medium and high-pressure units shall be constructed with additional bracing and supports. Units rated at 5.5 inches w.g. and higher shall be connected to accessories sections with double-thickness neoprene-coated flexible connection.
- C. Access Doors:
  - 1. Construction, thermal and air pressure performance same as casing.
  - 2. Provide surface mounted handles on hinged, swing doors.
- D. Outdoor Unit Roof:
  - 1. Factory install single layer outer roof above inner roof.
  - 2. Slope at a minimum of 0.125 inches per foot from one side of unit to the other side, or from center to sides of unit.
  - 3. Roof assembly to overhang each unit wall or base rail to overhang curb to facilitate water runoff and prevent water intrusion into roof curb to base connection.
- E. Outside Air and Exhaust Air Weather Hood:
  - 1. Fabricate from same material as casing outer panel.
  - 2. Extend hood past perimeter of unit casing opening so as not to obstruct airflow path.
  - 3. Paint hoods with same finish as external surface of outdoor units.
  - 4. Provide inlet hood for each fresh air damper with a sine wave moisture eliminator to prevent entrainment of water into the unit from outside air.
  - 5. Provide exhaust hoods for each exhaust air opening.
  - 6. Size each hood for 100 percent of nominal fresh air damper capacities.
  - 7. Protect each hood with bird screen to prevent nesting at intake or exhaust air flow paths.
- F. Unit Flooring: Construct with sufficient strength to support expected people and equipment loads associated with maintenance activities.
- G. Casing Leakage: Seal joints and provide airtight access doors so that air leakage does not exceed one percent of design flow at the specified casing pressure.

- H. Insulation:
1. Insulation: Comply with NFPA Standard 90A "Standard for the Installation of Air Conditioning and Ventilating Systems," for insulation.
    - a. Type:
      - 1) Coated, glass-fiber insulation having a minimum density of 1-1/2 pcf.
      - 2) Foam injection.
    - b. Thickness: 1 inch.
    - c. Minimum R-Value: R-4.
    - d. Completely fill panel cavities in each direction to prevent voids and settling.
    - e. Location and Application: Factory applied with adhesive and mechanical fasteners to the internal surface of section panels downstream from and including the cooling coil section.
- I. Drain Pan Construction:
1. Single-Wall Drain Pans: Formed sections of stainless steel. Fabricate pans in sizes and shapes to collect condensate from cooling coils (including coil piping connections and return bends) when units are operating at the maximum cataloged face velocity across the cooling coil. Insulate bottom and sides of drain pans. Comply with ASHRAE Std 62.1 for indoor air quality and sufficiently size to collect all condensate.
  2. Slope in two planes to promote positive drainage and eliminate stagnate water conditions.
  3. Locate outlet of sufficient diameter at lowest point of pan to prevent overflow at normal operating conditions.
  4. Provide threaded drain connections constructed of drain pan material, extended sufficient distance beyond the base to accommodate field installed, condensate drain trapping.
  5. Drain connections: Both ends of the pan.
  6. Pan top surface coating: Elastomeric compound.
  7. Units with stacked coils shall have an intermediate drain pan or a drain trough to collect condensate from top coil.
- J. Bottom Duct Connections: Provide steel or aluminum walking grate on structural supports where connections are located in sections accessible by personnel for maintenance.
- K. Marine Lights:
1. Provide factory mounted, water and dust resistant LED fixture(s) where shown on the Drawings with the following characteristics:
    - a. Non-ferrous metal housing.
    - b. Glass or polycarbonate lens.
    - c. Factory wired to a single switch within factory provided service module.
    - d. Instant on white light with minimum 8000 hour service life.
- L. Service Module:
1. Provide factory installed service module including GFCI receptacle independent from load side; designed to receive power from field supplied 120 volt source.
- M. Finish:
1. Outdoor Units:
    - a. Coat external surface of unit casing with primer and minimum 1.5 mil, enamel paint finish.
    - b. Comply with salt spray test in accordance with ASTM B177/B177M.
    - c. Color: Manufacturer's standard color.
  2. Indoor Units:
    - a. Provide exterior, galvanized steel panels without paint.

## 2.4 FAN ARRAY SECTION

- A. Performance — Fans shall conform to AMCA test standards, 205 (fan efficiency grade), 210 (air performance) and 300 (sound performance) and shall bear the AMCA certified ratings seal for

both sound and air, and fan efficiency grade (FEG). Sound certification shall apply to both inlet and outlet sound power levels.

- B. Construction — Fans shall be housed and incorporate a non-overloading type backward inclined airfoil blade wheel or centrifugal plenum wheel, heavy-gauge galvanized G90 steel frame, and front panel. The front panel shall have a removable inlet cone designed for smooth airflow transition into the wheel. The motor base shall be designed to ensure proper alignment of the fan wheel, motor and inlet cone. The design shall also ensure the structural integrity of the base to minimize vibration.
  - 1. The fan array shall consist of multiple fan and motor "cubes" or "cells", spaced in the air way tunnel cross section to provide a uniform air flow and velocity profile across the entire air way tunnel cross section and components contained therein.
  - 2. The fan cube dimensions must be variable, such that each fan rests in an identically sized cube or cell, and in a spacing such that the array dimensions fill a minimum of 90% of the cross sectional area of the AHU air way tunnel.
- C. Wheel — Wheels shall be constructed of non-overloading extruded airfoil shaped blades. Airfoil blades shall be continuously welded. The entire wheel shall be constructed of aluminum to reduce weight and vibration. Blades shall be extruded aluminum. Wheel hubs shall be machined aluminum. Aluminum fan wheels shall not require a finish coating. Wheels shall be attached to the motor shaft using taper lock bushings. The wheel and fan inlet shall be matched and have precise running tolerances for maximum performance and operating efficiency.
- D. Finish and Coating — Fans shall be constructed of corrosion resistant galvanized steel. Aluminum components shall be unpainted.
- E. Motors — Motors shall meet or exceed EISA 2007 (The Energy Independence and Security ACT of 2007) efficiencies. Motors shall be NEMA rated, 720, 900 1200, 1800 or 3600 RPM in 60 Hz, Open Drip Proof (ODP) or Totally Enclosed Fan Cooled (TEFC) with a 1.15 service factor. Motors shall include permanently sealed (L10-400,000 hr) bearings and shaft grounding rings to protect the motor bearings from electrical discharge machining due to stray shaft currents.
- F. Fan Balancing — All fans prior to shipment shall be run tested at the specified operating speed. Each fan shall be dynamically balanced as a complete unit in accordance with ANSI/AMCA 204-96 "Balance Quality and Vibration Levels for Fans" to a minimum Fan Application Category BV-3, Balance Quality Grade G6.3. Balance readings shall be taken electronically in the axial, vertical and horizontal directions. Records of each fan balance shall be maintained and a written copy shall be available upon request.
- G. Fan Isolation:
  - 1. Blank off Panels — Each Multiple Fan section to be provided with fan blank-off panels to enable manual isolation of fan for servicing. Quantity of panels shall equal number of fans on a single VFD.
- H. Fan airflow measurement:
  - 1. Piezometer Ring: Rings shall be factory installed in each fan inlet. The device shall have a measurement accuracy of  $\pm 5\%$ . Tubing shall be field installed along with corresponding air flow monitoring station by DDC controls contractor so that the measurement is representative of all fans in the array.
- I. Fan Array Motor Control (common VFD operation with Array split into two banks)
  - 1. All fan motors shall be factory-wired to individual manual motor protection (MMP) device which shall consist of a motor overload relay with adjustable current rating and an on-off disconnect switch (one per motor) for power isolation. Field wiring of MMPs to fan motors shall not be permitted.
  - 2. MMPs shall be contained in a single control panel (MMP panel) and shall be mounted on the exterior wall panel of the fan array section.
  - 3. MMP panel shall have a single point of connection for input power wiring and shall feed power to individual MMP's through a common bus bar. Independent wiring of input power to individual MMP's shall not be permitted.

4. All VFDs shall be operated together from a single control point so that all fan motors operate together. Independent control of VFDs and fan motors shall not be permitted.
5. Contractor shall set VFD maximum speed if fan design maximum is above 60HZ.

## 2.5 COIL SECTION

- A. Testing Requirements: The following factory tests are required:
  1. Coil Performance Tests: Cooling and heating coils, except sprayed surface coils, shall be factory tested for rating in accordance with AHRI 410 - Standard for Forced-Circulation Air-Cooling and Air-Heating Coils.
- B. Coil Pressure Ratings:
  1. Water Coils: Design for 200 psi working pressure at 325 F, and pressure test at 300 psi under water.
- C. Coil Sections: Common or individually insulated, galvanized steel casings for heating and cooling coils. Coil section shall be designed and constructed to facilitate removal of coil for maintenance and replacement and to assure full air flow through coils.
  1. Multizone units shall have air deflectors and air baffles for balanced air flow across both heating and cooling coils.
  2. Medium and high-pressure units shall have double gaskets between sections and coil connection penetrations through casing sealed to minimize leakage.
- D. Casing: Provide access to both sides of coils. Enclose coils with headers and return bends exposed outside casing. Slide coils into casing through removable end panel with blank off sheets and sealing collars at connection penetrations.
- E. Drain Pans: 24 inch downstream of coil and down spouts for cooling coil banks more than one coil high.
- F. Eliminators: Three break of galvanized steel, mounted over drain pan.
- G. Air Coils:
  1. Certify capacities, pressure drops, and selection procedures in accordance with AHRI 410.
- H. Fabrication:
  1. Tubes: 5/8 inch OD seamless copper expanded into fins, brazed joints.
  2. Fins: Aluminum or copper, constructed from flat plate with belled collars for tubes. Fins shall be bonded to tubes by mechanically expanding copper tubes.
    - a. Thickness: Minimum 0.006 inches.
    - b. Spacing: Maximum 12 fins per inch.
  3. Casing: Die formed channel frame of galvanized steel.
  4. Water Coil Turbulators: Bronze, spring-type.
- I. Water Heating Coils:
  1. Headers: Cast iron, seamless copper tube, or prime coated steel pipe with brazed joints.
  2. Configuration: Drainable, with threaded plugs for drain and vent; serpentine type.
- J. Water Cooling Coils:
  1. Headers: Cast iron, seamless copper tube, or prime coated steel pipe with brazed joints.
  2. Configuration: Drainable, with threaded plugs for drain and vent; threaded plugs in return bends and in headers opposite each tube.
  - 3.

## 2.6 FILTER AND AIR CLEANER SECTION

- A. General:
  1. Provide filter sections with filter racks, minimum of one access door for filter removal, and filter block-offs to prevent air bypass.

2. Filters shall comply with NFPA Standard 90A "Standard for the Installation of Air Conditioning and Ventilating Systems."
  3. Filter Section: Cabinet material and finish shall match the air-handling unit cabinet, with filter media holding frames arranged for flat or angular orientation. Section shall have access doors on both sides of the unit.
- B. Refer to Section "Particulate Air Filtration" for additional requirements for particulate air filters.
- C. Differential Pressure Gage:
1. Provide factory installed dial type differential pressure gage, flush mounted with casing outer wall, and fully piped to both sides of each filter to indicate status.
  2. Maintain plus/minus 5 percent accuracy within operating limits of 20 degrees F to 120 degrees F.

## 2.7 DAMPER SECTION

- A. General: Dampers and their operators shall comply with performance requirements specified in Division 23 Section "Instrumentation and Control Devices for HVAC."
- B. Mixing Boxes: Parallel-blade dampers in a reinforced, galvanized steel cabinet. Damper blades shall be galvanized steel mechanically fastened to steel operating rod. Connect operating rods for each set of dampers together with a common linkage and interconnect linkages so dampers operated simultaneously and in the opposite direction (one opens when the other closes).
- C. Combination Filter/Mixing Box: Parallel-blade dampers in a reinforced, galvanized steel cabinet. Damper blades shall be galvanized steel mechanically fastened to steel operating rod. Connect operating rods for each set of dampers together with a common linkage and interconnect linkages so dampers operate simultaneously and in the opposite direction (one opens when the other closes). Cabinet shall have support members to hold 2-inch-thick, pleated, flat permanent or throwaway filters. Mixing boxes shall have hinged access panels or doors to allow removal of filters for both sides of unit.
- D. Damper Blades:
1. Double-skin airfoil design with metal, compressible jamb seals and extruded-vinyl blade-edge seals on each blade.
  2. Self-lubricating stainless steel or synthetic sleeve bearings.
  3. Comply with ASHRAE Std 90.1 for rated maximum leakage rate.
  4. Provide leakage testing and pressure ratings in compliance with AMCA 500-D test methods.
  5. Arrange in parallel or opposed-blade configuration.

## 2.8 TOTAL ENERGY RECOVERY WHEEL SECTION

- A. Certified in accordance with AHRI 1060 I-P and UL 1812 for mechanical, electrical, and fire safety.
- B. Wheel Construction:
1. Dessicant Properties:
    - a. Factory coated.
    - b. Washable using standard detergent or alkaline based coil cleaner.
    - c. Resistant to high levels of humidity.
  2. Construct housing of stainless steel, aluminum, or galvanized steel.
  3. Factory set adjustable diameter seals and self-adjusting perimeter seals.
  4. Permanently sealed and lubricated wheel bearings.
  5. Motor:
    - a. Thermally protected.
    - b. Factory mounted.
- C. Maintenance and Access Features:
1. Access doors upstream and downstream of the wheel cassette.

2. Removable wheel segments to facilitate maintenance and cleaning.
  3. Adequate space for cleaning, service, and maintenance.
- D. Controls:
1. Wheel Control: Damper control of recovery capacity to 40 percent of initial total recovery capacity.
  2. Frost Prevention Control: Provide outside air bypass, return air preheat, or variable speed.

## 2.9 ACCESS SECTION

- A. Provide where indicated on the Drawings to allow for inspection, cleaning, and maintenance of field installed components.
- B. Construct access doors same as previously specified within this Section.

## 2.10 ELECTRICAL

- A. Combination Starter-Disconnects:
1. Provide combination starter-disconnect for each fan motor.
  2. Factory mount in full metal enclosure and wire to fan motor.
  3. Mount starter-disconnect on fan section externally in a NEMA enclosure rated for the installed location within a dedicated controls section or housed fan section.
    - a. Internal Enclosure Construction Characteristics:
      - 1) Integral part of unit casing to allow for thermal venting to casing interior.
      - 2) Accessible from unit exterior via access door.
      - 3) Construction of access doors same throughout unit.
  4. Include circuit breaker disconnect with through-the-door interlocking handle for externally mounted or beside--the-door interlocking handle for internally mounted starters,, spring loaded, and designed to rest only in the full and lockable ON or OFF state.
  5. Allow enclosure entry via a concealed defeater mechanism when the handle is in the ON position.
  6. Include the following items:
    - a. Hand-Off-Auto (H-O-A) switch.
    - b. Two normally open auxiliary contacts.
    - c. Overload heaters.
    - d. Manual reset overloads.
    - e. 120V control transformer with fusing and secondary grounding.
  7. Include power wiring from the starter control transformer to the secondary control system transformers, and start-stop wiring from the direct digital controller start-stop relay to the starter H-O-A switch.
- B. Combination VFD - Disconnects:
1. Provide factory mounted, combination VFD - disconnect for each fan motor or fan array arrangement as scheduled on the drawings.
    - a. Provide in accordance with Division 23 Section "Variable Frequency Drives".
  2. Factory mount in full metal enclosure and wire to fan motor.
  3. Mount VFD-disconnect on fan section externally in a NEMA enclosure rated for the installed location within a dedicated controls section, housed fan section or maintenance vestibule wall.
    - a. Internal Enclosure Construction Characteristics:
      - 1) Integral part of unit casing to allow for thermal venting to casing interior.
      - 2) Accessible from unit exterior via access door.
      - 3) Construction of access doors same throughout unit.
    - b. Provide service clearance required by VFD manufacturer and to meet NEC.
  4. Include circuit breaker disconnect with through-the-door interlocking handle for externally mounted or beside--the-door interlocking handle for internally mounted starters, spring loaded, and designed to rest only in the full and lockable ON or OFF state.

5. Allow enclosure entry via a concealed defeater mechanism when the handle is in the ON position.
6. Include control transformer with sufficient capacity to support the following items:
  - a. VFD and controls.
  - b. Binary output on-off wiring.
  - c. Analog output speed-signal wiring.
  - d. Wires that interface between VFD and direct digital controller.
7. Provide bypass relays and bypass circuitry with VFD-OFF-BYPASS selector switch where bypass is scheduled.

## 2.11 ROOF MOUNTING CURB

- A. Roof Curbs: Refer to Section "Hangers and Supports for HVAC" for pre-engineered roof equipment supports and Section "Vibration Isolation for HVAC Piping and Equipment" for vibration isolated equipment support bases.
- B. Include roof curb accessories for each roof mounted unit.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine areas and conditions under which air handling units are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

### 3.2 INSTALLATION

- A. Install products in accordance with manufacturer's instructions.
- B. Support floor-mounted units on concrete equipment bases using housed spring isolators. Secure units to anchor bolts installed in concrete equipment base.
- C. Suspended Units: Suspend units from structural steel support frame using threaded steel rods and vibration isolation springs.
- D. Secure roof-mounted units to roof equipment supports and grade-mounted units to curbs or base. Refer to the drawings for the type of support required for each air handling unit.
  1. Refer to Section "Hangers and Supports for HVAC Piping and Equipment" for standard roof curbs.
  2. Refer to Section "Vibration Isolation For HVAC" for vibration isolation curbs.
- E. Arrange installation of units to provide access space around air-handling units for service and maintenance.
- F. Bolt sections together with gaskets.
- G. Install assembled unit on vibration isolators. Install isolated fans with resilient mountings and flexible electrical leads. Install restraining snubbers as indicated. Refer to Section "Vibration Isolation for HVAC". Adjust snubbers to prevent tension in flexible connectors when fan is operating.
- H. Provide fixed sheaves required for final air balance.
- I. Make connections to coils with unions or flanges.
- J. Piping installation requirements are specified in other Division 23 sections. The Drawings indicate the general arrangement of piping, valves, fittings, and specialties. The following are specific connection requirements:
  1. Arrange piping installations adjacent to units to allow unit servicing and maintenance.

2. Route unit condensate drain piping to location shown on the plan or, if not shown, to the nearest equipment or floor drain. Provide trap at connection to drain pan with depth as noted on the drawings and install cleanouts at changes in direction. Size condensate drain piping in accordance with local code and as shown on the drawings.
- K. Duct installations and connections are specified in other Division 23 sections. Make final duct connections with flexible connections. Ensure that metal bands of connectors are parallel with minimum one inch flex between ductwork and fan while running.
- L. Electrical Connections: The following requirements apply:
  1. Electrical power wiring is specified in Division 26.
  2. Temperature control wiring and interlock wiring is specified in Division 23 section "Direct-Digital Control for HVAC."
- M. Grounding: Connect unit components to ground in accordance with the National Electrical Code.
- N. Hydronic Coils:
  1. Connect water supply to leaving air side of coil (counterflow arrangement).
  2. Provide shut-off valve on supply line and lockshield balancing valve with memory stop on return line.
  3. Locate water supply at bottom of supply header and return water connection at top.
  4. Provide manual air vents at high points complete with stop valve.
  5. Ensure water coils are drainable and provide drain connection at low points.
- O. Insulate Coil Headers Located Outside Air Flow as Specified for Piping: Refer to Section "HVAC Insulation" for additional requirements.
- P. Field-wire each factory provided control for field installation.

### 3.3 EQUIPMENT BASES

- A. Construct concrete equipment pads in accordance with Section "Common Work Results for HVAC."

### 3.4 ADJUSTING CLEANING AND PROTECTING

- A. Adjust water coil flow, with control valves to full coil flow, to indicated gpm.
- B. Adjust damper linkages for proper damper operation.
- C. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel, fan cabinet, intake plenum cabinet, heat exchange surfaces, cooling/heating coil sections, filter sections, access sections, etc.

### 3.5 FIELD QUALITY CONTROL

- A. Vibration Analysis:
  1. Measure vibration levels with an FFT (Fast Fourier Transformation) analyzer.
  2. Characteristics:
    - a. Frequency Response Range: 5 Hz thru 10 KHz (300 thru 600,000 cpm).
    - b. Capability to use a Hanning window.
    - c. Capacity to perform ensemble averaging.
    - d. Auto-ranging frequency amplitude.
    - e. Minimum amplitude accuracy over the selected frequency range of plus/minus 20 percent or plus/minus 1.5 dB.
  3. Use accelerometer, stud-mounted to collect data.
  4. Ensure the mass of the accelerometer and its mounting have minimal influence on the frequency response of the system over the selected measurement range.

- B. Final Acceptance Requirements:
  - 1. Use dial indicator gages to demonstrate fan and motor are aligned.
  - 2. Verify conformance to specifications using vibration analysis.
  - 3. Maximum Vibration Levels:
    - a. 0.075 inch per second at 1 times run speed and at fan/blade frequency.
    - b. 0.04 inch per second at other multiples of run speed.

### 3.6 SYSTEM STARTUP

- A. Final Checks Before Start-Up: Perform the following operations and checks before start-up:
  - 1. Remove shipping, blocking, and bracing.
  - 2. Verify unit is secure on mountings and supporting devices and that connections for piping, ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
  - 3. Perform cleaning and adjusting specified in this Section.
  - 4. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
  - 5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
  - 6. Set zone dampers to full open for each zone.
  - 7. Set face-and-bypass dampers to full face flow.
  - 8. Set outside-air and return-air mixing dampers to minimum outside-air setting.
  - 9. Comb coil fins for parallel orientation.
  - 10. Install clean filters. Do not operate air handling unit without pre-filters installed.
  - 11. Verify manual and automatic volume control, and fire and smoke dampers in connected ductwork systems are in the full-open position.
  - 12. Disable automatic temperature control operators.
- B. Provide manufacturer's field representative to observe and approve systems startup.
- C. Prepare and start equipment and systems in accordance with manufacturers' instructions and recommendations.
- D. Adjust for proper operation within manufacturer's published tolerances.
- E. Energize motor, verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
  - 1. Replace fan and motor pulleys as required to achieve design conditions.
  - 2. Measure and record motor electrical values for voltage and amperage.
  - 3. Shut unit down and reconnect automatic temperature control operators.
  - 4. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for air-handling-system testing, adjusting, and balancing.

### 3.7 TRAINING

- A. At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel on the operation and maintenance of the equipment provided under this section.
- B. Demonstration: Demonstrate operation of system to Owner's personnel.
  - 1. Use operation and maintenance data as reference during demonstration.
  - 2. Conduct walking tour of project.
  - 3. Briefly describe function, operation, and maintenance of each component.
- C. Training: Train Owner's personnel on operation and maintenance of system.
  - 1. Use operation and maintenance manual as training reference, supplemented with additional training materials as required.

2. Provide minimum of eight hours of training.
  3. Instructor: Manufacturer's training personnel.
- D. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- E. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**THIS PAGE INTENTIONALLY LEFT BLANK**

**SECTION 23 82 00 - TERMINAL HEATING AND COOLING UNITS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Unit heaters
- B. Fan-Coil units

**1.2 SUBMITTALS**

- A. Product Data: Submit product data for terminal heating and cooling units showing capacities, ratings, performance characteristics, and gages and finishes of materials..
- B. Shop Drawings: Submit assembly-type shop drawings showing unit dimensions, construction details, and field connection details.
  - 1. Indicate length and number of pieces of elements and enclosures.
  - 2. Show corner pieces, end caps, cap strips, access doors and pilaster covers.
  - 3. Show support points and fastening methods.
- C. Wiring Diagrams: Submit manufacturer's electrical requirements for power supply wiring to terminal heating and cooling units. Submit manufacturer's ladder-type wiring diagrams for interlock and control wiring. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
- D. Manufacturer's Instructions: Indicate installation instructions and recommendations.
- E. Operation and Maintenance Data: Submit maintenance instructions, including lubrication instructions, filter replacement, motor and drive replacement, and spare parts lists.
- F. Warranty: Submit manufacturer's warranty and ensure forms have been completed in Owner's name and registered with manufacturer.

**1.3 QUALITY ASSURANCE**

- A. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. AHRI Compliance: Comply with the following AHRI standards for the applicable components specified herein.
  - 1. AHRI 210/240 "Performance Rating of Unitary Air-conditioning & Air-Source Heat Pump Equipment".
  - 2. AHRI 350 "Sound Performance Rating of Non-Ducted Indoor Air Conditioning Equipment".
  - 3. AHRI 410 "Forced-Circulation Air-Cooling and Air-Heating Coils".
  - 4. AHRI 440 "Performance Rating of Room Fan-Coil".
  - 5. AHRI 840 "Performance Rating of Unit Ventilators".
- C. I B R Compliance: Test and rate baseboard and finned tube radiation in accordance with I B R, provide published ratings bearing emblem of I B R.
- D. ISO Compliance: Fan coil units shall be manufactured in accordance with standard ISO 9001, Quality Management Systems, most current edition.
- E. NFPA Compliance:
  - 1. NFPA 70 "National Electric Code".
  - 2. NFPA 90A "Standard for the Installation of Air-Conditioning and Ventilating Systems".
- F. UL compliance:

1. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.
2. UL 674 "Electrical Motors and Generators for Use in Hazardous (Classified) Locations".
3. UL 723 "Standard for Test for Surface Burning Characteristics of Building Materials, Underwriter's Laboratory".
4. UL 1995 "Heating and Cooling Equipment.

#### 1.4 DELIVERY STORAGE AND HANDLING

- A. Handle terminal heating and cooling units and components carefully to prevent damage, breaking, denting and scoring. Do not install damaged terminal heating and cooling units or components; replace with new.
- B. Store terminal heating and cooling units and components in clean dry place. Protect from weather, dirt, fumes, water, construction debris, and physical damage.
- C. Comply with Manufacturer's rigging and installation instructions for unloading terminal heating and cooling units, and moving them to final location.

#### 1.5 SPARE PARTS

- A. General: Furnish to Owner, with receipt, the following spare parts for terminal heating and cooling units.
  1. One set of matched fan belts for each belt driven fan.
  2. If HVAC equipment is used during the construction period, Contractor shall provide one set of filters (if system is designed to include pre-filters and after-filters, provide only pre-filters) when the unit is started and replace filters when needed, but not less than every month. On the day of substantial completion, the Contractor shall clean the unit and provide a new set of filters at each location in the unit.

### PART 2 - PRODUCTS AND MATERIALS

#### 2.1 UNIT HEATERS

- A. Manufacturers:
  1. Airtherm Mfg. Co.
  2. Daikin Applied.
  3. Dunham-Bush, Inc.
  4. Modine Mfg. Co.
  5. Rittling Hydro-Air Components, Inc.
  6. Trane (The) Co.
  7. Wing (The) Co.; Div. Wing Industries, Inc.
  8. Young Radiator Co.
- B. General: Provide unit heaters in locations as indicated, and of capacities, style, and having accessories as scheduled.
- C. Horizontal Unit Heaters:
  1. Casings: Construct of steel, phosphatized inside and out, and finished with baked enamel. Provide motor-mounted panel, minimum of 18-ga steel. Fabricate casing to enclose coil, louvers, and fan blades. Provide louvers for 4-way air diffusion.
  2. Fans: Construct of aluminum, and factory-balance. Provide fan inlet orifice, smooth, and drawn into casing back panel.
- D. Vertical Unit Heaters:

1. Casings: Construct of steel, phosphatized inside and out, and finished with baked enamel. Design casing to enclose fan, motor, and coil, design fan orifice formed into discharge panel. Provide air diffusers as scheduled.
  2. Fans: Construct of aluminum and factory-balance. Design so motor and fan assembly is removable through fan outlet panel.
- E. Coils: Construct of plate-type aluminum fins, mechanically bonded to copper tubes. Design coil for use in steam or hot water applications. Coil shall have minimum working pressure of 125 psig.
- F. Motors: Provide totally enclosed motors, with built-in overload protection, having electrical characteristics as scheduled.

## 2.2 FAN-COIL UNITS

- A. Manufacturers:
1. Airtherm Mfg. Co.
  2. Carrier Corp.
  3. Daikin Applied.
  4. Dunham-Bush, Inc.
  5. Enviro-Tec by Johnson Controls, Inc.
  6. Greenheck
  7. International Environmental Corp.
  8. Johnson Controls, Inc.
  9. Price
  10. Titus
  11. Trane (The) Co.
  12. Williams
  13. Zehnder Rittling.
- B. General: Provide fan-coil units having cabinet sizes, and in locations indicated, and of capacities, style, and having accessories as scheduled. Include in basic unit chassis, coils, fanboard, drain pan assembly, fans, housing, motor, filter and insulation.
1. Units shall be listed according to UL 1995.
  2. Units shall be certified according to AHRI 440.
  3. Units shall be manufactured in accordance with ISO 9001.
- C. Chassis: Construct chassis of galvanized steel with flanged edges.
- D. Insulation: Provide minimum 1/2-inch thick insulation for sound and thermal protection.
1. Provide faced, heavy density glass fiber.
- E. Cabinet: Construct of 18-ga steel removable panels, 16-ga front. Provide insulation over entire coil section. Clean cabinet parts, bonderize, phosphatize, and flow-coat with baked-on primer.
- F. Water Coils: Construct of 1/2 inch or 5/8 inch seamless copper tubes mechanically bonded to configured aluminum fins. Provide manual air vent to allow coil venting. Design for minimum 200 psi working pressure, and factory pressure test at minimum 300 psi under water.
- G. Auxiliary Heating Coils: Construct of 7/16 inch or 5/8 inch seamless copper tubes mechanically bonded to configured aluminum fins. Design for minimum 200 psi working pressure, and pressure test at minimum 300 psi under water.
- H. Drain Pans: Construct of galvanized steel. Insulate with polystyrene, elastomeric closed cell foam, or polyurethane insulation. Provide drain connection.
- I. Fans: Provide centrifugal forward curved double width wheels of reinforced fiberglass or galvanized steel, in galvanized steel fan scrolls.
- J. Motors: Provide motors with integral thermal overload protection. Run test motors at factory in assembled unit prior to shipping. Provide quickly detachable motor cords.

- K. Filters: Provide throwaway pleated type filters in fiberboard frames. Filters shall have minimum MERV rating per ASHRAE 52.2 of MERV 8 or as scheduled on the drawings.
- L. Dampers: Provide 18-ga steel damper blades with polyurethane stop across entire blade length. Provide factory-mounted electric operators for 25% open cycle.
- M. Electrical: Unit shall have single point power connection with voltage and phase as scheduled on the drawings.
- N. Accessories: Provide the following accessories as indicated and/or scheduled:
  - 1. Wall Boxes: Provide aluminum wall boxes with integral eliminators and insect screen.
  - 2. Discharge Grille Panels: Provide 18-ga galvanized or epoxy powder coated steel, stamped integral grilles, with access doors.
  - 3. Sub-Bases: Provide 18-ga steel sub-base, height as indicated.
  - 4. Extended Oilers: Provide plastic motor oiler tubes extending to beneath top discharge grille.
  - 5. Recessing Flanges: Provide 18-ga steel flanges for recessing fan-coil units into wall or ceiling.
  - 6. Provide an integral condensate switch to prevent unit from operating if drain becomes blocked.
  - 7. Provide an integral condensate pump with GFCI to continuously remove condensate.
  - 8. Floor mounted units: Provide adjustable leveling legs.
  - 9. Provide a service disconnect switch to isolate power from the unit during maintenance.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Examine areas to receive terminal heating and cooling units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 INSTALLATION**

- A. Install terminal heating and cooling units in accordance with manufacturer's written instructions.
- B. Suspended Units: Suspend units from structural steel support frame using threaded steel rods and vibration isolation. Refer to Section "Vibration Isolation for HVAC" for additional requirements.
- C. Arrange installation of units to provide access space around units for service and maintenance.
- D. Unit Heaters
  - 1. Hang units from building substrate, not from piping. Mount as high as possible to maintain greatest headroom possible unless otherwise indicated.
  - 2. Support units with rod-type hangers anchored to building substrate.
  - 3. Protect units with protective covers during balance of construction.
- E. Fan Coil Units
  - 1. Install fan coil units level and plumb.
  - 2. Install fan coil units to comply with NFPA 90A.
  - 3. Ductwork: Refer to Division-23 section "Metal Ducts". Connect supply and return ducts to unit with flexible duct connections. Provide transitions to exactly match unit duct connection size.
  - 4. Vertical Units: Support vertical units with vibration isolation pads. Provide concrete base where indicated on the drawings.

### 3.3 PIPING CONNECTIONS

- A. Piping: Piping installation requirements are specified in other Division 23 sections. The Drawings indicate the general arrangement of piping, valves, fittings, and specialties. The following are specific connection requirements:
1. Arrange piping installations adjacent to units to allow unit servicing and maintenance.
  2. Connect water supply piping to the air leaving side of water coils.
  3. Connect condensate drain piping to the unit with appropriate trap. Verify that the piping material and installation is in accordance with Division 22 requirements.

### 3.4 ELECTRICAL WIRING

- A. General: Install electrical devices furnished by manufacturer but not specified to be factory-mounted. Furnish copy of manufacturer's wiring diagram submittal to Electric Installer.
1. Verify that electrical wiring installation is in accordance with manufacturer's submittal and installation requirements of Division 26 Sections. Do not proceed with equipment start-up until wiring installation is acceptable to equipment installer.

### 3.5 ADJUSTING AND CLEANING

- A. General: Just prior to substantial completion clean unit's exposed surfaces and vacuum clean internal components including fan wheel, fan cabinet, all heat exchange surfaces, cooling/heating coil sections, filter sections, access sections, etc.
- B. Retouch any marred or scratched surfaces of factory-finished surfaces, using finish materials furnished by manufacturer.
- C. Install new filters in terminal heating and cooling units requiring same. Do not operate units without filters installed.

### 3.6 STARTUP

- A. Final Checks Before Start-Up: Perform the following operations and checks before start-up:
1. Remove shipping, blocking, and bracing.
  2. Verify unit is secure on mountings and supporting devices and that connections for piping, ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
  3. Perform cleaning and adjusting specified in this Section.
  4. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
  5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
- B. Start-Up Services: Start-up terminal heating and cooling units in accordance with manufacturer's written start-up instructions. Do not operate units without filters installed. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
1. Energize motor, verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
    - a. Replace fan and motor pulleys as required to achieve design conditions.
    - b. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for system testing, adjusting, and balancing.

**3.7 TRAINING**

- A. At a time mutually agreed upon between the Owner and Contractor, engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain terminal heating and cooling units.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
- C. Review data included in the operation and maintenance manuals.

END OF SECTION

**SECTION 23 84 14 - SELF CONTAINED HUMIDIFIERS****PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Electrode Steam Generator Unit.

**1.2 SUBMITTALS**

- A. Product Data: Submit manufacturer's humidifier specifications, installation and start-up instructions, and current humidifier performance information with selection points clearly indicated.
  - 1. Provide dimensions, performance and construction details for the dispersion tubes and panels.
- B. Shop Drawings: Submit manufacturer's shop drawings indicating dimensions, required clearances, piping details and methods of assembly of components.
- C. Wiring diagrams detailing wiring for power and controls and differentiating between manufacturer-installed wiring and field-installed wiring.
- D. Maintenance data for humidifiers, for inclusion in Operating and Maintenance Manual specified in Division 1 and Division 23 Section "General Mechanical Requirements."

**1.3 QUALITY ASSURANCE**

- A. Codes and Standards: Provide humidifiers conforming to the following standards:
  - 1. Underwriters Laboratories, Inc. (UL) or Electrical Testing Laboratories (ETL): Provide electric humidifiers with UL or ETL label and listing.
- B. Certification: Provide humidifiers whose performances, under specified operating conditions, are certified by the manufacturer.

**1.4 DELIVERY STORAGE AND HANDLING**

- A. Delivery: Handle humidifiers carefully to prevent damage, denting and scoring. Do not install damaged humidifiers or components; replace with new.
- B. Storage: Store humidifiers and components in a clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage.

**PART 2 - PRODUCTS AND MATERIALS****2.1 ELECTRODE STEAM GENERATOR HUMIDIFIER**

- A. Manufacturers:
  - 1. Armstrong Intl., Inc.
  - 2. Condair
  - 3. Dri-Steem Corporation
  - 4. Hygromatik, Div. of Carel
  - 5. Neptronic
  - 6. Pure Humidifier Co.

- B. Type: Provide packaged self-contained, all electric steam generators of the disposable or serviceable cylinder type, from which steam is piped to a dispersion tube or panel mounted in a duct or air handling unit or to a unit- or remote-mounted fan package as shown on the drawings.
- C. Steam Cylinders: Provide humidifier assemblies with one or more steam cylinders utilizing electrical current flow through the water to generate steam.
1. Provide cylindrical molded plastic casings.
  2. Provide cylinders with large surface area, lattice type electrodes.
- D. Dispersion Tubes:
1. Provide dispersion tubes designed to evenly distribute the specified quantity of steam uniformly over the entire cross section of the air stream.
  2. Provide single or multiple dispersion tubes as required to achieve total steam absorption in a steam travel distance as scheduled on the drawings.
  3. Construct dispersion tubes of Type 304 or 316 stainless steel.
  4. Provide condensate separators to remove condensate from steam supply to dispersion tube.
- E. Dispersion Panel:
1. Provide prefabricated steam dispersion grid assembly extending the full width and height of duct or plenum designed for short absorption distance with atmospheric steam applications.
  2. Provide nozzles/metered orifices, spaced evenly along distribution tubes to facilitate dry and uniform steam distribution.
  3. Provide Type 304 or 316 stainless steel headers and distribution tubes.
  4. Provide steam separator integral to the header to remove condensate from steam supply to dispersion tube.
- F. Steam Piping:
1. Provide type K or L, hard drawn copper pipe conforming to ASTM B88, from steam generator to dispersion tubes.
  2. Provide wrought copper, solder joint fittings conforming to ANSI B16.22.
  3. Make connections between copper pipe and steam generator and dispersion tube with insulated hose specifically designed for steam service.
  4. Slope piping down from dispersion tubes to steam generator minimum 1/4-inch per foot.
  5. Insulate piping in accordance with Division 23 Section "HVAC Insulation."
- G. Steam Generator Cabinet:
1. Provide 18 gauge, enamel finished steel steam generator cabinets.
  2. Provide lockable, hinged doors to allow access to cylinders, operating and safety controls, electrical components and water makeup and drain valves.
  3. Provide wall mounting brackets and associated hardware or floor supports with leveling adjustment as indicated.
- H. Controls:
1. Provide microprocessor based electronic humidifier operating controls.
  2. Provide capacity control based upon adjusting the water level in the cylinders and thereby modulating the electrical current flow through the water.
  3. Provide automatic adjustment of water level by the operation of automatic makeup and drain valves.
  4. Provide high water sensors in each cylinder which will close the makeup valve and energize an indicator light on the front of the steam generator cabinet.
  5. Provide controls that will automatically shut down the unit if an unsafe operating condition is detected and display failure mode.
  6. Provide a manual drain switch to allow draining of cylinders for servicing, replacement or mineral dilution.
  7. Provide a control package capable of accepting a varying electronic signal (voltage, resistance or current) from the control system specified in Division 23 Section "Direct-Digital Control for HVAC".

- I. Water Make-up and Drain:
  - 1. Provide humidifiers with factory piped water makeup and drain connections to the cylinders, with single point connections at the exterior of the cabinet.
  - 2. Provide separate makeup and drain solenoid valves for each cylinder in multiple cylinder units.
  - 3. Provide integral tempering system to maintain drain water at maximum temperature of 140 F.
  - 4. Provide an air gap at each fill connection to prevent back siphoning.
- J. Options: Provide the following options where scheduled on the drawings or as required for the installation.
  - 1. Provide a manual reset over-temperature switch factory installed on the humidifier reservoir for humidifier over-temperature protection.
  - 2. Provide airflow proving switch to lock out humidifier when no airflow is sensed.
  - 3. Insulate unit with minimum 1" thick fiberglass insulation with aluminum foil facing.
  - 4. Provide NEMA 3R or 4 weather tight control cabinet for units installed outdoors.
  - 5. Provide a factory installed temperature sensor mounted onto the front access plate of the humidifier reservoir utilized to maintain the water temperature above freezing for units installed outdoors.
  - 6. Provide a factory installed key lock on the cabinet door.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Examine ducts, air-handling units, and conditions for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine roughing-in for piping systems to verify actual locations of piping connections before humidifier installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 INSTALLATION**

- A. General: Install humidifiers in accordance with the manufacturer's instructions and in an arrangement that will permit access and ease of maintenance.
- B. Seal all duct and plenum penetrations with flange.
- C. Install galvanized steel drain pan with flood detector switch under each humidifier mounted in a duct.
  - 1. Provide alarm to the BAS or, if no BAS, to a local visual/audio alarm device.
  - 2. Provide drain connection near top of the drain pan side and connect to drain piping or route to nearest floor drain.
- D. Piping:
  - 1. Steam Piping: Install tube(s)/manifold supply piping pitched to drain condensate back to humidifier or as recommended by manufacturer.
  - 2. Water Piping: Install piping as indicated including unions, shutoff valves, strainers and pressure regulating valves. Refer to Division 22 for water piping and accessories.
  - 3. Drain Piping: Install drain piping as indicated including unions and traps and route to nearest floor drain.
  - 4. Slope steam and condensate piping towards traps. Slope drain piping towards discharge location.
- E. Electrical: Refer to Division 26 for electrical equipment, conduit and wiring requirements.

**3.3 FIELD QUALITY CONTROL**

- A. Provide the services of a factory authorized service representative to provide start-up service and to demonstrate proper operation of equipment, accessories and controls.

**3.4 TRAINING**

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
  - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
  - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
- D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

**SECTION 23 84 17 - DESICCANT WHEEL UNITS****PART 1 - GENERAL REQUIREMENTS****1.1 SUMMARY**

- A. This Section includes desiccant wheel air-handling units with coils for outdoor installations.

**1.2 SUBMITTALS**

- A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.
1. Product data for each desiccant wheel unit indicated, including the following:
    - a. Fan performance curves with system operating conditions indicated.
    - b. Fan sound power ratings.
    - c. Coil performance ratings with system operating conditions indicated.
    - d. Motor ratings and electrical characteristics plus motor and fan accessories.
    - e. Provide short circuit current rating of units with factory mounted starter or variable frequency drive.
    - f. Materials gages and finishes.
    - g. Filters with performance characteristics.
    - h. Dampers, including housings, linkages, and operators.
  2. Shop drawings from manufacturer detailing dimensions, weights, required clearances, components, and location and size of each field connection.
  3. Wiring diagrams detailing wiring for power and controls and differentiating between manufacturer-installed wiring and field-installed wiring.
  4. Product certificates signed by manufacturers of desiccant wheel units certifying that their products comply with specified requirements.
  5. Field quality control test reports specified in Part 3 of this Section.
  6. Maintenance data and recommended spare parts list for desiccant wheel units for inclusion in Operating and Maintenance Manual specified in Division 1 and Division 23 Section "General Mechanical Requirements."

**1.3 QUALITY ASSURANCE**

- A. NFPA Compliance: Desiccant wheel units and components shall be designed, fabricated, and installed in compliance with NFPA Standard 90A "Standard for the Installation of Air Conditioning and Ventilating Systems."
- B. AHRI Certification: Desiccant wheel units and their components shall be factory tested in accordance with the applicable portions of AHRI 430 - Standard for Air-Handling Units.

**1.4 SPARE PARTS**

- A. General: Furnish to Owner, with receipt, the following spare parts for each packaged heating and cooling unit.
1. One set of matched fan belts for each belt driven fan and desiccant wheel unit.
  2. If HVAC equipment is used during the construction period, Contractor shall provide one set of filters (if system is designed to include pre-filters and after-filters, provide only pre-filters) when the unit is started and replace filters when needed, but not less than every month. On the day of substantial completion, the Contractor shall clean the unit and provide a new set of filters at each location in the unit.
  3. Furnish one additional gasket for each sectional joint of each desiccant wheel unit.

**1.5 SPECIAL PROJECT WARRANTY**

- A. Warranty on Motor/Compressor: Provide written warranty, signed by manufacturer, agreeing to replace/repair, within warranty period, motors/compressors with inadequate and defective materials and workmanship, including leakage, breakage, improper assembly, or failure to perform as required; provided manufacturer's instructions for handling, installing, protecting, and maintaining units have been adhered to during warranty period. Replacement is limited to component replacement only, and does not include labor for removal and reinstallation.
1. Warranty Period: 5 years from Date of Substantial Completion.

**PART 2 - PRODUCTS AND MATERIALS****2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Bry-Air, Inc.
  2. Concepts and Designs
  3. Novel Aire
  4. Xetex, Inc.

**2.2 MANUFACTURED UNITS**

- A. General Description: Factory assembled, consisting of fans, motor and drive assembly, heating and cooling coils, desiccant wheel with reactivation system, damper, plenums, filters, and drip pans.
- B. Types: Desiccant wheel units included in this project are of the following types:
1. Chilled water coils.
- C. Motor and Electrical Components: Refer to Division 23 Section "Common Motor Requirements for HVAC Equipment."

**2.3 UNIT BASE AND CABINET**

- A. Provide unit base of all steel construction with formed 2 inch by 8 inch 12-gage galvanized steel channel around outside perimeter and reinforced with 2 inch by 6 inch 12-gage galvanized channel on centers not exceeding 24 inches. Provide completed base constructed with G90 galvanized materials.
- B. Floor Construction: Floor panels shall be minimum 18 gauge galvanized steel with airtight seams and 2" of fiberglass insulation. There shall be no exposed insulation underneath unit.
- C. Exterior Housing Construction:
1. Construct unit housing of 2" thick urethane foam double wall construction, with galvalume exterior and galvanized interior wall skins.
  2. Provide access to service areas by means of full size service doors located to allow periodic maintenance and inspections. Construct doors with continuous aluminum hinge, compression type latches, and resilient gaskets. Door openings shall be flush with the floor to allow for ease of cleaning and washdown. Fabricate access doors with minimum of 2 inch urethane board insulation.
- D. Double-Wall Drain Pans: Formed sections of 304 stainless steel. Fabricate pans in sizes and shapes to collect condensate from cooling coils (including coil piping connections and return bends) when units are operating at the maximum cataloged face velocity across the cooling coil. Fill space between double-wall construction with fiberglass or mineral wool insulation and seal moisture tight.

1. Units with stacked coils shall have an intermediate drain pan or a drain trough to collect condensate from top coil.
- E. Provide bird screen on all outdoor air inlets.
- F. Service Vestibule: Provide unit with built-in service vestibule that provides access to electrical panel, dehumidifier components, controls, variable frequency drive, and compressors while providing protection from weather. Construct service vestibule with synthetic rubber floor matting that provides electrical insulation to 20,000 volts RMS/AC, main unit disconnect switch, and service light and ground fault duplex receptacle powered independently from main unit power supply.

## 2.4 DEHUMIDIFIER AND CONTROL COMPONENTS

- A. Provide dehumidifier of design and construction proven in field by minimum of five years' operating performance.
- B. Dehumidifier: Non-cyclic sorption type with single desiccant rotary structure designed for continuous operation. Construction arrangement shall provide counter flow of process and reactivation air streams with full face pressure seals to prevent cross leakage with static pressure differentials up to 8 inches water gage.
- C. Provide rotary structure consisting of 100 percent inert silicates impregnated with an inorganic, non-granular, crystalline desiccant which transfers water in vapor phase or of non-crystalline form of silicon dioxide (titanium silica gel). The design shall assure laminar air flow through the structure for minimum pressure loss with maximum transfer surface.
- D. Dehumidifier shall include honeycomb desiccant wheel and drive system, natural gas direct-fired reactivation heater, fan and motor assemblies for reactivation and process air flow, reactivation and process air flow indicating gages, inlet filters for reactivation and process air, reactivation energy control system, and overheat, rotation, and heater proving fault circuitry.
- E. Heat pipe located in process air stream.
- F. Provide humidistats for each unit.

## 2.5 FAN SECTION

- A. Testing Requirements: Units' fans performance ratings for flow rate, pressure, power, air density, speed of rotation, and efficiency shall be factory tested.
- B. Fan Section Construction: Fan sections shall be equipped with a formed steel channel base for integral mounting of fan, motor, and casing panels. The fan scroll, wheel, shaft, bearings, and motor shall be mounted on a structural steel frame with frame mounted on base with spring vibration isolators with an isolation efficiency of not less than 90%. Supply fan shall be belt driven with an adjustable pitch sheave.
- C. Equip units with reactivation air fans to provide scheduled air flows against static pressures indicated. Reactivation air fan shall be single width, single inlet with backward inclined airfoil blades. Reactivation air fan shall be direct drive with a ODP motor. Motors shall be open drip proof NEMA Design B with Class B insulation and 1.15 service factor.
- D. Fans and Shafts: Statically and dynamically balanced and designed for continuous operation at the maximum rated fan speed and motor horsepower. Supply fan wheel shall be plenum fan with airfoil blades as indicated. Airfoil wheels shall be steel painted with zinc chromate primer and an enamel finish coat. Fan shaft shall be solid steel, turned, ground, and polished. Fan wheels shall be keyed to the shaft.
- E. Shaft Bearings: Grease-lubricated ball bearings selected for 200,000 hours' average life, with grease fittings extended to an accessible location outside the fan section.

- F. Fan Drives: Designed for a 1.4 service factor and factory mounted with final alignment and belt adjustment made after installation.
  - 1. Belt Drive: Motors and fan wheel pulleys shall be adjustable pitch for use with motors up to and including 15 HP and fixed pitch for use with motors larger than 15 HP.
  - 2. Motors shall have steel belt guards.

## 2.6 FAN MOTORS

- A. Torque Characteristics: Sufficient to accelerate the driven loads satisfactorily.
- B. Motor Sizes: Minimum size as indicated. If not indicated, large enough so that the driven load will not require the motor to operate in the service factor range.
- C. Temperature Rating: 50 deg C maximum temperature rise at 40 deg C ambient for continuous duty at full load (Class A Insulation).
- D. Service Factor: 1.15 for polyphase motors and 1.35 for single-phase motors.
- E. Motor Construction: NEMA Standard MG 1, general purpose, continuous duty, Design B. Refer to Section "Common Motor Requirements for HVAC Equipment" for additional requirements.
  - 1. Bases: Adjustable.
  - 2. Bearings: The following features are required:
    - a. Ball or roller bearings with inner and outer shaft seals.
    - b. Grease lubricated.
    - c. Designed to resist thrust loading where belt drives or other drives produce lateral or axial thrust in motor.
  - 3. Enclosure Type: The following features are required:
    - a. Open drip-proof motors where satisfactorily housed or remotely located during operation.
    - b. Guarded drip-proof motors where exposed to contact by employees or building occupants.
  - 4. Overload protection: Built-in, automatic reset, thermal overload protection.
  - 5. Noise rating: Quiet.
  - 6. Efficiency: Energy-efficient motors shall have a minimum efficiency as scheduled in accordance with IEEE Standard 112, Test Method B. If efficiency not specified, motors shall have a higher efficiency than "average standard industry motors" in accordance with IEEE Standard 112, Test Method B.
  - 7. Nameplate: Indicate the full identification of manufacturer, ratings, characteristics, construction, and special features.
- F. Starters, Electrical Devices, and Wiring: Electrical devices and connections are specified in Division 26.

## 2.7 WATER COILS

- A. Testing Requirements: The following factory tests are required:
  - 1. Coil Performance Tests: Cooling and heating coils, except sprayed surface coils, shall be factory tested for rating in accordance with AHRI 410 - Standard for Forced-Circulation Air-Cooling and Air-Heating Coils.
- B. Coil Sections: Common or individual insulated, galvanized steel casings for heating and cooling coils. Coil section shall be designed and constructed to facilitate removal of coil for maintenance and replacement and to assure full air flow through coils.
  - 1. Medium- and high-pressure units shall have double gaskets between sections and coil connection penetrations through casing sealed to minimize leakage.
- C. Coils, General: Drainable, rigidly supported across the full face of the coil, and pitched to allow drainage.

1. Fins: Aluminum or copper, constructed from flat plate with belled collars for tubes. Fins shall be bonded to tubes by mechanically expanding copper tubes.
2. Tubes: Seamless copper.
3. Coil Casing: Galvanized steel.
4. Headers for Water Coils: Steel or cast iron, with connections for drain valve and air vent and threaded piping connections.
5. Water Coil Turbulators: Bronze, spring-type.

## 2.8 FILTERS SECTION

- A. Air Filters: Refer to Division 23 Section "Particulate Air Filtration" for air filters required for desiccant wheel units.
- B. General: Filters shall comply with NFPA Standard 90A "Standard for the Installation of Air Conditioning and Ventilating Systems."
- C. Filter Section: Process air inlet, reactivation air inlet, and return air inlet plenums shall be equipped with heavy gage galvanized steel racks to provide for slide out removal of filters, with filter media holding frames arranged for flat orientation.

## 2.9 ELECTRICAL SECTION

- A. The main electrical control panel shall be located in a service vestibule that includes a vaporproof service light and ground fault receptacle powered independently from the main unit power supply.
- B. All electrical controls shall be UL listed, and the entire unit factory wired in accordance with National Electrical Code standards and either ETL or UL listed.
- C. The unit shall be supplied with a non-fused main power disconnect which is mounted in the service vestibule. A single point power connection shall be provided for all units.
- D. Provide phase loss and low voltage shutdown protection.

## 2.10 AUXILIARY GAS HEAT SECTION

- A. Gas fired heaters shall be sized to provide capacities scheduled for auxiliary supply air heat and auxiliary reactivation air heat.
- B. Gas heaters shall be of power vented type and shall be AGA or ETL certified. Heat transfer surface shall be constructed of type 400 series stainless steel or aluminized steel and shall be suitable for use downstream from a cooling coil.
- C. Heaters shall be complete with all operational controls including an integral induced draft fan, combination gas valve with manual shutoff, temperature limit control, and automatic spark or hot surface ignited pilot with electronic flame supervision.
- D. Heaters shall include a stainless steel drain pan to encompass entire heater.

## 2.11 VARIABLE FREQUENCY DRIVES

- A. Provide variable frequency drive where indicated on the drawings. Locate variable frequency drive in service vestibule of unit.
- B. Variable frequency drive shall comply with all the requirements in specification Division 23 Section "Variable Frequency Drives".

## 2.12 DAMPERS

- A. General: Dampers and their operators shall comply with requirements specified in Division 23 Section "Instrumentation and Control Devices for HVAC."

**PART 3 - EXECUTION****3.1 EXAMINATION**

- A. Examine areas and conditions under which desiccant wheel units are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

**3.2 INSTALLATION GENERAL**

- A. General: Install desiccant wheel units in accordance with manufacturer's installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances.
- B. Support roof-mounted units on roof curbs provided by General Contractor. Secure units to roof curb with anchor bolts. Refer to schedule on the drawings for minimum roof curb height.
- C. Arrange installation of units to provide access space around desiccant wheel units for service and maintenance.

**3.3 CONNECTIONS**

- A. Piping installation requirements are specified in other Division 23 Section "Basic Piping Materials and Methods". The Drawings indicate the general arrangement of piping, valves, fittings, and specialties. The following are specific connection requirements:
  - 1. Arrange piping installations adjacent to units to allow unit servicing and maintenance.
  - 2. Connection piping to air-handling units with flexible connectors.
  - 3. Connect water supply piping to the air leaving side of water coils.
  - 4. Condensate Drain Piping: Route condensate drain to nearest roof or equipment drain or to location shown on the drawings. Provide trap at connection to drain pan with depth as noted on the drawings and install cleanouts at changes in direction (refer to manufacturer's recommendations for any additional requirements). Size condensate drain piping in accordance with local code and as shown on the drawings.
- B. Duct installations and connections are specified in other Division 23 Section "Metal Ducts". Make final duct connections with flexible connections.
- C. Electrical Connections: Electrical power wiring is specified in Division 26.
- D. Grounding: Connect unit components to ground in accordance with the National Electrical Code.

**3.4 ADJUSTING CLEANING AND PROTECTING**

- A. Adjust water coil flow, with control valves to full coil flow, to indicated gpm.
- B. Adjust damper linkages for proper damper operation.
- C. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel, fan cabinet, intake plenum cabinet, heat exchange surfaces, desiccant wheel, cooling/heating coil sections, filter sections, access sections, etc.

**3.5 STARTUP**

- A. Supervision of start-up of equipment shall be provided by factory trained personnel.
- B. Final Checks Before Start-Up: Perform the following operations and checks before start-up:
  - 1. Remove shipping, blocking, and bracing.

2. Verify unit is secure on mountings and supporting devices and that connections for piping, ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
  3. Perform cleaning and adjusting specified in this Section.
  4. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
  5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
  6. Comb coil fins for parallel orientation.
  7. Install clean filters. Do not operate unit without filters.
  8. Verify manual and automatic volume control, and fire and smoke dampers in connected ductwork systems are in the full-open position.
  9. Disable automatic temperature control operators.
- C. Starting procedures for desiccant wheel units:
1. Manufacturer shall provide factory trained personnel to supervise start up and testing of equipment.
  2. Energize motor, verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
    - a. Replace fan and motor pulleys as required to achieve design conditions.
    - b. Measure and record motor electrical values for voltage and amperage.
    - c. Shut unit down and reconnect automatic temperature control operators.
    - d. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for air-handling-system testing, adjusting, and balancing.
  3. Energize dehumidifier, desiccant wheel, blowers, and auxiliary heaters.
    - a. Replace fan and motor pulleys as required to achieve design conditions.
    - b. Measure and record motor electrical values for voltage and amperage.
    - c. Shut unit down and reconnect automatic temperature control operators.

### 3.6 TRAINING

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of four hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
1. Overview of the system and/or equipment as it relates to the facility as a whole.
  2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
  3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."
